In this paper, we study the equilibrium points, local asymptotic stability of equilibrium points, global behavior of equilibrium points, boundedness and periodicity of the rational recursive sequence

\[ w_{n+1} = w_n - \left( \alpha + \left( \beta w_n \gamma w_n + \delta w_n \right) \right), \]

where \( \gamma w_n \neq -\delta w_n \) for \( r \in (0, \infty) \), \( \alpha, \beta, \gamma, \delta \in (0, \infty) \), and \( r > p \geq 0 \). With initial values \( w_{-p}, w_{-p+1}, \ldots, w_{-r}, w_{-r+1}, \ldots, w_0 \), and \( w_0 \) are positive real numbers. Some numerical examples are given to verify our theoretical results.

1. Introduction

It is very amusing to explore the nature of the solutions of a higher-order rational difference equation and to explain the local asymptotic stability of its equilibrium points. The inspection of some properties associated with these equations is a very enormous activity. Discrete dynamical systems or difference equations are diverse fields because various biological systems and models naturally lead to their study by means of a discrete variable. Applications of discrete dynamical systems and difference equations have appeared recently in many fields of science and technology. There is no doubt that the theory of difference equations will continue to play an important role in mathematics as a whole. Rational difference equations are a special form of nonlinear difference equations. Delay difference equations have rich dynamics to study. Due to adequate computational outcomes, discrete dynamical systems are awful lot better than allied structures in differential equations. Specifically, in case of nonoverlapping generations, difference equations are greater apposite to take a look at the behavior of population models [1, 2]. Also, an epidemiological approach to insurgent population modeling is mentioned in [3, 4]. The research of delay difference equations is a divergent field that involves most aspects of mathematics, including both applied and pure. Recently, there has been a symbolic development in the applications of difference equations. It is very interesting to investigate the behavior of solutions of a system of nonlinear difference equations and to discuss the local asymptotic stability of their equilibrium points. There are many papers in which systems and behavior of rational difference equations have been studied see [5–20]. Rational difference equations have been studied by several authors. There has been a great interest exclusively in the study of the attractiveness of the solution of such equations.

Here, we recall some basics and preliminaries that will be useful in our results and investigation.

2. Preliminaries and Definitions

Definition 1. Let \( I \) be some interval of real numbers, and let \( F: I^{k+1} \rightarrow I \),

\[ F: I^{k+1} \rightarrow I, \]  

(1)

be a continuously differentiable function. Then, for every set of initial conditions \( S_0, S_{k+1}, \ldots, S_0 \in I \), the difference equation
\[ S_{n+1} = R(S_n, S_{n-1}, \ldots, S_{n-k}), \quad n = 0, 1, \ldots \] (2)

has a unique solution \( \lim_{n \to \infty} S_n = \bar{S} \).

**Definition 2.** A point \( \bar{S} \in I \) is called an equilibrium point of equation (2) if

\[ \bar{S} = R(\bar{S}, \bar{S}, \ldots, \bar{S}). \] (3)

That is, \( S_n = \bar{S} \) for all \( n \geq 0 \), is a solution of equation (2), or equivalently, \( \bar{S} \) is a fixed point of \( R \).

**Definition 3.** (Periodicity.) A sequence \( \{S_n\}_{n=k}^{\infty} \) is said to be periodic with period \( p \) if \( S_{n+p} = S_n \) for all \( n \geq -k \).

**Definition 4.** (Fibonacci sequence.) The sequence \( \{F_m\}_{m=0}^{\infty} = \{1, 2, 3, 5, 8, 13, \ldots\} \) i.e. \( F_m = F_{m-1} + F_{m-2} \geq 0, F_2 = 0, F_1 = 1 \) is called Fibonacci sequence.

**Definition 5.** Equation (2) is called permanent and bounded if there exist numbers \( t \) and \( T \) with \( 0 < t < T < \infty \) such that for any initial values \( S_{-k}, S_{-k+1}, \ldots, S_1, S_0 \in I \), there exists a positive integer \( N \) which depends on these initial values such that \( t \leq S_n \leq T \), for all \( n \geq N \).

**Definition 6.** (Stability)

(i) The equilibrium point \( \bar{S} \in I \) of equation (2) is locally stable if for every \( \varepsilon > 0 \), there exists \( \delta > 0 \) such that for all \( S_{-k}, S_{-k+1}, \ldots, S_1, S_0 \in I \) with

\[ |S_{-k} - \bar{S}| + |S_{-k+1} - \bar{S}| + \cdots + |S_0 - \bar{S}| < \delta, \] (4)

we have

\[ |S_n - \bar{S}| < \varepsilon \] for all \( n \geq -k. \) (5)

(ii) The equilibrium point \( \bar{S} \) of equation (2) is locally asymptotically stable if \( \bar{S} \) is a locally stable solution of equation (2) and there exists \( \gamma > 0 \), such that for all \( S_{-k}, S_{-k+1}, \ldots, S_1, S_0 \in K \) with

\[ |S_{-k} - \bar{S}| + |S_{-k+1} - \bar{S}| + \cdots + |S_0 - \bar{S}| < \gamma, \] (6)

we have

\[ \lim_{n \to \infty} S_n = \bar{S}. \] (7)

(iii) The equilibrium point \( \bar{S} \) of equation (2) is global attractor if for all \( S_{-k}, S_{-k+1}, \ldots, S_1, S_0 \in I \), we have

\[ \lim_{n \to \infty} S_n = \bar{S}. \] (8)

(iv) The equilibrium point \( \bar{S} \) of equation (2) is globally asymptotically stable if \( \bar{S} \) is locally stable and \( \bar{S} \) is also a global attractor of equation (2).

(v) The equilibrium point \( \bar{S} \) of equation (2) is unstable if \( \bar{S} \) is not locally stable.

**Definition 7.** The linearized equation of equation (2) about the equilibrium \( \bar{S} \) is defined by the following equation:

\[ y_{n+1} = \sum_{i=0}^{3} \rho_i y_{n-i}, \] (9)

where

\[ \rho_0 = \frac{\partial F(\bar{S}, \bar{S}, \ldots, \bar{S})}{\partial S_0}, \quad \rho_1 = \frac{\partial F(\bar{S}, \bar{S}, \ldots, \bar{S})}{\partial S_{-1}}, \quad \rho_2 = \frac{\partial F(\bar{S}, \bar{S}, \ldots, \bar{S})}{\partial S_{-2}}, \quad \rho_3 = \frac{\partial F(\bar{S}, \bar{S}, \ldots, \bar{S})}{\partial S_{-3}}. \] (10)

**Lemma 1** (see[21]). Assume that \( p_i \in R \) and \( i \in \{1, 2, \ldots, k\} \). Then,

\[ \sum_{i=1}^{k} |p_i| < 1, \] (11)

is a sufficient condition for the asymptotic stability of the following difference equation:

\[ S_{n+k} + p_1 S_{n+k-1} + \cdots + p_k S_n = 0, \quad n = 0, 1, 2, \ldots. \] (12)

The following theorem will be useful for the proof of our results in this paper.

**Theorem 1.** Let \( [\alpha, \beta] \) be an interval of real numbers and assume that \( g: [\alpha, \beta]^2 \rightarrow [\alpha, \beta] \) is a continuous function, and consider the following equation:

\[ x_{n+1} = g(x_n, x_{n-1}), \quad n = 0, 1, \ldots. \] (13)

satisfying the following conditions:

(a) \( g(x, y) \) is nondecreasing in \( x \in [\alpha, \beta] \) for each fixed \( y \in [\alpha, \beta] \), and \( g(x, y) \) is nonincreasing in \( y \in [\alpha, \beta] \) for each fixed \( x \in [\alpha, \beta] \)

(b) If \( (m, M) \in [\alpha, \beta] \times [\alpha, \beta] \) is a solution of the systems

\[ M = g(M, m), \quad m = g(m, M), \] (14)
then $m = M$ and equation (2) has a unique equilibrium $\bar{S} \in [\alpha, \beta]$ and every solution of equation (2) converges to $\bar{S}$.

Some published works include the following: Ibrahim and El-Moneam [22] investigate the local and global stability of the following recursive sequence

$$S_{n+1} = S_{n-p} \left( \alpha + \frac{bs_{r-q}}{c_{r-q} + ds_{r-q}} \right),$$

(15)

where $c_{r-q} \neq -d_{r-q}$ for $k = 0, 1, \ldots, \min(q, r)$ and $\alpha, b, c,$ and $d$ are real numbers.

Aboutaleb et al. [23] studied the global attractiveness of the positive equilibrium of the following rational recursive equation:

$$y_{m+1} = \frac{\alpha - \beta y_m}{y + y_{m-1}}, \quad m = 0, 1, 2, \ldots,$$

(16)

where the coefficients $\alpha, \beta,$ and $\gamma$ are the nonnegative real numbers.

Several other researchers have studied the behavior of the solution of difference equations; for example, Devault et al. [24] investigated the global behavior of all positive solutions of the following equation:

$$S_{n+1} = p + \frac{S_{n-k}}{qS_{n-k}}.$$  

(17)

Elabbasy et al. [25] studied the boundedness, global stability, and periodicity character and gave the solution of some special cases of the following difference equation:

$$x_{n+1} = \frac{ax_{n-1} + \beta x_{n-k}}{cx_{n-1} + dx_{n-k}}.$$  

(18)

Elabbasy [26] gave the solution of the following difference equation:

$$S_{n+1} = aS_n - \frac{bs_n}{cS_n - dS_{n-1}}.$$  

(19)

El-Moneam and Zayed [27] investigated the global stability and periodicity character and gave the solution of some special cases of the following difference equation:

$$x_{n+1} = ax_{n-k} + \frac{bx_{n-k}}{cx_n + dx_{n-k}}.$$  

(20)

Zayed and El-Moneam [28] studied the global behavior of the following rational recursive sequence:

$$x_{n+1} = \frac{a_0x_n + a_1x_{n-1} + a_2x_{n-r} + a_3x_{n-r+m}}{b_0x_n + b_1x_{n-1} + b_2x_{n-m} + b_3x_{n-k}}.$$  

(21)

Motivated by the above study, the main focus of this article is to discuss some qualitative behaviors of the solutions of the following rational recursive sequence:

$$w_{n+1} = w_{n-p} \left( \alpha + \frac{\beta w_n}{\gamma w_n + \delta w_{n-r}} \right),$$  

(22)

where $\gamma w_n \neq -\delta w_{n-r}$ for $r \in (0, \infty), \alpha, \beta, \gamma, \delta \in (0, \infty),$ and $r > p \geq 0$. With initial values $w_{-p}, w_{-p+1}, \ldots, w_{-r}, w_{-r+1}, \ldots, w_{-1},$ and $w_0$ are the positive real numbers. Some numerical examples are given to verify our theoretical results.

3. Local Stability of Equation (22)

This section deals with the local stability character of the solutions of equation (22). Equation (22) has a unique equilibrium point, and it is given from

$$\omega = \omega \left( \alpha + \frac{\beta \omega}{\gamma \omega + \delta \omega} \right),$$  

(23)

or $\omega^2 (1 - \alpha) (\gamma + \delta) = \beta \omega^3,$

(24)

if $(1 - \alpha) (\gamma + \delta) \neq \beta.$

Then, the unique equilibrium point is $\omega = 0.$

Let $f: (0, \infty) \rightarrow (0, \infty)$ be a function defined by

$$f(s, u, v) = as + \frac{bsu}{\gamma u + \delta v}.$$  

(25)

Therefore, it follows that

$$f_s = \alpha + \frac{\beta u}{\gamma u + \delta v},$$  

$$f_u = \frac{\delta \beta v}{(\gamma u + \delta v)^2},$$  

$$f_v = \frac{-\beta su}{(\gamma u + \delta v)^2}.$$  

(26)

We see that

$$f_s (\omega, \omega, \omega) = \alpha + \frac{\beta}{\gamma + \delta} = -\alpha_2,$$

$$f_u (\omega, \omega, \omega) = \frac{\delta \beta}{(\gamma + \delta)^2} = -\alpha_1,$$

$$f_v (\omega, \omega, \omega) = \frac{-\beta \delta}{(\gamma + \delta)^2} = -\alpha_0.$$  

The linearized equation of equation (22) about $\omega$ is

$$T_{n+1} = a_0 T_n + a_1 T_{n-p} + a_2 T_{n-r}.$$  

(28)

The characteristic equation of equation (28) is

$$\lambda^{n+1} = a_0 \lambda^n + a_1 \lambda^{n-p} + a_2 \lambda^{n-r}.$$  

(29)

Theorem 2. Assume that

$$(\gamma + \delta)^2 (1 - \alpha) > \beta (\gamma + 3 \delta).$$  

(30)

Then, the equilibrium point of equation (22) is locally asymptotically stable.

Proof. It follows by Lemma 7 that equation (28) is asymptotically stable if
\[ \left| \alpha + \frac{\beta}{\gamma + \delta} + \frac{\delta \beta}{(\gamma + \delta)^2} \right| + \left| \frac{\delta \beta}{(\gamma + \delta)^2} \right| < 1, \]  
\text{or} \ \alpha + \frac{\beta}{\gamma + \delta} + \frac{2 \delta \beta}{(\gamma + \delta)^2} < 1, \tag{31} \]

and so
\[ \beta \gamma + 3 \beta \delta \frac{1}{(\gamma + \delta)^2} < (1 - \alpha). \tag{32} \]

Hence,
\[ (\gamma + \delta)^2 (1 - \alpha) > \beta (\gamma + 3 \delta). \tag{33} \]

\section*{4. Boundedness of the Solutions}

In this section, we show the boundedness of the positive solutions of equation (22).

\textbf{Theorem 3.} Every solution of equation (22) is bounded from above by
\[ M = \max \{ w_{-p+1}, w_{-p}, \ldots, w_{-2}, w_{-1}, w_0 \}, \tag{34} \]
if
\[ \alpha + \frac{\beta}{\gamma} < 1. \tag{35} \]

\textbf{Proof.} Let \( \{ F_n \}_{n=-p}^{\infty} \) be a solution of equation (22). It follows from equation (22) that
\[ w_{n+1} = aw_{n-p} + \frac{\beta w_n w_{n-p}}{\gamma w_n + \delta w_{n-r}} \leq aw_{n-p} + \frac{\beta w_n w_{n-p}}{\gamma w_n} = \left( \alpha + \frac{\beta}{\gamma} \right) w_{n-p}. \tag{36} \]

Then, for all \( n \geq N \),
\[ w_{n+1} \leq w_{n-p}, \quad \forall n \geq 0. \tag{37} \]

Then, all the subsequences \( \{ w_{(p+1)n+1} \}_{n=0}^{\infty}, \quad i = 0, 1, 2, \ldots, p \), are decreasing and so are bounded from above by
\[ M = \max \{ w_{-(p+1)}, w_{-p}, \ldots, w_{-2}, w_{-1}, w_0 \}. \tag{38} \]

\textbf{Theorem 4.} If \( \alpha > 1 \), then each solution of equation (22) will be unbounded.

\textbf{Proof.} Let \( \{ w_n \}_{n=-p}^{\infty} \) be a solution of equation (22). Then, from equation (22), we see that
\[ w_{n+1} = aw_{n-p} + \frac{\beta w_n w_{n-p}}{\gamma w_n + \delta w_{n-r}} > aw_{n-p}, \quad \forall n \geq 1. \tag{39} \]

From above, the right-hand side can be written as follows:
\[ T_{n+1} = aT_{n-p} \implies T_n = a^n T_0, \tag{40} \]
and this equation is unstable because \( \alpha > 1 \) and \( \lim_{n \to \infty} T_n = \infty \).

Then, by using the ratio test, \( \{ w_n \}_{n=-p}^{\infty} \) is unbounded from above. \( \Box \)

\section*{5. Periodic Solutions of Equation (22)}

In this section, we satisfy the periodic solutions of equation (22).

\textbf{Theorem 5.} Equation (22) has no positive solutions of prime period two solution \( \forall \alpha, \beta, \gamma, \delta \in (0, \infty) \) in the following case, if \( p \) is even and \( r \) is odd.

\[ \phi, \phi, \phi, \phi, \phi, \phi, \ldots \] is prime period two solution of equation (22). We have
\[ \phi = \phi^*(\alpha + \frac{\beta}{\gamma \phi + \delta}). \tag{41} \]
\[ \phi = \phi^*(\alpha + \frac{\beta}{\gamma \phi + \delta}). \tag{42} \]

By simplifying equations (41) and (42), we obtain
\[ (\phi - \phi \alpha)(\gamma \phi - \delta \phi) = \beta \phi^2 (\phi - \phi \alpha)(\gamma \phi - \delta \phi) = \beta \phi^2. \tag{43} \]

By subtracting, we deduce that
\[ (\phi - \phi \alpha)(\gamma \phi - \delta \phi) - (\phi - \phi \alpha)(\gamma \phi - \delta \phi) = \beta \phi^2 \]
\[ - \beta \phi^2 (\delta + \phi \gamma + \delta) \phi^2 = (\beta + \phi \gamma + \delta) \phi^2 \implies \phi^2 = \phi^2 = 0. \tag{44} \]

This implies that equation (22) has no positive solutions of prime period two. \( \Box \)

\textbf{Theorem 6.} Equation (22) has positive period two solution \( \forall \alpha, \beta, \gamma, \delta \in (0, \infty) \) in the following cases:

(i) \( (\gamma + \delta)(1 + \alpha) + \beta = 0 \) \( (p \text{ and } r \text{ are even}) \)
(ii) \( \alpha = 1 \) \( (p \text{ and } r \text{ are odd}) \)
(iii) \( (\gamma + \delta)(1 - \alpha) - \beta = 0 \) \( (p \text{ is odd}; r \text{ is even}) \)

\textbf{Proof.} We will prove case (i) and the other cases (ii) and (iii) are obtained by the same way. Assume that there exist two distinct positive real numbers \( \phi, \phi \in (0, \infty) \) such that \( \phi, \phi, \phi, \phi, \phi, \phi, \ldots \) is prime period two solution of equation (22):
\[ \phi = \phi^*(\alpha + \frac{\beta}{\gamma \phi + \delta}). \tag{45} \]
\[ \phi = \phi^*(\alpha + \frac{\beta}{\gamma \phi + \delta}). \tag{46} \]

From equation (45) and equation (46), we obtain
\[ (\phi - \phi \alpha)(\gamma + \delta) = \beta \phi (\phi - \phi \alpha)(\gamma + \delta) = \beta \phi, \tag{47} \]
By solving these equations, we obtain
\[(\phi - \varphi)(y' + \delta)(1 + \alpha) + \beta = 0.\] (48)

Since \(\alpha, \beta, \gamma,\) and \(\delta\) are nonzero positive real numbers, and \(\phi \neq \varphi.\)

This implies that
\[(y + \delta)(1 + \alpha) + \beta = 0.\] (49)

6. Global Stability

We will study the global asymptotic stability of the positive solutions of equation (22) in this section.

**Theorem 7.** The equilibrium point \(\bar{w}\) of equation (22) is a global attractor if
\[
\beta \neq (1 - \alpha)\gamma, \tag{50}
\]

**Proof.** Let \(a\) and \(b\) are real numbers and assume that \(f: (a, b)^3 \rightarrow (a, b)\) be a function defined by
\[f(s, u, v) = as + (b\beta u/\gamma u + \delta v).\]

Thus, we see that the function \(f(s, u, v)\) is increasing in \(s\) and \(u\) and is decreasing in \(v.\)

Let \((g, G)\) is a solution of the system \(G = f(G, G, g)\) and \(g = f(g, G, G).\)

Then, from (22), we see that
\[
G = aG + \frac{\beta G^2}{\gamma G + \delta g}, \tag{51}
\]
and
\[
g = a g + \frac{\beta g^2}{\gamma g + \delta G}. \tag{52}
\]

\[
G(1 - \alpha) = \frac{\beta G^2}{\gamma G + \delta g}, \tag{53}
\]
and
\[
g(1 - \alpha) = \frac{\beta g^2}{\gamma g + \delta G}. \tag{54}
\]

Then,
\[
\gamma(1 - \alpha)G^2 + \delta(1 - \alpha)Gg = G^2 \beta, \tag{55}
\]
and
\[
\gamma(1 - \alpha)g^2 + \delta(1 - \alpha)Gg = g^2 \beta. \tag{56}
\]

By subtracting these equations, we obtain
\[
\gamma(1 - \alpha)(G^2 - g^2) = \beta(G^2 - g^2), \quad \gamma(1 - \alpha) \neq \beta. \tag{57}
\]

Thus,
\[
G = g. \tag{58}
\]

It follows that the equilibrium point \(\bar{w}\) of equation (22) is a global attractor. \(\square\)

7. Applications

In this section, we will discuss the solution of some special cases of equation (22).

**Case 1.** When \(\alpha = 0, \rho = r = 0.\) In this case, we have the following special type of difference equation:
\[
w_{n+1} = \frac{\beta w_n^2}{\gamma w_n + \delta w_n} = w_n\left(\frac{\beta}{\gamma + \delta}\right). \tag{59}
\]

**Theorem 8.** The general solution of equation (56) is
\[
w_n = \frac{a \beta^n}{(\gamma + \delta)^n}, \tag{60}
\]
where
\[
w_0 = a. \tag{61}
\]

**Proof.** Proof is obtained by induction, and it is easy to do. \(\square\)

**Case 2.** When \(\alpha = 1\) and \(\beta = \gamma = \delta = 1, \rho = 3\) and \(r = 4.\) In this case, we have the following special case of difference equation:
\[
w_{n+1} = \frac{w_{n+2} w_{n-3}}{w_{n+1} + w_{n-4}}, \tag{62}
\]
where \(w_{-4}, w_{-3}, w_{-2}, w_{-1},\) and \(w_0\) are the arbitrary real numbers.

**Theorem 9.** Let \(\{w_n\}_{n=-4}^{+\infty}\) be a solution of equation (59). Then, for \(n = 0, 1, 2, \ldots,\)
\[
w_{n+1} = a \prod_{i=0}^{n-1} \frac{F_{8i+8} a + F_{8i+9} e}{F_{8i+6} a + F_{8i+7} e}, \tag{63}
\]
\[
w_{n+2} = a \prod_{i=0}^{n-1} \frac{F_{8i+6} a + F_{8i+7} e}{F_{8i+4} a + F_{8i+5} e}, \tag{64}
\]
\[
w_{n+3} = a \prod_{i=0}^{n-1} \frac{F_{8i+4} a + F_{8i+5} e}{F_{8i+2} a + F_{8i+3} e}, \tag{65}
\]
where \(w_{-4} = a, w_{-3} = b, w_{-2} = c, w_{-1} = d, \quad w_0 = e, \quad a, b, c, d, \) and \(F_{m+1} = \{0, 1, 1, 2, 3, 5, 8, 13, 21, \ldots, \}.

**Proof.** For \(n = 0,\) the result holds. Now, suppose that \(n > 0\) and that our assumption holds for \(n - 1\) and \(n - 2;\)
\[ w_{4n-4} = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right), \]

\[ w_{4n-5} = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+6} + F_{8i+7} e}{F_{8i+5} + F_{8i+6}} \right), \]

\[ w_{4n-6} = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+4} + F_{8i+5} e}{F_{8i+3} + F_{8i+4}} \right), \]

\[ w_{4n-7} = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+2} + F_{8i+3} e}{F_{8i+1} + F_{8i+2}} \right), \]

\[ w_{4n-8} = e^{n-3} \prod_{i=0}^{n-3} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right), \]

\[ \text{Now, it follows from (59) that} \]

\[ w_{4n} = w_{n-4} \frac{w_{4n-1} w_{4n-4}}{w_{4n-1} - w_{4n-5}} - e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right) \]

\[ - \frac{d}{dn} \left( \frac{F_{8i+6} + F_{8i+7} e}{F_{8i+5} + F_{8i+6}} \right) \]

\[ - d \prod_{i=0}^{n-2} \left( \frac{F_{8i+6} + F_{8i+7} e}{F_{8i+5} + F_{8i+6}} \right) - d \prod_{i=0}^{n-2} \left( \frac{F_{8i+6} + F_{8i+7} e}{F_{8i+5} + F_{8i+6}} \right) - 1 \]

\[ = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right) \]

\[ \times \left[ 1 - \frac{d}{dn} \left( \frac{F_{8i+6} + F_{8i+7} e}{F_{8i+5} + F_{8i+6}} \right) \right] \]

\[ = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right) \]

\[ \times \left[ 1 - \frac{d}{dn} \left( \frac{F_{8i+6} + F_{8i+7} e}{F_{8i+5} + F_{8i+6}} \right) \right] \]

\[ = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right) \]

\[ \times \left[ 1 - \frac{F_{8i+2} + F_{8i+3} e}{F_{8i+1} + F_{8i+2}} \right] \]

\[ = e^{n-2} \prod_{i=0}^{n-2} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right) \]

\[ \times \left[ 1 - \frac{F_{8i+2} + F_{8i+3} e}{F_{8i+1} + F_{8i+2}} \right] \]

\[ \text{Thus, we have} \]

\[ w_{4n} = e^{n-1} \prod_{i=0}^{n-1} \left( \frac{F_{8i+8} + F_{8i+9} e}{F_{8i+7} + F_{8i+8}} \right), \]

\[ w_{4n+1} = w_n w_{n-3}, \quad w_n + w_{n-3}. \]

The following theorem gives the solution of equation (64).

**Theorem 10.** Let \( \{w_n\}_{n=-p}^{\infty} \) be a solution of equation (64). Then, the solution for equation (64) is given by

\[ w_n = \frac{w_{4n} w_{n-1} w_{n-2} w_{n-3}}{F_{n-2} w_0 w_1 w_2 + F_{n-1} w_0 w_2 w_3 + F_n w_1 w_2 w_3 + F_{n+1} w_0 w_1 w_2}, \]
where \( F_n = F_{n-1} + F_{n-2}, n \geq 4, F_0 = 0, \) and \( F_1 = F_2 = F_3 = 1 \)
and initial values \( w_3 = d, w_2 = c, w_1 = b, \) and \( w_0 = a \) are
the arbitrary positive real numbers.

\[
\begin{align*}
\frac{w_1}{w_0 + w_3} &= \frac{w_0 w_{-1} w_{-3}}{w_0 w_{-1} w_{-2} + w_{-1} w_{-3}} \\
&= \frac{w_0 w_{-1} w_{-3}}{(F_0) w_{-1} w_{-3} + (F_1) w_{-2} w_{-3} + (F_2) w_{-3} w_{-2} + (F_3) w_{-1} w_{-2}}.
\end{align*}
\]

(66)

Hence, the relation holds true. Now, suppose that relation (64) holds for \( n = k. \)

\[
\begin{align*}
w_k &= (F_{k-2}) w_{0} w_{-1} w_{-3} + (F_{k-1}) w_{0} w_{-2} w_{-3} + (F_k) w_{1} w_{-2} w_{-3} + (F_{k+1}) w_{3} w_{-1} w_{-2}.
\end{align*}
\]

(67)

We now want to show that relation (64) holds true for \( n = k + 1: \)

\[
\begin{align*}
\frac{w_{k+1}}{w_k + w_{-1}} &= \frac{w_{0} w_{-1} w_{-3}}{(F_{k+2}) w_{0} w_{-1} w_{-3} + (F_{k+1}) w_{0} w_{-2} w_{-3} + (F_k) w_{1} w_{-2} w_{-3} + (F_{k+3}) w_{3} w_{-1} w_{-2}} \\
&= \frac{w_{0} w_{-1} w_{-3}}{(F_{k+2}) w_{0} w_{-1} w_{-3} + (F_{k+1}) w_{0} w_{-2} w_{-3} + (F_k) w_{1} w_{-2} w_{-3} + (F_{k+3}) w_{3} w_{-1} w_{-2}}.
\end{align*}
\]

(68)

Case 4. When \( \alpha = 1 \) and \( \beta = y = \delta = 1, \rho = 2 \) and \( r = 3. \)
In this case, we have the following special case of difference equation:

\[
w_{n+1} = w_{n-2} + \frac{w_n w_{n-2}}{w_0 + w_{n-3}}.
\]

(69)

where \( w_{-3}, w_{-2}, w_{-1}, \) and \( w_0 \) are the arbitrary real numbers.

**Theorem 11.** Let \( \{w_n\}_{n=3}^{\infty} \) be a solution of equation (69).
Then, for \( n = 0, 1, 2, \ldots, \)

\[
\begin{align*}
\frac{w_3}{d} &= \prod_{i=0}^{n-1} \left( \frac{F_{6i+6} a + F_{6i+7} d}{F_{6i+5} a + F_{6i+6} d} \right), \\
\frac{w_{3n+2}}{c} &= \prod_{i=0}^{n-1} \left( \frac{F_{6i+4} a + F_{6i+5} d}{F_{6i+3} a + F_{6i+4} d} \right), \\
\frac{w_{3n+1}}{b} &= \prod_{i=0}^{n-1} \left( \frac{F_{6i+2} a + F_{6i+3} d}{F_{6i+1} a + F_{6i+2} d} \right).
\end{align*}
\]

(70)

Now, it follows from (69) that
\[ w_{3i} = \frac{w_{3i+1}w_{3i-3}}{w_{3i+1} - w_{3i-2}} \]

\[ w_{3i} = d \prod_{i=0}^{n-2} \left( \frac{F_{6i+6a} + F_{6i+7d}}{F_{6i+5a} + F_{6i+6d}} \right) \left[ 1 - b \prod_{i=0}^{n-1} \left( \frac{F_{6i+2a} + F_{6i+3d}/F_{6i+4a} + F_{6i+2d}}{F_{6i+2a} + F_{6i+3d}/F_{6i+4a} + F_{6i+2d}} \right) \right] \]

\[ w_{3i} = \prod_{i=0}^{n-2} \left( \frac{F_{6i+6a} + F_{6i+7d}}{F_{6i+5a} + F_{6i+6d}} \right) \left[ 1 - b \prod_{i=0}^{n-1} \left( \frac{F_{6i+2a} + F_{6i+3d}/F_{6i+4a} + F_{6i+2d}}{F_{6i+2a} + F_{6i+3d}/F_{6i+4a} + F_{6i+2d}} \right) \right] \]

\[ w_{3i} = \prod_{i=0}^{n-2} \left( \frac{F_{6i+6a} + F_{6i+7d}}{F_{6i+5a} + F_{6i+6d}} \right) \left[ 1 - \frac{F_{6i-4a} + F_{6i-3d}/F_{6i-5a} + F_{6i-4d}}{F_{6i-4a} + F_{6i-3d}/F_{6i-5a} + F_{6i-4d}} \right] \]

\[ w_{3i} = \prod_{i=0}^{n-2} \left( \frac{F_{6i+6a} + F_{6i+7d}}{F_{6i+5a} + F_{6i+6d}} \right) \left[ F_{6i-3a} - F_{6i-4a} + F_{6i-3d}/F_{6i-4a} + F_{6i-3d} \right] \]

\[ w_{3i} = \prod_{i=0}^{n-1} \left( \frac{F_{6i+6a} + F_{6i+7d}}{F_{6i+5a} + F_{6i+6d}} \right) \left[ F_{6i-1a} + F_{6i-1d} \right], \]

\[ w_{3i} = d \prod_{i=0}^{n-1} \left( \frac{F_{6i+6a} + F_{6i+7d}}{F_{6i+5a} + F_{6i+6d}} \right). \]

Hence, the proof is complete.

Example 2. Figure 2 shows the behavior of solution of equation (59) when we take

\[ w_{-4} = 1, \]
\[ w_{-3} = 2, \]
\[ w_{-2} = 3, \]
\[ w_{-1} = 4, \]
\[ w_0 = 5, \]
\[ \alpha = 1, \]
\[ \beta = \gamma = \delta = 1, \]
\[ \rho = 3, \]
\[ r = 4. \]

(74)

Example 3. Figure 3 shows that the solution of equation (64) is globally asymptotically stable when we take

\[ w_0 = 0.1, \]
\[ \alpha = 0, \]
\[ \beta = \gamma = \delta = 1, \]
\[ \alpha = 0, \]
\[ \rho = r = 0. \]

(73)
Example 4. Figure 4 shows the solution of equation (69) has no positive prime period two solution if we take
\[ w_{-3} = 1, \]
\[ w_{-2} = 2, \]
\[ w_{-1} = 3, \]
\[ w_0 = 4, \]
\[ \alpha = 0, \]
\[ \beta = \gamma = \delta = 1, \]
\[ p = r = 3. \]  
(75)

9. Concluding Remarks

In the literature, several articles are related to qualitative behavior of rational difference equations. It is a very interesting mathematical problem to study the dynamics of such equations because these are closely related to models in population dynamics and biological sciences. We have investigated the existence and uniqueness of positive equilibrium points, and boundedness and persistence of positive solutions are proved. Moreover, we have shown that they are locally as well as globally asymptotically stable. The main objective of dynamical systems theory is to predict the global behavior of these systems.
behavior of a system based on the knowledge of its present state. We have taken some special cases as applications of equation (22) in Section 7 and found the closed form of the solutions. Finally, some illustrative examples are provided to support our theoretical discussion.
