OPERATOR SPACE $L_p$ EMBEDDING THEORY I

MARIUS JUNGE∗ AND JAVIER PARCET†

ABSTRACT. Let $X_1$ and $X_2$ be subspaces of quotients of $R \oplus OH$ and $C \oplus OH$ respectively. We use new free probability techniques to construct a completely isomorphic embedding of the Haagerup tensor product $X_1 \otimes_h X_2$ into the predual of a sufficiently large QWEP von Neumann algebra. As an immediate application, given any $1 < q \leq 2$, our result produces a completely isomorphic embedding of $\ell^q$ (equipped with its natural operator space structure) into $L_1(A)$ with $A$ a QWEP von Neumann algebra.

INTRODUCTION

The idea of replacing functions by linear operators, the process of quantization, goes back to the foundations of quantum mechanics and has a great impact in mathematics. This applies for instance to representation theory, noncommutative geometry, operator algebra, quantum and free probability or operator space theory among other fields. The quantization of measure theory leads to the theory of $L_p$ spaces defined over general von Neumann algebras, so called noncommutative $L_p$ spaces. This theory was initiated by Segal, Dixmier and Kunze in the fifties and continued years later by Haagerup, Fack, Kosaki and many others. We refer to the recent survey [30] for a complete exposition. In a series of papers beginning with this work, we will investigate noncommutative $L_p$ spaces in the language of noncommutative Banach spaces, so called operator spaces.

The theory of operator spaces took off in 1988 with Ruan’s work [32] and it has been developed since then by Blecher/Paulsen, Effros/Ruan and Pisier as a noncommutative generalization of Banach space theory [8, 22, 26]. In his book [25] on vector-valued noncommutative $L_p$ spaces, Pisier considered a distinguished operator space structure on $L_p$. In fact, the right category when dealing with noncommutative $L_p$ is in many aspects that of operator spaces. Indeed, this has become clear in the last years by recent results on noncommutative martingales and related topics. In this and forthcoming papers we shall prove a fundamental structure theorem of $L_p$ spaces in the category of operator spaces, solving a problem formulated by Gilles Pisier.

Theorem. Let $1 \leq p < q \leq 2$ and let $\mathcal{M}$ be a von Neumann algebra. Then, there exists a sufficiently large von Neumann algebra $\mathcal{A}$ and a completely isomorphic embedding of $L_q(\mathcal{M})$ into $L_p(\mathcal{A})$, where both spaces are equipped with their respective natural operator space structures. Moreover, we have

i) If $\mathcal{M}$ is QWEP, we can choose $\mathcal{A}$ to be QWEP.

ii) If $\mathcal{M}$ is hyperfinite, we can choose $\mathcal{A}$ to be hyperfinite.

iii) If $\mathcal{M}$ is infinite-dimensional, then $\mathcal{A}$ must be of type III.

In the category of operator spaces, the $L_p$ embedding theory presents some significant differences, some of them already apply to OH. For example, in sharp contrast with the classical theory, it was proved in [6] that OH does not embed completely isomorphically into any $L_p$ space for $2 < p < \infty$. Moreover, after [27] we know that there is no possible cb-embedding of OH into the predual of a semifinite von Neumann algebra. As it follows from our result, this also happens for $1 \leq p < q \leq 2$ and justifies the relevance of type III von Neumann algebras in the subject. In this paper we prove only a part of the Theorem stated above. Our concern in this paper will be to prove a particular case of our result which is simple enough to present a self-contained approach and general enough to serve as a guide for the reader in the forthcoming papers. More precisely, we shall assume that $p = 1$ and $L_q(M)$ is either $\ell_q$ or the Schatten class $S_q$. This reduces our result to the operator space embedding of discrete $L_q$ spaces into the predual of a von Neumann algebra. The complete proof (including the properties of $A$) will be given in [15], except for the lack of semifiniteness announced in iii) which will be considered independently in [16] since requires different techniques from [14].

In order to put our result in the right context, let us stress the interaction between harmonic analysis, probability and Banach space theory carried out mostly in the 70’s. Based on previous results by Beck, Grothendieck, Lévy, Orlicz... probabilistic methods in Banach spaces became the heart of the work developed by Kwapień, Maurey, Pisier, Rosenthal and many others. A fundamental motivation for this new field relied on the embedding theory of classical $L_p$ spaces. This theory was born in 1966 with the seminal paper [1] of Bretagnolle, Dacunha-Castelle and Krivine. They constructed an isometric embedding of $L_q$ into $L_p$ for $1 \leq p < q \leq 2$, a Banach space version of our main result; see also [7] for the analogous result with noncommutative $L_p$ spaces. The simplest form of such embedding was known to Lévy and is given by

\[
\left( \sum_{k=1}^{\infty} |\alpha_k|^q \right)^{\frac{1}{q}} = \left\| \sum_{k=1}^{\infty} \alpha_k \theta_k \right\|_{L_1(\Omega)},
\]

for scalars $(\alpha_k)_{k \geq 1}$ and where $(\theta_k)_{k \geq 1}$ is a suitable sequence of independent $q$-stable random variables in $L_1(\Omega)$ for some probability space $(\Omega, \mu)$. In other words, we have the relation

\[
\mathbb{E} \exp \left( i \sum_k \alpha_k \theta_k \right) = \exp \left( -c_q \sum_k |\alpha_k|^q \right).
\]

More recently, it has been discovered a parallel connection between operator space theory and quantum probability. The operator space version of Grothendieck theorem by Pisier and Shlyakhtenko [29] and the embedding of OH [9] require tools from free probability. In this context we should replace the $\theta_k$’s by suitable operators so that (1) holds with matrix-valued coefficients $\alpha_1, \alpha_2, \ldots$. To that aim, we develop new tools in quantum probability and construct an operator space version of $q$-stable random variables. To formulate this quantized form of (1) we need some basic results of Pisier’s theory [25]. The most natural operator space structure on $\ell_\infty$ comes from the diagonal embedding $\ell_\infty \hookrightarrow \mathcal{B}(\ell_2)$. The natural structure on $\ell_1$ is given by operator space duality, while the spaces $\ell_p$ are defined by means of the complex interpolation method [24] for operator spaces. Let us denote by $(\delta_k)_{k \geq 1}$ the unit vector basis of $\ell_q$. If $\otimes$ denotes the operator space projective tensor product and $S_p$ stands for the Schatten $p$-class over $\ell_2$, it was
shown in [25] that
\[
\left\| \sum_{k=1}^{\infty} a_k \otimes \delta_k \right\|_{S_1 \otimes \ell_q}^q = \inf_{a_k = \alpha b_k \beta} \left\| \alpha \right\|_{S_2 q'} \left( \sum_{k=1}^{\infty} \left\| b_k \right\|_{S_q}^q \right)^{\frac{q}{q'}},
\]
The answer to Pisier’s problem for \( \ell_q \) reads as follows.

**Theorem A.** If \( 1 < q \leq 2 \), there exists a sufficiently large von Neumann algebra \( A \) and a sequence \((x_k)_{k \geq 1}\) in \( L_1(A) \) such that the equivalence below holds for any family \((a_k)_{k \geq 1}\) of trace class operators
\[
\inf_{a_k = \alpha b_k \beta} \left\| \alpha \right\|_{2 q'} \left( \sum_{k=1}^{\infty} \left\| b_k \right\|_{q}^{\frac{q}{q'}} \right)^{\frac{q'}{q}} \left\| \beta \right\|_{2 q'} \sim_c \left\| \sum_{k=1}^{\infty} a_k \otimes x_k \right\|_{L_1(A \otimes B(\ell_2))}.
\]
This gives a completely isomorphic embedding of \( \ell_q \) into \( L_1(A) \). Moreover, the sequence \( x_1, x_2, \ldots \) provides an operator space version of a \( q \)-stable process and motivates a cb-embedding theory of \( L_p \) spaces. A particular case of Theorem A is the recent construction [9] of a cb-embedding of Pisier’s operator Hilbert space \( OH \) into a von Neumann algebra predual. In other words, a complete embedding of \( \ell_2 \) with its natural operator space structure into a noncommutative \( L_1 \) space, see also Pisier’s paper [28] for a shorter proof and Xu’s alternative construction [38]. Other related results appear in [11, 27, 29, 37], while semi-complete embeddings between vector-valued \( L_p \) spaces can be found in [12, 21]. All these papers will play a role in our analysis, either here or in the forthcoming papers.

The construction which leads to this operator space version of \( q \)-stable random variables is simpler than the one needed for the general case and will serve as a model for the latter in [15]. Let us sketch it in some detail. A key ingredient in our proof is the notion of the Haagerup tensor product \( \otimes_h \). We first note that \( \ell_q \) is the diagonal subspace of the Schatten class \( S_q \). According to [25], \( S_q \) can be written as the Haagerup tensor product of its first column and first row subspaces \( S_q = C_q \otimes_h R_q \). Moreover, using a simple generalization of “Pisier’s exercise” (see Exercise 7.9 in Pisier’s book [26]) we have
\[
C_q \hookrightarrow_{cb} (R \oplus OH)/\text{graph}(\Lambda_1)^\perp, \\
R_q \hookrightarrow_{cb} (C \oplus OH)/\text{graph}(\Lambda_2)^\perp,
\]
with \( \Lambda_1 : C \to OH \) and \( \Lambda_2 : R \to OH \) suitable injective, closed, densely-defined operators with dense range and where \( \hookrightarrow_{cb} \) denotes a cb-embedding, see [9, 28, 37] for related results. By [9] and duality, it suffices to see that
\[
\text{graph}(\Lambda_1) \otimes_h \text{graph}(\Lambda_2)
\]
is cb-isomorphic to a cb-complemented subspace of \( L_\infty(A; OH) \). Before proceeding it is important to have a little discussion on this space. Namely, our methods in this paper will lead us to obtain such cb-embedding for a free product von Neumann algebra \( A \). In particular, \( A \) will not be hyperfinite and Pisier’s theory [25] of vector valued noncommutative \( L_p \) spaces does not consider this space. Our definition of it is given by complex interpolation
\[
L_\infty(A; OH_n) = \left[ C_n(A), R_n(A) \right]_{\frac{1}{2}},
\]
where \( R_n(A) \) and \( C_n(A) \) are the row and column subspaces of
\[
M_n(A) = M_n \otimes_{\min} A = C_n \otimes_h A \otimes_h R_n.
\]
In fact, given $1 \leq p \leq \infty$ and using instead the row and column subspaces of the vector-valued Schatten class $S^m_p(L_p(\mathcal{A}))$, we find a definition of $L_p(\mathcal{A}; OH_n)$. On the other hand, we also know from [8] a definition of the spaces $L_p(\mathcal{A}; \ell_1^n)$ and $L_p(\mathcal{A}; \ell_\infty^n)$ for any von Neumann algebra $\mathcal{A}$. In particular, we might wonder whether or not our definition of $L_p(\mathcal{A}; OH_n)$ satisfies the following complete isometry

$$L_p(\mathcal{A}; OH_n) = [L_p(\mathcal{A}; \ell_1^n), L_p(\mathcal{A}; \ell_\infty^n)]_{\frac{1}{p}}.$$

Fortunately this is the case and the proof can be found in Chapter 1 of \[13\].

Let us now assume that we just try to embed the finite-dimensional space $M_{n}$ as the density $d$ on $\mathcal{B}$. The notation for the Haagerup tensor product, $graph(\Lambda_1) \otimes_h graph(\Lambda_2)$ is an intersection of four spaces. Let us explain this in detail. By a standard discretization argument which will be given in Lemma \[4\] below, we may assume that $\Lambda_j = d_{\lambda_j} = \sum_k \lambda^j_k e_{kk}$ is a diagonal operator on $\ell_2$ for $j = 1, 2$. Moreover, letting $[w]$ denote the integer part of $w$ and taking

$$\lambda_k = \lambda^j_{[k+1/2]} \quad \text{for} \quad k \equiv j \pmod{2},$$

it is no restriction to assume that the eigenvalues of $\Lambda_1$ and $\Lambda_2$ are the same. In particular, our considerations allow us to rewrite $graph(\Lambda_1) \otimes_h graph(\Lambda_2)$ in the form below

$$J_{1\infty,2} = graph(d_{\lambda_1}) \otimes_h graph(d_{\lambda_2}) = \left( C \cap \ell_2^{oh}(\lambda_1) \right) \otimes_h \left( R \cap \ell_2^{oh}(\lambda_2) \right),$$

where $\ell_2^{oh}(\lambda)$ is a weighted form of OH according to the action of $d_{\lambda}$, so that

$$C \cap \ell_2^{oh}(\lambda) = \left\{ (e_{i_1}, \lambda_i e_{i_1}) \mid i \geq 1 \right\} \subset C \oplus OH,$$

$$R \cap \ell_2^{oh}(\lambda) = \left\{ (e_{j_1}, \lambda_j e_{j_1}) \mid j \geq 1 \right\} \subset R \oplus OH.$$

The notation for $J_{1\infty,2}$ follows \[13\]. Namely, the symbol $\infty$ in $J_{1\infty,2}$ is used because we shall consider $L_p$ versions of these spaces in \[13\]. The number 2 denotes that this space arises as a ‘middle point’ in the sense of interpolation theory between two related $J$-spaces, see \[13\] and \[15\] for more details. Now, regarding $d^1_\psi = \sum_k \lambda^j_k e_{kk}$ as the density $d_{\psi}$ of some normal strictly semifinite faithful weight $\psi$ on $\mathcal{B}(\ell_2)$, the space $J_{1\infty,2}$ splits up into a 4-term intersection space. In other words, we find

$$J_{1\infty,2}(\psi) = \left( C \otimes_h R \right) \cap \left( C \otimes_h OH \right) d^1_{\psi} \cap d^1_{\psi} \left( OH \otimes_h R \right) \cap d^1_{\psi} \left( OH \otimes_h OH \right) d^1_{\psi}.$$

The norm of $x$ in $J_{1\infty,2}(\psi)$ is given by

$$\max \left\{ \|x\|_{B(\ell_2)}, \|xd_{\psi}^\perp\|_{C \otimes_h OH}, \|d_{\psi}^\perp \|_{OH \otimes_h R}, \|d_{\psi}^\perp \|_{OH \otimes_h OH} \right\}.$$

The two middle terms are not as unusual as it might seem

$$\|d_{\psi}^\perp (x_{ij})\|_{M_{0}(OH \otimes_h R)} = \sup_{\|\alpha\|_{\ell_\infty^n} \leq 1} \|d_{\psi}^\perp \left( \sum_{k=1}^m \alpha_{ik} x_{kj} \right)\|_{L_4(M \otimes B(\ell_2))},$$

$$\|(x_{ij})d_{\psi}^\perp\|_{M_{0}(C \otimes_h OH)} = \sup_{\|\beta\|_{\ell_\infty^n} \leq 1} \left\| \left( \sum_{k=1}^m x_{ik} \beta_{kj} \right) d_{\psi}^\perp \right\|_{L_4(M \otimes B(\ell_2))}.$$
and according to the results from [11], we can take $n \sim m \log m$. In this case we rename $\psi$ by $\psi_n$ and we may easily assume that

$$\text{tr}(d_{\psi_n}) = \sum_k \lambda^4_k = k_n$$

is a positive integer. Therefore, we consider the following state on $\mathcal{B}(\ell^2_2)$

$$\varphi_n(x) = \frac{1}{k_n} \sum_{k=1}^n \lambda^4_k x_{kk}.$$ 

In this particular case, the space $J_{\infty,2}(\psi_n)$ can be obtained using free probability.

**Theorem B.** Let $A = A_1 \ast A_2 \ast \cdots \ast A_{k_n}$ be the reduced free product of $k_n$ copies of $\mathcal{B}(\ell^2_2) \oplus \mathcal{B}(\ell^2_2)$ equipped with the state $\frac{1}{k_n}(\psi \oplus \varphi_n)$. If $\pi_k : A_j \to A$ denotes the canonical embedding into the $j$-th component of $A$, the mapping

$$u_n : x \in J_{\infty,2}(\psi_n) \mapsto \sum_{j=1}^{k_n} \pi_j(x, -x) \otimes \delta_j \in L_\infty(A; \text{OH}_{k_n})$$

is a cb-embedding with cb-complemented image and constants independent of $n$.

Theorem B and its generalization for arbitrary von Neumann algebras is a very recent result from [13]. However, since the result proved there covers a wider range of indices, the proof is rather long and quite technical. In order to be self-contained we provide a second proof of this particular case only using elementary tools from free probability. We think this approach is of independent interest. Now, by duality we obtain a cb-embedding of $S^m_q$ into $L_1(A; \text{OH}_{k_n})$. Then, we conclude using the cb-embedding of OH from [9] and an ultraproduct procedure. In fact, what we shall prove is a far reaching generalization of Theorem A. Namely, the same result holds replacing $C_q$ and $R_q$ by subspaces of quotients of $R \oplus \text{OH}$ and $C \oplus \text{OH}$.

**Theorem C.** Let $X_1$ be a subspace of a quotient of $R \oplus \text{OH}$ and let $X_2$ be a subspace of a quotient of $C \oplus \text{OH}$. Then, there exist some QWEP von Neumann algebra $A$ and a cb-embedding

$$X_1 \otimes_h X_2 \hookrightarrow_{cb} L_1(A).$$

Now we may explain how the paper is organized. In Section 1 we just prove the complete embeddings (1). This is a simple consequence of Pisier’s exercise 7.9 in [26] and Xu’s generalization [37]. However, we have decided to include the proof since it will serve as a model to follow in [15]. In Section 2 we will give an elementary proof of Theorem B using just free probability tools. The link between Theorems B and C is given in the first half of Section 3. The second half is devoted to the proof of Theorem C and thereby of Theorem A.

**Background and notation.** We shall assume that the reader is familiar with those branches of operator algebra related to the theories of operator spaces and noncommutative $L_p$ spaces. The recent monographs [3] and [26] on operator spaces contain more than enough information for our purposes. We shall work over general von Neumann algebras so that we use Haagerup’s definition [4] of $L_p$, see also Terp’s excellent exposition of the subject [34]. The basics on von Neumann algebras and Tomita’s modular theory to work with these notions appear in Kadison/Ringrose books [20]. We shall also assume certain familiarity with Pisier’s vector-valued non-commutative $L_p$ spaces [25] and Voiculescu’s free probability theory [36].
We shall follow the standard notation in the subject. Anyway, let us say a few words on our terminology. The symbols \((\delta_i)\) and \((e_{ij})\) will denote the unit vector basis of \(\ell_2\) and \(B(\ell_2)\) respectively. The letters \(A, M\) and \(N\) are reserved to denote von Neumann algebras. Almost all the time, the inclusions \(N \subset M \subset A\) will hold. We shall use \(\varphi\) and \(\phi\) to denote normal faithful \((n.f.\) in short\) states, while the letter \(\psi\) will be reserved for normal strictly semifinite faithful \((n.s.s.f.\) in short\) weights. Inner products and duality brackets will be anti-linear on the first component and linear on the second. Given \(\gamma > 0\), we shall write \(\gamma X\) to denote the space \(X\) equipped with the norm \(\|x\|_{\gamma X} = \gamma \|x\|_X\). In particular, if \(M\) is a finite von Neumann algebra equipped with a finite weight \(\psi\), we shall usually write \(\psi = k\varphi\) with \(k = \psi(1)\) so that \(\varphi\) becomes a state on \(M\). In this situation, the associated \(L_p\) space will be denoted as \(k^{1/p}L_p(M)\), so that the \(L_p\) norm is calculated using the state \(\varphi\). Note that this notation does not follow the tradition in interpolation theory, which denotes by \(\gamma X\) the Banach space with unit ball \(\gamma B_X\) and so the norm is divided and not multiplied by \(\gamma\). Given an operator space \(X\), the \(X\)-valued Schatten \(p\)-class over the algebra \(B(\ell_2)\) will be denoted by \(S_p(X)\).

Acknowledgement. The former version of this paper was much longer and also significantly more technical, since it almost contained the proof of our main result in full generality. This included all the results in this paper and also the results announced for \([15]\). We owe the referee to suggest this more accessible presentation which we hope will help the nonexpert reader.

1. ON “PISIER’S EXERCISE”

We begin by proving a generalization of Exercise 7.9 in \([26]\). This result became popular after Pisier applied it in \([28]\) to obtain a simpler way to cb-embed \(OH\) into the predual of a von Neumann algebra. In fact, our argument is quite close to the one given in \([37]\) for a similar result and might be known to experts. Nevertheless we include it here for completeness and also since we can think of it as a model for our construction in the non-discrete case. In fact, in this paper we shall only use Lemma 1.1 below for \(p = 1\), while in \([15]\) we will apply it in full generality.

Let us set some notation. Given a Hilbert space \(\mathcal{H}\), we shall write \(\mathcal{H}_r = B(\mathcal{H}, \mathbb{C})\) and \(\mathcal{H}_c = B(\mathbb{C}, \mathcal{H})\) for the row and column quantizations on \(\mathcal{H}\). Moreover, given \(1 \leq p \leq \infty\) we shall use the following terminology

\[
\mathcal{H}_{rp} = [\mathcal{H}_r, \mathcal{H}_c]_{\frac{1}{p}} \quad \text{and} \quad \mathcal{H}_{cp} = [\mathcal{H}_c, \mathcal{H}_r]_{\frac{1}{p}}.
\]

There are two particular cases for which we use another terminology. When \(\mathcal{H} = \ell_2\), we shall use \((R, C, R_p, C_p)\) instead. Moreover, when the Hilbert space is \(L_2(M)\) for some von Neumann algebra \(M\), we shall write \(L^{\text{cb}}_p(M)\) and \(L^{\text{sh}}_p(M)\). In the same fashion, \(\mathcal{H}_{\text{sh}}\) and \(L^{\text{sh}}_2(M)\) stand for the operator Hilbert space structures. Given two operator spaces \(X_1\) and \(X_2\), the expression \(X_1 \simeq_{\text{cb}} X_2\) means that there exists a complete isomorphism between them. We shall write \(X_1 \in QS(X_2)\) to denote that \(X_1\) is completely isomorphic to a quotient of a subspace of \(X_2\). Let \(\mathcal{S}\) denote the strip

\[
\mathcal{S} = \left\{ z \in \mathbb{C} \mid 0 < \text{Re}(z) < 1 \right\}
\]

and let \(\partial \mathcal{S} = \partial_0 \cup \partial_1\) be the partition of its boundary into

\[
\partial_0 = \left\{ z \in \mathbb{C} \mid \text{Re}(z) = 0 \right\} \quad \text{and} \quad \partial_1 = \left\{ z \in \mathbb{C} \mid \text{Re}(z) = 1 \right\}.
\]
Given $0 < \theta < 1$, let $\mu_\theta$ be the harmonic measure of the point $z = \theta$. This is a probability measure on $\partial S$ (with density given by the Poisson kernel in the strip) that can be written as $\mu_\theta = (1 - \theta)\mu_0 + \theta\mu_1$, with $\mu_j$ being probability measures supported by $\partial_j$ and such that

\[
(1.1) \quad f(\theta) = \int_{\partial S} f \, d\mu_\theta
\]

for any bounded analytic function $f : S \to \mathbb{C}$ which is extended non-tangentially to $\partial S$. Now, before proving the announced result, we need to set a formula from $[24]$. Given $2 \leq p \leq \infty$ and $0 < \theta < 1$, the norm of $x = \sum_k x_k \otimes \delta_k$ in

\[
[S_p(C_p), S_p(R_p)]_\theta
\]

is given by

\[
(1.2) \quad \sup \left\{ \left( \sum_k \|\alpha x_k\beta\|_{S_2}^2 \right)^{\frac{1}{2}} \left( \|\alpha\|_{S_\alpha}, \|\beta\|_{S_\beta} \leq 1 \right) \right\},
\]

where the indices $(u, v)$ are determined by

\[
(1/u, 1/v) = (\theta/q, (1 - \theta)/q) \quad \text{with} \quad 1/2 = 1/p + 1/q.
\]

Of course, this formula trivially generalizes for the norm in the space

\[
[S_p(H_{c_p}), S_p(H_{r_p})]_\theta.
\]

**Lemma 1.1.** If $1 \leq p < q \leq 2$, we have

\[
R_q \in QS(R_p \oplus_2 OH) \quad \text{and} \quad C_q \in QS(C_p \oplus_2 OH).
\]

**Proof.** We only prove the first assertion since the arguments for both are the same. In what follows we fix $0 < \theta < 1$ determined by the relation $R_q = [R_p, OH]_\theta$. In other words, we have $1/q = (1 - \theta)/p + \theta/2$. According to the complex interpolation method and its operator space extension $[24]$, given a compatible couple $(X_0, X_1)$ of operator spaces we define $\mathcal{F}(X_0, X_1)$ as the space of bounded analytic functions $f : S \to X_0 + X_1$ and we equip it with the following norm

\[
\|f\|_{\mathcal{F}(X_0, X_1)} = \left( (1 - \theta) \|f|_{\theta_0}\|_{L_2(\partial_0; X_0)}^2 + \theta \|f|_{\theta_1}\|_{L_2(\partial_1; X_1)}^2 \right)^{\frac{1}{2}}.
\]

Then, the complex interpolation space $X_\theta = [X_0, X_1]_\theta$ can be defined as the space of all $x \in X_0 + X_1$ such that there exists a function $f \in \mathcal{F}(X_0, X_1)$ with $f(\theta) = x$. We equip $X_\theta$ with the norm

\[
\|x\|_{X_\theta} = \inf \left\{ \|f\|_{\mathcal{F}(X_0, X_1)} \mid f \in \mathcal{F}(X_0, X_1) \text{ and } f(\theta) = x \right\}.
\]

In our case we set $X_0 = R_p$ and $X_1 = OH$. If we define

\[
\mathcal{H} = (1 - \theta)\frac{1}{2} L_2(\partial_0; \ell_2) \quad \text{and} \quad \mathcal{K} = \theta\frac{1}{2} L_2(\partial_1; \ell_2),
\]

it turns out that $\mathcal{F}(R_p, OH)$ can be regarded (via Poisson integration) as a subspace of $\mathcal{H} \oplus \mathcal{K}$. Moreover, we equip $\mathcal{F}(R_p, OH)$ with the operator space structure inherited from $\mathcal{H}_{r_p} \oplus_2 \mathcal{K}_{oh}$. Then, we define the mapping

\[
Q : f \in \mathcal{F}(R_p, OH) \mapsto f(\theta) \in R_q.
\]

The assertion follows from the fact that $Q$ is a complete metric surjection. Indeed, in that case we have $R_q \simeq_{ch} \mathcal{F}(R_p, OH)/\ker Q$, which is a quotient of a subspace of $R_p \oplus_2 OH$. In order to see that $Q$ is a complete surjection, it suffices to see that the map $id_{S_{p'}} \otimes Q : S_p(\mathcal{F}(R_p, OH)) \to S_{p'}(R_q)$ is a metric surjection. We begin
by showing that \( id_{S_{p'}} \otimes Q \) is contractive. Let \( f \in S_{p'}(\mathcal{F}(R_p, \text{OH})) \) be of norm < 1 and let us write
\[
f(\theta) = \sum_k f_k(\theta) \otimes \delta_k \in S_{p'}(R_q).
\]
To compute the norm of \( f(\theta) \) we note that
\[
S_{p'}(R_q) = \left[ S_{p'}(C_{p'}), S_{p'}(R_{p'}) \right]_\eta \quad \text{with} \quad 1/q = (1 - \eta)/p + \eta/p'.
\]
Then it follows from (1.2) that
\[
(1.3) \quad \| f(\theta) \|_{S_{p'}(R_q)} = \sup \left\{ \left( \sum_k \| \alpha f_k(\theta) \beta \|_{S_2}^2 \right)^{\frac{1}{2}} \; | \; \| \alpha \|_{S_{2r'/\eta}}, \| \beta \|_{S_{2r/(1-\eta)}}, \leq 1 \right\}
\]
where \( 1/2r = 1/2 - 1/p' = 1/p - 1/2. \) Moreover, by polar decomposition it is clear that we can restrict the supremum above to all \( \alpha \) and \( \beta \) in the positive parts of their respective unit balls. Taking this restriction in consideration, we define
\[
g(z) = \sum_k g_k(z) \otimes \delta_k \quad \text{with} \quad g_k(z) = \alpha^* f_k(z) \beta^{\frac{2-z}{z}}.
\]
The \( g_k \)'s are analytic in \( \mathcal{S} \) and take values in \( S_2 \). Thus, we have the identity
\[
(1.4) \quad \left( \sum_k \| \alpha f_k(\theta) \beta \|_{S_2}^2 \right)^{\frac{1}{2}} = \left( \sum_k \| g_k(\theta) \|_{S_2}^2 \right)^{\frac{1}{2}} = \left( (1 - \theta) \int_{\partial_0} \sum_k \| g_k(z) \|_{S_2}^2 d\mu_0 + \theta \int_{\partial_1} \sum_k \| g_k(z) \|_{S_2}^2 d\mu_1 \right)^{\frac{1}{2}}.
\]
The contractivity of \( id_{S_{p'}} \otimes Q \) will follow from
\[
(1.5) \quad \int_{\partial_0} \sum_k \| g_k(z) \|_{S_2}^2 d\mu_0 \leq \| f_{|_{\partial_0}} \|_{S_{p'}(L_{2r}(\partial_0; \ell_2))}^2,
\]
\[
(1.6) \quad \int_{\partial_1} \sum_k \| g_k(z) \|_{S_2}^2 d\mu_1 \leq \| f_{|_{\partial_1}} \|_{S_{p'}(L_{2r}(\partial_1; \ell_2))}^2.
\]
Indeed, if we combine (1.3) and (1.4) with the operator space structure defined on \( \mathcal{F}(R_p, \text{OH}) \), it turns out that inequalities (1.5) and (1.6) are exactly what we need. To prove (1.5) we observe that \( 2\eta = \theta \) and \( r' = p'/2 \), so that
\[
\int_{\partial_0} \sum_k \| g_k(z) \|_{S_2}^2 d\mu_0 = \int_{\partial_0} \sum_k \| f_k(z) \beta^{\frac{2-z}{2}} \|_{S_2}^2 d\mu_0 = \int_{\partial_0} \sum_k \text{tr} (f_k(z)^* f_k(z) \beta^{\frac{2-z}{2}} (\beta^{\frac{2-z}{2}})^*) d\mu_0 \leq \| \beta^{\frac{2-z}{2}} \|_{S_r} \left\| \int_{\partial_0} \sum_k f_k(z)^* f_k(z) d\mu_0 \right\|_{S_{p'}}.
\]
This gives
\[
\int_{\partial_0} \sum_k \| g_k(z) \|_{S_2}^2 d\mu_0 \leq \| \beta \|_{S_{2r/(1-\eta)}} \left( \int_{\partial_0} \sum_k f_k(z)^* f_k(z) d\mu_0 \right)^{\frac{1}{2}} \left\| f_{|_{\partial_0}} \|_{S_{p'}(L_{2r}(\partial_0; \ell_2))}^2.
\]
The first term on the right is \( \leq 1 \). Hence, we have
\[
\int_{\partial_0} \sum_k \| g_k(z) \|_{S_2}^2 d\mu_0 \leq \| f_{|_{\partial_0}} \|_{S_{p'}(L_{2r}(\partial_0; \ell_2))}^2 = \| f_{|_{\partial_0}} \|_{S_{p'}(L_{2r}(\partial_0; \ell_2))}^2.
\]
This proves (1.5) while for (1.6) we proceed in a similar way
\[
\int_{\partial_1} \sum_k \|g_k(z)\|_{S_{2}}^2 \, d\mu_1 = \int_{\partial_1} \sum_k \|\alpha^* f_k(z)\theta_{k}\|_{S_{2}}^2 \, d\mu_1 = \int_{\partial_1} \sum_k \|\alpha^* f_k(z)\theta_{k}\|_{S_{2}}^2 \, d\mu_1 \leq \sup \left\{ \int_{\partial_1} \sum_k \|\alpha f_k(z)b\|_{S_{2}}^2 \, d\mu_1 \mid \|a\|_{S_{4r}}, \|b\|_{S_{4r}} \leq 1 \right\} = \sup \left\{ \left\| \alpha \left( \sum_k f_k|_{0} \otimes \delta_k \right)b \right\|^2_{S_{2}(L_{2}^{2}(\partial_{1};\mathbb{C}_{2}))} \mid \|a\|_{S_{4r}}, \|b\|_{S_{4r}} \leq 1 \right\}.
\]
According to (1.2), this proves (1.6) and we have a contraction. Reciprocally, given \( x \in S_{p}(R_q) \) of norm \( < 1 \), we are now interested on finding \( f \in S_{p}(F(R_p, OH)) \) such that \( f(\theta) = x \) and \( \|f\|_{S_{p}(F(R_p, OH))} \leq 1 \). Since
\[
[S_{p}(R_p), S_{p}(OH)]_{\theta} = S_{p}(R_q)
\]
there must exists \( f \in F(S_{p}(R_p), S_{p}(OH)) \) such that \( f(\theta) = x \) and
\[
\|f\|_{F(S_{p}(R_p), S_{p}(OH))} = \left( 1 - \theta \right) \|f|_{1_{0}}\|_{L_{2}(\partial_{1};S_{p}(R_p))} + \theta \|f|_{1_{1}}\|_{L_{2}(\partial_{1};S_{p}(OH))} \right)^{\frac{1}{2}} \leq 1.
\]
Therefore, it remains to see that
\[
(1.7) \quad \|f|_{1_{0}}\|_{S_{p}(L_{2}^{k}(\partial_{1};\mathbb{C}_{2}))} \leq \|f|_{1_{0}}\|_{L_{2}(\partial_{1};S_{p}(R_p))},
\]
\[
(1.8) \quad \|f|_{1_{1}}\|_{S_{p}(L_{2}^{k}(\partial_{1};\mathbb{C}_{2}))} \leq \|f|_{1_{1}}\|_{L_{2}(\partial_{1};S_{p}(OH))}.
\]
However, the identities below are clear by now
\[
\|f|_{1_{0}}\|_{S_{p}(L_{2}^{k}(\partial_{1};\mathbb{C}_{2}))} = \left\| \left( \int_{\partial_1} \sum_k f_k(z)z^{*} f_k(z) \, d\mu_1 \right)^{\frac{1}{2}} \right\|_{S_{p}},
\]
\[
\|f|_{1_{1}}\|_{L_{2}(\partial_{1};S_{p}(R_p))} = \left( \int_{\partial_1} \left\| \left( \sum_k f_k(z)z^{*} f_k(z) \right)^{\frac{1}{2}} \right\|^2 \, d\mu_1 \right)^{\frac{1}{2}}.
\]
In particular, (1.7) follows automatically. On the other hand, (1.2) gives
\[
\|f|_{1_{0}}\|_{S_{p}(L_{2}^{k}(\partial_{1};\mathbb{C}_{2}))} = \sup \left\{ \int_{\partial_1} \sum_k \|\alpha f_k(z)\beta\|_{S_{2}}^2 \, d\mu_1 \mid \|\alpha\|_{4r}, \|\beta\|_{4r} \leq 1 \right\}^{\frac{1}{2}},
\]
\[
\|f|_{1_{1}}\|_{L_{2}(\partial_{1};S_{p}(OH))} = \left( \int_{\partial_1} \sup \left\{ \int_{\partial_1} \sum_k \|\alpha f_k(z)\beta\|_{S_{2}}^2 \, d\mu_1 \mid \|\alpha\|_{4r}, \|\beta\|_{4r} \leq 1 \right\}^{\frac{1}{2}} \right)^{\frac{1}{2}}.
\]
Thus, inequality (1.8) also follows easily and \( Q \) is a complete metric surjection. □

**Remark 1.2.** If \( 1 \leq p_0 \leq p \leq p_1 \leq \infty \), it is also true that
\[
R_p \in \mathcal{Q}S(R_{p_0} \oplus_2 R_{p_1}) \quad \text{and} \quad C_p \in \mathcal{Q}S(C_{p_0} \oplus_2 C_{p_1}).
\]

**Remark 1.3.** In Lemma 1.1 we have obtained
\[
R_q \simeq_{cb} F(R_p, OH)/\ker Q \in \mathcal{Q}S(R_{p} \oplus_2 OH),
\]
\[
C_q \simeq_{cb} F(C_p, OH)/\ker Q \in \mathcal{Q}S(C_p \oplus_2 OH).
\]
However, it will be convenient in the sequel to observe that ker Q can be regarded in both cases as the annihilator of the graph of certain linear operator, see [2]. Recall that for a linear map between Hilbert spaces \( \Lambda : K_1 \to K_2 \) with domain \( \text{dom}(\Lambda) \)

\[
\text{graph}(\Lambda) = \left\{ (x_1, x_2) \in K_1 \oplus K_2 \mid x_1 \in \text{dom}(\Lambda) \text{ and } x_2 = \Lambda(x_1) \right\}.
\]

Let us consider for instance the case of \( R_p \). We first note that \( \mathcal{F}(R_p, \text{OH}) \) is the graph of an injective, closed, densely-defined operator \( \Lambda \) with dense range. This operator is given by \( \Lambda(f_{\omega_0}) = f_{\omega_1} \) for all \( f \in \mathcal{F}(R_p, \text{OH}) \). \( \Lambda \) is well defined and injective by Poisson integration due to the analyticity of elements in \( \mathcal{F}(R_p, \text{OH}) \). On the other hand, ker \( Q \) is the subspace of \( \mathcal{F}(R_p, \text{OH}) \) composed of functions \( f \) vanishing at \( z = \theta \). Then, it easily follows from [11] that ker \( Q \) is the annihilator of \( \mathcal{F}(R_p, \text{OH}) = \text{graph}(\Lambda) \) regarded as a subspace of

\[
(1 - \theta)^{\frac{1}{2}} L_2^{\nu'}(\partial_1; \ell_2) \oplus 2 \theta^{\frac{1}{2}} L_2^{\nu} (\partial_1; \ell_2).
\]

2. FREE HARMONIC ANALYSIS

We start with the proof of a generalized form of Theorem B for arbitrary von Neumann algebras. Although we just use in this paper its discrete version as stated in the Introduction, the general formulation does not present extra difficulties and will be instrumental when dealing with non-discrete algebras in [15]. Our starting point is a von Neumann algebra \( \mathcal{M} \) equipped with a n.f. state \( \varphi \) and associated density \( d_\varphi \). Let \( \mathcal{N} \) be a von Neumann subalgebra of \( \mathcal{M} \). According to Takesaki [32], the existence and uniqueness of a n.f. conditional expectation \( E : \mathcal{M} \to \mathcal{N} \) is equivalent to the invariance of \( \mathcal{N} \) under the action of the modular automorphism group \( \sigma_\varphi^t \) associated to \( (\mathcal{M}, \varphi) \). In that case, \( E \) is \( \varphi \)-invariant and following Connes [2] we have \( E \circ \sigma_\varphi^t = \sigma_\varphi^t \circ E \). In what follows, we assume these properties in all subalgebras considered. Now we set \( \mathcal{A}_k = \mathcal{M} \oplus \mathcal{M} \) and define \( \mathcal{A} \) to be the reduced amalgamated free product \( *_{\mathcal{A}} \mathcal{A}_k \) of the family \( \mathcal{A}_1, \mathcal{A}_2, \ldots, \mathcal{A}_n \) over the subalgebra \( \mathcal{N} \), where the embedding of the subalgebra \( \mathcal{N} \) into \( \mathcal{M} \oplus \mathcal{M} \) is given by \( x \mapsto (x, x) \).

Note that our notation \( *_{\mathcal{A}} \mathcal{A}_k \) for reduced amalgamated free products does not make explicit the dependence on the conditional expectations \( E_k : \mathcal{A}_k \to \mathcal{N} \), given by \( E_k(a, b) = \frac{1}{2} E(a) + \frac{1}{2} E(b) \). The following is the operator-valued version [9, 17] of Voiculescu inequality [35], for which we need to introduce the mean-zero subspaces

\[
\mathcal{A}_k = \left\{ x \in \mathcal{A}_k \mid E_k(a_k) = 0 \right\}.
\]

**Lemma 2.1.** If \( a_k \in \mathcal{A}_k \) for \( 1 \leq k \leq n \) and \( E_{\mathcal{N}} : \mathcal{A} \to \mathcal{N} \) stands for the conditional expectation of \( \mathcal{A} \) onto \( \mathcal{N} \), the following equivalence of norms holds with constants independent of \( n \)

\[
\left\| \sum_{k=1}^{n} a_k \right\| \mathcal{A} \sim \max_{1 \leq k \leq n} \left\| x_k \right\| \mathcal{A}_k + \left\| \left( \sum_{k=1}^{n} E_{\mathcal{N}}(a_k a_k^*) \right)^{\frac{1}{2}} \right\| \mathcal{N} + \left\| \left( \sum_{k=1}^{n} E_{\mathcal{N}}(a_k^* a_k) \right)^{\frac{1}{2}} \right\| \mathcal{N}.
\]

Moreover, we also have

\[
\left\| \sum_{k=1}^{n} a_k a_k^* \right\| \mathcal{A} \sim \max_{1 \leq k \leq n} \left\| a_k \right\| \mathcal{A}_k + \left\| \left( \sum_{k=1}^{n} E_{\mathcal{N}}(a_k a_k^*) \right)^{\frac{1}{2}} \right\| \mathcal{N},
\]

\[
\left\| \sum_{k=1}^{n} a_k^* a_k \right\| \mathcal{A} \sim \max_{1 \leq k \leq n} \left\| a_k \right\| \mathcal{A}_k + \left\| \left( \sum_{k=1}^{n} E_{\mathcal{N}}(a_k^* a_k) \right)^{\frac{1}{2}} \right\| \mathcal{N}.
\]
Remark 2.2. It is easily seen that

\[ E \text{ is mean-zero.} \]

In the following we shall use with no further comment the identities

\[ \text{distributed variables.} \]

In other words, given \( R \), here the letters \( L \) to introduce the spaces

\[ \text{spaces as endpoints in an interpolation scale.} \]

Finally, the norms on the right induce

\[ \text{spaces. The number 1 arises from interpolation theory, because we think of these} \]

For the first inequality we refer to [9]. The others can be proved in a similar way. Alternatively, both can be deduced from the first one. Indeed, using the identity

\[ \left\| \left( \sum_{k=1}^{n} a_k a_k^* \right)^{\frac{1}{2}} \right\|_{\mathcal{A}} = \left\| \sum_{k=1}^{n} a_k \otimes e_{1k} \right\|_{M_n(\mathcal{A})} \]

and recalling the isometric isomorphism

\[ M_n(\mathcal{A}) = M_n(\mathcal{N})^* M_n(\mathcal{A}), \]

we may apply Voiculescu’s inequality over the triple

\[ \left( M_n(\mathcal{A}), M_n(\mathcal{A}_k), M_n(\mathcal{N}) \right). \]

Taking \( \tilde{E}_\mathcal{N} = \text{id}_{M_n} \otimes E_\mathcal{N} \), the last term disappears because

\[ \left\| \left( \sum_{k=1}^{n} \tilde{E}_\mathcal{N}((a_k \otimes e_{1k}^*)(a_k \otimes e_{1k})) \right)^{\frac{1}{2}} \right\|_{M_n(\mathcal{N})} = \sup_{1 \leq k \leq n} \left\| \tilde{E}_\mathcal{N}(a_k^* a_k)^{\frac{1}{2}} \right\|_{\mathcal{N}} \leq \sup_{1 \leq k \leq n} \| a_k \|_{\mathcal{A}_k}. \]

The third equivalence follows by taking adjoints. The proof is complete. \( \square \)

Let \( \pi_k : \mathcal{A}_k \to \mathcal{A} \) denote the embedding of \( \mathcal{A}_k \) into the \( k \)-th component of \( \mathcal{A} \). Given \( x \in \mathcal{M} \), we shall write \( x_k \) as an abbreviation of \( \pi_k(x, -x) \). Note that \( x_k \) is mean-zero. In the following we shall use with no further comment the identities

\[ E_\mathcal{N}(x_k x_k^*) = E(x x^*) \text{ and } E_\mathcal{N}(x_k^* x_k) = E(x^* x). \]

We will mostly work with identically distributed variables. In other words, given \( x \in \mathcal{M} \) we shall work with the sequence \( x_k = \pi_k(x, -x) \) for \( 1 \leq k \leq n \). In terms of the last equivalences in Lemma 2.1, we may consider the following norms

\[ \| x \|_{\mathcal{R}_{\infty, 1}} = \max \left\{ \| x \|_{\mathcal{M}}, \sqrt{n} \left\| E(x x^*)^{\frac{1}{2}} \right\|_{\mathcal{N}} \right\}, \]

\[ \| x \|_{\mathcal{C}_{\infty, 1}} = \max \left\{ \| x \|_{\mathcal{M}}, \sqrt{n} \left\| E(x^* x)^{\frac{1}{2}} \right\|_{\mathcal{N}} \right\}. \]

Here the letters \( \mathcal{R} \) and \( \mathcal{C} \) stand for row and column according to Lemma 2.1. The symbol \( \infty \) is motivated because in [13] and [15] we work with \( L_p \) versions of these spaces. The number 1 arises from interpolation theory, because we think of these spaces as endpoints in an interpolation scale. Finally, the norms on the right induce to introduce the spaces \( L_{\infty}(\mathcal{M}, \mathcal{E}) \) and \( L_{\infty}(\mathcal{M}, \mathcal{E}) \) as the closure of \( \mathcal{M} \) with respect to the norms

\[ \left\| E(x x^*)^{\frac{1}{2}} \right\|_{\mathcal{N}} \text{ and } \left\| E(x^* x)^{\frac{1}{2}} \right\|_{\mathcal{N}}. \]

In this way, we obtain the spaces

\[ \mathcal{R}_{\infty, 1}(\mathcal{M}, \mathcal{E}) = \mathcal{M} \cap \sqrt{n} L_{\infty}(\mathcal{M}, \mathcal{E}), \]

\[ \mathcal{C}_{\infty, 1}(\mathcal{M}, \mathcal{E}) = \mathcal{M} \cap \sqrt{n} L_{\infty}(\mathcal{M}, \mathcal{E}). \]

Remark 2.2. It is easily seen that

\[ \left\| E(x x^*)^{\frac{1}{2}} \right\|_{\mathcal{N}} = \sup \left\{ \| \alpha \|_{L_2(\mathcal{M})} \mid \| \alpha \|_{L_2(\mathcal{N})} \leq 1 \right\}, \]

\[ \left\| E(x^* x)^{\frac{1}{2}} \right\|_{\mathcal{N}} = \sup \left\{ \| x \|_{L_2(\mathcal{M})} \mid \| \beta \|_{L_2(\mathcal{N})} \leq 1 \right\}. \]

This relation will be crucial in this paper and will be assumed in what follows.
The state \( \varphi \) induces the \( n.f. \) state \( \phi = \varphi \circ E_N \) on \( \mathcal{A} \). If \( \mathcal{A}_{\oplus n} \) denotes the \( n \)-fold direct sum \( \mathcal{A} \oplus \mathcal{A} \oplus \ldots \oplus \mathcal{A} \) (which we shall identify with \( \mathcal{A} \otimes \mathbb{C}^n \) in the sequel) we consider the \( n.f. \) state \( \phi_n : \mathcal{A}_{\oplus n} \to \mathbb{C} \) and the conditional expectation \( E_n : \mathcal{A}_{\oplus n} \to \mathcal{A} \) given by

\[
\phi_n \left( \sum_{k=1}^n a_k \otimes \delta_k \right) = \frac{1}{n} \sum_{k=1}^n \phi(a_k) \quad \text{and} \quad E_n \left( \sum_{k=1}^n a_k \otimes \delta_k \right) = \frac{1}{n} \sum_{k=1}^n a_k.
\]

Let us consider the map

\[
u : x \in \mathcal{M} \mapsto \sum_{k=1}^n x_k \otimes \delta_k \in \mathcal{A}_{\oplus n} \quad \text{with} \quad x_k = \pi_k(x, -x).
\]

**Lemma 2.3.** The mappings

\[
u_r : x \in \mathcal{R}_{\infty, 1}(\mathcal{M}, E) \mapsto \sum_{k=1}^n x_k \otimes e_{1k} \in R_n(\mathcal{A}),
\]

\[
u_c : x \in \mathcal{C}_{\infty, 1}(\mathcal{M}, E) \mapsto \sum_{k=1}^n x_k \otimes e_{k1} \in C_n(\mathcal{A}),
\]

are isomorphisms onto complemented subspaces with constants independent of \( n \).

**Proof.** Given \( x \in \mathcal{R}_{\infty, 1}(\mathcal{M}, E) \), Lemma 2.1 gives

\[
\|\nu_r(x)\|_{R_n(\mathcal{A})} = \left\| \left( \sum_{k=1}^n x_k x^*_k \right)^{1/2} \right\|_{\mathcal{A}} \sim \max_{1 \leq k \leq n} \|x_k\|_{\mathcal{A}} + \left\| \left( \sum_{k=1}^n E_N(x_k x^*_k) \right)^{1/2} \right\|_{\mathcal{N}}.
\]

In other words, we have

\[
\|\nu_r(x)\|_{R_n(\mathcal{A})} \sim \|x\|_{\mathcal{M}} + \sqrt{n} \|x\|_{L_{\infty}^n(\mathcal{M}, E)} \sim \|x\|_{\mathcal{R}_{\infty, 1}(\mathcal{M}, E)}.
\]

Thus \( \nu_r \) is an isomorphism onto its image with constants independent of \( n \). The same argument yields to the same conclusion for \( \nu_c \). Let \( d_\varphi \) and \( d_\phi \) be the densities associated to the states \( \varphi \) and \( \phi \). To prove the complementation, we consider the map

\[
\omega_r : x \in L_1(\mathcal{M}) + \frac{1}{\sqrt{n}} L_1^r(\mathcal{M}, E) \mapsto \frac{1}{n} \sum_{k=1}^n x_k \otimes e_{1k} \in R_n^r(L_1(\mathcal{A})),
\]

where \( L_1^r(\mathcal{M}, E) \) is the closure of \( \mathcal{N} d_\varphi \mathcal{M} \) with respect to the norm \( \|E(xx^*)^{1/2}\|_1 \).

Now we use approximation and assume that \( x = ad_\varphi a \) for some \( (\alpha, a) \in \mathcal{N} \times \mathcal{M} \). Then, taking \( a_k = \pi_k(a, -a) \) it follows from Theorem 7.1 in [13] that

\[
\|\omega_r(x)\|_{R_n^r(L_1(\mathcal{A}))} = \frac{1}{n} \left\| \alpha d_\varphi \left( \sum_{k=1}^n a_k a_k^* \right) d_\phi \alpha^* \right\|_{L_{1/2}(\mathcal{A})}^{1/2}
\]

\[
\leq \frac{1}{n} \left\| \alpha d_\varphi \left( \sum_{k=1}^n E_N(a_k a_k^*) \right) d_\phi \alpha^* \right\|_{L_{1/2}(\mathcal{N})}^{1/2}
\]

This gives

\[
\|\omega_r(x)\|_{R_n^r(L_1(\mathcal{A}))} \leq \frac{1}{\sqrt{n}} \|x\|_{L_1^r(\mathcal{M}, E)}.
\]
On the other hand, by the triangle inequality
\[ \|\omega_r(x)\|_{R^r_i(L_1(\mathcal{A}))} = \frac{1}{n} \left\| \sum_{k=1}^{n} x_k \otimes e_1 \right\|_{R^r_i(L_1(\mathcal{A}))} \leq \|x\|_{L_1(\mathcal{M})}. \]

These estimates show that \(\omega_r\) is a contraction. Note also that
\[ \langle u_r(x), \omega_r(y) \rangle = \frac{1}{n} \sum_{k=1}^{n} \text{tr}_A(x^*_ky_k) = \frac{1}{n} \sum_{k=1}^{n} \text{tr}_M(x^*y) = \langle x, y \rangle. \]

In particular, since it follows from Corollary 2.12 of [8] that
\[ R^r_{\infty,1}(\mathcal{M}; E) = \left( L_1(\mathcal{M}) + \frac{1}{\sqrt{n}} L_1^r(\mathcal{M}, E) \right)^*, \]

it turns out that the map \(\omega^*_r u_r\) is the identity on \(R^r_{\infty,1}(\mathcal{M}; E)\) and \(u_r \omega^*_r\) is a bounded projection onto the image of \(u_r\) with constants independent of \(n\). This completes the proof in the row case. The column case follows in the same way. \(\square\)

The careful reader will have observed that the projection maps \(u_r w^*_r\) and \(u_r w^*_c\) are algebraically the same map \(uw^*\), modulo the identification of \(R^r_n(\mathcal{A})\) and \(C^r_n(\mathcal{A})\) with \(A_{\infty,n}\). If we consider the conditional expectation \(E_{\mathcal{A}_k}: \mathcal{A} \to \mathcal{A}_k\) and we set \(E_{\mathcal{A}_k}(z_k) = (\alpha_k, \beta_k)\), then
\[ uw^* \left( \sum_{k=1}^{n} z_k \otimes \delta_k \right) = \sum_{k=1}^{n} \pi_k \left( \frac{1}{2n} \sum_{j=1}^{n} \alpha_j - \beta_j, \frac{1}{2n} \sum_{j=1}^{n} \beta_j - \alpha_j \right) \otimes \delta_k. \]

In particular, Lemma 23 allows us to identify the interpolation space
\[ X_{\frac{1}{2}} = \left[ C^r_{\infty,1}(\mathcal{M}, E), R^r_{\infty,1}(\mathcal{M}, E) \right]_{\frac{1}{2}} \]
with a complemented subspace of \(L_\infty(\mathcal{A}; OH_n)\). This will be implicitly used below. However, the difficult part in proving Theorem B is to identify the norm of the space \(X_{\frac{1}{2}}\). Of course, according to the fact that we are interpolating 2-term intersection spaces, we expect a 4-term maximum. This is the case and we define \(J^r_{\infty,2}(\mathcal{M}, E)\) as the space of elements \(x\) in \(\mathcal{M}\) equipped with the norm
\[ \max_{u,v \in \{4, \infty\}} \left\{ n \frac{1}{\xi(u,v)} \sup \left\{ \|\alpha \|_{L_\xi(u,v)(\mathcal{M})}, \|\beta\|_{L_\xi(u,v)(\mathcal{N})} \right\} : \|\alpha\|_{L_\xi(u,v)(\mathcal{N})}, \|\beta\|_{L_\xi(u,v)(\mathcal{N})} \leq 1 \right\}, \]

where \(\xi(u,v)\) is given by \(\frac{1}{\xi(u,v)} = \frac{1}{u} + \frac{1}{v}\). Obviously, multiplying by elements \(\alpha, \beta\) in the unit ball of \(L_\infty(\mathcal{N})\) and taking suprema does not contribute to the corresponding \(L_\xi(u,v)(\mathcal{M})\) term. In other words, we may rewrite the norm of \(x\) in \(J^r_{\infty,2}(\mathcal{M}, E)\) as
\[ \|x\|_{J^r_{\infty,2}(\mathcal{M}, E)} = \max \left\{ \|x\|_{\Lambda^r_{(u,v)}} \mid u, v \in \{4, \infty\} \right\} \]
where the \(\Lambda^r_{(u,v)}\) norms are given by
\[ \|x\|_{\Lambda^r_{(\infty, \infty)}} = \|x\|_{\mathcal{M}}, \]
\[ \|x\|_{\Lambda^r_{(\infty, \infty)}} = n^{\frac{1}{u}} \sup \left\{ \|\alpha \beta\|_{L_4(\mathcal{M})}, \|\beta\|_{L_4(\mathcal{N})} \leq 1 \right\}, \]
\[ \|x\|_{\Lambda^r_{(\infty, \infty)}} = n^{\frac{1}{u}} \sup \left\{ \|\alpha\|_{L_4(\mathcal{M})}, \|\alpha\|_{L_4(\mathcal{N})} \leq 1 \right\}, \]
\[ \|x\|_{\Lambda^r_{(\infty, \infty)}} = n^{\frac{1}{u}} \sup \left\{ \|\alpha \beta\|_{L_2(\mathcal{M})}, \|\alpha\|_{L_4(\mathcal{N})}, \|\beta\|_{L_4(\mathcal{N})} \leq 1 \right\}. \]
These norms arise as particular cases of the so-called conditional $L_p$ spaces, which were defined in [13] and will be further exploited in [15]. Before identifying the norm of $X_\frac{1}{2}$, we need some information on interpolation spaces.

**Lemma 2.4.** If $(1/u, 1/v) = (\theta/2, (1 - \theta)/2)$, we have for $x \in \mathcal{M}$

$$\|x\|_{[\mathcal{M}, L^\theta_{\infty}(\mathcal{M}, \mathcal{E})]} = \sup \left\{ \|\alpha x\|_{L^\theta(\mathcal{M})} : \|\alpha\|_{L^\theta(\mathcal{N})} \leq 1 \right\},$$

$$\|x\|_{[L^\theta_{\infty}(\mathcal{M}, \mathcal{E}), \mathcal{M}]} = \sup \left\{ \|x\beta\|_{L^\theta(\mathcal{M})} : \|\beta\|_{L^\theta(\mathcal{N})} \leq 1 \right\},$$

$$\|x\|_{[L^\theta_{\infty}(\mathcal{M}, \mathcal{E}), L^\theta_{\infty}(\mathcal{M}, \mathcal{E})]} = \sup \left\{ \|\alpha x\beta\|_{L^\theta(\mathcal{M})} : \|\alpha\|_{L^\theta(\mathcal{N})}, \|\beta\|_{L^\theta(\mathcal{N})} \leq 1 \right\}.$$

The proof can be found in [13]. In the finite setting, this result follows from a well-known application of Helson/Lowdenslager, Wiener/Masani type results on the existence of operator-valued analytic functions. This kind of applications has been used extensively by Pisier in his theory of vector-valued $L_p$ spaces. We shall also need an explicit expression for the norm of $L^\infty(\mathcal{A}; \mathcal{OH}_\theta)$. The formula below was originally obtained by Pisier in [23]. The proof for non-hyperfinite von Neumann algebras (as it is our case) can be found in [14 39].

**Lemma 2.5.** We have

$$\left\| \sum_{k=1}^n a_k \otimes \delta_k \right\|_{L^\infty(\mathcal{A}; \mathcal{OH}_\theta)} = \sup \left\{ \left\| \sum_{k=1}^n a_k^* \alpha a_k \right\|_{L^2(\mathcal{A})} : \alpha \geq 0, \|\alpha\|_2 \leq 1 \right\}.$$

Now we are ready for the main result in this section.

**Theorem 2.6.** We have isomorphically

$$[C^\theta_{\infty, 1}(\mathcal{M}, \mathcal{E}), R^\theta_{\infty, 1}(\mathcal{M}, \mathcal{E})]_{\frac{1}{2}} \simeq \mathcal{J}^n_{\infty, 2}(\mathcal{M}, \mathcal{E}).$$

Moreover, the constants in these isomorphisms are uniformly bounded on $n$.

**Proof.** We have a contractive inclusion

$$X_{\frac{1}{2}} \subset \mathcal{J}^n_{\infty, 2}(\mathcal{M}, \mathcal{E}).$$

Indeed, by elementary properties of interpolation spaces we find

$$X_{\frac{1}{2}} \subset [\mathcal{M}, \mathcal{M}]_{\frac{1}{2}} \cap [\sqrt{n}L^\theta_{\infty}, \mathcal{M}]_{\frac{1}{2}} \cap [\mathcal{M}, \sqrt{n}L^\theta_{\infty}]_{\frac{1}{2}} \cap [\sqrt{n}L^\theta_{\infty}, \sqrt{n}L^\theta_{\infty}]_{\frac{1}{2}},$$

where $L^\theta_{\infty}$ and $L^\theta_{\infty}$ are abbreviations for $L^\theta_{\infty}(\mathcal{M}, \mathcal{E})$ and $L^\theta_{\infty}(\mathcal{M}, \mathcal{E})$ respectively. Using the obvious identity $[\lambda_0 X_0, \lambda_1 X_1]_\theta = \lambda_0^{1-\theta} \lambda_1^\theta X_0$ and applying Lemma 2.4 we rediscover the norm of the space $\mathcal{J}^n_{\infty, 2}(\mathcal{M}, \mathcal{E})$ on the right hand side. This gives that the inclusion $X_{\frac{1}{2}} \subset \mathcal{J}^n_{\infty, 2}(\mathcal{M}, \mathcal{E})$ holds contractively.

To prove the reverse inclusion, we note from Lemmas 2.3 and 2.5 that

$$\|x\|_{X_{\frac{1}{2}}} \sim \|u(x)\|_{[C^\theta(\mathcal{A}), R(\mathcal{A})]_{\frac{1}{2}}} = \left\| \sum_{k=1}^n x_k \otimes \delta_k \right\|_{L^\infty(\mathcal{A}; \mathcal{OH}_\theta)} = \sup \left\{ \left\| \sum_{k=1}^n x_k^* \alpha x_k \right\|_{L^2(\mathcal{A})} : \alpha \geq 0, \|\alpha\|_2 \leq 1 \right\} = A.$$
In order to justify (2.2), we introduce the orthogonal projections $L_k$ and $R_k$ in $L_2(A)$ defined as follows. Given $a \in L_2(A)$, the vector $L_k(a)$ (resp. $R_k(a)$) collects the reduced words in $a$ starting (resp. ending) with a letter in $A_k$. In other words, following standard terminology in free probability, we have

\[
L_k : L_2(A) \rightarrow L_2\left(\bigoplus_{m \geq 1, j_1 \neq k \neq j_2 \neq \cdots \neq j_m} \hat{A}_{j_1} \hat{A}_{j_2} \cdots \hat{A}_{j_m}\right),
\]

\[
R_k : L_2(A) \rightarrow L_2\left(\bigoplus_{m \geq 1, j_1 \neq k \neq j_2 \neq \cdots \neq j_m} \hat{A}_{j_1} \hat{A}_{j_2} \cdots \hat{A}_{j_m}\right).
\]

Now, given a positive operator $a$ in $L_2(A)$ and a fixed integer $1 \leq k \leq n$, we consider the following way to decompose $a$ in terms of the projections $L_k$ and $R_k$ and the conditional expectation $E_{N} : A \rightarrow N$

\[
a = E_N(a) + (L_k(a) + R_k(a) - R_kL_k(a)) + \gamma_k(a),
\]

where the term $\gamma_k(a)$ has the following form

\[
\gamma_k(a) = a - E_N(a) - L_k(a) - R_k(a - L_k(a)).
\]

The triangle inequality gives $A^2 \leq A_1^2 + A_2^2 + A_3^2$, where the terms $A_j$ are the result of replacing $a$ in $A$ by the $j$-th term in the decomposition (2.3). The terms in the bracket of (2.3) are understood as one term which gives rise to $A_2$. For the first term we use

\[
A_1^2 = \left\| \sum_{k=1}^{n} x_k^* E_N(a)x_k \right\|_{L_2(A)}^2 \leq \left\| \sum_{k=1}^{n} E_N(x_k^* E_N(a)x_k) \right\|_{L_2(N)}^2 + \left\| \sum_{k=1}^{n} x_k^* E_N(a)x_k - E_N(x_k^* E_N(a)x_k) \right\|_{L_2(A)}^2 = A_{11}^2 + A_{12}^2.
\]

Since $E_N(x_k^* E_N(a)x_k) = E(x^* E_N(a)x)$ and $a \in B_{L_2(A)}^+$, we obtain

\[
A_{11} = n^2 \sup \left\{ \|x\|_{L_{4}(N)} \leq 1 \right\}
\]

\[
\leq n^2 \sup \left\{ \|x\|_{L_{4}(N)} \leq 1 \right\}.
\]

This gives $A_{11} \leq \|x\|_{L_{4}(N)} \leq \|x\|_{\mathcal{F}_{\infty,2}(\mathcal{M},E)}$. On the other hand, by freeness

\[
A_{12}^2 = \left( \sum_{k=1}^{n} \left\| x_k^* E_N(a)x_k - \mathcal{E}_N(x_k^* E_N(a)x_k) \right\|_{L_2(A)}^2 \right)^{\frac{1}{2}} \leq 2 \left( \sum_{k=1}^{n} \left\| x_k^* E_N(a)x_k \right\|_{L_2(A)}^2 \right)^{\frac{1}{2}} = 2 n^2 \left\| x^* E_N(a)x \right\|_{L_2(A)}^2.
\]

Then positivity gives

\[
A_{12} \leq \sqrt{2} \left\| x \right\|_{L_{4}(N)} \leq \sqrt{2} \left\| x \right\|_{\mathcal{F}_{\infty,2}(\mathcal{M},E)}.
\]
Let us now estimate the term $A_2$

$$\left\| \sum_{k=1}^{n} x_k^*(L_k(a) + R_k(a) - R_kL_k(a))x_k \right\|_{L_2(A)}$$

$$= \sup \left\{ \sum_{k=1}^{n} \text{tr}_A \left( b x_k^* (L_k(a) + R_k(a) - R_kL_k(a)) x_k \right) \mid \|b\|_{L_2(A)} \leq 1 \right\}$$

$$= \sup \left\{ \sum_{k=1}^{n} \text{tr}_A \left( x_k b x_k^* (L_k(a) + R_k(a) - R_kL_k(a)) \right) \mid \|b\|_{L_2(A)} \leq 1 \right\}$$

$$\leq \sup_{\|b\|_{L_2(A)} \leq 1} \left( \sum_{k=1}^{n} \|x_k b x_k^*\|_{L_2(A)}^2 \right)^{\frac{1}{2}} \left( \sum_{k=1}^{n} \|L_k(a) + R_k(a) - R_kL_k(a)\|_{L_2(A)}^2 \right)^{\frac{1}{2}}.$$

The second factor on the right is estimated by orthogonality

$$\left( \sum_{k=1}^{n} \|L_k(a) + R_k(a) - R_kL_k(a)\|_{L_2(A)}^2 \right)^{\frac{1}{2}} \leq 3 \|a\|_{L_2(A)} \leq 3.$$

For the first factor, we write $b$ as a linear combination $(b_1 - b_2) + i(b_3 - b_4)$ of four positive operators. Therefore, all these terms are covered by the following estimate, to be proved below.

**Claim.** Given $a \in B^+_{L_2(A)}$, we have

$$(2.4) \quad \left( \sum_{k=1}^{n} \|x_k a x_k^*\|_{L_2(A)}^2 \right)^{\frac{1}{2}} \lesssim \max \left\{ \|a\|_{M}, n^{\frac{1}{2}} \sup_{\|\beta\|_{L_2(A)} \leq 1} \|x_k \beta\|_{L_2(M)} \right\}.$$

Before justifying our claim, we complete the proof. It remains to estimate the term $A_3$ associated to $\gamma_k(a)$. We first observe that $\gamma_k(a)$ is a mean-zero element of $L_2(A)$ made up of reduced words not starting nor ending with a letter in $A_k$. Indeed, note that $E_{\mathcal{N}}(\gamma_k(a)) = 0$ and that we first eliminate the words starting with a letter in $A_k$ by subtracting $L_k(a)$ and, after that, we eliminate the remaining words which end with a letter in $A_k$ by subtracting $R_k(a - L_k(a))$. Therefore, it turns out that the family of random variables $x_1^*\gamma_1(a)x_1, x_2^*\gamma_2(a)x_2, \ldots, x_n^*\gamma_n(a)x_n$ is free over $\mathcal{N}$.

In particular, by orthogonality

$$\left\| \sum_{k=1}^{n} x_k^* \gamma_k(a) x_k \right\|_{L_2(A)} \leq \left( \sum_{k=1}^{n} \|x_k^* \gamma_k(a) x_k\|_{L_2(A)}^2 \right)^{\frac{1}{2}}.$$

However, recalling that $\gamma_k(a)$ is a mean-zero element made up of words not starting nor ending with a letter in $A_k$, the following identities hold for the conditional expectation $E_{A_k} : L_1(A) \rightarrow L_1(A_k)$

$$(2.5) \quad E_{A_k} \left( \gamma_k(a)^* (x_k x_k^* - E_{\mathcal{N}}(x_k x_k^*)) \gamma_k(a) \right) = 0,$$

$$E_{A_k} \left( \gamma_k(a) (x_k x_k^* - E_{\mathcal{N}}(x_k x_k^*)) \gamma_k(a)^* \right) = 0.$$

Using property $(2.5)$ we find

$$\|x_k^* \gamma_k(a) x_k\|_{L_2(A)}^2 = \text{tr}_A \left( x_k^* \gamma_k(a)^* x_k x_k^* \gamma_k(a) x_k \right)$$

$$= \text{tr}_A (x_k^* E_{A_k} (\gamma_k(a)^* x_k x_k^* \gamma_k(a)) x_k)$$

$$= \text{tr}_A (x_k^* E_{A_k} (\gamma_k(a)^* E_{\mathcal{N}}(x_k x_k^*) \gamma_k(a)) x_k).$$
\[= \text{tr}_A(\gamma_k(a)x_k x_k^* \gamma_k(a)^*) E_N(x_k x_k^*) \]
\[= \text{tr}_A(E_{A_k}(\gamma_k(a)x_k x_k^* \gamma_k(a)^*) E_N(x_k x_k^*)) \]
\[= \text{tr}_A(E_{A_k}(\gamma_k(a) E_N(x_k x_k^* \gamma_k(a)^*) E_N(x_k x_k^*))) \]
\[= \text{tr}_A(E_N(x_k x_k^*) \gamma_k(a) E_N(x_k x_k^* \gamma_k(a)^*) E_N(x_k x_k^*))) \]

In conjunction with \( \|\gamma_k(a)\|_2 \leq 5 \|a\|_2 \) and Hölder’s inequality, this yields
\[ \|x_k^* \gamma_k(a) x_k\|_{L_2(A)}^2 = \|E_N(x x^*) \gamma_k(a) E_N(x x^*) \|_{L_2(A)}^2 \leq 25 \|x\|_{L_\infty(M, E)}^4. \]

We refer to Lemma 2.4 or 13 for the fact that
\[ \|x\|_{L_\infty(M, E)} \leq \sup \{\|\alpha x\|_{L_4(M)} \mid \|\alpha\|_{L_4(N)} \leq 1\} \]

The inequalities proved so far give rise to the following estimate
\[ \left\| \sum_{k=1}^n x_k^* \gamma_k(a) x_k \right\|_{L_2(A)}^{1/2} \leq \sqrt{5} \|x\|_{\Lambda_{4,4}} \leq \sqrt{5} \|x\|_{J_{\infty, 4}(M, E)}. \]

Therefore, it remains to prove the claim. We proceed in a similar way. According to the decomposition (2.3), we may use the triangle inequality and decompose the left-hand side of (2.4) into three terms B_1, B_2, B_3. For the first term, we deduce from positivity that
\[ \left( \sum_{k=1}^n \|x_k E_N(a) x_k^* 2_{L_2(A)} \right)^{1/2} = n^{1/2} \|x E_N(a) x^* \|_{L_2(M)} \leq n^{1/2} \sup_{\|\beta\|_{L_4(N)} \leq 1} \|x \beta\|_{L_4(M)}. \]

On the other hand, it is elementary that
\[ \left( \sum_{k=1}^n \|x_k^* (L_k(a) + R_k(a) - R_k L_k(a)) x_k\|_{L_2(A)}^2 \right)^{1/2} \leq \|x\|_{M} \left( \sum_{k=1}^n \|x_k^* (L_k(a) + R_k(a) - R_k L_k(a)) x_k\|_{L_2(A)}^2 \right)^{1/2} \leq 3 \|x\|_{M}. \]

This leaves us with the term B_3. Arguing as above
\[ \left( \sum_{k=1}^n \|x_k^* \gamma_k(a) x_k^* \|_{L_2(A)}^2 \right)^{1/2} \leq \sqrt{5} n^{1/2} \sup_{\|\beta\|_{L_4(N)} \leq 1} \|x \beta\|_{L_4(M)}. \]

Therefore, the claim holds and the proof is complete. \( \square \)

**Remark 2.7.** The arguments in Theorem 2.6 also give
\[ \|x\|_{[M, R_{\infty, 1}(M, E)]}^{1/2} \sim \max \left\{\|x\|_{M}, \|x\|_{\Lambda_{4,4}} \right\}, \]
\[ \|x\|_{[C_{\infty, 1}(M, E), M]}^{1/2} \sim \max \left\{\|x\|_{M}, \|x\|_{\Lambda_{4,4}} \right\}. \]

Now we show how the space X_{1/2} is related to Theorem 3. The idea follows from a well-known argument in which complete boundedness arises as a particular case of amalgamation. More precisely, if \( L_2^0(M), L_2^0(M) \) denote the row/column quantizations of \( L_2(M) \) and \( 2 \leq q \leq \infty \), the row/column operator space structures on \( L_q(M) \) are defined as follows
\[ L_q^0(M) = [M, L_2^0(M)]_{\frac{q}{2}}, \]
\[ L_q^0(M) = [M, L_2^0(M)]_{\frac{q}{2}}. \]
The following result from [13] is a generalized form of (3) in the Introduction.

**Lemma 2.8.** If \( \mathcal{M}_m = M_m(\mathcal{M}) \), we have

\[
\| d_{p}^{\frac{1}{p}}(x_{ij}) \|_{M_m(L_p^\infty(\mathcal{M}))} = \sup_{\| \alpha \|_{\mathcal{S}^\infty_p} \leq 1} \| d_{p}^{\frac{1}{p}} \left( \sum_{k=1}^{m} \alpha_{ik} x_{kj} \right) \|_{L_\infty(\mathcal{M}_m)},
\]

\[
\| (x_{ij}) d_{p}^{\frac{1}{p}} \|_{M_m(L_p^\infty(\mathcal{M}))} = \sup_{\| \beta \|_{\mathcal{S}^\infty_p} \leq 1} \left\| \left( \sum_{k=1}^{m} x_{ik} \beta_{kj} \right) d_{p}^{\frac{1}{p}} \right\|_{L_\infty(\mathcal{M}_m)}.
\]

The proof follows from

\[
\| d_{p}^{\frac{1}{p}}(x_{ij}) \|_{M_m(L_p^\infty(\mathcal{M}))} = \sup_{\| \alpha \|_{\mathcal{S}^\infty_p} \leq 1} \| d_{p}^{\frac{1}{p}} \left( \sum_{k=1}^{m} \alpha_{ik} x_{kj} \right) \|_{L_{\infty}(\mathcal{M}_m)},
\]

\[
\| (x_{ij}) d_{p}^{\frac{1}{p}} \|_{M_m(L_p^\infty(\mathcal{M}))} = \sup_{\| \beta \|_{\mathcal{S}^\infty_p} \leq 1} \left\| \left( \sum_{k=1}^{m} x_{ik} \beta_{kj} \right) d_{p}^{\frac{1}{p}} \right\|_{L_{\infty}(\mathcal{M}_m)},
\]

and some complex interpolation formulas developed in [13]. The identity (2.7) from which we interpolate is a well-known expression in operator space theory, see e.g. p.56 in [3]. Now we define the space \( J_{\infty}^{n}(\mathcal{M}) \) as follows

\[ J_{\infty}^{n}(\mathcal{M}) = \mathcal{M} \cap n^{\frac{1}{p}} L_{\infty}^{\frac{1}{p}}(\mathcal{M}) \cap n^{\frac{1}{p}} L_{\infty}^{\frac{1}{p}}(\mathcal{M}) \cap n^{\frac{1}{p}} L_{2}(\mathcal{M}). \]

Lemma 2.8 determines the operator space structure of the cross terms in \( J_{\infty}^{n}(\mathcal{M}) \). On the other hand, according to Pisier’s fundamental identity (1.2) or to Lemma 2.7, it is easily seen that we have

\[
\| d_{p}^{\frac{1}{p}}(x_{ij}) d_{p}^{\frac{1}{p}} \|_{M_m(L_2(\mathcal{M}))} = \sup_{\| \alpha \|_{\mathcal{S}^\infty_p}, \| \beta \|_{\mathcal{S}^\infty_p} \leq 1} \left\| d_{p}^{\frac{1}{p}} \left( \sum_{k=1}^{m} \alpha_{ik} x_{kl} \beta_{lj} \right) d_{p}^{\frac{1}{p}} \right\|_{L_2(\mathcal{M}_m)}.
\]

In other words, the o.s.s. of \( J_{\infty}^{n}(\mathcal{M}) \) is described by the isometry

\[
M_m(J_{\infty}^{n}(\mathcal{M})) = J_{\infty}^{n}(\mathcal{M}_m, E_m),
\]

where \( \mathcal{M}_m = M_m(\mathcal{M}) \) and \( E_m = \text{id}_{M_m} \otimes \varphi : \mathcal{M}_m \rightarrow M_m \) for \( m \geq 1 \). This means that the vector-valued spaces \( J_{\infty}^{n}(\mathcal{M}, E) \) describe the o.s.s. of the scalar-valued spaces \( J_{\infty}^{n}(\mathcal{M}) \). In the result below we prove that the operator space/free analogue of a form of Rosenthal’s inequality in the limit case \( p \rightarrow \infty \), see [13, 15] for more details. This result does not have a commutative counterpart. The particular case for \( \mathcal{M} = B(\ell_2) \) recovers Theorem 13. Given a von Neumann algebra \( \mathcal{M} \), we set as above \( A_k = \mathcal{M} \otimes M_k \).

**Corollary 2.9.** If \( \mathcal{A}_N = \mathcal{A}_N A_k \), the map

\[ u : x \in J_{\infty}^{n}(\mathcal{M}_n, E) \mapsto \sum_{k=1}^{n} x_{k} \otimes \delta_{k} \in L_\infty(\mathcal{A}_N; OH_n) \]

is an isomorphism with complemented image and constants independent of \( n \). In particular, replacing as usual \( (\mathcal{M}, \mathcal{N}, E) \) by \( (\mathcal{M}_m, \mathcal{M}_n, E_m) \) and replacing \( \mathcal{A}_N \) by the non-amalgamated algebra \( \mathcal{A} = A_1 \ast A_2 \ast \cdots \ast A_n \), we obtain a cb-isomorphism with cb-complemented image and constants independent of \( n \)

\[ \sigma : x \in J_{\infty}^{n}(\mathcal{M}) \mapsto \sum_{k=1}^{n} x_{k} \otimes \delta_{k} \in L_\infty(\mathcal{A}; OH_n). \]
Proof. The first assertion follows from Lemma 2.3 and Theorem 2.6. To prove the second assertion we choose the triple \((M_m, M_m, \mathcal{E}_m)\) and apply (2.3). This provides us with an isomorphic embedding

\[
\sigma_m : x \in M_m(\mathcal{J}_{\infty,2}^n(M)) \mapsto \sum_{k=1}^n x_k \otimes \delta_k \in L_\infty(A_m; \text{OH}_n),
\]

where the von Neumann algebra \(A_m\) is given by

\[
A_m = M_m(\mathcal{A}) = M_m(A_1) \ast M_m(A_2) \ast M_m(A_3) \cdots \ast M_m(A_n).
\]

The last isometry is well-known, see e.g. [9]. In particular

\[
L_\infty(A_m; \text{OH}_n) = M_m(L_\infty(\mathcal{A}; \text{OH}_n))
\]

and it turns out that the map \(\sigma_m = id_{M_m} \otimes \sigma\). This completes the proof.  \(\Box\)

3. Complete embedding of Schatten classes

Given \(1 < q < 2\), we construct a completely isomorphic embedding of \(S_q\) into the predual of a QWEP von Neumann algebra. In fact, we prove Theorem C and deduce our cb-embedding via Lemma 1.1. Theorem A and the subsequent family of operator space \(q\)-stable random variables arise by injecting the space \(\ell_q\) into the diagonal of the Schatten class \(S_q\).

3.1. Embedding of \(K\)-spaces. We fix \(\mathcal{M} = \mathcal{B}(\ell_2)\) and consider a family \(\gamma_1, \gamma_2, \ldots\) of strictly positive numbers. Then we consider the diagonal operator on \(\ell_2\) defined by \(d_\gamma = \sum_k \gamma_k e_{kk}\). This operator can be regarded as the density \(d_\psi\) associated to a normal strictly semifinite faithful (n.s.s.f. in short) weight \(\psi\) on \(\mathcal{B}(\ell_2)\). Let us set \(q_n\) to be the projection \(\sum_{k \leq n} e_{kk}\) and let us consider the restriction of \(\psi\) to the subalgebra \(q_n\mathcal{B}(\ell_2)q_n\)

\[
\psi_n \left( q_n \left( \sum_{ij} x_{ij} e_{ij} \right) q_n \right) = \sum_{k=1}^n \gamma_k x_{kk}.
\]

Note that if we set \(k_n = \psi_n(q_n)\), we obtain \(\psi_n = k_n \varphi_n\) for some state \(\varphi_n\) on \(q_n\mathcal{B}(\ell_2)q_n\). If \(d_\varphi_n\) denotes the density on \(q_n\mathcal{B}(\ell_2)q_n\) associated to the weight \(\varphi_n\), we define the space \(\mathcal{J}_{\infty,2}(\psi_n)\) as the subspace

\[
\left\{ (z, zd_\varphi_n, d_\varphi_n z, zd_\varphi_n z) \mid z \in q_n\mathcal{B}(\ell_2)q_n \right\}
\]

of the direct sum

\[
\mathcal{L}_\infty = (C_n \otimes_h R_n) \oplus (C_n \otimes_h \text{OH}_n) \oplus (\text{OH}_n \otimes_h R_n) \oplus (\text{OH}_n \otimes_h \text{OH}_n).
\]

In other words, we obtain the intersection space considered in the Introduction

\[
(C_n \otimes_h R_n) \cap (C_n \otimes_h \text{OH}_n) d_{\psi_n}^4 \cap d_{\psi_n}^4 (\text{OH}_n \otimes_h R_n) \cap d_{\psi_n}^4 (\text{OH}_n \otimes_h \text{OH}_n) d_{\psi_n}^4.
\]

Lemma 3.1. Let us consider

\[
K_{1,2}(\psi_n) = \mathcal{J}_{\infty,2}(\psi_n)^*.
\]

Assume that \(k_n = \sum_{k=1}^n \gamma_k\) is an integer and define \(A_n\) to be the \(k_n\)-fold reduced free product of \(q_n\mathcal{B}(\ell_2)q_n \oplus q_n\mathcal{B}(\ell_2)q_n\). If \(\pi_j : q_n\mathcal{B}(\ell_2)q_n \oplus q_n\mathcal{B}(\ell_2)q_n \rightarrow A_n\) is the
natural embedding into the $j$-th component of $\mathcal{A}_n$ and $x_j = \pi_j(x, -x)$

$$\omega : x \in K_{1,2}(\psi_n) \mapsto \frac{1}{k_n} \sum_{j=1}^{k_n} x_j \otimes \delta_j \in L_1(\mathcal{A}_n; \text{OH}_{k_n})$$

is a cb-embedding with cb-complemented image and constants independent of $n$.

**Proof.** We claim that

$$J_{\infty,2}(\psi_n) = J_{\infty,2}^{k_n}(q_n B(\ell_2) q_n)$$

completely isometrically. Indeed, by (2.6)

$$k_n^4 L_1^n(q_n B(\ell_2) q_n, \varphi_n) = k_n^4 \left[ B(\ell_2), L_1^n(B(\ell_2), \varphi_n) \right]$$

$$= k_n^4 \left[ B(\ell_2), d_{\psi_n}^4 L_2^n(B(\ell_2), \text{tr}_n) \right]$$

$$= k_n^4 d_{\psi_n}^4 \left[ C_n \otimes_h R_n, R_n \otimes_h R_n \right] = d_{\psi_n}^4 (\text{OH}_n \otimes_h R_n).$$

We can treat the other terms similarly and obtain

$$k_n^4 L_2^n(q_n B(\ell_2) q_n, \varphi_n) = (C_n \otimes_h \text{OH}_n) d_{\psi_n}^4,$$

$$k_n^4 L_3^n(q_n B(\ell_2) q_n, \varphi_n) = d_{\psi_n}^4 (\text{OH}_n \otimes_h \text{OH}_n) d_{\psi_n}^4.$$

In particular, Corollary 2.9 provides a cb-isomorphism

$$\sigma : x \in J_{\infty,2}(\psi_n) \mapsto \sum_{j=1}^{k_n} x_j \otimes \delta_j \in L_\infty(\mathcal{A}_n; \text{OH}_{k_n})$$

onto a cb-complemented subspace with constants independent of $n$ and

$$\langle \sigma(x), \omega(y) \rangle = \frac{1}{k_n} \sum_{j=1}^{k_n} \text{tr}_{\mathcal{A}_n}(x_j^* y_j) = \text{tr}_n(x^* y) = \langle x, y \rangle.$$

Therefore, the stated properties of $\omega$ follow from those of the mapping $\sigma$. \qed

Now we give a more explicit description of $K_{1,2}(\psi_n)$. Using the terminology introduced before Lemma 3.1, the dual of the space $L_1^n$ is given by the following direct sum

$$L_1^n = (R_n \otimes_h C_n) \oplus_2 (R_n \otimes_h \text{OH}_n) \oplus_2 (\text{OH}_n \otimes_h C_n) \oplus_2 (\text{OH}_n \otimes_h \text{OH}_n).$$

Thus, we may consider the map

$$\Psi_n : L_1^n \to L_1(q_n B(\ell_2) q_n)$$

given by

$$\Psi_n(x_1, x_2, x_3, x_4) = x_1 + x_2 d_{\psi_n}^4 + d_{\psi_n}^4 x_3 + d_{\psi_n}^4 x_4 d_{\psi_n}^4.$$

Then it is easily checked that $\ker \Psi_n = J_{\infty,2}(\psi_n)^\perp$ with respect to the anti-linear duality bracket and we deduce $K_{1,2}(\psi_n) = L_1^n / \ker \Psi_n$. The finite-dimensional spaces defined so far allow us to take direct limits

$$J_{\infty,2}(\psi) = \bigcup_{n \geq 1} J_{\infty,2}(\psi_n) \quad \text{and} \quad K_{1,2}(\psi) = \bigcup_{n \geq 1} K_{1,2}(\psi_n).$$
Lemma 3.2. Let $\lambda_1, \lambda_2, \ldots \in \mathbb{R}_+$ be a sequence of strictly positive numbers and define the diagonal operator $d_\lambda = \sum_k \lambda_k e_{kk}$ on $\ell_2$. Let us equip the space $\text{graph}(d_\lambda)$ with the following operator space structures

$$
R \cap \ell_2^h(\lambda) = \text{graph}(d_\lambda) \subset R \oplus_2 \text{OH},
$$

$$
C \cap \ell_2^h(\lambda) = \text{graph}(d_\lambda) \subset C \oplus_2 \text{OH}.
$$

Then, if we consider the dual spaces

$$
C + \ell_2^h(\lambda) = (C \oplus_2 \text{OH})/ (R \cap \ell_2^h(\lambda))^\perp,
$$

$$
R + \ell_2^h(\lambda) = (R \oplus_2 \text{OH})/ (C \cap \ell_2^h(\lambda))^\perp,
$$

there exists a n.s.s.f. weight $\psi$ on $\mathcal{B}(\ell_2)$ such that

$$
(R + \ell_2^h(\lambda)) \otimes_h (C + \ell_2^h(\lambda)) = \mathcal{K}_{1,2}(\psi).
$$

Proof. Let $q_n$ be the projection

$$
\sum_{k=1}^\infty \alpha_k \delta_k \in \ell_2 \mapsto \sum_{k=1}^n \alpha_k \delta_k \in \ell_2^n.
$$

If $q_n = q_n \oplus q_n$, we define the subspaces

$$
q_n(C + \ell_2^h(\lambda)) = \left\{ q_n(a, b) + (R \cap \ell_2^h(\lambda))^\perp \mid (a, b) \in C \oplus_2 \text{OH} \right\} \subset C + \ell_2^h(\lambda),
$$

$$
q_n(R + \ell_2^h(\lambda)) = \left\{ q_n(a, b) + (C \cap \ell_2^h(\lambda))^\perp \mid (a, b) \in R \oplus_2 \text{OH} \right\} \subset R + \ell_2^h(\lambda).
$$

Note that, since the corresponding annihilators are $q_n$-invariant, these are quotients of $C \oplus_2 \text{OH}_n$ and $R_n \oplus_2 \text{OH}_n$ respectively. Moreover, recalling that $q_n(x) \to x$ as $n \to \infty$ in the norms of $R, \text{OH}, C$, it is not difficult to see that we may write the Haagerup tensor product $(R + \ell_2^h(\lambda)) \otimes_h (C + \ell_2^h(\lambda))$ as the direct limit

$$
\bigcup_{n \geq 1} q_n(R + \ell_2^h(\lambda)) \otimes_h q_n(C + \ell_2^h(\lambda)).
$$

Therefore, it suffices to show that

$$
q_n(R + \ell_2^h(\lambda)) \otimes_h q_n(C + \ell_2^h(\lambda)) = \mathcal{K}_{1,2}(\psi_n),
$$

where $\psi_n$ denotes the restriction to $q_n \mathcal{B}(\ell_2) q_n$ of some n.s.s.f. weight $\psi$. However, by duality this is equivalent to see that $q_n(C \cap \ell_2^h(\lambda)) \otimes_h q_n(R \cap \ell_2^h(\lambda)) = \mathcal{J}_{\infty,2}(\psi_n)$ where the spaces $q_n(R \cap \ell_2^h(\lambda))$ and $q_n(C \cap \ell_2^h(\lambda))$ are the span of

$$
\left\{ (\delta_k, \lambda_k \delta_k) \mid 1 \leq k \leq n \right\}
$$

in $R_n \oplus_2 \text{OH}_n$ and $C_n \oplus_2 \text{OH}_n$ respectively. Indeed, we have

$$
q_n(C \cap \ell_2^h(\lambda)) = (C_n \oplus_2 \text{OH}_n)/ q_n(R \cap \ell_2^h(\lambda))^\perp,
$$

$$
q_n(R \cap \ell_2^h(\lambda)) = (R_n \oplus_2 \text{OH}_n)/ q_n(C \cap \ell_2^h(\lambda))^\perp,
$$

completely isometrically. Using row/column terminology in terms of matrix units

$$
q_n(C \cap \ell_2^h(\lambda)) = \text{span}\left\{ (e_{i1}, \lambda_i e_{i1}) \in C_n \oplus_2 \text{OH}_n \right\},
$$

$$
q_n(R \cap \ell_2^h(\lambda)) = \text{span}\left\{ (e_{ij}, \lambda_j e_{ij}) \in R_n \oplus_2 \text{OH}_n \right\}.
$$

Therefore, the space $q_n(C \cap \ell_2^h(\lambda)) \otimes_h q_n(R \cap \ell_2^h(\lambda))$ is the subspace

$$
\text{span}\left\{ (e_{ij}, \lambda_j e_{ij}, \lambda_i e_{ij}, \lambda_i \lambda_j e_{ij}) \mid z \in q_n \mathcal{B}(\ell_2) q_n \right\}
$$
of the space $L^\infty$ defined above. Then, we define $\gamma_k \in \mathbb{R}^+$ and consider the n.s.s.f. weight $\psi$ on $B(\ell_2)$ induced by $d_\gamma$. In particular, we immediately obtain

$$q_n(C \cap \ell_2^h(\lambda)) \otimes_k q_n(R \cap \ell_2^h(\lambda)) = \left\{ (z, zd_\psi^{1/4}z, zd_\psi^{1/4}z) \right\}.$$ 

The space on the right is by definition $J_\infty$, $2(\psi_n)$. This completes the proof. 

3.2. Proof of Theorem C. In this last paragraph, we prove Theorem C. Let us begin with some preliminary results. The next lemma has been known to Xu and the first-named author for quite some time. We refer to Xu’s paper [37] for an even more general statement than the result presented below.

**Lemma 3.3.** Given $1 \leq p \leq \infty$ and a closed subspace $X$ of $R_p \oplus_2 OH$, there exist closed subspaces $H_1, H_2, K_1, K_2$ of $\ell_2$ and an injective closed densely-defined operator $\Lambda : K_1 \to K_2$ with dense range such that

$$X \simeq_{cb} H_1, r_p \oplus_2 H_2, oh \oplus_2 \text{graph}(\Lambda),$$

where the graph of $\Lambda$ is regarded as a subspace of $K_1, r_p \oplus_2 K_2, oh$ and the relevant constants in the complete isomorphism above do not depend on the subspace $X$. Moreover, since $R_p = C_p'$ the same result can be written in terms of column spaces.

In the following, we shall also need to recognize Pisier’s operator Hilbert space OH as the graph of certain diagonal operator on $\ell_2$. More precisely, the following result will be used below.

**Lemma 3.4.** Given $1 \leq p \leq \infty$, there exists a sequence $\lambda_1, \lambda_2, \ldots$ in $\mathbb{R}^+$ for which the associated diagonal map $d_\lambda = \sum_k \lambda_k e_{kk} : R_p \to OH$ satisfies the following complete isomorphism

$$OH \simeq_{cb} \text{graph}(d_\lambda).$$

**Proof.** Let us define

$$u : \delta_k \in OH \mapsto (\lambda_k^{-1} \delta_k, \delta_k) \in \text{graph}(d_\lambda).$$

The mapping $u$ establishes a linear isomorphism between OH and $\text{graph}(d_\lambda)$. The inverse map of $u$ is the coordinate projection into the second component, which is clearly a complete contraction. Regarding the cb-norm of $u$, since $\text{graph}(d_\lambda)$ is equipped with the o.s.s. of $R_p \oplus_2 OH$, we have

$$\|u\|_{cb} = \sqrt{1 + \xi^2}$$

with $\xi$ standing for the cb-norm of $d_{\lambda^{-1}} : OH \to R_p$. We claim that

$$\xi \leq \left( \sum_k |\lambda_k^{-1}|^4 \right)^{1/4},$$

so that it suffices to take $\lambda_1, \lambda_2, \ldots$ large enough to deduce the assertion. Indeed, it is well-known that the inequality above holds for the map $d_{\lambda^{-1}} : OH \to R$ and also for $d_{\lambda^{-1}} : OH \to C$. Therefore, our claim follows by complex interpolation. 

**Remark 3.5.** The constants in Lemma 3.4 are uniformly bounded on $p$.

Before beginning with the proof, we need a bit more preparation. The following discretization result might be also well-known. Nevertheless, since we are not aware of any reference for it, we include the proof for the sake of completeness.
Lemma 3.6. Given $1 \leq p \leq \infty$ and a closed densely-defined operator $\Lambda : R_p \to \text{OH}$ with dense range in OH, there exists a diagonal operator $d_\lambda = \sum_k \lambda_k \epsilon_{kk}$ on $\ell_2$ such that, when regarded as a map $d_\lambda : R_p \to \text{OH}$, we obtain

$$\text{graph}(d_\lambda) \simeq_{cb} \text{graph}(\Lambda).$$

Moreover, the relevant constants in the cb-isomorphism above do not depend on $\Lambda$.

Proof. Let us first assume that $\Lambda$ is positive. Then, since $R_p$ is separable we deduce from spectral calculus [20] that there exists a $\sigma$-finite measure space $(\Omega, \mathcal{F}, \mu)$ for which $\Lambda$ is unitarily equivalent to a multiplication operator $M_f : L_2(\Omega) \to L_2(\Omega)$. Thus we may assume $\Lambda = M_f$. Now, we employ a standard procedure to create a diagonal operator. Given $\delta > 0$, we may approximate the function $f$ by

$$g = \sum_k (k\delta)^1_{k\delta < f \leq (k+1)\delta}.$$

This yields a $1 + \delta$ cb-isomorphism

$$\text{graph}(M_f) \simeq_{cb} \text{graph}(M_g).$$

Therefore, defining the measurable sets

$$\Omega_k = \{ w \in \Omega \mid k\delta < f(w) \leq (k+1)\delta \},$$

we have that $L_2(\Omega_k)$ is isomorphic to $\ell_2(n_k)$ with $0 \leq n_k = \dim L_2(\Omega_k) \leq \infty$. Choosing an orthonormal basis for $L_2(\Omega_k)$, we find that $M_g$ is similar to $d_\lambda$ where $\lambda_k = k\delta$ with multiplicity $n_k$. This gives the assertion for positive operators. If $\Lambda$ is not positive, we consider the polar decomposition $\Lambda = u|\Lambda|$. By extension we may assume that $u$ is a unitary. Thus, we get a cb-isometry $\text{graph}(\Lambda) \simeq_{cb} \text{graph}(|\Lambda|)$ and the general case can be reduced to the case of positive operators. □

Lemma 3.7. Let $\mathcal{M}$ be a von Neumann algebra. Then

$$L_1(\mathcal{M}; \text{OH}) = [L_1(\mathcal{M}; C), L_1(\mathcal{M}; R)]_*$$

completely embeds into $L_1(\mathcal{A})$ for some von Neumann algebra $\mathcal{A}$. Moreover, we have

i) If $\mathcal{M}$ is QWEP, we can choose $\mathcal{A}$ to be QWEP.

ii) If $\mathcal{M}$ is hyperfinite, we can choose $\mathcal{A}$ to be hyperfinite.

Proof. We recall from Pisier’s theorem [28] (see also [13, 39]) that

$$\left\| \sum_k x_k \otimes \delta_k \right\|_{L_1(\mathcal{M}; \text{OH})} = \inf_{x_k = a_k \otimes b} \|a\|_4 \left( \sum_k \|y_k\|_2^2 \right)^{\frac{1}{2}} \|b\|_4.$$

The first part of the proof recaptures Pisier’s argument in [28]. Pisier’s exercise with endpoints $L_1(\mathcal{M}; C)$ and $L_1(\mathcal{M}; R)$ implies that $L_1(\mathcal{M}; \text{OH})$ is completely isomorphic to the quotient of $\mathcal{F}(L_1(\mathcal{M}; C), L_1(\mathcal{M}; R))$ by the kernel of the mapping $Q : f \in \mathcal{F}(L_1(\mathcal{M}; C), L_1(\mathcal{M}; R)) \mapsto f(1/2) \in L_1(\mathcal{M}; \text{OH})$.

Here $\mathcal{F}(L_1(\mathcal{M}; C), L_1(\mathcal{M}; R))$ is viewed as a subspace of $L_1(\mathcal{M}; L_2^*(\partial_0, \ell_2)) \oplus L_1(\mathcal{M}; L_2^*(\partial_1, \ell_2))$ and we find a completely isomorphic embedding

$$L_1(\mathcal{M}; \text{OH}) \subset L_1(\mathcal{M}; L_2^*(\partial_0, \ell_2)) \oplus L_1(\mathcal{M}; L_2^*(\partial_1, \ell_2))/\ker Q.$$
It is worth mentioning that formally we might need a finite \( M \) here to make the interpolation argument work. However, this is no restriction in view of Haagerup’s reduction procedure \([5]\). Write \( \ker Q \) as a tensor product \( L_1(M) \otimes \ker q \) with

\[ q : f \in \mathcal{F}(C, R) \mapsto f(1/2) \in \text{OH} \]

and diagonalize \( \ker q \) as in Lemma \([3, 3]\). Hence, it suffices to consider the quotient space

\[
\left\| \sum_k x_k \otimes \delta_k \right\|_{L_1(M; Q(\lambda, \mu))} = \inf_{x_k = a_k + b_k} \left( \frac{1}{2} \sum \lambda_j a_{kj}^* a_{kj} \right)^{1/2} + \left( \sum \mu_j b_{kj} b_{kj}^* \right)^{1/2}.
\]

Indeed, a continuous version of this formula has been obtained in \([28]\) and the proof there generalizes to arbitrary von Neumann algebras. Now, we may apply Pisier’s approach \([28]\) and find an embedding of \( \Gamma(\lambda, \mu) \) into \( \Gamma(\lambda, \mu) \) where \( \Gamma(\lambda, \mu) \) is the free quasi-free factor introduced by Shlyakhtenko.

To preserve hyperfiniteness, something that will not be applied in this paper but in \([15]\), we have to refer to \([11]\). The results there are also stated in the operator space setting. However, the isomorphism is based on the central limit procedure and a Khintchine type inequality which holds in full generality. For the central limit procedure we shall first consider finitely many coordinates \( x_1, x_2, \ldots, x_m \) and finite sequences

\[ \lambda(n) = (\lambda_1, \lambda_2, \ldots, \lambda_n) \quad \text{and} \quad \mu(n) = (\mu_1, \mu_2, \ldots, \mu_n). \]

Let \( R(\lambda, \mu) \) denote the Araki-Woods factor constructed from \( (\lambda, \mu) \) with quasi-free state \( \phi \) and density \( d \). Let \( R(\lambda(n), \mu(n)) \) be the corresponding finite dimensional matrix algebras and

\[ \mathcal{R}_{m, n} = \bigotimes_{1 \leq k \leq m} R(\lambda(n), \mu(n)). \]

This yields elements \( \xi_k \in L_1(\mathcal{R}_{m, n}) \) such that

\[
\left\| \sum_{k \leq m} x_k \otimes \delta_k \right\|_{L_1(M; Q(\lambda(n), \mu(n))))} \sim_c \left\| \sum_{k \leq m} x_k \otimes \xi_k(\lambda(n), \mu(n)) \right\|_{L_1(M \otimes \mathcal{R}_{m, n})}.
\]

Then we take first \( n \to \infty \) and then \( m \to \infty \). Here we use the isometric embedding of \( L_1(M, Q(\lambda, \mu)) \) in its bidual and the fact that finite sequences are dense in \( L_1(M; \text{OH}) \). We obtain an infinite tensor product \( \mathcal{R} = \bigotimes_{k \geq 1} R(\lambda, \mu) \). This yields an embedding in \( L_1(M \otimes \mathcal{R}) \) where \( \mathcal{R} \) is an Araki-Woods factor. Indeed, the \( \text{III}_1 \) factor will do. By replacing \( M \) with \( M_m \otimes M \) we see that this embedding is automatically a complete isomorphism. Thus for \( M \) hyperfinite (resp. QWEP) the tensor product \( M \otimes \mathcal{R} \) has the same property.

**Proof of Theorem** \([C]\) By injectivity of the Haagerup tensor product, we may assume that \( (X_1, X_2) \in Q(R \oplus_2 \text{OH}) \times Q(C \oplus_2 \text{OH}) \). In particular, the duals \( X_1^* \) and \( X_2^* \) are subspaces of \( C \oplus_2 \text{OH} \) and \( R \oplus_2 \text{OH} \) respectively. Therefore, according to Lemma \([3, 3]\) above, we may find Hilbert spaces \( \mathcal{H}_{ij} \) and \( \mathcal{K}_{ij} \) for \( i, j = 1, 2 \) such that

\[
X_1^* \simeq_{cb} \mathcal{H}_{11, c} \oplus_2 \mathcal{H}_{12, oh} \oplus_2 \text{graph}(\Lambda_1),
\]

\[
X_2^* \simeq_{cb} \mathcal{H}_{21, r} \oplus_2 \mathcal{H}_{22, oh} \oplus_2 \text{graph}(\Lambda_2),
\]

and
where the operators $\Lambda_1 : \mathcal{K}_{11,oh} \to \mathcal{K}_{12,oh}$ and $\Lambda_2 : \mathcal{K}_{21,r} \to \mathcal{K}_{22,oh}$ are injective, closed, densely-defined with dense range. On the other hand, using the complete isometries $\mathcal{H}_r^* = \mathcal{H}_c$ and $\mathcal{H}^*_c = \mathcal{H}_r$, we easily obtain the cb-isomorphisms
\[
X_1 \simeq_{cb} \mathcal{H}_{11,r} \oplus_2 \mathcal{H}_{12,oh} \oplus_2 \left( (\mathcal{K}_{11,oh} \oplus_2 \mathcal{K}_{12,oh})/\text{graph}(\Lambda_1) \right),
\]
\[
X_2 \simeq_{cb} \mathcal{H}_{21,c} \oplus_2 \mathcal{H}_{22,oh} \oplus_2 \left( (\mathcal{K}_{21,oh} \oplus_2 \mathcal{K}_{22,oh})/\text{graph}(\Lambda_2) \right).
\]

Let us set for the sequel
\[
Z_1 = (\mathcal{K}_{11,oh} \oplus_2 \mathcal{K}_{12,oh})/\text{graph}(\Lambda_1),
\]
\[
Z_2 = (\mathcal{K}_{21,oh} \oplus_2 \mathcal{K}_{22,oh})/\text{graph}(\Lambda_2).
\]

Then, we have the following cb-isometric inclusion
\[
X_1 \otimes_h X_2 \subset A_1 \oplus_2 A_2 \oplus_2 A_3 \oplus_2 A_4 \oplus_2 A_5 \oplus_2 A_6,
\]
where the $A_j$'s are given by
\[
A_1 = Z_1 \otimes_h Z_2,
\]
\[
A_2 = \mathcal{H}_{11,r} \otimes_h X_2,
\]
\[
A_3 = X_1 \otimes_h \mathcal{H}_{21,c},
\]
\[
A_4 = \mathcal{H}_{12,oh} \otimes_h Z_2,
\]
\[
A_5 = Z_1 \otimes_h \mathcal{H}_{22,oh},
\]
\[
A_6 = \mathcal{H}_{12,oh} \otimes_h \mathcal{H}_{22,oh}.
\]

We now reduce the proof to the construction of a cb-embedding $Z_1 \otimes_h Z_2 \to L_1(\mathcal{A})$ for some QWEP von Neumann algebra $\mathcal{A}$. Indeed, according to [9] we know that OH cb-embeds in $L_1(\mathcal{A})$ for some QWEP type III factor $\mathcal{A}$. Hence, the term $A_6$ automatically satisfies the assertion. A similar argument works for the terms $A_2$ and $A_3$. Indeed, they clearly embed into the vector-valued Schatten classes $S_1(X_2)$ and $S_1(X_1)$ cb-isometrically. On the other hand, since $OH \in QS(C \oplus R)$ by “Pisier’s exercise” and we have by hypothesis
\[
X_1 \in QS(R \oplus_2 OH) \quad \text{and} \quad X_2 \in QS(C \oplus_2 OH),
\]
both $X_1$ and $X_2$ are cb-isomorphic to an element in $QS(C \oplus R)$. According to [9] one more time, we know that any operator space in $QS(C \oplus R)$ cb-embeds into $L_1(\mathcal{A})$ for some QWEP von Neumann algebra $\mathcal{A}$. Thus, the spaces $S_1(X_1)$ and $S_1(X_2)$ also satisfy the assertion. Finally, for $A_4$ and $A_5$ we apply Lemma 3.6 and write OH as the graph of a diagonal operator on $\ell_2$. By the self-duality of OH we conclude that these terms can be regarded as particular cases of $A_1$.

It remains to see that the term $Z_1 \otimes_h Z_2$ satisfies the assertion. According to the discretization Lemma 3.6 we may assume that the graphs appearing in the terms $Z_1$ and $Z_2$ above are graphs of diagonal operators $d_{\lambda_1}$ and $d_{\lambda_2}$. In fact, by polar decomposition as in the proof of Lemma 3.6, we may also assume that both diagonal operators are positive. Moreover, by adding a perturbation term we can take the eigenvalues $\lambda_{1k}, \lambda_{2k} \in \mathbb{R}_+$ strictly positive. Indeed, if we replace $\lambda_{jk}$ by $\xi_{jk} = \lambda_{jk} + \varepsilon_k$ for $j = 1, 2$, the new diagonal operators $d_{\xi_1}$ and $d_{\xi_2}$ satisfy the cb-isomorphisms
\[
\text{graph}(d_{\lambda_j}) \simeq_{cb} \text{graph}(d_{\xi_j}) \quad \text{for} \quad j = 1, 2.
\]
where (arguing as in Lemma 3.4 above) the cb-norms are controlled by
\[
\left( \sum_k |\varepsilon_k|^4 \right)^{\frac{1}{4}}.
\]
Therefore, taking the \( \varepsilon_k \)'s small enough, we may write
\[
Z_1 = (R \oplus_2 \text{OH})/\left( C \cap \varepsilon_2^b(\lambda_1) \right) = R + \varepsilon_2^b(\lambda_1) \quad \text{with} \quad d_{\lambda_1} : C \to \text{OH},
\]
\[
Z_2 = (C \oplus_2 \text{OH})/\left( R \cap \varepsilon_2^b(\lambda_2) \right) = C + \varepsilon_2^b(\lambda_2) \quad \text{with} \quad d_{\lambda_2} : R \to \text{OH},
\]
where \( d_{\lambda_1}, d_{\lambda_2} \) are positive and invertible. Now we set
\[
\lambda_k = \lambda^j_{[k+1/2]} \quad \text{for} \quad k \equiv j \pmod{2}.
\]
If we define \( d_\lambda = \sum_k \lambda_k e_{kk} \), we find a complete embedding
\[
Z_1 \otimes_h Z_2 \subset (R + \varepsilon_2^b(\lambda)) \otimes_h (C + \varepsilon_2^b(\lambda)).
\]
According to Lemma 3.2, we can regard \( Z_1 \otimes_h Z_2 \) as a subspace of
\[
\mathcal{K}_{1,2}(\psi) = \bigcup_{n \geq 1} \mathcal{K}_{1,2}(\psi_n),
\]
for some n.s.s.f. weight \( \psi \) on \( B(\ell_2) \). It remains to construct a completely isomorphic embedding from \( \mathcal{K}_{1,2}(\psi) \) into \( L_1(\mathcal{A}) \) for some QWEP algebra \( \mathcal{A} \). To that aim we assume that the numbers \( k_n = \psi_n(q_n) \) are non-decreasing positive integers. This can always be achieved by the same perturbation argument used above. This will allow us to apply Lemma 3.1. Now, in order to cb-embed \( \mathcal{K}_{1,2}(\psi) \) into \( L_1(\mathcal{A}) \) it suffices to construct a cb-embedding of \( \mathcal{K}_{1,2}(\psi_n) \) into \( L_1(\mathcal{A}_n') \) for some \( \mathcal{A}_n' \) being QWEP and with relevant constants independent of \( n \). Indeed, if so we may consider an ultrafilter \( \mathcal{U} \) containing all the intervals \( (n, \infty) \), so that we have a completely isometric embedding
\[
\mathcal{K}_{1,2}(\psi) = \bigcup_{n \geq 1} \mathcal{K}_{1,2}(\psi_n) \to \prod_{n \in \mathcal{U}} \mathcal{K}_{1,2}(\psi_n).
\]
Then, according to 3.1, our assumption provides a cb-embedding
\[
\mathcal{K}_{1,2}(\psi) \to L_1(\mathcal{A}) \quad \text{with} \quad \mathcal{A} = \left( \prod_{n \in \mathcal{U}} \mathcal{A}_n' \right)^*.
\]
Moreover, we know from 10 that \( \mathcal{A} \) is QWEP provided the \( \mathcal{A}_n' \)'s are. Thus, it remains to construct the cb-embeddings \( \mathcal{K}_{1,2}(\psi_n) \to L_1(\mathcal{A}_n') \). According to Lemma 3.7 we have a cb-embedding
\[
\mathcal{K}_{1,2}(\psi_n) \to L_1(\mathcal{A}_n; \text{OH}_{k_n}).
\]
Now we observe that \( \mathcal{A}_n \) is QWEP since it is the free product of \( k_n \) copies of \( M_n \oplus M_n \) and we know from 9 that the QWEP is stable under reduced free products. Hence Lemma 3.7 implies that \( L_1(\mathcal{A}_n; \text{OH}_{k_n}) \subset L_1(\mathcal{A}_n') \) such that \( \mathcal{A}_n' \) is also QWEP. \( \square \)

**Corollary 3.8.** If \( 1 < q \leq 2 \), we have
\[
S_q \hookrightarrow_{cb} L_1(\mathcal{A})
\]
for some von Neumann algebra \( \mathcal{A} \) satisfying the QWEP.

**Proof.** Using the complete isometry
\[
S_q = C_q \otimes_h R_q,
\]
the assertion follows combining Lemma 1.1 and Theorem C. \( \square \)
