Abstract

The general form of the Bethe-Salpeter wave functions for the bound states composed of two vector fields of arbitrary spin and definite parity is corrected. Using the revised general formalism, we investigate the observed $Y(3940)$ state which is considered as a molecule state consisting of $D^{*0}\bar{D}^{*0}$. Though the attractive potential between $D^{*0}$ and $\bar{D}^{*0}$ including one light meson ($\sigma$, $\pi$, $\omega$, $\rho$) exchange is considered, we find that in our approach the contribution from one-$\pi$ exchange is equal to zero and consider SU(3) symmetry breaking. The obtained mass of $Y(3940)$ is consistent with the experimental value.

PACS numbers: 12.40.Yx, 14.40.Rt, 12.39.Ki
I. INTRODUCTION

The exotic state $Y(3940)$ was discovered by the Belle collaboration [1] and then confirmed by the BABAR collaboration [2]. The investigation of the structure of $Y$ is of great significance, while the conventional $c\bar{c}$ charmonium interpretation for this state is disfavored [3]. Then possible alternative interpretations have been proposed, such as hadronic molecule and tetraquark states. Following the experimental results, it is suggested in Ref. [4] that the $Y(3940)$ is a hadronic molecule state of $D^{*0}\bar{D}^{*0}$. However, in previous work [4], the numerical result of the binding energy for the molecule state sensitively depends on the value of typical cutoff in the effective interaction potential between two heavy vector mesons, and this two heavy mesons are considered as pointlike objects. Furthermore, the spin-parity quantum numbers $J^P$ of the $Y(3940)$ are not unambiguously determined in experiment, except for $C = +$. The molecule state hypothesis implies that the quantum numbers of $Y(3940)$ are $0^+$ or $2^+$, but Ref. [4] can not deduce the definite quantum numbers in theory.

Though the general form of the Bethe-Salpeter (BS) wave functions for the bound states consisting of two vector fields of arbitrary spin and definite parity has been given in Ref. [5], we find that the derivation of this formalism has a serious defect. In this work, the general formalism is firstly corrected. Then we assume that the $Y(3940)$ state is a molecule state composed of two heavy vector mesons $D^{*0}\bar{D}^{*0}$ and the revised general formalism is applied to investigate this two-body system. To construct the interaction kernel between two heavy mesons derived from one light meson ($\sigma$, $\pi$, $\omega$, $\rho$) exchange, we consider that the heavy meson is not a point-like particle but a bound state composed of $u$-quark and $c$-quark and then investigate the light meson interaction with the $u$-quark in the heavy meson. Through the form factor we can obtain the light meson interaction with heavy meson and the potential between two heavy mesons without an extra parameter. [6, 7] Obviously, this potential in our approach contains more inspirations of quantum chromodynamics (QCD). Finally, numerically solving the relativistic Schrödinger-like equation with this potential, we can obtain the mass of the molecule state and then deduce the definite quantum numbers of the $Y(3940)$ system.

In this work, one-$\pi$ exchange is considered in the interaction kernel between two heavy mesons. When investigating this pseudoscalar meson interaction with the $u$-quark in the heavy meson, we find that the coupling $\mathcal{L}_I = ig_\pi \bar{u}\gamma_5 u\pi$ should have no contribution to this
interaction and represent it as the derivative coupling Lagrangian $\mathcal{L}_I = if_{\pi} \bar{u} \gamma_\mu \gamma_5 u \partial_\mu \pi$. In this approach we find that one-$\pi$ exchange has no contribution to the potential between two heavy vector mesons. Besides, it should be noted that the flavor-SU(3) singlet and octet states of vector mesons mix to form the physical $\omega$ and $\phi$ mesons, so the exchange-mesons between two heavy mesons should not be the physical mesons but rather the singlet and octet states. Then in the interaction kernel between two heavy mesons SU(3) symmetry breaking should be considered.

This paper has the structure as follows. In Sec. II the revised general form of BS wave functions for the bound states composed of two vector fields with arbitrary spin and definite parity is given. In Sec. III we show the BS wave functions for the molecule states of $D^{*0} \bar{D}^{*0}$ with $J^P = 0^+$ and $2^+$. After constructing the interaction kernel between two heavy vector mesons, we obtain the Schrödinger type equations in instantaneous approximation. In Sec. IV we show how to calculate the form factors of the heavy meson $D^*$. Then the interaction potential and the mass of $Y$ are calculated. Our conclusion is presented in Section V.

II. REVISED GENERAL FORM OF THE BS WAVE FUNCTIONS

If a bound state of spin $j$ and parity $\eta_{P'}$ is composed of two vector fields with masses $M_1$ and $M_2$, respectively, its BS wave function is a $4 \times 4$ matrix

$$\chi^j_{P'\lambda\tau}(x'_1, x'_2) = \langle 0| T A_\lambda(x'_1) A_\tau(x'_2)| P', j\rangle,$$

which can be written as

$$\chi^j_{P'\lambda\tau}(x'_1, x'_2) = e^{iP' \cdot X'} \chi^j_{P'\lambda\tau}(x'),$$

where $X' = \eta_1 x'_1 + \eta_2 x'_2$, $x' = x'_1 - x'_2$ and $\eta_{1,2}$ are two positive quantities such that $\eta_{1,2} = M_{1,2}/(M_1 + M_2)$. Then one has the BS wave function in the momentum representation

$$\chi^j_{\lambda\tau}(P', p') = \int d^4 x' e^{-ip' \cdot x'} \chi^j_{P'\lambda\tau}(x'),$$

where $P'$ is the momentum of the bound state, $p'$ is the relative momentum of two vector fields and we have $P' = p'_1 + p'_2$, $P' = \eta_2 p'_1 - \eta_1 p'_2$, $p'_1$ and $p'_2$ are the momenta of two vector fields, respectively. This can be shown as Fig. [1].

The polarization tensor $\eta_{\mu_1 \mu_2 \cdots \mu_j}$ describing the spin of the bound state can be separated

$$\chi^j_{\lambda\tau}(P', p') = \eta_{\mu_1 \mu_2 \cdots \mu_j} \chi_{\mu_1 \mu_2 \cdots \mu_j \lambda\tau}(P', p').$$
and the polarization tensor is totally symmetric, transverse and traceless:

\[ \eta_{\mu_1 \mu_2 \cdots} = \eta_{\mu_2 \mu_1 \cdots}, \quad P'_{\mu_1} \eta_{\mu_1 \mu_2 \cdots} = 0, \quad \eta^{\mu_1}_{\mu_1 \mu_2 \cdots} = 0. \]  

(5)

Because of Eq. (5), \( \chi_{\mu_1 \cdots \mu_j \lambda \tau} \) is totally symmetric with respect to indices \( \mu_1, \cdots, \mu_j \). It is necessary to note that the polarization tensor \( \eta_{\mu_1 \mu_2 \cdots \mu_j} \) of the vector-vector bound state should contain all contributions from the spins of two vector fields and then \( \chi_{\mu_1 \cdots \mu_j \lambda \tau} \) should be independent of the polarization vectors of two vector fields. Therefore, from the BS wave function (1) and Lorentz covariance, we have

\[ \chi_{\mu_1 \cdots \mu_j \lambda \tau} = p'_{\mu_1} \cdots p'_{\mu_j} [g_{\lambda \tau} f_1 + (P'_{\lambda} p'_{\tau} + P'_{\tau} p'_{\lambda}) f_2 + (P'_{\lambda} p'_{\tau} - P'_{\tau} p'_{\lambda}) f_3 + P'_{\lambda} P'_{\tau} f_4 + p'_{\lambda} p'_{\tau} f_5] \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \lambda p'_\tau + (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \tau p'_{\lambda} f_6 \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \lambda p'_\tau - (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \tau p'_{\lambda} f_7 \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \lambda p'_\tau + (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \tau p'_{\lambda} f_8 \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \lambda P'_{\tau} - (p'_{\mu_2} \cdots p'_{\mu_j} g_{\mu_1}) \tau P'_{\lambda} f_9 \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \lambda \xi \zeta P'_{\zeta} P'_{\tau} f_{10} + p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \xi \zeta P'_{\zeta} f_{11} + p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \xi \zeta P'_{\zeta} f_{12} \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \lambda \xi \zeta P'_{\zeta} P'_{\tau} + (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \tau \xi \zeta P'_{\zeta} P'_{\lambda} f_{13} \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \lambda \xi \zeta P'_{\zeta} P'_{\tau} - (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \tau \xi \zeta P'_{\zeta} P'_{\lambda} f_{14} \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \lambda \xi \zeta P'_{\zeta} P'_{\tau} + (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \tau \xi \zeta P'_{\zeta} P'_{\lambda} f_{15} \\
+ (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \lambda \xi \zeta P'_{\zeta} P'_{\tau} - (p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}) \tau \xi \zeta P'_{\zeta} P'_{\lambda} f_{16}, \]  

(6)

where \( \{\mu_1, \cdots, \mu_j\} \) represents symmetrization of the indices \( \mu_1, \cdots, \mu_j \). There are only 16 scalar functions \( f_i(P' \cdot p', p'^2)(i = 1, \cdots, 16) \) in Eq. (6). From the massive vector field commutators for arbitrary times \( x'_{10} \) and \( x'_{20} \)

\[ [A_\lambda(x'_1), A_\tau(x'_2)] = 0 \quad \text{for} \quad M_1 \neq M_2, \]

\[ [A_\lambda(x'_1), A_\tau(x'_2)] = i(\delta_\lambda \tau - \frac{\partial_\lambda \partial_\tau}{M_1^2}) \Delta'(x'_1 - x'_2) \quad \text{for} \quad M_1 = M_2, \]

where the right side of second equation is a c-number function, one can have

\[ \langle 0 | T A_\lambda(x'_{1}) A_\tau(x'_{2}) | P', j \rangle = \langle 0 | T A_\tau(x'_{2}) A_\lambda(x'_{1}) | P', j \rangle. \]

(7)

So we obtain that in momentum representation the BS wave function of two same or different vector fields is invariant under the substitutions \( p'_{1} \rightarrow p'_{2} \) and \( p'_{2} \rightarrow p'_{1} \), i.e.,

\[ \chi_{\lambda \tau}(P', p') = \chi_{\tau \lambda}(P', -p'). \]

(8)
This invariance is similar to crossing symmetry which implies that the scalar functions in Eq. (6) have the following properties: for $j = 2n, \ n = 0, 1, 2, 3 \cdots$, 

\[
 f_i(P' \cdot p', p'^2) = + f_i(-P' \cdot p', p^2) \quad i = 1, 3, 4, 5, 6, 9, 10, 12, 14, 15, \\
 f_i(P' \cdot p', p'^2) = - f_i(-P' \cdot p', p^2) \quad i = 2, 7, 8, 11, 13, 16, 
\]

and, for $j = 2n + 1, \ n = 0, 1, 2, 3 \cdots$, 

\[
 f_i(P' \cdot p', p'^2) = + f_i(-P' \cdot p', p^2) \quad i = 2, 7, 8, 11, 13, 16, \\
 f_i(P' \cdot p', p'^2) = - f_i(-P' \cdot p', p^2) \quad i = 1, 3, 4, 5, 6, 9, 10, 12, 14, 15. \quad (9)
\]

Then we will reduce the general form without any assumption and approximation.

Using the subsidiary condition $\partial_\mu A_\mu (x) = 0$ for the massive vector field and the equal-time commutation relation, we get 

\[
 \partial_{1\lambda} T A_\lambda (x'_1) A_\tau (x'_2) = \partial_{2\tau} T A_\lambda (x'_1) A_\tau (x'_2) = 0. 
\]

The proof has been given by Ref. [5]. The BS wave function in Eq. (1) has this relation 

\[
 \partial_{1\lambda} \langle 0 | T A_\lambda (x'_1) A_\tau (x'_2) | P', j \rangle = \partial_{2\tau} \langle 0 | T A_\lambda (x'_1) A_\tau (x'_2) | P', j \rangle = 0, \quad (10)
\]

and in momentum representation 

\[
 p'^{\lambda\lambda'} (P', p') = p'^{\tau\tau'} (P', p') = 0. \quad (11)
\]

To satisfy Eqs. (8) and (11), the BS wave function of the bound state becomes 

\[
 \chi^{\lambda=0}_{\lambda\tau} (P', p') = \frac{(p'_1 \cdot p'_2) g_{\lambda\tau} - p'_2 P'_{1\tau}}{(p'_1 \cdot p'_2) g_{\lambda\tau} + (p'_1 \cdot p'_2) p'^{\lambda}\lambda'} + \left[ (p'_1 \cdot p'_2) g_{\lambda\tau} - p'_2 P'_{1\tau}\right] \phi_1 + \sum_{j} \left[ \frac{1}{j!} p'_1 \cdots p'_j \epsilon_{\lambda\tau} \phi_3 + (p'_1 \cdot p'_2) g_{\lambda\tau} - p'_2 P'_{1\tau} \right] \phi_2 + \epsilon_{\lambda\tau} p'_\xi P'_\xi \psi_1. \quad (12)
\]

\[
 \chi^{\lambda\neq0}_{\lambda\tau} (P', p') = 
\]

\[
 \eta_{\mu_1 \cdots \mu_j} \left\{ \left[(p'_1 \cdot p'_2) g_{\lambda\tau} - p'_2 P'_{1\tau}\right] \phi_1 + [p'_1 \epsilon_2 P' P'_{1\tau} - p'_2 P'_{1\tau}\phi_2 + \frac{1}{j!} \epsilon_{\lambda\tau} \psi_1 \left[ (p'_1 \cdot p'_2) g_{\lambda\tau} - p'_2 P'_{1\tau}\right] \phi_3 + \frac{1}{j!} \epsilon_{\lambda\tau} \psi_1 \left[ (p'_1 \cdot p'_2) g_{\lambda\tau} - p'_2 P'_{1\tau}\right] \phi_4 + \epsilon_{\lambda\tau} p'_\xi P'_\xi \psi_1 \right\}.
\]

(13)
\[+ \{(p'_2 \cdot p' - p'_1 \cdot p')p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi + [\eta_2(p'_1 \cdot p') + \eta_1(p'_2 \cdot p')]p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi
\]
\[+ p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \xi P'_\xi \psi P'_\lambda + p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\tau \xi P'_\xi \psi'_3
\]
\[+ \{(p'_1 \cdot p')[(p'_1 \cdot p')p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi + [\eta_1(p'_1 \cdot p') + \eta_2(p'_2 \cdot p')]p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi
\]
\[+ p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \xi P'_\xi \psi P'_\lambda + p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\tau \xi P'_\xi \psi'_3
\]
\[+ \{(p'_2 \cdot P') - (p'_1 \cdot P')p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi + \eta_2(p'_1 \cdot P') + \eta_1(p'_2 \cdot P')p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi
\]
\[+ p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \xi P'_\xi \psi P'_\lambda + p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\tau \xi P'_\xi \psi'_3
\]
\[+ \{(p'_1 \cdot P') + (p'_2 \cdot P')p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi + \eta_2(p'_1 \cdot P') - \eta_2(p'_2 \cdot P')p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \tau \xi P'_\xi
\]
\[+ p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\lambda \xi P'_\xi \psi P'_\lambda - p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1}\tau \xi P'_\xi \psi'_3 \},
\]
where \(\phi_i\) and \(\psi_i\) are the linear combinations of \(f_i(i = 1, \cdots, 16)\) in Eq. (13), respectively. This derivation makes use of the fact that \(P', p'\) and \(\eta_{\mu_1} \cdots \mu_j\) are linearly independent.

Now, under space reflection
\[x'_i \rightarrow x''_i = -x'_i, \quad x''_0 = x'_0,
\]
one has
\[PA_\lambda(x')P^{-1} = P_{\lambda \xi}A_\xi(x''), \quad P_{\lambda \xi} = \begin{pmatrix}
-1 & 0 & 0 & 0 \\
0 & -1 & 0 & 0 \\
0 & 0 & -1 & 0 \\
0 & 0 & 0 & 1
\end{pmatrix},
\]
and
\[P|0\rangle = |0\rangle, \quad P|P', j\rangle = \eta_{P'}|P'', j\rangle, \quad (14)
\]
with \(x'' = (-x', x'_0)\) and \(P'' = (-P', P'_0)\).

We obtain the properties of the BS wave function under space reflection from Eqs. (11) and (14):
\[\chi^j_{P'\lambda\tau}(x'_1, x'_2) = \eta_{P'} \mathcal{P}_{\lambda \xi} \mathcal{P}_{\tau \xi} \chi^j_{P''\xi\xi}(x''_1, x''_2) \quad (15)
\]
and in the momentum representation
\[\chi^j_{\lambda\tau}(P', p') = \eta_{P'} \mathcal{P}_{\lambda \xi} \mathcal{P}_{\tau \xi} \chi^j_{P''\xi\xi}(P'', p''). \quad (16)
\]
From Eqs. (4), (6), (12), (13) and (16), it is easy to derive that, for \(\eta_{P'} = (-1)^j\),
\[\chi^{j=0}_{\lambda\tau}(P', p') = [(p'_1 \cdot p'_2)g_{\lambda \tau} - p'_2 p'_{\lambda 1\tau}]\phi_1
\]
\[+ [p'_1 p'_2 g_{\lambda \tau} + (p'_1 \cdot p'_2)p'_{1\lambda} p'_{2\tau} - p'_{1\lambda} p'_{2\tau} - p'_{1\lambda} p'_{2\lambda} p'_{2\tau} + p'_{1\lambda} p'_{2\lambda} p'_{2\tau} + p'_{1\lambda} p'_{2\lambda} p'_{2\tau}]\phi_2. \quad (17)
\]
\[ \chi^{i=0}_{j=0}(P', p') = \eta_{\mu_1\cdots\mu_j} \{ p'_{\mu_1} \cdots p'_{\mu_j} \{ [(p'_1 \cdot p'_2) g_{\lambda \tau} - p'_2 P'_{\lambda \tau}] \phi_1 \\
+ [p'_1 P'_2 g_{\lambda \tau} + (p'_1 \cdot p'_2) p'_1 p'_{2\tau} - p'_1 P'_1 p'_{2\lambda} - p'_2 P'_2 p'_{2\tau}] \phi_2 \\
+ \left\{ \frac{1}{j} p'_{\mu_2} \cdots p'_{\mu_j} \{ p'_1 P'_2 p'_1 p'_{2\lambda} - (p'_1 \cdot p'_2) p'_1 p'_{2\lambda} \} \phi_3 \\
+ \left\{ \frac{1}{j} p'_{\mu_2} \cdots p'_{\mu_j} \{ p'_1 \cdot p'_2 p'_1 p'_{2\lambda} - p'_1 P'_1 p'_{2\lambda} \} \phi_4 \right\} \right\}, \quad (18) \]

and, for \( \eta_{P'} = (-1)^{j+1} \),

\[ \chi^{i=0}_{j=0}(P', p') = \epsilon_{\lambda \tau \xi \zeta} p'_\xi P'_\zeta \psi_1, \quad (19) \]

\[ \chi^{i=0}_{j=0}(P', p') = \eta_{\mu_1\cdots\mu_j} \{ p'_{\mu_1} \cdots p'_{\mu_j} \epsilon_{\lambda \tau \xi \zeta} p'_\xi P'_\zeta \psi_1 \}
+ \left\{ \left[ (p'_2 \cdot p'_{P'}) - (p'_1 \cdot p') ) p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta p'_\xi \psi_1 + [\eta_2 (p'_1 \cdot p') + \eta_1 (p'_2 \cdot p') ] p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta P'_\xi \psi_2 \\
+ \left\{ \left[ (p'_1 \cdot p') + (p'_2 \cdot p') \right] p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta p'_\xi \psi_1 + [\eta_1 (p'_1 \cdot p') - \eta_2 (p'_2 \cdot p') ] p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta P'_\xi \psi_3 \\
+ \left\{ \left[ (p'_2 \cdot P') - (p'_1 \cdot P') \right] p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta p'_\xi \psi_1 + [\eta_2 (p'_1 \cdot P') + \eta_1 (p'_2 \cdot P') ] p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta P'_\xi \psi_4 \\
+ \left\{ \left[ (p'_1 \cdot P') + (p'_2 \cdot P') \right] p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta p'_\xi \psi_1 + [\eta_1 (p'_2 \cdot P') - \eta_2 (p'_1 \cdot P') ] p'_{\mu_2} \cdots p'_{\mu_j} \epsilon_{\mu_1} \lambda \tau \xi \zeta P'_\xi \psi_5 \right\} \right\}. \quad (20) \]

The general form of the BS wave functions for the bound states composed of two massive vector fields of arbitrary spin and definite parity is obtained. No matter how high the spin of the bound state is, its BS wave function should satisfy Eq. (17), (18), (19) or (20). From Eqs. (17) and (18), we conclude that the BS wave function of a bound state composed of two massive vector fields with spin \( j \neq 0 \) and parity \( (-1)^j \) has only four independent components and that of a bound state with \( J^P = 0^+ \) has only two independent components. From Eqs. (19) and (20), we conclude that the BS wave function of a bound state with spin \( j \) and parity \( (-1)^{j+1} \) has only five independent components except for \( j = 0 \) and one for \( j = 0 \). Up to now, all the above analyses are model independent. In the next section we will apply the general formalism to investigate molecule states composed of two vector mesons.
III. THE EXTENDED BETHE-SALPETER EQUATION

Assuming that the $Y(3940)$ is a S-wave molecule state consisting of two heavy vector mesons $D^*o$ and $D^*0$, one can have $J^P = 0^+$ or $2^+$ for this system. From Eqs. (17) and (18), we can obtain the BS wave function describing this bound state, for $J^P = 0^+$,

$$\chi^{0+}_{\lambda\tau}(P', p') = [(p'_1 \cdot p'_2) g_{\lambda\tau} - p'_{2\lambda} p'_{1\tau}] F_1$$

$$+ [p'^2_1 p'^2_2 g_{\lambda\tau} + (p'_1 \cdot p'_2) p'_{1\lambda} p'_{2\tau} - p'^2_2 p'_{1\lambda} p'_{2\tau} - p'^2_1 p'_{2\lambda} p'_{2\tau}] F_2, \quad (21)$$

or, for $J^P = 2^+$,

$$\chi^{2+}_{\lambda\tau}(P', p') = \eta_{\mu_1 \mu_2} \{ p'_{\mu_1} p'_{\mu_2} \left\{ [ (p'_1 \cdot p'_2) g_{\lambda\tau} - p'_{2\lambda} p'_{1\tau}] G_1 ight.$$

$$+ [p'^2_1 p'^2_2 g_{\lambda\tau} + (p'_1 \cdot p'_2) p'_{1\lambda} p'_{2\tau} - p'^2_2 p'_{1\lambda} p'_{2\tau} - p'^2_1 p'_{2\lambda} p'_{2\tau}] G_2 \}$$

$$+ \left\{ \frac{1}{2!} p'_{(\mu_2 g_{\mu_1})\lambda} [ p'^2_1 p'^2_2 p'_{1\tau} - (p'_1 \cdot p'_2) p'_{2\lambda} p'_{2\tau} ] \right\} G_3$$

$$+ \left\{ \frac{1}{2!} p'_{(\mu_2 g_{\mu_1})\tau} [ (p'_1 \cdot p'_2) p'^2_1 p'_{\lambda} - p'^2_2 p'^2_2 p'_{2\lambda} ] \right\} G_4$$

$$+ p'_{\mu_1} p'_{\mu_2} \left\{ (p'_1 \cdot p'_2) p'_{1\lambda} p'_{2\tau} - p'^2_1 p'^2_2 p'_{2\tau} \right\} \} \right\} \right\}. \quad (22)$$

The BS wave function of this bound state satisfies the Bethe-Salpeter equation

$$\chi_{\lambda\tau}(P', p') = \int \frac{id^4q'}{(2\pi)^4} \Delta_{F_{\lambda\alpha}}(p'_1) \chi_{\alpha\theta, \beta\kappa}(p', q'; P') \chi_{\theta\kappa}(P', q') \Delta_{F_{\beta\tau}}(p'_2), \quad (23)$$

where $\chi_{\alpha\theta, \beta\kappa}$ is the interaction kernel, the propagators for the spin 1 fields $\Delta_{F_{\lambda\alpha}}(p'_1) = (\delta_{\lambda\alpha} + \frac{p'_{1\lambda} p'_{1\rho}}{M_1^2 - i\epsilon})$ and $\Delta_{F_{\beta\tau}}(p'_2) = (\delta_{\beta\tau} + \frac{p'_{2\beta} p'_{2\rho}}{M_2^2 - i\epsilon})$ and the bound state momentum is set as $P' = (0, 0, 0, iM)$ in the rest frame. In Ref. [5], we have considered that the effective interaction between two heavy mesons is derived from one light meson ($\sigma, \omega, \rho$) exchange and obtained that the molecule state $D^*o D^*0$ lies above the threshold. In this work, one-$\pi$ exchange is also considered and one-$\omega$ exchange is reconsidered, shown as in Fig. [2]

Now, we construct the kernel between two heavy vector mesons from one-$\pi$ exchange. The charmed meson $D^*$ is composed of a heavy quark $c$ and a light antiquark $\bar{u}$. Owing to the large mass of $c$-quark, the Lagrangian representing the interaction of $\pi$-meson triplet with quarks should be

$$\mathcal{L}_1 = i g_\pi \left( \bar{u} \, \bar{d} \, \bar{c} \right) \gamma_5 \begin{pmatrix} \pi^0 & \sqrt{2}\pi^+ & 0 \\ \sqrt{2}\pi^- & -\pi^0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} u \\ d \\ c \end{pmatrix}, \quad (24)$$
or

\[
\mathcal{L}_I = i f_\pi \left( \bar{u} \ d \ c \right) \gamma_\mu \gamma_5 \left( \begin{array}{ccc}
\partial_\mu \pi^0 & \sqrt{2} \partial_\mu \pi^+ & 0 \\
\sqrt{2} \partial_\mu \pi^- & -\partial_\mu \pi^0 & 0 \\
0 & 0 & 0
\end{array} \right) \left( \begin{array}{c}
u \\
d \\
c
\end{array} \right), 
\]

(25)

where \( g_\pi \) and \( f_\pi \) are the \( \pi \)-meson-quark coupling constants, \( g_\pi = \frac{340}{\sqrt{2}} \). Because the contribution of Fig. 2 is from the term \( i \bar{u} \gamma_5 \pi^0 u \) or \( i \bar{u} \gamma_\mu \gamma_5 \partial_\mu \pi^0 u \), we set \( f_\pi = \frac{g_\pi}{2m_u} \) and \( m_u \) is u-quark mass. Then the effective quark current is \( J^- = i \bar{u} \gamma_5 u \) or \( J_\mu^+ = i \bar{u} \gamma_\mu \gamma_5 u \) and the S-matrix element between two heavy mesons is

\[
V_\pi = g_\pi^2 \langle V(p'_1)|J^-|V(q'_1)\rangle \frac{1}{k^2 + m_\pi^2} \langle V(p'_2)|J^-|V(q'_2)\rangle, 
\]

(26)

or

\[
V_\pi = f_\pi^2 \langle V(p'_1)|J_\mu^+|V(q'_1)\rangle \frac{1}{k^2 + m_\pi^2} \langle V(p'_2)|J_\mu^+|V(q'_2)\rangle, 
\]

(27)

where \( \langle V|J^-|V \rangle \) and \( \langle V|J_\mu^+|V \rangle \) represent the vertices of the pseudoscalar meson interaction with the heavy vector meson, respectively. The matrix elements of these quark currents can be expressed as

\[
\langle V(p'_1)|J^-|V(q'_1)\rangle = \frac{1}{\sqrt{2}E_1(p'_1) \sqrt{2}E_1(q'_1)} h^-(k^2)\epsilon_{abcd}p'_{1a}q'_{1b}\epsilon^*_c(p'_1)\epsilon_d(q'_1), 
\]

(28)

\[
\langle V(p'_2)|J^-|V(q'_2)\rangle = \frac{1}{2\sqrt{2}E_2(p'_2)E_2(q'_2)} \bar{h}^-(k^2)\epsilon_{a'b'c'd'}p'_{2a}q'_{2b}\epsilon^*_{c'}(p'_2)\epsilon_{d'}(q'_2), 
\]

(29)

\[
\langle V(p'_1)|J_\mu^+|V(q'_1)\rangle = \frac{1}{2\sqrt{2}E_1(p'_1)E_1(q'_1)} h^{(\mu)}(k^2)\epsilon_{\mu ab}c\epsilon^*_b(p'_1)c\epsilon_d(q'_1)(p'_1 + q'_1)c, 
\]

(30)

\[
\langle V(p'_2)|J_\mu^+|V(q'_2)\rangle = \frac{1}{2\sqrt{2}E_2(p'_2)E_2(q'_2)} \bar{h}^{(\mu)}(k^2)\epsilon_{\mu a'b'}c\epsilon^*_{b'}(p'_2)c\epsilon_{d'}(q'_2)(p'_2 + q'_2)c, 
\]

(31)

where \( p'_1 = (p', ip'_{10}) \), \( p'_2 = (-p', ip'_{20}) \), \( q'_1 = (q', iq'_{10}) \), \( q'_2 = (-q', iq'_{20}) \), \( k = p'_1 - q'_1 = q'_2 - p'_2 \) is the momentum of the light meson and \( k = p' - q' \); \( h(k^2) \) and \( \bar{h}(k^2) \) are scalar functions, the four-vector \( \epsilon(p) = (\bar{\epsilon} + \frac{1}{2\sqrt{2}E_H(p)} \frac{\bar{h}}{M_H(p)} + \frac{\epsilon}{M_H(p)} \frac{h}{M_H(p)} \) is the polarization vector of heavy vector meson with momentum \( p \), \( E_H(p) = \sqrt{p^2 + M_H^2} \), \( (\epsilon, 0) \) is the polarization vector in the heavy meson rest frame. In our approach, considering that the exchange-meson is off the mass
we consider that the exchange-mesons are not the physical mesons and the exchanged mesons.

\[ \theta \]

where the mixing angle \( \theta \) becomes obtained by KLOE\[10\]. Because of the SU(3) symmetry, we consider that the exchange-mesons are not the physical mesons and the exchanged mesons should be the octet \( V_8 \) and singlet \( V_1 \) states. From Eq. \[33\], we can obtain the relation of the octet-quark coupling constant \( g_8 \) and the singlet-quark coupling constant \( g_1 \)

\[ g_\phi = -g_8 \cos \theta + g_1 \sin \theta, \quad g_\omega = g_8 \sin \theta + g_1 \cos \theta, \quad (34) \]

where \( g_\phi \) and \( g_\omega \) are the corresponding meson-quark coupling constants, \( g_8^2 = 2.42 \) and \( g_1^2 = 13.0 \). Since the SU(3) is broken, the masses of the singlet \( V_1 \) and octet \( V_8 \) states are approximatively identified with the two physical masses of \( \omega \) and \( \phi \) mesons, respectively. The interaction kernel derived from one scalar meson exchange and one vector meson exchange has been given in Ref. \[5\], and the kernel from one light meson \((\pi, \sigma, \rho, V_1, V_8)\) exchange becomes

\[ \begin{aligned}
V_{\alpha\beta,\gamma\delta}(p', q'; P') &= h_1^{(p)}(k^2)\epsilon_{\mu\nu\alpha\beta}(p'_1 + q'_1)c_k\frac{f_\pi^2}{k^2 + m_\pi^2}h_1^{(p)}(k^2)\epsilon_{\mu\nu\beta\gamma}(p'_2 + q'_2)c_k
+ h_1^{(s)}(k^2)\frac{g_\rho^2}{k^2 + m_\rho^2}h_1^{(s)}(k^2)\delta_{\alpha\rho}\delta_{\beta\rho} + \left( \frac{g_\rho^2}{k^2 + m_\rho^2} + \frac{g_\omega^2}{k^2 + m_\omega^2} + \frac{g_8^2}{k^2 + m_8^2} \right)\left\{ h_1^{(s)}(k^2)h_1^{(s)}(k^2) \right\}
\times (p'_1 + q'_1) \cdot (p'_2 + q'_2)\delta_{\alpha\rho}\delta_{\beta\rho} - h_1^{(s)}(k^2)h_2^{(s)}(k^2)\delta_{\alpha\rho}[q_{2\beta}^{(p)}(p'_1 + q'_1)\gamma + (p'_1 + q'_1)\gamma p_{2\gamma}]
- h_2^{(s)}(k^2)h_1^{(s)}(k^2)[q_{1\alpha}(p'_2 + q'_2)\gamma + (p'_2 + q'_2)\gamma p_{1\alpha}]\delta_{\beta\gamma} + h_2^{(s)}(k^2)h_2^{(s)}(k^2)[q_{1\alpha}'q_{2\gamma}\delta_{\beta\gamma}
+ q_{1\alpha}'\delta_{\beta\gamma}p_{2\gamma} + \delta_{\alpha\rho}p_{1\alpha}q_{2\beta} + \delta_{\beta\alpha}p_{1\beta}p_{2\gamma}] \},
\end{aligned} \quad (35) \]
where $k = (k, 0)$.

Firstly, we assume that the $Y(3940)$ is a molecule state with $J^P = 0^+$. Substituting its BS wave function given by Eq. (21) and the kernel (35) into the BS equation (23), we find that the integral of one term on the right-hand side of Eq. (21) has contribution to the one of itself and the other term. Moreover, the cross terms contain the factors of $\frac{1}{M_1^2}$ and $\frac{1}{M_2^2}$, which are small for the masses of the heavy mesons are large. It is difficult to strictly solve the BS equation, in this paper we use a simple approach to solve it as follow. Ignoring the cross terms, one can obtain two individual equations:

$$
F^1_{\lambda \tau}(P' \cdot p', p'^2) = \int \frac{id^4q}{(2\pi)^4} \Delta_{F\lambda \alpha}(p'_1) V_{\alpha \beta \kappa}(p', q'; P') F^1_{\beta \tau}(P' \cdot q', q'^2) \Delta_{F\beta \tau}(p'_2),
$$

(36)

$$
F^2_{\lambda \tau}(P' \cdot p', p'^2) = \int \frac{id^4q}{(2\pi)^4} \Delta_{F\lambda \alpha}(p'_1) V_{\alpha \beta \kappa}(p', q'; P') F^2_{\beta \tau}(P' \cdot q', q'^2) \Delta_{F\beta \tau}(p'_2),
$$

(37)

where $F^1_{\lambda \tau}(P' \cdot p', p'^2) = [(p'_1 \cdot p'_2)g_{\lambda \tau} - p'_2k_1P'_{1\tau}] F_1(P' \cdot p', p'^2)$ and $F^2_{\lambda \tau}(P' \cdot p', p'^2) = [p'_1 p'_2 g_{\lambda \tau} + (p'_1 \cdot p'_2)p'_1 k_1 P'_{1\tau} - p'_2 k_2 P'_{2\tau}] F_2(P' \cdot p', p'^2)$. And solving this equations respectively, one can obtain two series of eigenvalues and eigenfunctions. Because the cross terms are small, we can take the ground state BS wave function to be a linear combination of two eigenstates $F^0_{\lambda \tau}$ and $F^0_{\lambda \tau}$ corresponding to lowest energy in Eqs. (36) and (37). Then in the basis provided by $F^0_{\lambda \tau} = [(p'_1 \cdot p'_2)g_{\lambda \tau} - p'_2k_1P'_{1\tau}] F_10(P' \cdot p', p'^2)$ and $F^0_{\lambda \tau} = [p'_1 p'_2 g_{\lambda \tau} + (p'_1 \cdot p'_2)p'_1 k_1 P'_{1\tau} - p'_2 k_2 P'_{2\tau}] F_20(P' \cdot p', p'^2)$, the BS wave function $\chi^0_{\lambda \tau}$ is considered as

$$
\chi^0_{\lambda \tau}(P', p') = c_1 F^0_{\lambda \tau}(P' \cdot p', p'^2) + c_2 F^0_{\lambda \tau}(P' \cdot p', p'^2).
$$

(38)

Substituting Eq. (38) into the BS equation (23) and comparing the tensor structures in both sides, we obtain a eigenvalue equation

$$
c_1 F_{10}(P' \cdot p', p'^2) =
\begin{align*}
\frac{1}{p'_1^2 + M_1^2} - & \frac{1}{-i e p'_2 + M_2^2 - i e} \{ \int \frac{id^4q}{(2\pi)^4} \left\{ h^{(s)}_1(k^2) \frac{g^2_\sigma}{k^2 + m^2_\sigma} \tilde{h}^{(s)}_1(k^2) + \left( \frac{g^2_{1\tau}}{k^2 + m^2_{1\tau}} \right) \right\} + \frac{g^2_5}{k^2 + m^2_5} \left\{ (q'_1 \cdot q'_2) - (q'_1 \cdot q'_2) \right\} \} c_1 F_{10}(P' \cdot q', q'^2) \\
+ & \int \frac{id^4q}{(2\pi)^4} \left\{ \frac{g^2_1}{k^2 + m^2_1} + \frac{g^2_1}{k^2 + m^2_1} \right\} \left\{ h^{(1)}_1(k^2) \tilde{h}^{(1)}_1(k^2)(p'_1 + q'_1) \cdot (p'_2 + q'_2) + 2h^{(1)}_1(k^2) \tilde{h}^{(1)}_2(k^2) \right\} \left\{ (q'_1 \cdot q'_2) - (q'_1 \cdot q'_2) \right\} \\
+ & 2h^{(1)}_1(k^2) \tilde{h}^{(1)}_1(k^2) \left\{ (q'_1 \cdot q'_2) - (q'_1 \cdot q'_2) \right\} \right\} c_1 F_{10}(P' \cdot q', q'^2)
\end{align*}
$$

11
\[ c_2 \mathcal{F}_{20}(P', p', p^2) = \frac{1}{p'^2 + M_1^2 - i\epsilon p'^2 + M_2^2 - i\epsilon} \left\{ \int \frac{d^4 q'}{(2\pi)^4} \frac{1}{M_1^2 p'^2} \left( \frac{g_{\rho}^2}{k^2 + m_\rho^2} + \frac{g_{\pi}^2}{k^2 + m_\pi^2} + \frac{g_{\omega}^2}{k^2 + m_\omega^2} \right) \times \left\{ h_1^{(s)}(k^2) \bar{h}_2^{(v)}(k^2) \right\} \right\} \]

where the eigenvalues are different from the eigenvalues in (36) and (37). From this equation, we can obtain the eigenvalues and eigenfunctions which contain the contribution from the cross terms.

Comparing the terms \( p'_{2\lambda} p'_{1\tau} \) in the left and right sides of Eq. (36), we obtain

\[ \mathcal{F}_1(P', p', p^2) = \frac{1}{p'^2 + M_1^2 - i\epsilon p'^2 + M_2^2 - i\epsilon} \int \frac{d^4 q'}{(2\pi)^4} V_1(p', q'; P') \mathcal{F}_1(P', q', q^2), \]

where \( V_1(p', q'; P') \) contains all coefficients of the term \( p'_{2\lambda} p'_{1\tau} \) in the right side of Eq. (36).

In this paper, we set \( k = (k, 0) \). Then the fourth components of momenta of two heavy mesons have no change: \( p'_{20} = q'_{20} = E_1(p'_1) = E_1(q'_1), \)

\( p'_{20} = q'_{20} = E_2(p'_2) = E_2(q'_2). \)

To simplify the potential, we replace the heavy meson energies \( E_1(p'_1) = E_1(q'_1) \rightarrow E_1 = (M^2 - M_2^2 + M_1^2)/(2M), E_2(p'_2) = E_2(q'_2) \rightarrow E_2 = (M^2 - M_1^2 + M_2^2)/(2M). \) The potential depends on the three-vector momentum \( V(p', q'; P') \Rightarrow V(p', q', M). \) Integrating both sides of Eq. (40) over \( p'_0 \) and multiplying by \((M + \omega_1 + \omega_2)(M^2 - (\omega_1 - \omega_2)^2)), \) we obtain the equation of the Schrödinger type

\[ \left( \frac{\lambda(M)}{2\mu_R} - \frac{P^2_{2\lambda}}{2\mu_R} \right) \Psi_1^{0+}(p') = \int \frac{d^3 k}{(2\pi)^3} V_1^{0+}(p', k) \Psi_1^{0+}(p', k) \]

and the potential between \( D^*0 \) and \( \bar{D}^*0 \) up to the second order of the \( p'/M_H \) expansion

\[ V_1^{0+}(p', k) = \frac{h_1^{(s)}(k^2)}{2E_1} \frac{g_{\rho}^2}{k^2 + m_\rho^2} \frac{h_1^{(s)}(k^2)}{2E_2} + h_1^{(v)}(k^2) \left( \frac{g_{\rho}^2}{k^2 + m_\rho^2} + \frac{g_{\pi}^2}{k^2 + m_\pi^2} + \frac{g_{\omega}^2}{k^2 + m_\omega^2} \right) \]

\[ \times \left[ -1 - \frac{4p'^2 + 5k^2}{4E_1E_2} \right]. \]
where \( \Psi_0^{+}(p') = \int dp_0 F_1(p' \cdot p', p'^2), \mu_R = E_1 E_2/(E_1 + E_2) = [M^4 - (M_1^2 - M_2^2)^2]/(4M^3), \)
\( b^2(M) = [M^2-(M_1+M_2)^2][M^2-(M_1-M_2)^2]/(4M^2), \omega_1 = \sqrt{p'^2 + M_1^2} \) and \( \omega_2 = \sqrt{p'^2 + M_2^2}. \)

And comparing the terms \( p_1'p_1' \tau \) in both sides of Eq. (37), we obtain
\[
 p_2'^2 F_2(p' \cdot p', p'^2) = \frac{1}{p_1'^2 + M_1^2 - i\epsilon} \int \frac{id^4q'}{(2\pi)^4} V_2(p', q'; p'^2) F_2(p' \cdot q', q'^2). \tag{43}
\]

Setting \( \Psi_2^{+}(p') = \int dp_0 p_2'^2 F_2(p' \cdot p', p'^2) \), we obtain the Schrödinger type equation
\[
 \left( \frac{b_2^2(M)}{2\mu_R} - \frac{D^2}{2\mu_R} \right) \Psi_2^{+}(p') = \int \frac{d^3k}{(2\pi)^3} V_2^{+}(p', k) \Psi_2^{+}(p', k) \tag{44}
\]

and the potential between \( D^{+0} \) and \( \bar{D}^{+0} \) up to the second order of the \( p'/M_H \) expansion
\[
 V_2^{+}(p', k) = \frac{h_1^{(s)}(k^2)}{2E_1} \frac{g_\sigma^2}{k^2 + m_\sigma^2} \frac{\bar{h}_1^{(s)}(k^2)}{2E_2} \left[ 1 - \frac{k^2}{M_1^2} \right] + \frac{h_1^{(v)}(k^2)}{k^2 + m_\rho^2} \left( \frac{g_\rho^2}{k^2 + m_\rho^2} + \frac{g_1^2}{k^2 + m_\omega^2} + \frac{g_2^2}{k^2 + m_\phi^2} \right)
\times \bar{h}_1^{(v)}(k^2) \left[ 1 - \frac{2p'^2 + 2k^2}{4M_1^2} - \frac{2p'^2 + 2k^2}{4E_1 E_2} \right]. \tag{45}
\]

In instantaneous approximation the eigenfunctions in Eqs. (36) and (37) can be calculated and the eigenvalue equation (39) becomes
\[
 \begin{pmatrix}
 \frac{b_{10}^2(M)}{2\mu_R} - \lambda \\
 H_{21}
 \end{pmatrix}
 \begin{pmatrix}
 \xi_1' \\
 \xi_2'
 \end{pmatrix} = 0, \tag{46}
\]

where the matrix elements
\[
 H_{12} = H_{21} = \int d^3p' \bar{\Psi}_0^{+}(p') \int \frac{d^3k}{(2\pi)^3} \bar{h}_1^{(v)}(k^2) \left( \frac{g_\rho^2}{k^2 + m_\rho^2} + \frac{g_1^2}{k^2 + m_\omega^2} + \frac{g_2^2}{k^2 + m_\phi^2} \right)
\times \frac{k^2}{E_1 E_2} \Psi_0^{+}(p', k), \tag{47}
\]

and \( b_{10}^2(M)/(2\mu_R) \) and \( b_{20}^2(M)/(2\mu_R) \) are the eigenvalues corresponding to lowest energy in Eqs. (41) and (44), respectively; \( \Psi_1^{+} \) and \( \Psi_2^{+} \) are the corresponding eigenfunctions. In Eqs. (42), (45) and (47) the contribution from one-\( \pi \) exchange to the potential between two heavy vector mesons has vanished, but we still give the heavy meson form factors \( h^{(p)}(k^2) \) and \( \bar{h}^{(p)}(k^2) \) in Sec. IV. Then applying the method as above, we can investigate the alternative \( J^P = 2^+ \) assignment for the \( Y \) state.

**IV. FORM FACTORS OF HEAVY VECTOR MESONS**

To calculate these heavy vector meson form factors \( h(k^2) \) describing the heavy meson structure, we have to know the wave function of heavy vector meson in instantaneous approximation. The heavy vector meson \( D^{+0} \) is regarded as a resonance and its three-vector
wave function in the rest frame has been given [5] 

\[ \Psi^V(p) = \frac{2\pi i}{N^V 4\omega_c \omega_u} \left\{ \exp \left[ -2p^2 - M^2_1 - m^2_c + 2M_1 \omega_c + \Gamma^2/4 + (M_1 - \omega_c)i\Gamma \right] \right\} \]

\[ \times \left\{ -\frac{M_1 - \omega_c - \omega_u - i\Gamma/2}{(M_1 - \omega_c - \omega_u)^2 + \Gamma^2/4} + \frac{M_1 - \omega_c - \omega_u + i\Gamma/2}{(M_1 - \omega_c - \omega_u)^2 + \Gamma^2/4} \right\} \frac{p^2}{3} + \omega_c M_1 - \omega_c^2 + \Gamma^2/4 \]

\[ + \frac{m_c m_u + i(M_1 \Gamma/2 - \omega_c \Gamma)}{\omega_{D^*}} \exp \left( \frac{-2p^2 - m^2_u}{\omega_{D^*}} \right) \left( \frac{p^2}{3} - \omega_u^2 + M_1 \omega_u + m_c m_u \right) \]

\[ \times \frac{M_1 - \omega_c - \omega_u + i\Gamma/2}{(M_1 - \omega_c - \omega_u)^2 + \Gamma^2/4} \right\} \sqrt{5p}, \] (48)

where \( p \) is the relative momentum between quark and antiquark in heavy meson, \( \hat{p} \) is the unit momentum, \( N^V \) is the normalization, \( \omega_{D^*} = 1.81\text{GeV} \) [12], \( \Gamma \) is the width of resonance, \( \omega_{c,u} = \sqrt{p^2 + m_{c,u}} \) and \( m_{c,u} \) are the constituent quark masses.

In this paper, we emphasize to introduce the form factors \( h^-(k^2) \) and \( h^+(k^2) \) derived from one-\( \pi \) exchange, while \( h^{(s)}(k^2) \) and \( h^{(v)}(k^2) \) have been calculated [5]. Firstly, the matrix element of the quark current \( J^- = i\bar{u} \gamma_5 u \) between the heavy meson states (H) has the form [13, 14]

\[ \langle H(Q)|J^-(0)|H(P)\rangle = \int \frac{d^2q d^3p}{(2\pi)^6} \bar{\Psi}^H_q(p) \Gamma(p, q) \Psi^H_p(p), \] (49)

where \( \Gamma(p, q) \) is the two-particle vertex function and \( \Psi^H_p \) is the heavy vector meson wave function boosted to the moving reference frame with momentum \( Q \). In Fig. 3 the vertex function \( \Gamma(p, q) \) in the impulse approximation is shown. The corresponding vertex function of the meson-quark interaction is given by

\[ \Gamma^{(1)}(p, q) = \begin{cases} \bar{u}(q) i \gamma_5 v_u(p) (2\pi)^3 \delta(q_2 - p_2) & \text{for } D^{*0} \\ \bar{u}(q) i \gamma_5 u_u(p) (2\pi)^3 \delta(q_2 - p_2) & \text{for } \bar{D}^{*0} \end{cases}, \] (50)

where \( u_u(p) \) and \( v_u(p) \) are the spinors of the quark \( u \) and antiquark \( \bar{u} \), respectively,

\[ u_\lambda(p) = \frac{1}{\sqrt{2\epsilon_u(p)}} \left( \begin{array}{c} \epsilon_u(p) + m_u \\ \epsilon_u(p) + m_u \end{array} \right) \chi_\lambda, \quad v_\lambda(p) = \frac{1}{\sqrt{2\epsilon_u(p)}} \left( \begin{array}{c} \epsilon_u(p) + m_u \\ \epsilon_u(p) + m_u \end{array} \right) \chi_\lambda, \] (51)

with \( \epsilon_{u,c}(p) = \sqrt{p^2 + m^2_{u,c}} \) and [13, 14]

\[ \begin{align*}
q_{1,2} &= \epsilon_{u,c}(q) Q M_H \pm \sum_{i=1}^{3} n^{(i)}(Q) q_i, \\
M_H &= \epsilon_u(q) + \epsilon_c(q), \\
p_{1,2} &= \epsilon_{u,c}(p) P M_H \pm \sum_{i=1}^{3} n^{(i)}(P) p_i,
\end{align*} \]
and \( n^{(i)} \) are three four-vectors defined by
\[
\begin{align*}
n^{(i)}(P) &= \left\{ \delta_{ij} + \frac{P_i P_j}{M_H[E_H(P) + M_H]}, i P_i \right\}, \\
E_H(P) &= \sqrt{P^2 + M_H^2}.
\end{align*}
\]

In Eq. (50) the first term represents the light pseudoscalar meson interaction with the \( u \)-antiquark in \( D^* \), while the second term represents its interaction with the \( u \)-quark in \( \bar{D}^* \). Substituting the vertex function \( \Gamma^{(1)} \) given by Eq. (50) into the matrix element (49) and then comparing the resulting expressions with the form factor decompositions (28) and (29), we find
\[
h^-(k^2) = \bar{h}^-(k^2) = 0.
\]

Then the quark current becomes \( J^+_\mu = i\bar{u}\gamma_\mu\gamma_5u \) and the matrix element between heavy meson states has the form
\[
\langle H(Q)|J^+_\mu(0)|H(P)\rangle = \int \frac{d^3q d^3p}{(2\pi)^6} \Psi^H_{\bar{q}}(q)\Gamma_\mu(p, q)\Psi^H(p),
\]
and the corresponding vertex function is
\[
\Gamma^{(1)}_\mu(p, q) = \begin{cases} 
\bar{v}_u(q_1)i\gamma_\mu\gamma_5v_u(p_1)(2\pi)^3\delta(q_2 - p_2) & \text{for } D^*, \\
\bar{u}_u(q_1)i\gamma_\mu\gamma_5u_u(p_1)(2\pi)^3\delta(q_2 - p_2) & \text{for } \bar{D}^*.
\end{cases}
\]

The form factors corresponding to one light pseudoscalar meson exchange are obtained
\[
h^{(p)}(k^2) = \bar{h}^{(p)}(k^2) = F_3(k^2),
\]
\[
F_3(k^2) = \frac{\sqrt{E_H M_H}}{E_H + M_H} \int \frac{d^3p}{(2\pi)^3} \Psi^V(p + \frac{2\epsilon(p)}{E_H + M_H}k) \left( \frac{\epsilon_u(p + k) + m_u}{2\epsilon_u(p + k)} \right) \frac{p k}{(\epsilon_u(p + k) + m_u)(\epsilon_u(p) + m_u)} \Psi^V(p),
\]
where \( \Psi^V \) is the wave function of heavy vector meson expressed as Eq. (48). The function \( F_3(k^2) \) is shown in Fig. 4

Finally, we obtain the potentials between two heavy vector mesons for \( J^P = 0^+ \)
\[
\begin{align*}
V^{0+}_1(p', k) &= -F_1(k^2)\frac{g_1^2}{k^2 + m_\rho^2}F_1(k^2) - F_2(k^2)(\frac{g_\pi^2}{k^2 + m_\pi^2} + \frac{g_1^2}{k^2 + m_2^2} + \frac{g_3^2}{k^2 + m_3^2}) \\
&\times F_2(k^2)[1 + \frac{4|p'|^2 + 5k^2}{4E_1E_2}],
\end{align*}
\]
\[
\begin{align*}
V^{0+}_2(p', k) &= -F_1(k^2)\frac{g_1^2}{k^2 + m_\rho^2}F_1(k^2)[1 - \frac{k^2}{M_1^2}] - F_2(k^2)(\frac{g_\pi^2}{k^2 + m_\pi^2} + \frac{g_1^2}{k^2 + m_2^2} + \frac{g_3^2}{k^2 + m_3^2}) \\
&\times F_2(k^2)[1 + \frac{2|p'|^2 + 2k^2}{4M_1^2} + \frac{2|p'|^2 + 2k^2}{4E_1E_2}],
\end{align*}
\]
\[\tag{56}\]
where $F_1(k^2)$ and $F_2(k^2)$ represent the form factors corresponding to one light scalar and vector meson exchange, respectively, which have been given in our previous work [5].

The constituent quark masses $m_c = 1.55\text{GeV}$, $m_u = 0.33\text{GeV}$, the meson masses $m_\sigma = 0.46\text{GeV}$, $m_\rho = 0.775\text{GeV}$, $m_\omega = 0.782\text{GeV}$, $m_\phi = 1.019\text{GeV}$, $m_{D^{*0}} = m_{D^{*0}} = 2.007\text{GeV}$ and the width of the heavy vector meson $\Gamma = 0.002\text{GeV}$ [15]. The equations (41) and (44) can be solved numerically with these potentials in Eq. (56), and then the eigenvalue equation (46) can be solved. Using the same method, we investigate the molecule state $D^{*0}\bar{D}^{*0}$ with $J^P = 2^+$. Additionally, we investigate the molecule states consisting of two heavy vector mesons $B^{*0}\bar{B}^{*0}$, which are composed of bottom quark and $d$-quark. Then the constituent quark masses $m_b = 4.88\text{GeV}$, $m_d = 0.33\text{GeV}$, the meson masses $m_{B^{*0}} = m_{\bar{B}^{*0}} = 5.325\text{GeV}$, the width $\Gamma = 0.015\text{keV}$ and $\omega_{B^{*0}} = \omega_{\bar{B}^{*0}} = 1.81\text{GeV}$ [12]. Table I shows our results for the masses of these molecule states.

| Composite State | $J^P$ | This work |
|-----------------|-------|-----------|
| $D^{*0}\bar{D}^{*0}$ | 0$^+$ | 3.947 | 3.970 |
|                  | 2$^+$ | 4.142 | 4.147 | 4.147 | 4.152 |
| $B^{*0}\bar{B}^{*0}$ | 0$^+$ | 10.459 | 10.476 |
|                  | 2$^+$ | 10.697 | 10.699 | 10.699 | 10.701 |

For the molecule state $D^{*0}\bar{D}^{*0}$ with $J^P = 0^+$, we obtain two solutions from Eq. (46). The lower energy should be the ground state mass of this molecule state which lies below the threshold and the calculated mass is consistent with the experimental data, while in the experiment the mass of $Y(3940)$ is 3.943GeV [1]. This result is different from Ref. [5], this is because in this paper we consider the SU(3) symmetry. At the same time, the molecule state $D^{*0}\bar{D}^{*0}$ with $J^P = 2^+$ lies above the threshold. Therefore, we can have a conclusion that if the $Y(3940)$ state is a molecule state composed of $D^{*0}\bar{D}^{*0}$, its quantum numbers should be $J^P = 0^+$. Besides, we can predict that two bottom mesons $B^{*0}\bar{B}^{*0}$ can be bound by one light meson exchange as a molecule state with $J^P = 0^+$. 

16
V. CONCLUSION

In this work, we assume that the exotic state $Y(3940)$ is a $D^{*0}\bar{D}^{*0}$ molecule state and calculate its mass. The revised general formalism of the BS wave functions for the bound states composed of two vector fields is applied to investigate this issue. Considering one-$\pi$ exchange and SU(3) symmetry breaking, we construct the interaction potential between $D^{*0}$ and $\bar{D}^{*0}$ through the heavy vector meson form factors describing the heavy meson structure. The calculated mass of the molecule state with $J^P = 0^+$ is consistent with the mass of the $Y$ state in experiment, so we conclude that if the $Y(3940)$ state is a molecule state composed of $D^{*0}\bar{D}^{*0}$, its quantum numbers should be $J^P = 0^+$. Adopting this method, we investigate the molecule states composed of two bottom mesons.

\[ \chi_{\lambda}(P', p') \]

\[ p_1' = \eta_1 P^0 + p' \]

\[ p_2' = \eta_2 P^0 - p' \]
