THE COHOMOLOGY OF THE SPORADIC GROUP $J_2$ OVER $\mathbb{F}_3$

ANTONIO DÍAZ RAMOS AND OIHANA GARAI ALDE OCAÑA

ABSTRACT. We describe the cohomology ring $H^*(J_2;\mathbb{F}_3)$ both as subring of $H^*(3^{1+2};\mathbb{F}_3)$ and with an abstract presentation. We also give its Poincaré series. We use as tool a spectral sequence for the strongly closed 3-subgroup of $J_2$. This method might be used to compute the cohomology of any finite simple group with a strongly closed $p$-subgroup.

MSC2010: 55T10, 55R35, 20J06, 20D20.

Keywords: cohomology ring, Hall-Janko group, spectral sequence.

1. Introduction

The computation of the cohomology of the sporadic finite simple groups is an intrinsically interesting subject in which only partial answers are yet known. By far, the most complete knowledge is at the prime 2, see for instance [1] and [2], where the authors tackle this problem using homotopy theory methods. Even with coefficients in $\mathbb{F}_2$ not all the cohomology rings of the sporadic groups are fully understood. For $p$ odd and when the Sylow $p$-subgroup is the extraspecial group $3^{1+2}$ of order $p^3$ and exponent $p$, the description of the full cohomology ring has been circumvented, see [16] and [17]. In general, due to the complexity of the problem, computer calculations are in some cases the only or most complete source of information, see [11] for instance.

In this work, we present a method that involves the stable elements theorem [5] together with the spectral sequence [6]. The approach is classical but the novelty is that this spectral sequence applies on the weak hypothesis of the existence of a strongly closed $p$-subgroup. Hence, this procedure can be utilized to compute the cohomology ring of any finite simple group which possesses a strongly closed $p$-subgroup. There is a classification of such finite simple groups [8].

For the particular case of the Hall-Janko group or second Janko group $J_2$, the ring $H^*(J_2;\mathbb{F}_2)$ was studied in [4] with the partial aid of computer calculations. At the prime 3, a Sylow 3-subgroup $S$ of $J_2$ is isomorphic to $3^{1+2}$ and $H^*(J_2;\mathbb{F}_3)$ has been determined by computer [9], [10]. Using our alternative method we give here a computer-free description of the cohomology ring $H^*(J_2;\mathbb{F}_3)$ both as a subring of $H^*(3^{1+2};\mathbb{F}_3)$ and with an abstract presentation.

Recall that in the finite simple group $J_2$ of order 604,800, the center $Z(S) \cong C_3$ is a strongly closed 3-subgroup of $S$. Moreover, as the normalizer of $S$ controls fusion [15], Remark 1.4, the spectral sequence of [6] amounts to the following: Firstly, set
$E_*$ to be the Lyndon-Hochschild-Serre spectral sequence of the central extension

$$C_3 \to 3^{1+2} \to C_3 \times C_3,$$

with second page $E_2^{n,m} = H^n(C_3 \times C_3; H^m(C_3; \mathbb{F}_3))$ and converging to $H^*(3^{1+2}; \mathbb{F}_3)$. Secondly, the group $\text{Out}_J(S) = C_8$ acts on each page of this spectral sequence and taking invariants gives rise to a spectral sequence $E_*^{C_8}$ which converges to $H^*(J_2; \mathbb{F}_3)$. In particular, the second page is $H^n(C_3 \times C_3; H^m(C_3; \mathbb{F}_3))^{C_8}$. The Lyndon-Hochschild-Serre spectral sequence $E_*$ of $3^{1+2}$ was computed by Leary in \cite{Leary} and it collapses in $E_6 = E_\infty$. Hence, the invariants $E_6^{C_8} = E_\infty^{C_8}$ is a bigraded algebra associated to some filtration of $H^*(J_2; \mathbb{F}_2)$ and we use this fact to determine the ring $H^*(J_2; \mathbb{F}_3) = H^*(3^{1+2}; \mathbb{F}_3)^{C_8}$.

The layout of the paper is as follows: We start in Section 2 by providing a detailed description of the page $E_6$. Then in Section 3 we compute the invariants $E_6^{C_8}$ and the Poincaré series of $H^*(J_2; \mathbb{F}_3)$. With the aid of the bigraded algebra $E_6^{C_8}$ we determine in Section 4 the ring $H^*(J_2; \mathbb{F}_3)$ as a subring of $H^*(3^{1+2}; \mathbb{F}_3)$ and an abstract presentation of $H^*(J_2; \mathbb{F}_3)$.

**Acknowledgements:** We are grateful to Universidad de Málaga and Universidad del País Vasco for their hospitality and travel and accommodation support in several occasions during the development of this work.

2. The cohomology groups of $3^{1+2}$.

We denote by $S = 3^{1+2}$ the extraspecial group of order 27 and exponent 3. It has the following presentation

$$S = \langle A, B, C \mid A^3 = B^3 = C^3 = [A, C] = [B, C] = 1, [A, B] = C \rangle.$$

The center of $S$ is $Z(S) = \langle C \rangle \cong C_3$ and hence we have the following central extension:

$$C_3 \to 3^{1+2} \to C_3 \times C_3.$$

Leary describes in \cite{Leary} the LHSs. $E_*$ of this extension. Its second page is given by

$$E_2^{+,+} = H^*(C_3; \mathbb{F}_3) \otimes H^*(C_3 \times C_3; \mathbb{F}_3) = \Lambda(u) \otimes \mathbb{F}_3[t] \otimes \Lambda(y_1, y_2) \otimes \mathbb{F}_3[x_1, x_2],$$

with the following degrees for the generators

$$\text{deg}(u) = \text{deg}(y_1) = \text{deg}(y_2) = 1, \text{deg}(t) = \text{deg}(x_1) = \text{deg}(x_2) = 2$$

and with Bockstein operations $\beta(u) = t$ and $\beta(y_1) = x_1$, $\beta(y_2) = x_2$. The extension \cite{Leary} is classified by $y_1 y_2 \in H^2(C_3 \times C_3; \mathbb{F}_3)$ and, according to \cite{Leary}, the differentials in $E_*$ are the following:

\begin{enumerate}
  \item $d_2(u) = y_1 y_2$, $d_2(t) = 0$,
  \item $d_3(t) = x_1 y_2 - x_2 y_1$,
  \item $d_4(t^i u (x_1 y_2 - x_2 y_1)) = it^{-1} (x_1 x_2 y_2 - x_2^2 x_2 y_1)$, $d_4(t^2 y_1) = u (x_1 y_2 - x_2 y_1) x_1$,
  \item $d_5(t^2 (x_1 y_2 - x_2 y_1)) = x_1 x_2 - x_1 x_3$, $d_5(u t^2 y_1 y_2) = ku (x_1^2 y_2 - x_2^2 y_1)$, $k \neq 0$.
\end{enumerate}

A long and intricate computation leads from $E_2$ to $E_6$. We give an explicit description of $E_6$ but we omit most of the calculations.
2. Lemma. With the notations above, the following table gives representatives of classes that form an $F_3$-basis of $E_6^{n,m}$ for $0 \leq n \leq 6$ and $0 \leq m \leq 5$:

|   | 0   | 1   | 2   | 3   | 4   | 5   | 6   |
|---|-----|-----|-----|-----|-----|-----|-----|
| 5 |      |     |     |     |     |     |     |
| 4 |      |     |     |     |     |     |     |
| 3 | $ut_3y_2$ |     |     |     |     |     |     |
| 2 | $ty_1, ty_2$ | $ty_1x_1, ty_1x_2$ | $tx_1^2y_1, tx_1^2y_2$ |     |     |     |     |
| 1 | $uy_1, uy_2$ | $uy_1x_1, uy_1x_2$ | $ux_1^2y_1, ux_1^2y_2$ |     |     |     |     |
|   | $uy_2x_1, uy_2x_2$ | $ux_2^3y_1, ux_2^3y_2$ |     |     |     |     |     |
| 0 | $y_1, y_2$ | $x_1, x_2$ | $y_1x_1, y_1x_2$ | $x_1^2, x_2^2$ | $x_1^2y_1, x_1^2y_2$ | $x_2^3y_1, x_2^3y_2$ | $x_1^2, x_2^3$ |

It turns out that this description of the corner of $E_6$ determines the rest of $E_6$ as there are both vertical and horizontal periodicities. More precisely, we show below that $E_6^{n,m} \cong E_6^{n,m+6}$ for $n, m \geq 0$ and that $E_6^{n,m} \cong E_6^{n+2,m}$ for $n \geq 5$ and $m \geq 0$. To recognize these isomorphisms we need nevertheless to fully understand the page $E_6$. The following result gives an explicit description of $E_6^{n,m}$ as a subquotient of $E_2^{n,m}$.

3. Lemma. Assume the notations above and let $n \geq 0$ and $m \geq 0$. Set

$$z = \begin{cases} 
\ell^{[m/6]}, & m = 0 \mod 6 \\
uf^{[m/6]}, & m = 1 \mod 6 \\
\ell^{[m/6]}/1, & m = 2 \mod 6 \\
uf^{[m/6]}/1, & m = 3 \mod 6.
\end{cases}$$

Then we have:

(i) For $n = 0$, $E_6^{n,m} = \langle z \rangle$ for $m = 0 \mod 6$ and $E_6^{n,m} = 0$ otherwise.
(ii) For $n = 1$, $E_6^{n,m} = \langle y_1, y_2 \rangle$ for $m = 0, 1, 2 \mod 6$ and $E_6^{n,m} = 0$ otherwise.
(iii) For $n = 2$, $E_6^{n,m} = \langle x_1, x_2 \rangle$ for $m = 0 \mod 6$, $E_6^{n,m} = \langle y_1y_2 \rangle$ for $m = 1, 3 \mod 6$ and $E_6^{n,m} = 0$ otherwise.
(iv) For $n = 3$, $E_6^{n,m} = E_2^{n,m}$ for $m = 1 \mod 6$, $E_6^{n,m}$ is the following quotient:

$$\langle x_1y_1, x_1y_2, x_2y_1, x_2y_2 \rangle / \langle x_1y_2 - x_2y_2 \rangle$$

for $m = 0, 2 \mod 6$ and $E_6^{n,m} = 0$ otherwise.
(v) For $n \geq 4$ and $n = 2q$, $E_6^{n,m}$ is the following quotient if $m = 0 \mod 6$:

$$\langle x_1^iq^{-1}, 0 \leq i \leq q \rangle / \langle x_1^iq^{-1} - x_1^{i+2q^{-1}}x_2^{-1}, 1 \leq i \leq q - 3 \rangle,$$

and $E_6^{n,m} = 0$ otherwise.
(vi) For $n \geq 4$ and $n = 2q+1$, if $m = 0, 1, 2 \mod 6$, then $E_6^{n,m}$ is the quotient of

$$\langle x_1^iq^{-i}y_1, x_1^iq^{-i}y_2, 0 \leq i \leq q \rangle$$

by

$$\langle x_1^iq^{-i}y_1 - x_1^{i+1}x_2^{-1}y_1, x_1^iq^{-i}y_2 - x_1^{q-i+1}x_2^{-1}y_2, 0 \leq i \leq j, 1 \leq j \leq q - 2 \rangle,$$

and $E_6^{n,m} = 0$ otherwise.

As a direct consequence of this lemma we obtain representatives for a basis of $E_6^{n,m}$ and any $n, m \geq 0$. 
4. Corollary. Assume the notations above and define $z$ as in Lemma 3. For each $n \geq 0$ and $m \geq 0$ we denote by $B \leq E_{n,m}^8$ a set of elements such that their classes survive to $E_{n,m}^8$ and form a basis of $E_{n,m}^8$. Then we have:

(i) For $n = 0$, $B = \{z\}$ for $m = 0 \pmod{6}$ and $B = \emptyset$ otherwise.

(ii) For $n = 1$, $B = \{zy_1, zy_2\}$ for $m = 0, 1, 2 \pmod{6}$ and $B = \emptyset$ otherwise.

(iii) For $n = 2$, $B = \{zx_1, zx_2\}$ for $m = 0 \pmod{6}$, $B = \{zy_1y_2\}$ for $m = 1, 3 \pmod{6}$ and $B = \emptyset$ otherwise.

(iv) For $n = 3$, $B = \{zx_1y_1, zx_1y_2, zx_2y_1, zx_2y_2\}$ for $m = 1 \pmod{6}$, $B$ equals $\{zx_1y_1, yx_1y_2, zyx_2y_2\}$ if $m = 2 \pmod{6}$ and $B = \emptyset$ otherwise.

(v) For $n \geq 4$ and $n = 2q$, $B = \{zx_q^1, zx_q^{-1}x_2, zx_q^{-2}x_2, zyx_q^2\}$ if $m = 0 \pmod{6}$ and $B = \emptyset$ otherwise.

(vi) For $n \geq 4$ and $n = 2q + 1$, $B = \{zx_q^1y_1, zx_q^1y_2, zx_q^{-1}y_2, zyx_q^2y_2\} = \{zx_q^1y_1, yx_q^1y_2, zyx_q^2y_2\}$ if $m = 0, 1, 2 \pmod{6}$ and $B = \emptyset$ otherwise.

5. Lemma. With the notations above, the element $t^3$ survives to $E_6$. Moreover, for each $n \geq 0$ and $m \geq 0$, multiplication by $t^3$ is an isomorphism $\Psi_n^m : E_{n,m}^6 \to E_{n,m+6}^6$ of vector spaces over $\mathbb{F}_3$.

Proof. By Corollary 4 or by an Evens’ norm map argument [7], the element $t^3$ is a permanent cycle and hence it survives to $E_\infty = E_6$. In particular, multiplication by $t^3$ commutes with all the differentials and induces a linear map $\Psi_n^m : E_{n,m}^6 \to E_{n,m+6}^6$ for all $n \geq 0$, $m \geq 0$ and $i \geq 2$. From Corollary 4 we deduce that $\Psi_n^m$ is an isomorphism.

Now we can state the horizontal periodicity.

6. Lemma. With the notations above, for each $n \geq 5$ and $m \geq 0$, the map $\Phi_n^m : E_{n,m}^6 \to E_{n+2,m}^6$ given by

$$zx_q^1 \mapsto zx_q^{q+1}, zx_q^{q-1}x_2 \mapsto zx_q^q x_2, zx_1^q x_2^q \mapsto zx_1^{q-1}x_2, zx_2^q \mapsto zx_2^{q+1}$$

for $n = 2q$ and $m = 0 \pmod{6}$ and by

$$zx_1^q y_1 \mapsto zx_1^{q+1} y_1, zx_1^q y_2 \mapsto zx_1^{q+1} y_2, zx_1^q x_2 y_2 \mapsto zx_1^q x_2 y_2, zx_2^q y_2 \mapsto zx_2^{q+1} y_2$$

for $n = 2q + 1$ and $m = 0, 1, 2 \pmod{6}$ is an isomorphism of vector spaces over $\mathbb{F}_3$.

Proof. This follows from Corollary 4 by inspection. □

3. INVARIANT ELEMENTS IN $E_6$

In this section we compute $C_8$-invariants. Recall first that the outer automorphism group of $S \cong 3^1_{+2}$ is $\text{GL}_2(3)$, with the matrix $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ acting as $A \mapsto A^n B^c$, $B \mapsto A^d B^a$ and $C \mapsto C^{ad-bc}$. As a generator of $C_8 = \text{Out}_{J_3}(S)$ we may choose $\begin{pmatrix} 1 & 1 \\ -1 & 1 \end{pmatrix}$, which maps $A \mapsto AB$, $B \mapsto A^{-1}B$ and $C \mapsto C^{-1}$. The induced isomorphism in cohomology $E_2 \to E_2$ is given by

$$y_1 \mapsto y_1 - y_2, y_2 \mapsto y_1 + y_2, x_1 \mapsto x_1 - x_2, x_2 \mapsto x_1 + x_2$$

and by $u \mapsto -u, t \mapsto -t$. We denote by $\alpha : E_6^{+,+} \to E_6^{+,+}$ the map induced in the sixth page. The following lemma shows that both $\Psi^2$ (Lemma 5) and $\Phi^2$ (Lemma 6) commute with $\alpha$. Hence, the computation of the $C_8$-invariants of $E_6$ is reduced to the computation of $C_8$-invariants in $\{F_6^{+,+}\}_{0 \leq n \leq 8, 0 \leq m \leq 11}$.

7. Lemma. With the notations above we have:
(i) For each $n \geq 0$ and $m \geq 0$ the following square commutes:

\[
\begin{array}{ccc}
E_{6}^{n,m} & \xrightarrow{\alpha^{n,m}} & E_{6}^{n,m} \\
\Phi^{n,m} & \xrightarrow{\alpha^{n,m}} & \Phi^{n,m}
\end{array}
\]

(ii) For each $n \geq 5$ and $m \geq 0$ the following square commutes:

\[
\begin{array}{ccc}
E_{6}^{n,m} & \xrightarrow{\alpha^{n,m}} & E_{6}^{n,m} \\
\Phi^{n,m} & \xrightarrow{\alpha^{n,m}} & \Phi^{n,m}
\end{array}
\]

Proof. Part (i) is a direct consequence of $\alpha(t^6) = \alpha(t)^6 = (-t)^6 = t^6$. For part (ii) the situation is more involved. By induction and using the relations in (v) and (vi) of Lemma 3 one can show that the following formula hold in $E_{6}^{q,0}$ for $q \geq 2$:

\[
(x_1 \pm x_2)^q = \begin{cases} 
  x_1^q + x_2^q + x_1^{q-1}x_2, & \text{if } q \text{ is even} \\
  x_1^q \pm x_2^q, & \text{if } q \text{ is odd.}
\end{cases}
\]

From this, it is a direct computation to show that the equation $\Phi^2(\alpha(x_1^q)) = \Phi^2((x_1 - x_2)^q)$ holds for each generator $b$ of the basis $B$ described in points (v) and (vi) of Corollary 4. For instance, for $q$ even and the element $x_1^q$ we have:

\[
\Phi^2(\alpha(x_1^q)) = \Phi^2((x_1 - x_2)^q) = \Phi^2(x_1^q + x_2^q + x_1^{q-1}x_2) = x_1^{q+2} + x_2^{q+2} + x_1^{q+1}x_2
\]

and

\[
\alpha(\Phi^2(x_1^q)) = \alpha(x_1^{q+2}) = (x_1 - x_2)^{q+2} = x_1^{q+2} + x_2^{q+2} + x_1^{q+1}x_2.
\]

\[\square\]

8. Lemma. With the notations above, the following table gives representatives of classes that form an $\mathbb{F}_3$-basis of $(E_{6}^{n,m})_{C_8}$ for $0 \leq n \leq 8$ and $0 \leq m \leq 11$:
where
\begin{align*}
w_{2,1} &= uy_{1}y_{2}, w_{3,1} = uy_{1}x_{1} + uy_{2}x_{2}, w_{3,1} = uy_{1}x_{2} - uy_{2}x_{1}, \\
w_{3,2} &= ty_{1}x_{1} + ty_{2}x_{2}, w_{3,6} = t^{3}(y_{1}x_{1} + y_{2}x_{2}), w_{4,6} = t^{3}(x_{1}^{2} + x_{2}^{2}), \\
w_{2,9} &= ut^{3}y_{1}y_{2}, w_{7,0} = x_{1}^{3}y_{1} + x_{2}^{3}y_{2} - t^{3}x_{2}y_{2}, w_{7,1} = x_{1}^{3}y_{1} + x_{2}^{3}y_{2}, \\
w_{8,6} &= x_{4}^{4} + x_{2}^{4} - x_{1}^{2}x_{2}^{2}, w_{8,6} = t^{3}x_{4}^{4} + t^{3}x_{2}^{4}.
\end{align*}

From this table and Lemma 7 the Poincaré series \( P(t) \) of \( J_{2} \) is as follows:
\[
\sum_{i=0}^{\infty} t^{12i}(1 + t^{3} + 2t^{4} + t^{5} + t^{9} + t^{10} + t^{11} + \sum_{j=0}^{\infty} t^{4j}(t^{7} + 2t^{8} + t^{9} + t^{13} + 2t^{14} + t^{15})),
\]
from where we obtain
\[
P(t) = \frac{1 + t^{3} + t^{4} + t^{5} + t^{9} + t^{10} + t^{11} + t^{14}}{(1 - t^{4})(1 - t^{12})}.
\]

4. Ring structure

In this section we give a description of the ring \( H^{*}(J_{2}; \mathbb{F}_{3}) \) both as a subring of \( H^{*}(3^{1+2}; \mathbb{F}_{3}) \) and as an abstract ring via generators and relations. Recall that the ring \( H^{*}(3^{1+2}; \mathbb{F}_{3}) \) was described by Leary as follows:

10. Theorem (13 Theorem 7). The ring \( H^{*}(3^{1+2}; \mathbb{F}_{3}) \) is generated by elements \( y, y', x, x', Y, Y', X, X', z \) with
\[
\begin{align*}
deg(y) &= \deg(y') = 1, \deg(x) = \deg(x') = \deg(Y) = \deg(Y') = 2, \\
\deg(X) &= \deg(X') = 3 \text{ and } \deg(z) = 6
\end{align*}
\]
subject to the following relations:
\[
\begin{align*}
xy &= 0, xy' = x'y, yY &= y'Y = xy', yY' &= y'Y, \\
Yy' &= xy', Y^{2} &= x'y', Y^{2} &= x'y, \\
yX &= xY - xx', yX' &= x'Y' - xx', \\
x'y &= x'Y - Yx', x'y &= x'Y - xY, \\
XY &= x'X, X'Y &= x'X, XY &= -X'Y, xX' &= -x'X, \\
XX &= 0, xx'(yY' + xY') &= -xx'2, x'(xY' + xY) = -x'x^{2}, \\
x^{3}y &= x^{3}y = 0, x^{3}x' &= x^{3}x = 0, \\
x^{3}Y' + x^{3}Y &= -x^{2}x^{2} \text{ and } x^{3}X' + x^{3}X = 0.
\end{align*}
\]

To study the ring of invariants \( H^{*}(3^{1+2}; \mathbb{F}_{3})^{C_{8}} \) we need the action of the generator of \( C_{8} \) on the generators described in the previous theorem. This action is
\[
\begin{align*}
y &\mapsto y - y', y' \mapsto y + y', \\
x &\mapsto x - x', x' \mapsto x + x', \\
y &\mapsto x + x' - Y - Y', Y' \mapsto x - x' + Y - Y', \\
X &\mapsto X - X', X' \mapsto X - X', \\
z &\mapsto -z.
\end{align*}
\]

The action is determined by 13 Theorem 7 as follows: \( y \) and \( y' \) are the group homomorphisms dual to \( A \) and \( B \) respectively. The degree 2 generators \( Y \) and \( Y' \) are the triple Massey products \( Y = \{y, y, y'\} \) and \( Y' = \{y', y, y\} \). Then \( x, x', X \) and \( X' \) are the image by the Bockstein homomorphism of \( y, y', Y \) and \( Y' \) respectively. To finish, the generator of \( C_{8} \) maps \( C \) to \( C^{-1} \) and hence \( z \) is mapped to \(-z\).
Next, we determine the graded algebra $H^*(J_2; \mathbb{F}_3) = H^*(3^{1+2}_+; \mathbb{F}_3)^C$ using its associated bigraded algebra $E_{12}^G$. The link is provided as follows: the Lyndon-Hochschild-Serre spectral sequence $E_s$ converging to $H^*(3^{1+2}_+; \mathbb{F}_3)$ comes equipped with a filtration $\{F^n H^n\}_{i=0}^{n+1}$ of $H^n = H^n(3^{1+2}_+; \mathbb{F}_3)$ such that

$$F^i H^n / F^{i+1} H^n \cong \mathbb{E}_{i,n-i}^G$$

for $i = 0, \ldots, n$.

Now, as proven in [9], for the spectral sequence $E^G_s$ converging to $H^*(J_2; \mathbb{F}_3)$, we have a filtration of $H^*(J_2; \mathbb{F}_3)$ given by taking invariants in the previous filtration, $\{(F^n H^n)^C_s\}_{i=0}^{n+1}$, and this filtration satisfies

$$(F^n H^n)^C_s / (F^{n+1} H^n)^C_s \cong \mathbb{E}_{i,n-i}^G$$

for $i = 0, \ldots, n$.

For a class $c \in F^3 H^n \setminus F^4 H^n$ set $\bar{c} \in F^3 H^n / F^4 H^n$ to be the non-zero image of $c$ in this quotient. From the previous discussion, if $c \in H^*(J_2; \mathbb{F}_3)$ then $\bar{c}$ belongs to $E_{12}^G$. For the generators in Theorem 10 we have the following, where the last line is consequence of [12] Lemma 2.4, Lemma 2.13:

$$\bar{c} = y_1, \overline{y'} = y_2, \bar{x} = x_1, \overline{x'} = x_2, \overline{y} = uy_1, \overline{y'} = uy_2, \overline{x} = tx_1, \overline{x'} = tx_2, \overline{y} = t\bar{y} = t'.$$

To find generators for $H^*(J_2; \mathbb{F}_3)$ it is enough to find generators of $E_{12}^G$ and then lift them. A set of generators for $E_{12}^G$ is given by (see Table I and Lemma I):

$$w_{2,1}, w_{3,1}, w_{3,1}, w_{3,2}, w_{3,6}, w_{4,6}, w_{2,9}, t^6,$$

$$w_{7,0}, w_{8,0}, w_{7,1}, tw_{7,1}, t^3w_{7,1}, tw_{7,0}, t^4w_{7,0}, t^4w_{7,0}, w_{8,6}, w_{11,0}, w_{12,0},$$

where $w_{11,0} = \Phi^2(w_{7,0}) = x_1^5y_1 + x_1^5y_2 - x_1^4x_2y_2$, $w_{12,0} = \Phi^2(w_{8,0}) = x_1^6 + x_1^5 - x_1^4x_2^2$. Nevertheless, as we show in the next result, it is enough to lift the first 8 generators listed above. To this purpose, note that the Poincaré series of $H^*(J_2; \mathbb{F}_3)$ is [9]

$$P(t) = 1 + t^3 + 2t^4 + t^5 + t^7 + 2t^8 + 2t^9 + t^{10} + 2t^{11} + 3t^{12} + \ldots.$$  

From this expression we deduce that the lifts of the generators $w_{2,1}, w_{3,1}, w_{3,1}, w_{3,2}$ are the linear generators of $H^n(3^{1+2}_+; \mathbb{F}_3)^C$ for $n = 3, 4, 5$. For the generators $w_{3,6}, w_{4,6}, w_{2,9},$ as they are multiples of $t^3$, an appropriate guess is that their lifts are of the form $zc$, where $c$ is mapped to $-c$ under the action and $c$ has total degree 3, 4 or 5. To sum up, we need to solve some linear algebra problems in $H^n(3^{1+2}_+; \mathbb{F}_3)$ with $n \in \{3, 4, 5\}$. Basis for these vector spaces are described in [12] Lemma 2.4(2), proof of Theorem 2.15.

13. **Theorem.** The ring $H^*(J_2; \mathbb{F}_3)$ is the subring of $H^*(3^{1+2}_+; \mathbb{F}_3)$ generated by elements $a, b, c, d, e, f, g, h$ with

$$a = Y y' - x y - x' y', b = Y x - Y' x', c = x^2 + x'^2 + xY + x'Y$$

$$d = X x - X' x', e = z(y x + y x'), f = z(x^2 + x'^2),$$

$$g = -z(X x - X' x' + Y X'), h = z^2$$

and degrees

$$\deg(a) = 3, \deg(b) = \deg(c) = 4, \deg(d) = 5,$$

$$\deg(e) = 9, \deg(f) = 10, \deg(g) = 11, \deg(h) = 12.$$
Proof. It is a straightforward computation using the action of $C_8$ (Equation 11) and the presentation of $H^* (\mathbb{Z}_2^{1+2}; \mathbb{F}_3)$ (Theorem 10) that the elements in the statement are indeed invariant under this action. For instance, for $g = -z(x - X - X') + Y X'$, its image under the action is

$$z[(x - x')(-X - X') - (x + x')(X - X') + (x + x' - Y - Y')(X - X')]$$

$$= z(-x X - x X' + x X' - x X + x X' - x X + x X' + x X - x X')$$

$$+ x X' - x X' - Y X + Y X' - Y' X + Y' X')$$

$$= z(-x X - x X' + x X' - Y X + Y X' - Y' X + Y' X')$$

$$= z(-x X - x X' - Y X') + z(x X - x X' + Y X').$$

Now, using Equation 12 we obtain:

$$\overline{a} = u y_1 y_2, \overline{b} = u y_1 x_1 + u y_2 x_2, \overline{c} = u y_1 x_2 - u y_2 x_1,$$

$$\overline{d} = t (y_1 x_1 + y_2 x_2), \overline{e} = t^3 (y_1 x_1 + y_2 x_2), \overline{f} = t^3 (x_1^2 + x_2^2),$$

$$\overline{g} = u t^4 y_1 y_2, \overline{h} = t^6,$$

or, with the notations of Lemma 8

$$\overline{a} = w_{2,1}, \overline{b} = w_{3,1}, \overline{c} = w_{3,1}, \overline{d} = w_{3,2}, \overline{e} = w_{3,6}, \overline{f} = w_{3,6}, \overline{g} = w_{2,9}, \overline{h} = t^6.$$

To prove that $a, b, c, d, e, f, g, h$ generate $H^* (\mathbb{Z}_2; \mathbb{F}_3)$ we show that the subalgebra $\langle a, b, c, d, e, f, g \rangle$ generates the full bigraded algebra $E_{6}^{C_8}$. As $h = t^6$, multiplication in $E_{6}^{C_8}$ by $h$ gives exactly the vertical periodicity $\Psi^2$ of $(a)$ in Lemma 7. So we just need to show that the rows from 0 to 11 are generated by the overlines of elements in $(a, b, c, d, e, f, g)$. The rest of the elements in the table of Lemma 8 are generated as follows:

$$\overline{ac} = w_{7,0}, \overline{bc} = u w_{7,1}, \overline{dc} = t w_{7,1},$$

$$\overline{ce} = t^3 w_{7,1}, \overline{fe} = w_{8,6}, \overline{ga} = u t^3 w_{7,0}, \overline{gc} = t^4 w_{7,0}.$$

Now, the following computation shows that the horizontal periodicity $\Phi^2$ of $(b)$ of Lemma 7 is realized by multiplication by $c$ at the ring level:

$$\overline{ac^i} = z(x^{2i+1} + y + x^{2i+1} y' - x^{2i+1} y') = \Phi^2(i-1)(w_{7,0}),$$

$$\overline{bc^i} = z(x^{2i+1} + y'x^{2i+1} y'),$$

$$\overline{dc^i} = z(x^{2i+1} - x^{2i+1} X'),$$

$$\overline{ec^i} = z((x^{2i+1} + y')x^{2i+1} X'),$$

$$\overline{fc^i} = z(x^{2i+1} + x^{2i+1} X'),$$

$$\overline{gc^i} = z((x^{2i+1} + y')X'),$$

for $i \geq 1$ and the following for $i \geq 2$:

$$\overline{c^i} = z(x^{2i+1} + y^{2i-1} x^{2i} y') = \Phi^2(i-2)(w_{8,0}).$$

This finishes the proof. \qed
14. Remark. The action of the Steenrod algebra $A_3$ on $H^*(J_2; \mathbb{F}_3)$ can be easily deduced from its action on $H^*(3^{1+2}; \mathbb{F}_3)$, which was described by Leary in [13].

The previous theorem shows that the corner of the bigraded algebra $E_0^{C^s}$ is generated by the following overlined elements (cf. Lemma 8):

\[
\begin{array}{cccccccccccc}
11 & 10 & 9 & 8 & 7 & 6 & 5 & 4 & 3 & 2 & 1 & 0 \\
\hline
11 & \overline{7} & \overline{q}^2 & \overline{q}^{3+2} & \overline{q}^{4+2} & \overline{q}^{5+2} & \overline{q}^{6+2} & \overline{q}^{7+2} & \overline{q}^{8+2} & \overline{q}^{9+2} & \overline{q}^{10+2} & \overline{q}^{11+2} \\
9 & \overline{e} & \overline{e}^2 & \overline{e}^3 & \overline{e}^4 & \overline{e}^5 & \overline{e}^6 & \overline{e}^7 & \overline{e}^8 & \overline{e}^9 & \overline{e}^{10} & \overline{e}^{11} \\
8 & \overline{u} & \overline{u}^2 & \overline{u}^3 & \overline{u}^4 & \overline{u}^5 & \overline{u}^6 & \overline{u}^7 & \overline{u}^8 & \overline{u}^9 & \overline{u}^{10} & \overline{u}^{11} \\
7 & \overline{d} & \overline{d}^2 & \overline{d}^3 & \overline{d}^4 & \overline{d}^5 & \overline{d}^6 & \overline{d}^7 & \overline{d}^8 & \overline{d}^9 & \overline{d}^{10} & \overline{d}^{11} \\
6 & \overline{c} & \overline{c}^2 & \overline{c}^3 & \overline{c}^4 & \overline{c}^5 & \overline{c}^6 & \overline{c}^7 & \overline{c}^8 & \overline{c}^9 & \overline{c}^{10} & \overline{c}^{11} \\
5 & \overline{f} & \overline{f}^2 & \overline{f}^3 & \overline{f}^4 & \overline{f}^5 & \overline{f}^6 & \overline{f}^7 & \overline{f}^8 & \overline{f}^9 & \overline{f}^{10} & \overline{f}^{11} \\
4 & \overline{g} & \overline{g}^2 & \overline{g}^3 & \overline{g}^4 & \overline{g}^5 & \overline{g}^6 & \overline{g}^7 & \overline{g}^8 & \overline{g}^9 & \overline{g}^{10} & \overline{g}^{11} \\
3 & \overline{c} & \overline{c}^2 & \overline{c}^3 & \overline{c}^4 & \overline{c}^5 & \overline{c}^6 & \overline{c}^7 & \overline{c}^8 & \overline{c}^9 & \overline{c}^{10} & \overline{c}^{11} \\
2 & \overline{d} & \overline{d}^2 & \overline{d}^3 & \overline{d}^4 & \overline{d}^5 & \overline{d}^6 & \overline{d}^7 & \overline{d}^8 & \overline{d}^9 & \overline{d}^{10} & \overline{d}^{11} \\
1 & \overline{e} & \overline{e}^2 & \overline{e}^3 & \overline{e}^4 & \overline{e}^5 & \overline{e}^6 & \overline{e}^7 & \overline{e}^8 & \overline{e}^9 & \overline{e}^{10} & \overline{e}^{11} \\
0 & \overline{1} & \overline{2} & \overline{3} & \overline{4} & \overline{5} & \overline{6} & \overline{7} & \overline{8} & \overline{9} & \overline{10} & \overline{11} \\
\end{array}
\]

By inspection, columns 11 and 12 are obtained from columns 7 and 8 via multiplication by $c$ at the ring level. In fact, we proved in Theorem 13 that the rest of the columns are obtained by multiplying by the successive powers of $c$, and the missing rows by multiplying by powers of $h$.

15. Theorem. The ring $H^*(J_2; \mathbb{F}_3)$ is the free graded-commutative algebra on the generators $a, b, c, d, e, f, g, h$ with

\[
\begin{align*}
\deg(a) &= 3, \deg(b) = \deg(c) = 4, \deg(d) = 5, \\
\deg(e) &= 9, \deg(f) = 10, \deg(g) = 11, \deg(h) = 12
\end{align*}
\]

subject to the following relations:

\[
\begin{align*}
ab &= 0, b^2 = 0, bc + ad = 0, bd = 0, ae = 0, be = 0, fa + ce = 0, bf = ag, ed = ag, \\
b^2 &= 0, f^2 = 0, f^2 + cg = 0, dg = 0, ef + ach = 0, eg = had, f^2 = e^2h, f^2 + chd = 0.
\end{align*}
\]

Proof. By Theorem [13] we know that there is a surjective homomorphism from the free graded-commutative algebra $R$ on generators $a, b, c, d, e, f, g, h$ of the stated degrees to $H^*(J_2; \mathbb{F}_3)$. Each generator of $R$ is mapped to the generator with the same name in $H^*(J_2; \mathbb{F}_3)$. To compute the kernel of this homomorphism we start looking at relations in $E_0^{C^s}$ among the elements $\overline{a}, \overline{b}, \overline{c}, \overline{d}, \overline{e}, \overline{f}, \overline{g}, \overline{h}$. Then we lift these relations back to $H^*(J_2; \mathbb{F}_3)$. To decide whether we have considered enough relations we use Poincaré series. We find that the highest order relation occurs in total degree 21.

Recall from the proof of Theorem [13] that

\[
\overline{a} = w_{2,1}, \overline{b} = w_{3,1}, \overline{c} = w_{3,1}, \overline{d} = w_{3,2}, \overline{e} = w_{3,5}, \overline{f} = w_{4,6}, \overline{g} = w_{2,9}.
\]
Now, from Table 1, where we show the corner \( \{E_{n,m}^{C_{S}}\}_{n,m=0,...,21} \), we find that the following 16 products are 0:

\[
\overline{a}, b', c_l, \overline{c}_l, d, \overline{d}, e_f, \overline{e}_f, \overline{a}g, c_l, d, \overline{d}, \overline{c}_l, \overline{e}_f, f, g.
\]

All these products are zero since they have bidegree \((n,m)\) with \( E_{n,m}^{C_{S}} = 0 \). Now assume some product \( \overline{a}b, \overline{b}c, \overline{c}d, \overline{d}e_f, \overline{e}_f \) \( b_{l}d, c_l, d, \overline{d}, e_f, \overline{e}_f, f, g \) is 0 in \( E_{6}^{n,n-1} \), which is isomorphic to \( (F^iH^n)^{C_{S}}/ (F^{i+1}H^n)^{C_{S}} \). Here we have \( n = 3i_a + 4i_b + 4i_c + 5i_d + 9i_e + 10i_f + 11i_g \) and \( i = 2i_a + 3i_b + 3i_c + 3i_d + 3i_e + 4i_f + 2i_g \). Then the element \( a^ib^ic^j \) \( d^k e^l f^m g^n h^p \) of \( (F^iH^n)^{C_{S}} \) lies in \( (F^{i+1}H^n)^{C_{S}} \) too and hence it may be written using elements from the latter. This gives rise to a relation. For instance, for \( \overline{a}d = 0 \in E_{5,3}^{C_{S}} \), and using the fact that

\[
E_{6}^{C_{S}} = 0, E_{6}^{1,1} = \langle \overline{b}c \rangle, E_{6}^{8,0} = \langle \overline{c}d \rangle,
\]

we deduce that \( ad = \alpha bc + \beta c^2 \) holds in \( H^*(J_2; \mathbb{F}_3) \) for some \( \alpha \) and \( \beta \) in \( \mathbb{F}_3 \). In this case, the equation is satisfied for \( \alpha = -1 \) and \( \beta = 0 \):

\[
bc = (Yx - Y'x')(x^2 + x^2 + xY' + xY)
\]

\[
= Yx^3 + Yxx^2 + YY'x^2 + Y^2xx' - x^2x'Y' - x^3Y' - x^2Y' - x^2Y' - x^2Y - x^3
\]

\[
= Yx^3 - Yx^3
\]

and

\[
ad = (Yx' - xy - x'y')(Xx - X'x')
\]

\[
= xy'YX - x'y'YX' - x^2yX + xx'yX' - xx'yX + xx'yX
\]

\[
= xx'yX - x^2yX' - x^2yX + xx'yX + xx'yX
\]

\[
= -x^2yX + x^2yX' = -x^2(xY - xx') + x^2(x'Y' - xx')
\]

\[
= -x^2y + x^3x' + x^3y' - xx^3 = -Yx^3 + Y'x^3.
\]

The same analysis for the products \( \overline{a}f, \overline{ag}, \overline{ed}, \overline{cg}, \overline{c}_l, \overline{e}_f, \overline{f}, \overline{g} \) produce the following relations respectively:

\[
af = -ec = -z(x^3y + x'y'),
\]

\[
ag = bf = z(x^3Y - x^3Y' - xx^2Y + x^3x'),
\]

\[
ed = ag = z(x^3Y - x^3Y' - xx^2Y + x^3x'),
\]

\[
cg = -fd = -z(Xx^3 - X'x^3 + X'x^2x'),
\]

\[
ach = -ef = -z^2(x^3y + x^3y' - x^2x'y'),
\]

\[
ec = had = z^2(-x^3Y + x^3Y'),
\]

\[
c^2h = f^2 = z^2(x^4 + x^4 - x^2x^2),
\]

\[
fg = -chd = z^2(-Xx^3 + X'x^3).
\]
For the remaining products \( b_5 b_6, b_7 b_8, b_9 b_{10}, b_9 b_{11}, b_{12} b_{13} \) we obtain \( ab = b^2 = bd = ae = be = bg = dg = 0 \). For example,

\[
ab = (Yy' - xy - x'y')(Yx - Y'x')
\]

\[
= Y^2xy' - YY'x'y' - Yx^2y + Y'xx'y - Yxx'y' + Y'x^2y'
\]

\[
= Y^2x'y' - xx^2y' - Yx^2y + Y'x^2y' - Yx^2y + Y'x^2y'
\]

\[
= x^3y' - x^3y - x^3y' + x^3y' - xx^2y' + xx^2y' = x^3y' - x^3y = 0.
\]

Therefore, we get the following relations:

\[
ab, b^2, bc + ad, bd, ae, be, fa + ce, bf - ag, cd - ag,
bg, fd + cg, dg, ef + cha, eg - had, f^2 - c^2h, fg + chd.
\]

Set \( I \) to be the ideal of \( R \) generated by these relations and set \( H = R/I \). We show that \( H \cong H^*(J_2; \mathbb{F}_3) \). The subalgebra of \( H \) generated by \( c \) and \( h \) is the polynomial algebra on a generator of degree 4 and a generator of degree 12, \( \mathbb{F}_3[c, h] \). Using that \( H \) is graded-commutative and the 16 relations above it is easy to check that every monomial \( m = a^i b^j c^k d^l e^m f^n g^p h^q \) of \( H \) may be rewritten as \( m = m'c^i h^j \) with \( m' \in \{1, a, b, d, e, f, g, ga\} \). Hence, \( H \) is finite over \( \mathbb{F}_3[c, h] \),

\[
(H) = \mathbb{F}_3[c, h]\{1, a, b, d, e, f, g, ga\},
\]

and its Poincaré series coincides with that of \( J_2 \) \(^1\). It follows that \( H \cong H^*(J_2; \mathbb{F}_3) \).

**17. Remark.** As noted in the introduction, a presentation of \( H^*(J_2; \mathbb{F}_3) \) was already obtained by computer \(^9\). There the generators are denoted by

\[
a_{3,0}, a_{4,1}, b_{4,0}, a_{5,0}, a_{9,1}, b_{10,0}, a_{11,1}, c_{12,1},
\]

with degrees given by the first coordinate of the sub-index. An isomorphism with the presentation of Theorem \(^1\) is given by

\[
a \mapsto -a_{3,0}, b \mapsto a_{4,1}, c \mapsto b_{4,0}, d \mapsto a_{5,0}, e \mapsto a_{9,1}, f \mapsto b_{10,0}, g \mapsto a_{11,1}, h \mapsto -c_{12,1}.
\]
| $t^{6}w_{2,9}$ | $t^{10}w_{7,0}$ | $t^{7}w_{4,6}w_{7,1}$ | $t^{10}w_{7,0}w_{8,0}$ | $t^{7}w_{4,6}w_{7,1}w_{8,0}$ |
| $t^{6}w_{2,1}$ | $t^{6}w_{3,1}$ | $t^{6}w_{3,2}w_{8,0}$ | $t^{7}w_{7,2}w_{8,0}$ | $t^{6}w_{3,2}w_{8,0}$ |
| $w_{3,6}$ | $w_{4,6}$ | $w_{8,6}$ | $w_{4,6}w_{8,0}$ | $t^{3}w_{7,3}w_{8,0}$ |
| $w_{3,2}$ | $tw_{7,1}$ | $w_{8,2}$ | $tw_{7,1}w_{9,0}$ | $w_{3,2}w_{8,0}$ |
| $w_{2,1}$ | $w_{3,1}$ | $w_{8,1}$ | $w_{8,0}$ | $w_{3,1}w_{8,0}$ |
| $w_{1}$ | $w_{7,0}$ | $w_{8,0}$ | $w_{8,0}$ | $w_{12,0}w_{8,0}$ |
