Abstract

The aim of this research was to determine the differences among the top soccer players of the club in Bosnia and Herzegovina, CSC Zrinjski Mostar and the top soccer players of the club in Montenegro FC Buducnost, the champions in their countries, in the anthropometric characteristics and body composition. A sample of 58 subjects was divided into two sub-samples. The first sub-sample of the subjects consisted of 28 soccer players of CSC Zrinjski Mostar of the average age 24.36±4.14, the champions of the Bosnia and Herzegovina in the season 2016/17, while the other sub-sample consisted of 30 soccer players of FC Buducnost of the average age 22.73±4.33, the champions of the Montenegro Championship in the season 2016/17. Soccer players were tested immediately after the end of the competition season 2016/17. Anthropometric characteristics in the body composition were evaluated by a battery of 10 variables: body height, body weight, waist circumference, triceps skinfold, biceps skinfold, skinfold of the back, abdominal skinfold, body mass index, fat percentage and muscle mass. The standard central and dispersion parameters of all variables were calculated. The significance of the differences between the players of the top two soccer clubs in the Anthropometric characteristics and variables for assessing body composition was determined by a t-test for independent samples. It was found that the soccer players of the two mentioned clubs have statistically significant differences by three variables that estimate the waist circumference, biceps skinfold and abdominal skinfold, in favor of CSC Zrinjski Mostar.

Key words: Football, Morphological Characteristics, Football Players, Bosnia and Herzegovina, Montenegro

Introduction

A soccer game is said to be the most important secondary thing in the world, it gathers huge masses at stadiums and in front of TVs (Gardašević, 2010; Gardašević, Bjelica, Popović, & Milašinović, 2016). It is a highly dynamic and fast team game which, with its richness of movement, falls under category of polystructural sports games (Bjelica, 2005; Gardašević i Goranović, 2011; Gardašević i Bjelica, 2013; Gardašević & Bjelica, 2014a; Gardašević i Bjelica, 2014b). Soccer is a sport that is characterized by numerous and various complex and dynamic kinesiological activities which are then characterized by either cyclical (Gardašević, Vasiljević i Bojanić, 2015; Bjelica, Popović, & Gardašević, 2016a; Bjelica, Popović i Gardašević, 2016b; Sermaxhaj, Popovic, Bjelica, Gardasevic, & Arifi, 2017; Gardašević, Bjelica & Vasiljević, 2017a; Gardašević, Bjelica & Vasiljević, 2017b) or acyclical movement (Gardašević, 2015; Gardašević i sar., 2015; Gardašević, Bjelica i Vasiljević, 2016a; Gardašević, Bjelica i Vasiljević, 2016b; Gardašević, Bjelica, Milasinovic i Vasiljevic, 2016; Gardašević i Vasiljević, 2016; Gardašević, Popovic, & Bjelica, 2016). In soccer, top score can be achieved only under conditions of well-programmed training process (Gardašević, Bjelica i Popović, 2015). High quality management of the training process depends on the knowing of the structure of certain anthropological capabi-
Anthropometric characteristics and body composition of top-level senior soccer players

The aim of this research was to determine anthropometric characteristics and body composition of elite soccer players, players of CSC Zrinjski Mostar who compete in the Telecom Premier League of Bosnia and Herzegovina and players of FC Buducnost, who compete in the First Montenegrin Telecom League. After which, compare the variables between these soccer players and determine the possible differences between them.

Method

The data obtained in the study of anthropometric characteristics and body composition are checked and prepared for processing according to the set goal. Data bases are arranged according to the features and prepared for planned statistical processing. The results obtained by statistical analysis are presented in the tables and analyzed by the corresponding logical units. In general, the results of the research, through gradualness in the explanation of individual relationships, allow seeing differences in the observed anthropometric measures and body composition in accordance with the aim of the research, that is, they contribute to a clearer application of the obtained results in practice. In terms of time constraint, the research is of transversal character, and it consists of a one-off measurement of the corresponding anthropometric characteristics and body composition of top-level senior soccer players.

Sample of subjects

A sample of the subjects consists of a total of 58 top-level senior soccer players who performed in the Premier League of Bosnia and Herzegovina and the First Montenegrin Telecom League, divided into two sub-samples. The first one consists of 28 soccer players of CSC Zrinjski Mostar, the average age of 24.36±4.14, Bosnia and Herzegovina's Championship winner in season 2016/17, and the second one that consists of 30 soccer players of FC Buducnost of the average age 22.73±4.33, the champions of the Montenegro Championship in the season 2016/17. The soccer players were tested immediately after the 2016/17 season ended.

Sample of measures

Anthropometric research has been carried out with respect to the basic rules and principles related to the selection of measuring instruments and measurement techniques standardized in accordance with the International Biological Program guidelines. For the purpose of this study, 7 anthropometric measures have been taken: body height, body weight, waist circumference, triceps skinfold, biceps skinfold, skinfold of the back and abdominal skinfold, and 3 body composition assessment variables: body mass index, fat percentage and muscle mass. Anthropometer, caliper, and measuring tape were used for anthropometric measurements. To evaluate the body composition, Tanita body fat scale - model BC-418MA, was used. The principle of this scale is based on indirect measurement of the body composition; a safe electrical signal is transmitted through the body via electrodes located in the standalone unit. The Tanita Scale, thanks to its athletics mode, enables athletes to closely monitor their body weight, health condition and form with all relevant parameters.

Method of data processing

The data obtained through the research are processed by descriptive and comparative statistical procedures. For each variable, central and dispersion parameters, as well as asymmetry and flattening measures are processed. Differences in anthropometric characteristics and the composition of the body of the soccer players of these two clubs were determined by using a discriminatory parametric procedure with t-test for small independent samples, with statistical significance of p<0.05.

Results

In Tables 1 and 2, basic descriptive statistical parameters of anthropometric variables and body composition of the soccer players of the two clubs, where the values of central measurements and dispersion tendencies are calculated, are shown: Arithmetic mean (Mean), Standard deviation (S.D.), Variance (Variance), Minimal (Min) i Maximal (Max) values, coefficient of Curvature (Skewness) and Elongation (Kurtosis). First, the central and dispersion parameters of the variables were analyzed to evaluate the anthropometric characteristics and body composition of the soccer players of CSC Zrinjski Mostar (Table 1).
Based on the central and dispersion parameters, the values of the skewness and the kurtosis, it can be noted that all the variables are placed within the normal distribution boundaries. Generally, according to all statistical parameters, it can be concluded that here we have some top soccer players; that there is a normal distribution in all variables and that the results that prevail are superior to the arithmetic mean, which is not statistically significant because it is to be expected that regarding soccer players of a professional soccer club, there is no too large a span between the results of analyzed variables. Table 2 showed the central and dispersion parameters of the variables were analyzed to evaluate the anthropometric characteristics and body composition of the soccer players of FC Buducnost.

Based on the central and dispersion parameters, the values of skewness and kurtosis of the soccer players of FC Buducnost, it can be stated that all the variables are within the normal distribution boundaries and that the values are very similar to those of the soccer players of CSC Zrinjski Mostar. It can also be stated that the soccer players of FC Buducnost are younger on average. It can also be concluded that almost all variables of quantitative value are better with soccer players of CSC Zrinjski Mostar. However, a comparative statistical procedure, t-test (Table 3), will show whether it is statistically significant. By the value of the skewness, it can be noticed that in the variable of the abdominal skinfold (AAS), there was a slight inclination on the side of the lower results, which is good because subcutaneous fat is a disrupting factor for professional athletes. In order to determine whether there are statistically significant differences in the analyzed variables in the top soccer players of these two clubs, the statistical procedure t-test (Table 3) was applied.

Table 1. Central and dispersion parameters of variables for assessment of anthropometric characteristics and body composition of soccer players of CSC Zrinjski Mostar (N=28)

| Variable           | Min  | Max  | Mean ± S.D. | Variance | Skewness | Kurtosis |
|--------------------|------|------|-------------|----------|----------|----------|
| Body height        | 170.8| 193.0| 182.59±4.82 | 23.27    | -.07     | .25      |
| Body weight        | 70.0 | 90.5 | 78.85±5.80  | 33.68    | .13      | -.92     |
| Waist circumference| 77.0 | 98.0 | 86.39±4.35  | 18.91    | .34      | .95      |
| Triceps skinfold   | 4.6  | 13.0 | 7.59±2.09   | 4.39     | .88      | .63      |
| Biceps skinfold    | 3.3  | 6.2  | 4.33±.74    | .55      | 1.07     | .59      |
| Skinfold of the back| 3.7  | 13.8 | 9.23±2.18   | 4.74     | .31      | .92      |
| Abdominal skinfold | 4.0  | 15.0 | 8.02±2.77   | 7.66     | .89      | .36      |
| Body mass index    | 21.4 | 26.1 | 23.63±1.14  | 1.30     | .16      | -.47     |
| Fat percentage     | 3.9  | 14.6 | 8.79±3.18   | 10.14    | -.05     | -.88     |
| Muscle mass        | 35.5 | 46.9 | 40.67±2.67  | 7.12     | .05      | -.03     |

Note: Min - Minimal value; Max - Maximum value; Mean - Average value; SD - Standard deviation; Skewness - Measure asymmetry; Kurtosis - Measurement of flattening.

Table 2. Central and dispersion parameters of variables for assessment of anthropometric characteristics and body composition of soccer players of FC Buducnost (N=30)

| Variable           | Min  | Max  | Mean ± S.D. | Variance | Skewness | Kurtosis |
|--------------------|------|------|-------------|----------|----------|----------|
| Body height        | 171.1| 196.0| 181.96±5.89 | 34.748   | .339     | -.260    |
| Body weight        | 64.7 | 96.9 | 78.03±8.52  | 72.627   | .730     | -.308    |
| Waist circumference| 74.0 | 95.0 | 83.43±5.23  | 27.357   | .454     | -.260    |
| Triceps skinfold   | 4.0  | 13.6 | 7.79±2.45   | 6.008    | .481     | -.274    |
| Biceps skinfold    | 3.2  | 8.2  | 5.28±1.29   | 1.687    | .540     | -.556    |
| Skinfold of the back| 3.6  | 18.6 | 9.81±2.89   | 8.395    | .827     | 2.138    |
| Abdominal skinfold | 6.4  | 18.2 | 10.22±2.90  | 8.431    | 1.040    | .941     |
| Body mass index    | 21.1 | 27.1 | 23.49±1.45  | 2.113    | .872     | .762     |
| Fat percentage     | 5.2  | 16.0 | 9.98±2.76   | 7.632    | .160     | -.470    |
| Muscle mass        | 34.7 | 46.9 | 39.54±3.69  | 13.632   | .412     | -1.133   |

Based on the central and dispersion parameters, it can be stated that all the variables are placed within the normal distribution boundaries. Generally, according to all statistical parameters, it can be concluded that here we have some top soccer players; that there is a normal distribution in all variables and that the results that prevail are superior to the arithmetic mean, which is not statistically significant because it is to be expected that regarding soccer players of a professional soccer club, there is no too large a span between the results of analyzed variables. Table 2 showed the central and dispersion parameters of the variables were analyzed to evaluate the anthropometric characteristics and body composition of the soccer players of FC Buducnost.

Table 3. T-test values between the arithmetic mean of variables for the evaluation of anthropometric characteristics and body composition of soccer players of CSC Zrinjski Mostar (N=28) and FC Buducnost (N=30)

| Variable           | Club      | Mean ± S.D. | Mean Diff. | t-test | Sig.  |
|--------------------|-----------|-------------|------------|--------|-------|
| Body height        | CSC Zrinjski | 182.59±4.82 | .6329      | .446   | .658  |
|                    | FC Buducnost| 181.96±5.89 |           |        |       |
| Body weight        | CSC Zrinjski | 78.85±5.80  | .8233      | .427   | .671  |
|                    | FC Buducnost| 78.03±8.52  |           |        |       |
| Waist circumference| CSC Zrinjski | 86.39±4.35  | 2.9595     | 2.334  | .023  |
|                    | FC Buducnost| 83.43±5.23  |           |        |       |
| Triceps skinfold   | CSC Zrinjski | 7.59±2.09   | .1974      | .328   | .744  |
|                    | FC Buducnost| 7.79±2.45   |           |        |       |

(continued on next page)
Based on the obtained values of t-test results, it was found that the soccer players of the two mentioned clubs have statistically significant differences by the three variables that estimate the waist circumference (AWC), biceps skinfold (ABS) and abdominal skinfold (AAS), in favor of CSC Zrinjski Mostar.

**Discussion**

The aim of this study was to determine the difference in the anthropometric characteristics and body composition of the top soccer players of the club in Bosnia and Herzegovina, CSC Zrinjski Mostar and the top soccer players of the club in Montenegro FC Buducnost, the champions in their countries in the 2016/17 season. A sample of 58 respondents was divided into two sub-samples. The first sub-sample consisted of the 28 soccer players of CSC Zrinjski Mostar of 24.36±4.14 age on average, who were a statistically significant older than the 30 soccer players of FC Buducnost, who made the second sub-sample of 22.73±4.33 age on average. The results were obtained by using a battery of 10 tests in the area of anthropometric characteristics and body composition. By looking into the basic descriptive statistical parameters, it can be concluded that we have examined professional sportsmen indeed. It can be noticed that the soccer players of both clubs are of the approximately similar mean values of the variables analyzed, which is not surprising because these are the top two soccer clubs in Bosnia and Herzegovina and Montenegro, a states where there are also a great concentration of good soccer players. The t-test results showed that the soccer players of the two mentioned clubs have statistically significant differences by the three variables that estimate the waist circumference (AWC), biceps skinfold (ABS) and abdominal skinfold (AAS), in favor of CSC Zrinjski Mostar.

The first variable in which a statistically significant difference has been found is a variable that estimates waist circumference, where the soccer players of CSC Zrinjski Mostar also have a statistically higher value than the soccer players of FC Buducnost. Also, at the variables of biceps skinfold (ABS) and abdominal skinfold (AAS), soccer players of CSC Zrinjski Mostar have shown statistically better values because a smaller number means a better result when the disrupting factor of subcutaneous fat on playing soccer is taken into account. Very similar characteristics of soccer players were obtained in the region, which shows that soccer players have similar anthropometric characteristics and body composition in the whole region (Gardasevic, Bjelica, Popovic, Vasiljevic, & Milosevic, 2018; Bjelica, Gardasevic, & Vasiljevic, 2018; Corluka & Vasiljevic, 2018; Bjelica, & Gardasevic, 2019; Gardasevic, Bjelica, & Vasiljevic, 2019).

For other variables, some values are better for soccer players of CSC Zrinjski Mostar and for some for soccer players of FC Buducnost, although, insignificantly for statistics, which indicates that these soccer players have very similar anthropometric parameters and body composition, which is again, not surprising, considering that these two soccer clubs are the best in their countries in the 2016/17 competitive season. The values obtained in this research can be useful for coaches of these soccer clubs for making a comparison of their soccer players with others and formulate their work in a way that enables reduction of those parameters that are not good, and raise those that are good to a higher level. That will surely make their soccer players even better and more successful. Also, both clubs should turn to other researches and check the functional-motoric status, psychological preparation as well as tactical training of their soccer players and analyze whether there is room for their improvement. The results obtained in this research can serve as model parameters for the estimated variables for soccer players of all other soccer clubs in Bosnia and Herzegovina and Montenegro, because the soccer players that have been analyzed here, were among the best and the most successful soccer players in those two countries at the end of the competitive season 2016/17.
