Abstract. With the in-depth development of economic globalization, international trade has become one of the high-quality choices for many enterprises. International trade is even more inseparable from computer-aided support. Enterprises can minimize the cost and expenditure through exchange rate fluctuations and improve their economic benefits at the same time. As a big agricultural country, China has a huge advantage in the import of agricultural products while the increasing frequency of international trade in agricultural products can better promote the growth of China's economy. This paper mainly analyzes the economic benefits brought to China by agricultural products in international trade based on computer-aided.

Keyworsds: Agricultural Products, International Trade, China's Economy, Computer-aided

1. Introduction
The trend of globalization makes it more convenient to import commodities, so when carrying out international trade of agricultural products, changes of rate can better improve the real income of farmers and at the same time promote China's GDP and CPI index. From the long-term economic and trade situation, the international trade of agricultural products has a good role in promoting China's economic development. Therefore, China should give full play to its own agricultural brand advantages, improve the frequency of international trade in agricultural products and better enhance people's quality of life[1].

2. Impact of international trade in agricultural products on China's economic growth

2.1. Impact of international trade in agricultural products on China's CPI
In the current rapid development of market economy, the consumption demand of all countries is also growing. In particular, countries with small land areas and unfavorable climate conditions for crop cultivation need to import basic materials to meet their domestic needs. In the process of international trade in agricultural products, China will also get greater economic benefits, thus improving China's CPI index. In the process of China's agricultural products in international trade, we can improve the...
overall domestic consumption level through the changes in agricultural products prices to increase China's CPI index. Under the current situation, China's import of agricultural products is still restricted by the trade order of capitalist countries. In the actual process of trade, China's international trade still lacks the right to control the price of agricultural products, which puts us at a disadvantage in import trade.

2.2. Influence of international trade of agricultural products on China's industrial structure
With the development of China's international trade, China's industrial structure has changed. In order to better provide basic material security for people's life in our country, we need to strengthen domestic agricultural development and provide people with high-quality agricultural products. However, the export deficit of international trade can better drive the import of a large number of foreign agricultural products to increase China's crop reserves, realize the diversification of industrial structure and promote the rapid development of social economy. Secondly, a large number of imported agricultural products will achieve the overall development with the tertiary industry. In the process of the rapid development of the service industry, the import of raw materials through international trade can achieve the balance between supply and demand in order to better optimize the industrial structure and improve the economic benefits of the society. The following figure is the economic impact correlation graph of international agricultural trade objects, as shown in figure 1.

![Figure 1. The economic impact of the international agricultural trade object.](image)

2.3. Influence of agricultural products in international trade on the rate of economic growth
The development of international trade of agricultural products can not only better meet the material needs of our country, but also promote the growth rate of our economy to a large extent. International trade of agricultural products can realize the improvement of economic benefits through exchange rate fluctuations to realize the balance between supply and demand of China's industry and improve the efficiency of social operation. Secondly, international trade of agricultural products can indirectly increase the total value of GDP, promote the link between international trade and a variety of industries and promote the development of all industries. In addition, international trade of agricultural products can better liberate China's labor force and enhance the development level of the tertiary industry, which can help adjust and optimize China's industrial structure and accelerate the speed of economic growth.[2]
3. Countermeasures to promote the contribution of international trade of agricultural products
to economic growth

3.1. Improve the logistics of international trade of agricultural products
Logistics plays an important role in transactions, especially in international trade. Therefore, we should pay more attention to the relevant system of international logistics. The government should formulate relevant policies, strictly regulate logistics management and accumulate a good reputation in trade logistics, because the stable logistics of international trade is conducive to the development of international trade. From the current development model of logistics in China, there are still loopholes in laws and regulations. Lack of legal basis will cause trade disputes, which is not conducive to the development of trade. Therefore, the government should lay greater emphasis on the formulation of laws and regulations, combine the actual situation with the current logistics industry, improve the relevant laws and regulations in order to build a logistics management system acting according to the law. Standard management of logistics industry can guarantee the stability and health of international trade logistics of agricultural products. In addition, China can learn from the advanced logistics management system of foreign countries by learning from their strong points to offset our weakness and integrate with the logistics management of world trade to formulate a reasonable logistics management system. Since a perfect legal system will play a good role in enhancing healthy development of the logistics industry[3].

3.2. Standardize the management of export markets for agricultural products
National policies play a vital role in the trade market and the government should guide the process of trade. Our government chooses to develop our trade by means of state monopoly. In the Common Program of the Chinese People's Political Consultative Conference promulgated in 1949, it was stipulated that foreign trade control and protective trade policies should be adopted. This regulation effectively protects our country's international trade. China also needs to establish an export intermediary organization that can better transition export products to ensure the trade export procedures in an orderly manner. The organization can monitor trade conditions in a specialized and real-time manner. Intermediary organizations should play their guiding and managerial roles to regulate export markets[4]. China should also learn from the experience of advanced trading countries like standard export management mode, and perfect the laws and regulations of export market so that the export market can have certain standards. In addition, we should establish intermediaries to manage the import and export markets of agricultural products so as to prevent vicious competition in export markets. The following figure is the schematic diagram of the strategy of standardizing the management of export market of agricultural products, as shown in figure 2.

3.3. Improve the structure of imports and increase pricing power
International agricultural products’ prices will have a direct impact on China's domestic CPI index. Therefore, when carrying out the international trade of agricultural products, we should improve the consciousness of import structure optimization and enhance our own pricing power to better maintain our economic benefits. Optimizing the import structure of agricultural products can be started from
China's input in agricultural science and technology to improve the output of agricultural products, reduce the demand for agricultural products import, and control the right of discourse on the price. At the same time, we should actively participate in the international conference on the pricing of bulk agricultural products and strive to create a fair and reasonable price environment, which can improve the quality of international trade in agricultural products, the size of procurement and bargaining power. Because a complete procurement system can better reduce the import cost of agricultural products and improve the economic benefits of international trade[5].

4. Conclusion
In a word, China, as a big agricultural country, should be good at seizing opportunities in international trade. Based on computer-aided analysis, let us know that we should not only raise real economic benefits through exchange rate and trade deficit fluctuations, but also enhance our ability to cope with trade risks. We will continue to optimize the import mix of agricultural products, better ensure the economic benefits of international trade and promote the steady development of the Chinese economy. With the rapid development of China's computer-aided, accelerating the import and export of agricultural products can not only help us better integrate into the tide of economic globalization, but also establish the brand image of China's agricultural products to provide convenient ways for subsequent trade[6].
