Abstract. The intension of the recent study is to solve a class of biological nonlinear HIV infection model of latently infected CD4+ T cells using feedforward artificial neural networks, optimized with global search method, i.e. particle swarm optimization (PSO) and quick local search method, i.e. interior-point algorithms (IPA). An unsupervised error function is made based on the differential equations and initial conditions of the HIV infection model represented with latently infected CD4+ T cells. For the correctness and reliability of the present scheme, comparison is made of the present results with the Adams numerical results. Moreover, statistical measures based on mean absolute deviation, Theil’s inequality coefficient as well as root mean square error demonstrates the effectiveness, applicability and convergence of the designed scheme.

1. Introduction. HIV is known as a hazardous virus that grows by exploitation of body fluids and damage the immune system of the body. It destroys and kills many of the CD4 cells (T cells), so the body fails to fight off disease and infections, due to this, the CD4 cells are reduced. The attack on the immune system weakens the performance of the body to resist against infections and other diseases. Many serious/global diseases like cancer, HIV/AIDS and opportunistic infections get the advantage of the weak body’s immune system. The huge amount has been spent for the treatment of these kinds of diseases every year, but no cure is found yet [40]. The research community has introduced valuable mathematical formulations for understanding the dynamics of HIV infection spread and disease progression.
Research community shows that a substantial concentration of the T cells is affected via HIV virus attack and they presented a mathematical model of HIV infection spread in 1989 [50]. The main features of this model have three variables: infected, uninfected and virus free cells. To present the HIV infection model, the infected CD4+ T-cells ([50], [7]) are assumed in latent or active state.

Due to infection, most of the healthy T-cells lost, however, a small proportion of said cells may be productively infected, i.e., in active or latent state. The mathematical model of HIV infection in simple terms is given as follows ([1], [8]):

\[
\begin{align*}
\frac{dx}{dt} &= \mu - dx - \alpha x \nu, \quad x(0) = S_1 \\
\frac{dw}{dt} &= -(q - 1)\alpha x \nu - ew - \lambda w, \quad w(0) = S_2 \\
\frac{dy}{dt} &= \lambda w - ay + q \alpha x \nu, \quad y(0) = S_3 \\
\frac{d\nu}{dt} &= -u \nu + ky, \quad \nu(0) = S_4
\end{align*}
\]

where \( x, w, y, \) and \( \nu \) stand for susceptible, infected, recover and latently infected CD4+ T virus cells, with respective initial concentrations of \( S_1, S_2, S_3 \) and \( S_4 \), \( \lambda \) is a constants for recovery rate, \( \alpha \) is the rate of infection, \( \mu \) is the rate of iterance of uninfected CD4+ T cells, \( d \) stands for rate of death for susceptible CD4+ T cells, \( a \) is the death rate of HIV recover cells, \( e \) is the infection rate by recombination, \( k \) is the rate of latently infection HIV cells, \( u \) is the death rate of latently infected cells and \( q \) is the removal rate of recombinants.

To solve the biological model (1) is not easy due to the nonlinearity. However, only a few techniques are available in the literature to solve the biological nonlinear HIV infection model of latently infected CD4+ T cells. Few of them are Adomian decomposition method [8], finite difference scheme [42], Legendre wavelet method [49], sequential Bayesian analysis approach [30], homotopy analysis method [16], Bessel collocation technique [56] and method of differential transformation [46].

All the above mention techniques have their individual merits/demerits, advantages/disadvantages, whereas, stochastic numerical solvers based on artificial neural networks (ANNs) are found to be efficient, precise and consistent for solving competently optimization models arising in various fields [2]-[24]. Some recent applications of stochastic solvers are nonlinear prey-predator models [48], nonlinear Troesch’s problem arising in plasma physics [31], cell biology [43], inverse kinematics problems [26], thin-film flow [32], uncertainties in computational mechanics [45], power [27], fuzzy differential equations [12], nanofluidic problems [33], nonlinear singular Thomas-Fermi systems [41], doubly-singular systems [34], heat conduction model of human head [35], transistor-level uncertainty quantification [60], control system [21] and energy [59].

The aim of the present work is to solve the HIV model (1) numerically by using the ANNs optimized by particle swarm optimization (PSO), interior-point algorithm (IPA) and the hybrid combination of PSO-IPA. Some prime features of the present scheme are as follows:

- A novel development of ANNs based numerical computing method is presented to obtain the accurate and consistent approximate solutions for the nonlinear biological model of HIV infection spread.
2. Design methodology. The proposed structure of the present scheme of the model (1) is divided into two portions. By introducing an error based fitness function and the combination of PSO-IPA along with the pseudocode is discussed in detail, while and the graphical abstract of PSO-IPA is plotted in Fig. 1.

2.1. ANN modeling. The formulation of the model (1) with feed-forward ANNs in the form of \( x(t), w(t), y(t) \) and \( \nu(t) \), as well as, their respective \( n \) derivatives are given as:

\[
\begin{bmatrix}
\dot{x}(t), & \dot{w}(t), & \dot{\nu}(t)
\end{bmatrix} = \begin{bmatrix}
\sum_{i=1}^{m} \psi_{x,i} h(\phi_{x,i} t + b_{x,i}), & \sum_{i=1}^{m} \psi_{w,i} h(\phi_{w,i} t + b_{w,i}), & \sum_{i=1}^{m} \psi_{\nu,i} h(\phi_{\nu,i} t + b_{\nu,i})
\end{bmatrix},
\]

\[
\begin{bmatrix}
\dot{x}^{(n)}(t), & \dot{w}^{(n)}(t), & \dot{\nu}^{(n)}(t)
\end{bmatrix} = \begin{bmatrix}
\sum_{i=1}^{m} \psi_{x,i} (\phi_{x,i} t + b_{x,i}), & \sum_{i=1}^{m} \psi_{w,i} (\phi_{w,i} t + b_{w,i}), & \sum_{i=1}^{m} \psi_{\nu,i} (\phi_{\nu,i} t + b_{\nu,i})
\end{bmatrix},
\]

(2)

Where \( W \) is the unknown weight vector and defined as: \( W = (W_x, W_w, W_y, W_\nu) \), for \( W_x = (\psi_x, \phi_x, b_x) \), \( W_w = (\psi_w, \phi_w, b_w) \), \( W_y = (\psi_y, \phi_y, b_y) \) and \( W_\nu = (\psi_\nu, \phi_\nu, b_\nu) \). The weight vector \( W \) is given as:

\[\psi_x = (\psi_{x,1}, \psi_{x,2}, ..., \psi_{x,m}), \psi_w = (\psi_{w,1}, \psi_{w,2}, ..., \psi_{w,m}), \psi_y = (\psi_{y,1}, \psi_{y,2}, ..., \psi_{y,m}), \psi_\nu = (\psi_{\nu,1}, \psi_{\nu,2}, ..., \psi_{\nu,m}), \phi_x = (\phi_{x,1}, \phi_{x,2}, ..., \phi_{x,m}), \phi_w = (\phi_{w,1}, \phi_{w,2}, ..., \phi_{w,m}), \phi_y = (\phi_{y,1}, \phi_{y,2}, ..., \phi_{y,m}), \phi_\nu = (\phi_{\nu,1}, \phi_{\nu,2}, ..., \phi_{\nu,m}), b_x = (b_{x,1}, b_{x,2}, ..., b_{x,m}), b_w = (b_{w,1}, b_{w,2}, ..., b_{w,m}), b_y = (b_{y,1}, b_{y,2}, ..., b_{y,m}), b_\nu = (b_{\nu,1}, b_{\nu,2}, ..., b_{\nu,m}).\]

Using the log-sigmoid activation function \( \frac{1}{1 + \exp(-t)} \). The updated form of the network (2) becomes as:

\[
\begin{bmatrix}
\dot{x}(t), & \dot{w}(t), & \dot{\nu}(t)
\end{bmatrix} = \begin{bmatrix}
\sum_{i=1}^{m} \frac{\psi_{x,i} e^{-\left(\phi_{x,i} t + b_{x,i}\right)}}{1 + e^{-\left(\phi_{x,i} t + b_{x,i}\right)}}, & \sum_{i=1}^{m} \frac{\psi_{w,i} e^{-\left(\phi_{w,i} t + b_{w,i}\right)}}{1 + e^{-\left(\phi_{w,i} t + b_{w,i}\right)}}, & \sum_{i=1}^{m} \frac{\psi_{\nu,i} e^{-\left(\phi_{\nu,i} t + b_{\nu,i}\right)}}{1 + e^{-\left(\phi_{\nu,i} t + b_{\nu,i}\right)}}
\end{bmatrix},
\]

\[
\begin{bmatrix}
\dot{x}^{(n)}(t), & \dot{w}^{(n)}(t), & \dot{\nu}^{(n)}(t)
\end{bmatrix} = \begin{bmatrix}
\sum_{i=1}^{m} \psi_{x,i} \phi_{x,i} e^{-\left(\phi_{x,i} t + b_{x,i}\right)}, & \sum_{i=1}^{m} \psi_{w,i} \phi_{w,i} e^{-\left(\phi_{w,i} t + b_{w,i}\right)}, & \sum_{i=1}^{m} \psi_{\nu,i} \phi_{\nu,i} e^{-\left(\phi_{\nu,i} t + b_{\nu,i}\right)}
\end{bmatrix},
\]

(3)

Using the model (3), the fitness/error function is written as:

\[\xi = \xi_1 + \xi_2 + \xi_3 + \xi_4 + \xi_5\]

(4)
\[ \xi_1 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{dx_m}{dt} - \mu + dx_m + \alpha x_m \nu_m \right)^2, \]

\[ \xi_2 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{dw_m}{dt} + (q - 1) \alpha x_m \nu_m + \epsilon w_m + \lambda w_m \right)^2, \]

\[ \xi_3 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{dy_m}{dt} - \lambda w_m + ay_m - q \alpha x_m \nu_m \right)^2, \]

\[ \xi_4 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{dv_m}{dt} + w_m - k y_m \right)^2, \]

\[ \xi_5 = \frac{1}{3} \left( (\hat{x}_0 - S_1)^2 + (\hat{w}_0 - S_2)^2 + (\hat{y}_0 - S_3)^2 + (\hat{\nu}_0 - S_4)^2 \right), \]

for \( N = \frac{1}{h} \), \( \hat{x}_m = \hat{x}(t_m) \), \( \hat{w}_m = \hat{w}(t_m) \), \( \hat{y}_m = \hat{y}(t_m) \), \( \hat{\nu}_m = \hat{\nu}(t_m) \), \( t_m = mh \), \( \hat{x}_m, \hat{w}_m, \hat{y}_m \) and \( \hat{\nu}_m \) are representing the approximate solution for susceptible, \( x \), infected \( w \), recovered \( y \), and latently infected \( \nu \) CD4+T virus cells respectively. Accordingly, \( \xi_1, \xi_2, \xi_3 \) and \( \xi_4 \) are the fitness functions associated with differential equations of the model (1) for susceptible, \( x \), infected \( w \), recovered \( y \), and latently infected \( \nu \) CD4+T virus cells respectively. while, \( \xi_5 \) is the error function related to the initial condition of model (1). The proposed approximate solution can be attained from the available weights for which the fitness function in equation (4) approaches to zero, i.e., \( \xi \to 0 \). Then the approximate solutions \([\hat{x}(t_m), \hat{w}(t_m), \hat{y}(t_m), \hat{\nu}(t_m)]\) become identical with exact/desire results, i.e., \([\hat{x}(t_m) \to x(t)], [\hat{w}(t_m) \to w(t)], [\hat{y}(t_m) \to y(t)] \) and \([\hat{\nu}(t_m) \to \nu(t)]\).

2.2. **Optimization procedure: PSO-IPA.** For optimization of ANNs, hybrid-computing framework based on PSO-IPA is used. The PSO is a kind of effective global search heuristics method for optimization, suggested by Eberhart and Kennedy [44] and exploited by the research community as a replacement of genetic algorithms (GAs). The PSO is used as an optimization procedure because of easy implementation and short memory requirements [13]-[58]. Few recent potential applications addressed by PSO include fuel ignition model [40], solar photovoltaic system [22] and clustering high-dimensional data [14]. Therefore, PSO based algorithm should be testing for analysis of still nonlinear systems represented with differential equations [11]-[18].

In the theory of search space, every single candidate solution is denoted as a particle, and set of particles formulate a swarm. The position and velocity in the swarm are denoted by \( P_{LB}^{a-1} \) and \( P_{GB}^{a-1} \), respectively. The optimization model of PSO in standard mathematical notation is presented as follows:

\[ X_j^\alpha = X_j^{\alpha - 1} + V_j^{\alpha - 1}, \]

\[ V_j^\alpha = \omega V_j^{\alpha - 1} + a_1 r_1 (P_{LB}^{\alpha - 1} - X_j^{\alpha - 1}) + a_2 r_2 (P_{GB}^{\alpha - 1} - X_j^{\alpha - 1}), \]

where the vector \( X_j \) and \( V_j \) represents the \( j^{th} \) particle of the swarm and associated velocity vector, respectively. The random vectors are \( r_1 \) and \( r_2 \), \( \omega \) is the inertia weight of previous velocity, whereas, \( a_1 \) and \( a_2 \) are the local and global acceleration factors, respectively. The superscript \( \alpha \) is the flight index. The performance
of global search with PSO is further enhanced with the help of Interior-point algorithm, i.e., an efficient, rapid and fast local search optimization algorithm. Few IPA equally effective for both constrained and unconstrained optimization tasks. Recently, IPA is exploited in many fields e.g., active noise control problems [39], simulation of aircraft parts riveting [47], simulation of viscoplastic fluid flows [9], reliable treatment of economic load dispatch problem [38], for non-smooth contact dynamics [23] and non-smooth contact dynamics. In the proposed study, a hybrid computing tool PSO-IPA is exploited to tune the decision variables of ANN representing the model (1). The pseudocode of PSO-IPA is presented in Figure 2.
3. **Performance indices.** The performance measures for the HIV model (1) based on mean absolute deviation (MAD), root mean square error (RMSE) and Theil’s inequality coefficient (TIC). The mathematical form of MAD, RMSE and TIC is given as:

\[
MAD_x, MAD_w, MAD_y, MAD_\nu = \left[ \frac{1}{m} \sum_{i=1}^{m} |x_i - \hat{x}_i|, \frac{1}{m} \sum_{i=1}^{m} |w_i - \hat{w}_i|, \frac{1}{m} \sum_{i=1}^{m} |y_i - \hat{y}_i|, \frac{1}{m} \sum_{i=1}^{m} |\nu_i - \hat{\nu}_i| \right],
\]

\[
RMSE_x, RMSE_w, RMSE_y, RMSE_\nu = \left[ \sqrt{\frac{1}{m} \sum_{i=1}^{m} (x_i - \hat{x}_i)^2}, \sqrt{\frac{1}{m} \sum_{i=1}^{m} (w_i - \hat{w}_i)^2}, \sqrt{\frac{1}{m} \sum_{i=1}^{m} (y_i - \hat{y}_i)^2}, \sqrt{\frac{1}{m} \sum_{i=1}^{m} (\nu_i - \hat{\nu}_i)^2} \right],
\]

\[
TIC_x, TIC_w, TIC_y, TIC_\nu = \left[ \sqrt{\frac{1}{m} \sum_{i=1}^{m} (x_i - \hat{x}_i)^2 \left( \sqrt{\frac{1}{m} \sum_{i=1}^{m} x_i^2 + \frac{1}{m} \sum_{i=1}^{m} \hat{x}_i^2} \right)^{-1}}, \sqrt{\frac{1}{m} \sum_{i=1}^{m} (w_i - \hat{w}_i)^2 \left( \sqrt{\frac{1}{m} \sum_{i=1}^{m} w_i^2 + \frac{1}{m} \sum_{i=1}^{m} \hat{w}_i^2} \right)^{-1}}, \sqrt{\frac{1}{m} \sum_{i=1}^{m} (y_i - \hat{y}_i)^2 \left( \sqrt{\frac{1}{m} \sum_{i=1}^{m} y_i^2 + \frac{1}{m} \sum_{i=1}^{m} \hat{y}_i^2} \right)^{-1}}, \sqrt{\frac{1}{m} \sum_{i=1}^{m} (\nu_i - \hat{\nu}_i)^2 \left( \sqrt{\frac{1}{m} \sum_{i=1}^{m} \nu_i^2 + \frac{1}{m} \sum_{i=1}^{m} \hat{\nu}_i^2} \right)^{-1}} \right],
\]

4. **Results and discussion.** The detailed result and discussion of the model (1) is presented in this section by taking five number of neurons. The comparative study with the Adam’s numerical results is also presented to show the exactness and correctness of the proposed scheme. Moreover, statistical results are performed to check the precision and accuracy of the present technique.

4.1. **HIV infection model involving latently infected cells.** The updated form of the model (1) by taking the values reported in the literature for HIV infection [8] as listed in Table 1

The using the parameters as defined in Table 1, the model (1) is written in updated form as follows:

\[
\begin{align*}
\frac{dx}{dt} &= 0.4 - 0.01x - 0.04x \nu, \quad x(0) = 7 \\
\frac{dw}{dt} &= 0.008x \nu - 0.4w, \quad w(0) = 2 \\
\frac{dy}{dt} &= 0.3w - 0.2y + 0.032x \nu, \quad y(0) = 1 \\
\frac{d\nu}{dt} &= -0.03\nu + 0.6y, \quad \nu(0) = 4 
\end{align*}
\]

The error/fitness function of the model (5) is written as:

\[
\xi^* = \xi_1^* + \xi_2^* + \xi_3^* + \xi_4^* + \xi_5^*
\]

where
Start of PSO

Inputs:
The chromosome with same number of entries of the network
\[ W = [W_1, W_2, ..., W_m, (W_{x1}, W_{x2}, ..., W_{xN}), (W_{y1}, W_{y2}, ..., W_{yN}), (W_{v1}, W_{v2}, ..., W_{vN})] \]

\[ \phi_1 = [\phi_{x1}, \phi_{x2}, ..., \phi_{xN}], \phi_2 = [\phi_{y1}, \phi_{y2}, ..., \phi_{yN}], \phi_3 = [\phi_{v1}, \phi_{v2}, ..., \phi_{vN}] \]

\[ b_1 = [b_{x1}, b_{x2}, ..., b_{xN}], b_2 = [b_{y1}, b_{y2}, ..., b_{yN}], b_3 = [b_{v1}, b_{v2}, ..., b_{vN}] \]

Population: The set of chromosomes is

\[ P = [W_1, W_2, ..., W_m, (W_{x1}, W_{x2}, ..., W_{xN}), (W_{y1}, W_{y2}, ..., W_{yN}), (W_{v1}, W_{v2}, ..., W_{vN})] \]

Output: Global best values of PSO is denoted as \( W_{B:PSO} \)

Initialization

Produce \( W \) of real numbers to signify a chromosome to make an initial \( P \). Set the practice of Generation and declarations values of "PSO" and "gaoptimset" measures

Calculations of Fitness

To calculate the fitness \( \zeta \) using Eq. (4)

Ranking

Each \( W \) of \( P \) ranked through brilliance of the fitness rate.

Stopping criteria

Stop the optimization procedure for any of the following
- Level of fitness achieved
- Number of preferred flights/cycles performed

Renewal

Call the position using equations (10) and velocity using equation (11).

Improvement

Repeat the algorithm until the whole number of flights achieved

Storage

Store the best fitness values and signify it the global best particle.

End of PSO algorithms

PSO-IPA Procedure Start

Inputs \( W_{B:GA} \)

Output The best vector of PSO:IPA is \( W_{PSO:IPA} \)

Initialize

Use \( W_{B:GA} \) as a start point
Decelerations and bounded based on "optimset" and "fmincon" routines,
Table 1. List of parameter and setting used for reported study of HIV infection model.

| Index | Description                              | Settings [8] |
|-------|------------------------------------------|--------------|
| $S_1$ | Initial value of uninfected CD4+T cells  | 7            |
| $S_2$ | Initial value of infected CD4+T cells    | 2            |
| $S_3$ | Initial value of Virus free cells        | 1            |
| $S_4$ | Initial value of latently infected cells | 4            |
| $\mu$ | Rate of uninfected CD4+T cells           | 0.4          |
| $\lambda$ | Recovery Rate of infected cells          | 0.3          |
| $d$   | Death rate of uninfected CD4+T cells     | 0.01         |
| $\alpha$ | Rate of infection spread                 | 0.04         |
| $q$   | Rate of removal of recombinants          | 0.1          |
| $a$   | Death rate of virus free cells           | 0.2          |
| $u$   | Death rate of latently infected cells    | 0.03         |

$$
\xi_1 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{dx_m}{dt} - 0.4 + 0.01x_m + 0.04x_m \nu_m \right)^2, \\
\xi_2 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{dw_m}{dt} + 0.008x_m \nu_m + 0.4\nu_m \right)^2, \\
\xi_3 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{dy_m}{dt} - 0.3w_m + 0.2y_m - 0.032x_m \nu_m \right)^2, \\
\xi_4 = \frac{1}{N} \sum_{m=1}^{N} \left( \frac{d\nu_m}{dt} + \nu_m - 0.6y_m \right)^2, \\
\xi_5 = \frac{1}{4} ( (\hat{x}_0 - 7)^2 + (\hat{w}_0 - 2)^2 + (\hat{y}_0 - 1)^2 + (\hat{\nu}_0 - 1)^2 ).
$$

Optimization of all variants of the model (1) is supported by the combination of PSO-IPA for hundred numbers of runs to achieve the network parameters. The weights set is provided to obtain the approximate solution for the model (1). The mathematical form of the approximate solution becomes as:

$$
\hat{x}(t) = \frac{0.1615}{1 + e^{-(-4.5041t-2.7123)}} + \frac{1.4934}{1 + e^{-(-1.3373t-0.5227)}} + \frac{6.8018}{1 + e^{-(-3.0218t-6.9131)}} + \\
\frac{-0.3605}{1 + e^{-(-0.2689t-1.1503)}} + \frac{-2.6949}{1 + e^{-(-1.1514t-2.1777)}},
$$

$$
\hat{w}(t) = \frac{1.1743}{1 + e^{-(-0.4197t-0.9589)}} + \frac{2.3207}{1 + e^{-(-0.8906t-2.1978)}} + \frac{0.6713}{1 + e^{-(-1.7834t-8.4626)}} + \\
\frac{5.8251}{1 + e^{-(-0.0674t-1.0848)}} + \frac{-3.9497}{1 + e^{-(-0.4770t+1.0307)}},
$$

$$
\hat{y}(t) = \frac{6.1731}{1 + e^{-(-0.4578t-3.9406)}} + \frac{4.0619}{1 + e^{-(-1.3612t+1.8178)}} + \frac{0.1770}{1 + e^{-(-0.5817t-0.6665)}},
$$
SOLVING A CLASS OF BIOLOGICAL HIV INFECTION MODEL...

Figure 3. Trained weights or decision variables of ANN on the basis of best fitness achieved

\[
\hat{\nu}(t) = \frac{-3.5977}{1 + e^{-(0.9777t-2.1071)}} + \frac{-0.1097}{1 + e^{-(0.9777t-2.1071)}} + \frac{1.5157}{1 + e^{-(1.059t-5.8109)}} + \frac{-0.3853}{1 + e^{-(2.7099t+1.5490)}} + \frac{6.7429}{1 + e^{-(0.0742t-0.1897)}} + \frac{5.6749}{1 + e^{-(3.2119t-4.3057)}} + \frac{0.5811}{1 + e^{-(3.2119t-4.3057)}},
\]

The graphic illustration using GA-IPA for all the parameters of example 1 is narrated in Figures 3-8 in case of 5 neurons in ANN models. The set of weights for the parameters \(x(t)\), \(w(t)\), \(y(t)\) and \(\nu(t)\) using the best fitness values for 5 number of neuron is shown in Fig 3. The outcomes of proposed method ANN-PSO-IPA are presented in Fig. 4. The absolute error (AE) is calculated for the parameters \(x(t)\) and \(w(t)\) in the first half of Fig. 5, while the AE for \(y(t)\) and \(\nu(t)\) is calculated in the second half of Fig. 5. The presented results are compared with the Adams method based numerical results. It is clear in Fig. 5(a), that the AE for \(x(t)\) and \(w(t)\) lie in the ranges of \(10^{-06}\) to \(10^{-07}\), while the AE for \(y(t)\) and \(\nu(t)\) lie around \(10^{-05}\) to \(10^{-07}\). In these figures, the comparison with standard numerical results using 5 number of neurons in ANN models are provided. The first portion of the Fig. 5 shows the comparison for \(x(t)\) and \(w(t)\), while the second portion related the values of \(y(t)\) and \(\nu(t)\). The overlapping of the present results with the Adams numerical results show the correctness and exactness of the present scheme. The performance measures along with the histograms of the statistical operators MAD, RMSE and TIC are narrated in Figs. 6 to 8. One may infer from results presented in these graphical illustration 80% or more of independent runs achieved
Figure 4. Results for HIV infection spread model

the reasonable precise level of the statistical indices of MAD and RMSE. However, the level increasing up to 90% in case of TIC metric.

5. Conclusions. Concluding remarks of the presented scheme ANN-PSO-IPA are briefly listed as follows:

- A novel numerical computing method is presented for solving nonlinear biological HIV infection model of latently infected cells using artificial neural
Figure 5. Comparative study on AE of the presented solutions using 5 neurons with the Adams results

- The accuracy of presented scheme is verified by obtaining the overlapping outcomes with the Adams results having accuracy level up to 4–6 decimal places which proves the exactness for the designed scheme.
- The magnitudes of median and semi interquartile range calculated for 100 self-directed executions for a biological nonlinear HIV model that indicate the trustworthiness, steady and accurateness of the algorithm.

(a): Results on AE for 5 number of neurons in case of $x(t)$ and $w(t)$

(b): Results on AE for 5 number of neurons in case of $y(t)$ and $v(t)$
• Numerical values listed in the Figs. 9-10 and graphical results presented in the Figures 3-8 for different performance indices of MAD, RMSE and TIC authenticate the correctness, stability and reliability of the presented scheme.

In future one may exploited the proposed ANN-PSO-IPA as an alternate solver for the solution of potential nonlinear systems [52]-[57].
Figure 7. Analysis on RMSE for convergence along with the histograms for 5 neurons.

Acknowledgments. This paper has been partially supported by Ministerio de Ciencia, Innovacion y Universidades grant number PGC2018-0971-B-100 and Fundacion Seneca de la Region de Murcia grant number 20783/PI/18.

The authors declare that they have no conflict of interest.
