1. INTRODUCTION

The Thymelaeaceae are a family of dicotyledonous plants mainly found in the tropics and subtropics. They are mostly trees and shrubs, but include also a few vines and herbaceous plants. The family is especially diverse in the southern hemisphere, with many different species present in Africa and Australia [1]. Some species can also be found in Europe, and in parts of Asia and South America, but, in these latter regions, their diversity is much less [2]. Some genera are commercially grown for their sweet-scented and fragrant flowers. Other genera are cultivated for their hardwood, for their bark, which is a raw material for paper making, or for their odoriferous, highly resinous wood (agarwood), which is used for incense and perfume production.

Thymelaeaceae synthesize many, highly diverse secondary metabolites with a wide range of bioactivities, which has led to numerous applications of Thymelaeaceae plant extracts in traditional medicine. For instance, in Kampo medicine in Japan, agarwood preparations are used as sedative, analgesic and antispasmodic agents, as well as to treat injuries such as fractures and bruises [4], and, in Korea, agarwood has been used for the treatment of cough, asthma, and as a sedative among others [5].

A completely different application exploits the strong fragrance of Thymelaeaceae plants, in particular of *Aquilaria* species. In Saudi Arabia and other Arabic countries, the wood of *Aquilaria* trees is used as incense at important religious occasions [5, 6]. Wood from closely related species is used during Buddhist ceremonies in Asian countries such as Japan and India. Interestingly, the fragrant agarwood resin is not produced in normal wood tissues, but it is only formed when the plant is injured, *e.g.*, by wind, lightning, gnawing by ants or insects, or by microbial infection. These natural pro cesses are slow and occur by chance, causing the agarwood to develop very slowly over decades. Therefore, agarwood is also produced artificially by burning, holing, cutting, or deliberate inoculation of the trees with fungi such as *Fusarium* spp [7-10]. Nevertheless, despite the artificial production, the demand for agarwood far exceeds the available supply, fostering a deep interest in the secondary metabolites that are responsible for the fragrance properties of agarwood.

Widely studied *Aquilaria* species include *A. sinensis*, *A. malaccensis*, *A. crassna*, and *A. agallocha*. Depending on the region where these species grow, different names are used for the produced agarwood, such as Eaglewood, Gaharu, Kanankoh, Jinkoh, Chen Xiang or Tram [8, 9]. It is also called aloeswood or agalloch [8]. Each species produces agarwood with different fragrance properties, depending on the variety and quantity of the secondary metabolite content, especially sesquiterpenes and chromones. To assist in the search for alternative sources of agarwood-like fragrant resins, we review here the different secondary metabolites that have so far been characterized in *Aquilaria*.

There are two reviews that have been published that discussed about the same genus [11, 12]. These previous reviews did not discuss several classes of compounds such as diterpenoids, benzophenone, lignan and used references before 2011. Otherwise, this review was compiled using references, mostly published in 2001-2016. Some references which were dated before 2000 showed that the study of this genus had lasted for longtime. Another review published in 2016 discussed more on bioactivity of compounds contained in this genus [13].

2. PHYTOCHEMISTRY ASPECTS

2.1. Sesquiterpenes

The fragrant sesquiterpenes that have been found in the *Aquilaria* genus include compounds with a guaiane, eudesmane/selinane, eremophilane/nootkatane, agarofuran, vetispirane/agarospirane, or prezizane skeleton (Fig. 1). Most of these sesquiterpenes are oxygenated [14-16].
Almost all of these sesquiterpenes have been isolated from agarwood of several species of *Aquilaria*. For instance, guaiane sesquiterpenes were obtained from the agarwood of *A. agallocha* including α-guaiene (1), α-bulnesene (2), rotundone (3), 1,5-epoxy-nor ketoguaiene (4), as well as several guaia-1(10),11-diene derivatives (5a-g) [17, 18]. All reported guaiane sesquiterpenes were unsaturated guaianes with some of them being oxygenated.

An interesting guaiane sesquiterpene is 1,10-dioxo-4αH-5αH-7βH-11αH-1, 10-secoguaia-2(3)-en-12, 8β-olide (7), which exhibits anti-inflammatory activity with an IC₅₀ value of 8.1 μM. This compound was isolated from *A. sinensis* agarwood, together with its derivatives 7βH-guaia-1(10)-en-12,8β-olide (6) and 1β-hydroxy-4βH-5βH-7βH-11αH-8,9-secoguaia-9(10)-en-8,12-olide (8) [19], Fig. (2).

The sesquiterpene 10-epi-γ-eudesmol (9), which has an eudesmane skeleton, has been isolated from the wood of *A. malac-
censis [20]. Other eudesmanes, including selina-3,11-diene-9-one (10), selina-3,11-diene-9-ol (11), selina-3,11-diene-14-al (12), selina-4,11-diene-14-al (13), selina-3,11-diene-14-carboxylic acid (14), selina-4,11-diene-14-carboxylic acid (15), 9-hydroxy selina-4,11-diene-14-carboxylic acid (16) were isolated from agarwood of A. agallocha [18, 21]. In addition, A. sinensis, which had been subjected to artificial holing, produced several other eudesmane sesquiterpenes, such as 9-hydroxy-selina-3,11-diene-12-al (17), 9-hydroxy-selina-3,11-diene-14-al (18), 9-hydroxy-eudesma-3,11(13)-diene-12-methyl ester (19), 9-hydroxy-selina-4,11-diene-14-al (20), 8,12-dihydroxy-selina-4,11-diene-14-al (21), 3,4,4α,5,6,7,8,8α-octahydro-7-[1-(hydroxymethyl)ethyl]-1-methylnaphtalene-1-carboxaldehyde (22), 12,15-dioxa-α-selinen (23), 15-hydroxy-12-oxo-α-selinen (24), eudesmane-1β,5α,11-triol (25), 7βH-eudesmane-4α,11-diol (26), and ent-4(15)-eudesmen-1α,11-diol (27) [22]. Compound 23 has also been isolated from A. sinensis by Zhao together with its isomer (28) [19]. In the same year, Wu et al. reported a new eudesmane sesquiterpene (29) that was isolated from 70% MeOH extract of A. malaccensis agarwood chips along with (28) and (30) [23], Fig. (3).

The agarofuran skeleton was the first reported sesquiterpene skeleton found in Aquilaria. Three different sesquiter-

Fig. (3). Eudesmane sesquiterpenes in Aquilaria.
penes with this skeleton were isolated from agarwood oil, obtained from fungus-infected *A. agallocha* Roxb plants, and their structures and absolute configurations were determined by degradative studies and physical measurements. These sesquiterpenes were \( \alpha \)-agarofuran (31), \( \beta \)-agarofuran (32) and dihydroagarofuran (33) [24]. \( \beta \)-agarofuran has also been isolated from finely powdered *A. agallocha* wood originating from Vietnam, together with another agarofuran and nor-ketoagarofuran (34) [25], Fig. (4).

Another sesquiterpene skeleton present in *Aquilaria* plants is that of agarospirane. Some agarospirane sesquiterpenes that have been identified are agarospirol (35), isolated from agarwood of infected *A. agallocha* [26], oxo-agarospirol (36), isolated from *A. malaccensis* [20] and also found in *A. agallocha* agarwood [18, 25], and 1(10)-spirovetiven-11-ol-2-one (37), isolated from Vietnamese agarwood [8]. Zhao isolated compound (36) from *A. sinensis*, but named it baimuxinal [19] Fig. (5). This compound was also reported by Wu *et al.* in 2012, isolated from 70% MeOH extract of *A. malaccensis* agarwood chips [27], Fig. (5).

Sesquiterpenes with an eremophilane skeleton have also been identified in *A. agallocha* agarwood such as jinkoh eremol (38), kusunol (39), and dihydrokarakone (40) [25]. Alkhathlan *et al.* also successfully isolated the latter compound, but named it dehydrofukinone [6]. Ishihara *et al.* discovered the presence of the eremophilane sesquiterpene karanone (41) in agarwood from *A. agallocha* [17]. Two other eremophilane sesquiterpenes from *A. agallocha* were reported by Ishihara *et al.* in 1993, namely dehydrojinkoh-eremol (42) and neopetasane (43) [21]. The last compound, also reported by Wu *et al.* was isolated from 70% MeOH extract of *A. malaccensis* agarwood chips [27]. In 2014, Yang *et al.* published their research on the isolation and identification of compound (43), \( 7\beta \)-H-9(10)-ene-11,12-epoxy-8-o xoeremo-

---

**Fig. (4).** Agarofuran sesquiterpenes in *Aquilaria.*

**Fig. (6).** Eremophilane sesquiterpenes in *Aquilaria.*
philane (44) and 7α-H-9(10)-ene-11,12-epoxy-8-oxoermophilane (45) from Chinese agarwood (A. sinensis (Lour.) Gilg.) [16]. In 2012, Wu et al. reported the presence of three eremophilane sesquiterpenes (46), (47), and (48) isolated from 70% MeOH extract of A. malaccensis agarwood chips [23], Fig. (6).

The presence of prezizane sesquiterpenes in Aquilaria appears to be limited. Jinkohol (49) and jinkohol II (50) were present in agarwood from A. malaccensis. This finding was reported by Yoneda et al. in 1984 [25], Fig. (7). Previously, Nakanishi et al. had already reported the existence of jinkohol in Aquilaria sp. (Indonesian agarwood) [14].

![Fig. (7). Prezizane sesquiterpenes in Aquilaria.](image)

Miscellaneous sesquiterpenes found in Aquilaria are gmelofuran (51) and 8β-dihydrogmelofuran (52), which were isolated from wood of A. agallocha [27]. Aquilarin B, a degraded sesquiterpene (53), as well as another sesquiterpene (54), both with a guaiane-like skeleton, were identified from the stem of A. sinensis [28, 29]. In addition, Yang et al. obtained two other compounds from Chinese eaglewood, with one of them also having a guaiane-like skeleton. These two compounds are 8β-hydroxy-longicamphenylene (55) and 11β-hydroxy-13-isopropyl-dihydro-dehydrocostus lactone (56) [30]. Another compound identified in Chinese eaglewood, A. sinensis (Lour.) Gilg., is the sesquiterpenoid derivative 1α-hydroxy-4α,10α-dimethyl-5βH-octahydroazulen-8-one (57), which was isolated from a 95% ethanolic extract [19], Fig. (8).

![Fig. (8). Miscellaneous sesquiterpenes in Aquilaria.](image)

### 2.2. Chromones

Another class of extensively reported secondary metabolites that have been isolated from Aquilaria species is the chromones, Fig. (9). All isolated chromones are derivatives of 2-(2-phenylethyl) chromone. The first two chromones identified (58 and 59) were isolated from A. agallocha wood [31], but the most simple chromone reported was 2-(2-phenylethyl)chromone or flidersiachromone (60) which was isolated for the first time from the ether extract of powdered agarwood of A. malaccensis along with 6-methoxy-2-[2-(3-methoxy-4-hydroxyphenyl)ethyl]chromone (61), 6,8-dihydroxy-2-(2-phenylethyl)chromone (62), 6-hydroxy-2-[2-(4-hydroxyphenyl)ethyl]chromone (63), 6-hydroxy-2-[2-(2-hydroxyphenyl)ethyl]chromone (64), 7-hydroxy-2-(2-phenylethyl)chromone (65), and 6-hydroxy-7-methoxy-2-(2-phenylethyl)chromone (66) [32]. Another 2-(2-phenylethyl) chromone derivative, namely 7,8-dimethoxy-2-[2-(3'-acetoxyphenyl)ethyl] chromone (67), was isolated from an acetone extract of Cambodian agarwood of A. agallocha along with two other chromones, 6-methoxy-2-(2-phenylethyl) chromone (68) and 6,7-dimethoxy-2-(2-phenylethyl) chromone (69) [6]. Then, Yang et al. obtained eight 2-(2-phenylethyl) chromone derivatives (70-77) from an EtOH extract of Chinese eaglewood from the A. sinensis [33]. Six 2-(2-phenylethyl) chromones were isolated from a 70% MeOH extract of A. malaccensis agarwood chips [23]. Two chromones was reported before and identified as compound (58) and (59) and four others were compound 78-81. In the same year, 2012, Wu published again the report about some compounds contained in 70% MeOH extract of A. malaccensis agarwood chips. In that report, six chromones was isolated and identified [27]. Three compounds were reported before (60), (68) and (69), whereas three others had not been reported yet (82-84). In 2014, Li et al. reported the isolation of four 2-(2-phenylethyl)chromones (85-88), as well as other compounds that had been reported before, such as compounds 59, 61, 69, 76, 78, 79 and 84 from the EtOAc extract.
of Chinese agarwood induced by artificial holing originating from *A. sinensis* (Lour.) Gilg [9]. Phytochemical analysis of high quality Chinese agarwood from *A. sinensis* led to the isolation of three new 2-(2-phenylethyl) chromone derivatives (89-91) and two compounds that had been reported before [7]. In 2015, three 2-(2-phenylethyl) chromone derivatives were also isolated from the petioles and leaves of *A. sinensis*. The structures of these three chromones were elucidated and its structure were identical to compounds 58, 61 and 63 [34].
In addition to having been isolated from A. agallocha, compound 68 was also obtained from withered wood of A. sinensis, together with three other chromones (92, 93 and 94) [3]. The agarwood of the same plant gave also the 8-chloro-5,6,7-dihydroxy-2(3-hydroxy-4-methoxyphenylethyl)-5,6,7,8-tetrahydro-4H-chromen-4-one chromone (95), which was isolated and identified by a Chinese research team [35]. Compound 93, 94 and 95 belong to tetrahydrochromones. However, compound 94 and 95 are tetrahydrochromones that substituted by chloro in its structure. The presence of chloro in secondary metabolites structure is very rare. Meanwhile, compound 92 is unique because it is the only one chromone isolated and identified from Aquilaria that is hydroxylated in ethyl moiety. Subsequently, Dai et al. isolated and structurally characterized two isomers of another tetrahydrochromones (96 and 97) from the EtOH extract of the withered wood of A. sinensis [36], Fig. (10).

Three di-epoxy-tetrahydrochromones - oxidoagarochromones A (98), B (99), and C (100) - were isolated from agarwood that was artificially produced by intentional wounding of A. crassna [37]. Compounds 98 and 99 have also been obtained from Chinese agarwood of A. sinensis wounded by artificial holing [9]. In 2014, Li et al. reported the isolation of mono-epoxy-tetrahydrochromones (101, 102 and 103) [9], Fig. (11).

![Fig. (10). Some tetrahydrochromones from A. sinensis.](image1)

![Fig. (11). Epoxy-tetrahydrochromones from Aquilaria.](image2)
2.3. Flavonoids

From the leaves of *A. sinensis*, several flavonoids, both as glycoside or aglycon, have been isolated and identified. Some aglycon flavonoids found in *Aquilaria* were luteolin (104), genkwanin (105), and hydroxygenkwanin (106) that were isolated by Qi et al. [38]. Cheng et al. identified several other aglycon flavonoids, such as 7,4’-dimethyl luteolin (107), 5,7,3’,4’-tetramethoxy–flavone (108), 5,7,4’-trimethoxyflavone (109) and 5-hydroxy-3,4’,6,7-tetramethoxyflavone (110) [39]. Furthermore, several aglycon flavonoids were also isolated from the stem of this plant, such as 5-methylluteolin (isodeidoside A) (111) [40] and aquilarininoside A (112) [40].

Some flavonoids glycoside were also isolated from the leaves of *A. sinensis*, such as 5-methylluteolin (isodeidoside A) (111) [40], and lethedioside A (= 5-O-xylosylglucosides of 7,3’,4’-tri-O-methyluteolin) (113) [40].

Besides flavonoids, the presence of several xanthons has been reported, particularly mangiferin (106) and aquilarixanthin (107) in *A. sinensis* [38, 41]. One isoflavonoid, formoacetin (108), was also isolated and identified from the stem of this plant [40], Fig. (15).

### 2.4. Benzophenones

Such as flavonoids, *Aquilaria* benzophenone was also divided over the benzophenone aglycone and benzophenone glycoside. All benzophenone glycoside identified in *Aquilaria* are derivate of benzophenone iriflophenone (129) that was isolated from the leaves of *A. sinensis* along with the flavonoids described above [38]. An iriflophenone derivative, aquilarinoside A (130), was also obtained from the leaves of *A. sinensis*. Aquilarinoside A (130) was a benzophenone mono-glycoside with α-fructofuranose as a sugar moiety [38]. Some others iriflophenone mono-glycoside were iriflophenone 2-O-α-L-rhamnopyranoside (131) that was isolated from the leaves of *A. sinensis*, iriflophenone 3-C-β-D-glucoside (132) that were isolated from the petioles and leaves of *A. sinensis* [34] and another benzophenone that have been reported by other researchers and were identified as benzophenone C-glycoside (= 3C-β-D-glucopyranosyl-4’,2,4,6-tetrahydroxybenzophenone (133) [39, 43]. Aquilarinin (134) and iriflophenone 3,5-C-β-D-diglucopyranoside (135) that were isolated from the petioles and leaves of *A. sinensis* were exemples benzophenon iriflophenone diglycoside [34]. In 2014, Sun et al. published four benzophenone glycosides, the aquilarininsides A-D (136-139), which...

Fig. (15). Xanthones and isoflavonoid in A. sinensis.

had also been isolated from the leaves of the same plant [44]. In addition to these four compounds, an iriflophenone glycoside with acetyl group (140) was also reported. Based on these structures, it can be seen that there are iriflophenone-O-glycoside and iriflophenone-C-glycoside. A sugar moiety could substitute hydroxyl group either at position 2 or 6, Fig. (16). Meanwhile for iriflophenone-C-glycoside, a sugar moiety could be substituted at position 3, 5 or 5’.

2.5. Diterpenoids

All diterpenoid compounds that so far have been isolated from Aquilaria species have an abietane and podocarpane skeleton. Seven abietane diterpenoids (aquilarabietic acids 141-147) and one podocarpane diterpenoid (148) were obtained from the Chinese eaglewood, A. sinensis [45]. Meanwhile, a phorbol derivative - phorbol-13-acetate (149) - was isolated from the EtOH extract of the fresh stem of A. sinensis (Lour.) Gilg. [29]. Furthermore, an aglycon cucurbitacine triterpenoid (157) were reported by Wang along with some cucurbitane triterpene glycosides (158-161) [34], Fig. (18).

Three triterpenoids with a tirucallane skeleton have also been identified in A. sinensis. They are aquilacalane A (24-methylenetirucall-7(8)-en-3β,25-diol) (162), aquilacallane B (24-methylene-25-methyltirucall-8(9)-en-3β-ol-7,11-dione (163), and 24-methylene-25-methyltirucall-7-en-3-one (wallenone) (164)). They were isolated from the leaves of A. sinensis [39, 48]. The presence of these two tirucallane triterpenoids (162 and 163) in the petioles and leaves of A. sinensis have also reported by Wang [34], Fig. (19).

Oleanane triterpenoid skeletons were also found in A. sinensis such as those of 11-oxo-β-amyrin (165), hederagenin-an (166), 3β-acetoxyfriedelane (167) and ursolic acid (168). Their presence was reported by Cheng [39], Fig. (20).

2.7. Lignans

From the dried stems of A. sinensis that were collected in Qingyuan, Guangdong Province of China, seven lignans were isolated, including lignan aglycon and lignan glycoside [49]. They were identified as simulanol (169), syringaresinol

(170), conicaol B (171), aqularoside A (172), longifloroside A (173), conicaoside (174) and liriodendrin (175). These compounds are lignan derivatives with different skeletons, which are widely distributed in higher plants. Compounds 169, 172 and 173 are common benzofuran-type lignan derivatives, but compounds 170 and 175 are di-tetrahydrofuran lignans, while compounds 174 and 171 represent tetrahydrofuran and dibenzylbutyrolactone types, respectively. A coumarinolignan, namely aquillochin (176), was isolated from the whole plant of *A. agallocha*. The structure was proposed by Bhandari *et al.* on the basis of chemical and physical characterization [50], Fig. (21).

### 2.8. Miscellaneous

Several other compounds outside the compound classes discussed above are also found in *Aquilaria*. They include several nucleosides (177-182) and 4-hydroxyacetanilide (183). The nucleosides were isolated from the petioles and leaves of *A. sinensis*, whereas 4-hydroxyacetanilide (183) was obtained from a leaves extract of *A. malaccensis* [34, 51]. From the stem bark of *A. malaccensis* tree, the glyceride 1,3-dibehenyl-2-ferulyl glyceride (184) was isolated and identified [46], Fig. (22).

As *Aquilaria* plants are known as producers of high-quality fragrant material, then it is to be expected that these plants produce essential oils. 4-Phenyl-2-butaneone, α-bulnesene, α-guaiene, agarospirol, ledene oxide-(II), elemol and γ-eudesmol were identified as the major chemical constituents of Malaysian agarwood (*A. malaccensis*) oils [52]. The composition of essential oils can be used to determine the quality of agarwood obtained from healthy, naturally infected, or artificially wounded trees. Such research has been done with agarwood from *A. agallocha* Roxb. [53].

Not only *Aquilaria* species, but also the fungi infecting them may produce fragrant compounds. For instance, from a fermentation of the endophytic Chinese eaglewood fungus HP-1, four compounds were isolated that were identified as 3α, 3β, 10β-trimethyl-decahydroazuleno [6, 7] furan-8, 9, 14-triol (185), 4-hydroxyphenylacetic acid (186), 4-hydroxyphenethyl alcohol (187) and 5-hydroxymethyl-2-furancarboxaldehyde (188) [54], Fig. (23).

Table 1 provides a summary of secondary metabolites have been reported, along with parts of the plant and the species from which they were isolated.

Table 1. (contd...)
CONCLUSION

The *Aquilaria* genus is very rich in different classes of natural products, such as sesquiterpenes, chromones, flavonoids, benzophenones, diterpenoids, triterpenoids and lignans. Hundreds of compounds have been identified in extracts from these plants, with *A. sinensis* as the most intensively studied source. Almost all parts of the *A. sinensis* plant have been investigated. Knowing the content of secondary metabolites from each part will be able to help understand the diversity of the usefulness of this plant. An example is the use of leaves that were reported to be used locally in trauma-related diseases such as fracture, bruise etc. It was also reported that agarwood has significant anticancer activities, analgesic and anti-inflammatory activities and antidepressant activities [55]. Research on the phytochemicals from this genus (*Aquilaria*) will continue certainly because there are still some species that have not been studied. There is a high possibility to find other compounds, even new compounds, from species that have not yet been studied. In addition, knowledge of the fragrant constituents of agarwood may be useful for the development of new fragrance products from other natural sources in the future.

CONSENT FOR PUBLICATION

Not applicable.
CONFLICT OF INTEREST

The authors declare no conflict of interest, financial or otherwise.

ACKNOWLEDGEMENTS

The authors are thankful to the Directorate General of Higher Education, Ministry of Education and Culture, Republic of Indonesia, for supporting the research through funding of the PUPR Airlangga University research scheme year 2016. The authors are also grateful to Prof. Bauke W. Dijkstra from University of Groningen, Netherlands for manuscript correction.
