SERRE PROBLEM FOR UNBOUNDED PSEUDOCONVEX REINHARDT DOMAINS IN $\mathbb{C}^2$

LUKASZ KOSIŃSKI

ABSTRACT. We give a characterization of non-hyperbolic pseudoconvex Reinhardt domains in $\mathbb{C}^2$ for which the answer to the Serre problem is positive. Moreover, all non-hyperbolic pseudoconvex Reinhardt domains in $\mathbb{C}^2$ with non-compact automorphism group are explicitly described.

1. Statement of result

Throughout this paper the class of Stein domains $D$ for which the answer to the Serre problem is positive (with the fiber equal to $D$) is denoted by $\mathcal{S}$, i.e. $D \in \mathcal{S}$ if for any Stein manifold $B$, any holomorphic fiber bundle $E \to B$ with the base $B$ and the Stein fiber $D$ is Stein. In 1953 J-P. Serre raised a question whether all Stein manifolds are in $\mathcal{S}$.

Despite many positive results the answer to the Serre problem is in general negative. Actually, Skoda proved that $\mathbb{C}^2 \notin \mathcal{S}$ (see [Skd]). The counterexamples with bounded domains as fibers were found by G. Coeuré and J.-J. Loeb ([Coe-Loeb]). In [Pfl-Zwo] P. Pflug and W. Zwonek gave a characterization of all hyperbolic Reinhardt domains of $\mathbb{C}^2$ not in $\mathcal{S}$. Next K. Oeljeklaus and D. Zaffran solved the Serre problem for bounded Reinhardt domains in $\mathbb{C}^3$. Recently a classification result for bounded Reinhardt domains of $\mathbb{C}^d$ for arbitrary $d \geq 2$ has been obtained by D. Zaffran in [Zaf]. In particular, the case $\mathbb{C}^d$, $d \geq 2$, may be deduced from this result (it follows easily from [Zaf], Main Theorem).

In the paper we deal with non-hyperbolic Reinhardt domains in $\mathbb{C}^2$ and we solve the Serre problem for them. The main goal is to show the following

Theorem 1. Let $D$ be a pseudoconvex non-hyperbolic Reinhardt domain. Then $D \notin \mathcal{S}$ if and only if $\mathbb{C}^2_* \subset D$ or $D$ is algebraically equivalent to a domain of the form

$$\{(z_1, z_2) \in \mathbb{C}^2_* : |z_1|^p |z_2|^q < 1\},$$

2000 Mathematics Subject Classification. 32L05, 32A07.

Key words and phrases. Serre problem, Reinhardt domains.

where \( p, q \in \mathbb{Q}, q > 0, \sqrt{q} \in \mathbb{R} \setminus \mathbb{Q} \).

**Remark 2.** Note that for the pseudoconvex Reinhardt domain \( D \) the condition \( \mathbb{C}^2 \subset D \) means that \( D \in \{ \mathbb{C}^2, \mathbb{C}_*^2, \mathbb{C} \times \mathbb{C}_*, \mathbb{C}_* \times \mathbb{C} \} \).

The following result gives a description of non-hyperbolic pseudoconvex Reinhardt domains in \( \mathbb{C}^2 \) whose group of automorphisms is non-compact.

**Theorem 3.** Let \( D \) be a non-hyperbolic pseudoconvex Reinhardt domain in \( \mathbb{C}^2 \). Then the group \( \text{Aut}(D) \) is non-compact if and only if the logarithmic image of the domain \( D \) contains an affine line or (up to a permutation on components) \( D \) is contained in \( \mathbb{C} \times \mathbb{C}_*, \{0\} \times \mathbb{C}_* \subset D \) and \( \log D = \{(t, s) : t < \psi(s), s \in \mathbb{R}\} \), where \( \psi : \mathbb{R} \to \mathbb{R} \) is a concave function satisfying the property \( \psi(\beta + s) - \psi(s) = \alpha + ks, s \in \mathbb{R} \), for some \( \alpha, \beta \in \mathbb{R}, \beta \neq 0, k \in \mathbb{Z} \).

**Remark 4.** The examples of a functions \( \psi \) appearing in Theorem 3 are the functions \( \psi(s) = as^2 + bs + c, s \in \mathbb{R} \), where \( a < 0, b, c \in \mathbb{R} \).

The author expresses his thanks to the referee for his valuable suggestions to improve the shape of the original paper. Also, I would like to express my gratitude to professor Włodzimierz Zwonek for helpful discussions.

### 2. Preliminaries

Here is some notation. By \( \mathbb{D} \) we denote the open unit disc in the complex plane. Let \( \mathbb{A}(r, R) = \{ z \in \mathbb{C} : r < |z| < R \}, -\infty < r < R < \infty, R > 0 \). Note that if \( r > 0 \), then \( \mathbb{A}(r, R) \) is an annulus. For simplicity we put \( \mathbb{A}(r) = \mathbb{A}(1/r, r), r > 0 \). Moreover, for a domain \( D \) in \( \mathbb{C}^n \), the set \( D \setminus \{0\} \) is denoted by \( D_* \).

For a Reinhardt domain \( D \subset \mathbb{C}^n \) we define

\[
\log D = \{(x_1, \ldots, x_n) \in \mathbb{R}^n : (e^{x_1}, \ldots, e^{x_n}) \in D\}.
\]

It is well known that, for any pseudoconvex domain in \( \mathbb{C}^n \), its logarithmic image is convex.

Put

\[
\mathbb{C}(\lambda) := \begin{cases} 
\mathbb{C}, & \lambda \geq 0, \\
\mathbb{C}_*, & \lambda < 0,
\end{cases}
\]

and

\[
\mathbb{C}(\alpha) := \mathbb{C}(\alpha_1) \times \ldots \times \mathbb{C}(\alpha_n), \quad \alpha \in (\mathbb{R}^n).
\]

Given \( \alpha \in \mathbb{R}^n \) and \( z \in \mathbb{C}(\alpha) \), we put \( z^\alpha = z_1^{\alpha_1} \ldots z_n^{\alpha_n} \). Moreover, we define

\[
\varphi_A(z) := z^A := (z^{A_1}, \ldots, z^{A_m}), \quad z \in \mathbb{C}(A) := \bigcap_{j=1}^m \mathbb{C}(A^j),
\]

\[1\text{We define } 0^0 := 1.\]
where $A = (A^j_k)_{j=1,...,m,k=1,...,n} \in \mathbb{Z}^{m \times n}$.

Non-hyperbolic Reinhardt domains appearing in Theorem 1 have been characterized in the following way:

**Theorem 5** (see [Zwo]). Let $D$ be a pseudoconvex Reinhardt domain in $\mathbb{C}^n$. Then the following conditions are equivalent:

- $D$ is (Kobayashi, Carathéodory or Brody) hyperbolic;
- $D$ is algebraically equivalent to a bounded domain - in other words, there is an $A \in \mathbb{Z}^{n \times n}$ with $|\det A| = 1$ such that $\varphi_A(D)$ is bounded and $(\varphi_A)|_D$ is a biholomorphism onto the image;
- $\log D$ contains no straight lines and $D \cap (\mathbb{C}^{i-1} \times \{0\} \times \mathbb{C}^{n-j})$ is either empty or hyperbolic (viewed as domains in $\mathbb{C}^{n-1}$), $j = 1, \ldots, n$.

In view of Theorem 5, non-hyperbolic pseudoconvex Reinhardt domains in $\mathbb{C}^2$ not containing $\mathbb{C}^2_*$ may be divided into two classes.

The first one contains non-hyperbolic, pseudoconvex Reinhardt domains $D$ such that $D \cap \mathbb{C}^2_*$ is hyperbolic.

The second one consists of domains whose logarithmic images contain a straight line. One may prove that such domains are algebraically equivalent to

$$D_{\alpha,r-+} := \{(z_1, z_2) \in \mathbb{C}(\alpha) : r_- < |z_1|^{\alpha_1} |z_2|^{\alpha_2} < r_+\},$$

where $\alpha = (\alpha_1, \alpha_2) \in \mathbb{R}^2$, $-\infty < r_- < r_+ < \infty$, $r_+ > 0$.

**Definition 6.** A domain $D_{\alpha,r-+}$ is called to be of rational type if $t \alpha \in (\mathbb{Q}^2)_*$ for some $t > 0$.

Otherwise $D_{\alpha,r-+} \subset \mathbb{C}^2$ is said to be of irrational type.

It is clear that $D_{\alpha,r-+}$ is algebraically equivalent to a domain of one of the following types:

(a) $D_\beta := \{(z_1, z_2) \in \mathbb{C} \times \mathbb{C}(\beta) : |z_1| |z_2|^{\beta} < 1\}$, $\beta \in \mathbb{R}$,

(b) $D_\beta^\circ := \{(z_1, z_2) \in \mathbb{C}_* \times \mathbb{C}(\beta) : 0 < |z_1| |z_2|^{\beta} < 1\}$, $\beta \in \mathbb{R}_0$,

(c) $D_{\beta,r} := \{(z_1, z_2) \in \mathbb{C} \times \mathbb{C}(\beta) : 1/r < |z_1| |z_2|^{\beta} < r\}$, $\beta \in \mathbb{R}_0$, $r > 1$.

**Remark 7.** Observe that any Reinhardt domain $D_{\alpha,r-+}$ of rational type is algebraically equivalent to one of the following domains:

(d) $\mathcal{D} \times \mathcal{C}$, where $\mathcal{D}$ is either a disc, a pointed disc or an annulus and $\mathcal{C} \in \{\mathbb{C}, \mathbb{C}_*\}$,

(e) $\{(z, w) \in \mathbb{C}^2 : |z^p |w^q| < 1\}$, where $p, q \in \mathbb{N}$ are relatively prime.

\footnote{Note that replacing $(\alpha_1, \alpha_2)$ by $(-\alpha_1, \alpha_2)$ allows us to add or to remove the axis $\{0\} \times \mathbb{C}$ in the case when $\alpha_1 \neq 0$. In other words $\{(z_1, z_2) \in \mathbb{C}_* \times \mathbb{C}(\alpha_2) : r_- < |z_1|^{\alpha_1} |z_2|^{\alpha_2} < r_+\}$, where $\alpha_1 > 0, \alpha_2 \in \mathbb{R}$ is also covered by this symbol (it is algebraically equivalent to $D_{(-\alpha_1, \alpha_2),r-+}$). If $\alpha_1 = 0$, then $D_{\alpha,r-+} = \mathbb{A}(r_-, r_+) \times \mathbb{C}$. Moreover, $\mathbb{A}(r_-, r_+) \times \mathbb{C}_*$ is algebraically equivalent to $D_{(1,-1),r-+}$.}
(f) \( \{ (z, w) \in \mathbb{C} \times \mathbb{C} : |z^p| |w^q| < 1 \} \), where \( p, q \) are relatively prime natural numbers, \( (p, q) \neq (1, 1) \).

**Proof.** We will show that any domain of the form (a), (b), (c) with rational \( \beta \) is algebraically equivalent to one of the enumerated above domains.

Domains of the form \( D_0, D_0^* \) and \( D_{0, r} \) are in (d).

Note that domains of the form (e) may be written as \( D_{p/q} \). Moreover, domains of the form (f) are algebraically equivalent to \( D_{-p/q} \). Therefore any domain of the form (a) with \( \beta \neq 0 \) is of the form (e) or (f).

Fix a rational \( \beta > 0 \) and assume that \( \beta = p/q \), where \( p \) and \( q \) are relatively prime natural numbers. There are \( m, n \in \mathbb{Z} \) such that \( pm + qn = 1 \). Observe that the mapping \( D_{p/q}^* \ni (z_1, z_2) \rightarrow (z_1^p z_2^q, z_1^{-m} z_2^n) \in \mathbb{D}_* \times \mathbb{C}_* \) is biholomorphism.

Similarly, one may show that \( D_{\beta, r} \) is algebraically equivalent to \( A_r(r) \times \mathbb{C}_* \).

What remains to do is to observe that the set \( \{ (z, w) \in \mathbb{C}_* \times \mathbb{C} : |z||w| < 1 \} \) is algebraically equivalent to \( \mathbb{D} \times \mathbb{C}_* \). □

Our paper is organized as follows. In Section 3 we give the proof of Theorem 1 for Reinhardt domains of the form (2) of the rational type.

Section 4 is devoted to solving the Serre problem for Reinhardt domains of the form (2) of irrational type. We obtain there a natural correspondence between the automorphisms of Reinhardt domains of irrational type and the famous Pell’s equation.

In Section 5 we proof Theorem 1 for non-hyperbolic Reinhardt domains which are hyperbolic after removing the axes \( (\mathbb{C} \times \{0\}) \cup (\{0\} \times \mathbb{C}) \).

It seems to us probable that the solution of the Serre problem for \( \mathbb{C} \times \mathbb{C}_* \) is known, however we could not find it in the literature, therefore in the last section we present ideas explaining how to easily extend the procedure used in [Dem2] to this domain.

Finally, in Section 7 using obtained results we present the proofs of Theorem 1 and Theorem 3.

Two following theorems providing us with some classes of domains for which the answer to the Serre problem is positive will be useful. The first of them is the so-called Stehlé criterion.

**Theorem 8** (see [Mok2, Ste]). Let \( D \) be a domain in \( \mathbb{C}^n \). If there exists a real-valued plurisubharmonic exhaustion function \( u \) on \( D \) such that \( u \circ f - u \) is bounded from above for any \( f \in \text{Aut}(D) \), then \( D \in \mathcal{S} \).

Observe the Stehlé criterion is satisfied among others by domains whose group of automorphisms is compact.

**Theorem 9** (see [Mok1]). Any open Riemann surface belongs to \( \mathcal{S} \).
Let us recall basic facts and definitions related to holomorphic fiber bundles which will be useful in the sequel. For more information we refer the reader to [Hör].

Let \(E\) be an arbitrary holomorphic fiber bundle with the fiber \(X\). The automorphisms of the form \(\tau_{\alpha,\beta} = \tau_\alpha \circ \tau^{-1}_\beta \in \text{Aut}((\Omega_\alpha \cap \Omega_\beta) \times X)\), where \(\tau_\alpha\), \(\tau_\beta\) are trivializations (with associated domains \(\Omega_\alpha \times X, \Omega_\beta \times X\), respectively) are so-called transition functions. It is clear that
\[
\tau_{\alpha,\beta} \circ \tau_{\beta,\gamma} = \tau_{\alpha,\gamma} \quad \text{on} \quad (\Omega_\alpha \cap \Omega_\beta \cap \Omega_\gamma) \times X.
\]

On the other hand, having domains \((\Omega_\alpha)_\alpha\) and a family of functions \((\tau_{\alpha,\beta})_{\alpha,\beta} \in \text{Aut}((\Omega_\alpha \cap \Omega_\beta) \times X)\) satisfying the condition (3) we may define a holomorphic fiber bundle with the base \(B = \bigcup_\alpha \Omega_\alpha\) and the fiber \(X\) by putting
\[
E = \left( \bigcup_\alpha (\Omega_\alpha \times X) \right) / \sim,
\]
gluing the charts \(\Omega_\alpha \times X\) via identification: \((x_\alpha, z_\alpha) \sim (x_\beta, z_\beta)\) if and only if \(x_\alpha = x_\beta \in \Omega_\alpha \cap \Omega_\beta\) and \(\tau_{\alpha,\beta}(x_\beta, z_\beta) = (x_\alpha, z_\alpha)\).

Throughout this paper all holomorphic fiber bundles are understood to be of the form (4).

3. Rational case

We start this section with collecting the formulas for automorphisms of Reinhardt domains of rational type. Some of them may be found in [Jar-Pfl] and [Sol]. They may be also derived from the description of proper holomorphic mappings between Reinhardt domains of rational type obtained in [Edi-Zwo] and [Kos1]. As mentioned in Remark 7, any rational Reinhardt domain is algebraically equivalent to a domain of the form (d), (e) or (f).

Theorem 10.

(1) The group of automorphism of the domain \(\{(z_1, z_2) \in \mathbb{C}^2 : |z_1 z_2| < 1\}\) consists of the mappings
\[
(z_1, z_2) \to (z_1 f(z_1 z_2), e^{i\theta} z_2 / f(z_1 z_2))
\]
and
\[
(z_1, z_2) \to (z_2 f(z_1 z_2), e^{i\theta} z_1 / f(z_1 z_2)),
\]
where \(f \in \mathcal{O}^*(\mathbb{D})\) and \(\theta \in \mathbb{R}\).

(2) The group of automorphism of \(\{(z_1, z_2) \in \mathbb{C}^2 : |z_1^p| |z_2^q| < 1\}\), where \(p\) and \(q\) are relatively prime natural numbers, \((p, q) \neq (1, 1)\), consists of the mappings of the form
\[
(z_1, z_2) \to \left( a^{1/p}(z_1^p z_2^q) z, e^{i\theta} \frac{z_2}{a^{1/q}(z_1^p z_2^q)} \right),
\]
where \(a \in \mathbb{D}^*\).
where \( a \in \mathcal{O}^*(\mathbb{D}), \theta \in \mathbb{R} \).

(3) The group of automorphism of the domain \( \{(z_1, z_2) \in \mathbb{C}_s \times \mathbb{C} : |z_1^p||z_2^q| < 1\} \), where \( p \) and \( q \) are relatively prime natural numbers, \( p \geq 1, q \geq 2 \), consists of the mappings of the form

\[
(z_1, z_2) \mapsto \left( a^{1/p}(z_1^p z_2^q)z_1, e^{i\theta} \frac{z_2}{a^{1/q}(z_1^p z_2^q)} \right),
\]

where \( a \in \mathcal{O}^*(\mathbb{D}), \theta \in \mathbb{R} \).

(4) Let \( \mathcal{D} \subset \mathbb{C} \) be bounded and \( \mathcal{C} \in \{\mathbb{C}, \mathbb{C}_s\} \). The group of automorphisms of \( \mathcal{D} \times \mathcal{C} \) consist of the mappings

\[
\mathcal{D} \times \mathcal{C} \ni (\lambda, z) \mapsto (a(\lambda), f(\lambda, z)),
\]

where \( a \in \text{Aut}(\mathcal{D}) \).

In the case when \( \mathcal{C} = \mathbb{C} \) the mapping \( f \) is of the form

\[ f(\lambda, z) = b(\lambda)z + c(\lambda), \quad \lambda \in \mathcal{D}, \ z \in \mathbb{C}, \]

where \( b \in \mathcal{O}^*(\mathcal{D}) \) and \( c \in \mathcal{O}(\mathcal{D}) \).

If \( \mathcal{C} = \mathbb{C}_s \), then the mapping \( f \) is of the form

\[ f(\lambda, z) = b(\lambda)z^\epsilon, \quad \lambda \in \mathcal{D}, \ z \in \mathbb{C}_s, \]

where \( b \in \mathcal{O}^*(\mathcal{D}) \) and \( \epsilon = \pm 1 \).

The following lemma due to Stehlé will be needed

**Lemma 11 (Ste).** Let \( B \) be a Stein manifold. Then for any covering \( \{U_\alpha\} \) of \( B \) there is a locally finite covering \( \{B_j\}_{j \in \mathbb{N}} \) and a family of strictly plurisubharmonic, continuous functions \( h_j \) in a neighborhood of \( C_j \), where \( C_j = \bigcup_{i \leq j} B_i \), such that

(i) each \( B_j \) is relatively compact in some \( U_\alpha \),

(ii) \( C_j \) is Stein for any \( j \),

(iii) \( h_j < 0 \) in \( C_j \setminus B_j \) and \( h_j > 1 \) in the neighborhood (in \( C_j \)) of \( C_j \setminus C_j-1 \cap C_j, \ j \in \mathbb{N} \).

**Theorem 12.** Any Reinhardt domain \( D \) in \( \mathbb{C}^2 \) of the form \( \mathbb{Z} \) of rational type belongs to the class \( \mathcal{S} \).

**Remark 13.** Note that the function satisfying the Stehlé criterion does not exist for any domain appearing in the previous theorem. As an example let us take \( \mathbb{D} \times \mathbb{C} \). It is sufficient to observe that for any \( f \in \mathcal{O}(\mathbb{D}, \mathbb{C}_s) \) the mapping

\[
\mathbb{D} \times \mathbb{C} \ni (\lambda, z) \mapsto (\lambda, f(\lambda)z) \in \mathbb{D} \times \mathbb{C}
\]

is an automorphism of \( \mathbb{D} \times \mathbb{C} \), and the growth of the function \( f \) may be arbitrarily fast.
Proof of Theorem 12. The proof is divided into four cases.

(a) First we focus our attention on the case when the fiber is equal to $D = \{(z, w) \in \mathbb{C}^2 : |z| |w| < 1\}$.

We will modify the idea used by Stehlé in the proof of Theorem 8. Let $\pi : E \to B$ be a holomorphic fiber bundle with a Stein base $B$ and a fiber $D$. As we have already mentioned, $E$ is assumed to be given by the formula (4).

Using the description of the group of automorphisms of the domain $D$ we get that for any $b \in \Omega_{\alpha} \cap \Omega_{\beta}$ a transition function $\tau_{\alpha,\beta}$ is of one of two following forms:

$$
\begin{cases}
\tau_{\alpha,\beta}(b, z, w) = (b, zf_{\alpha,\beta}(b, zw), e^{i\theta_{\alpha,\beta}(b)}w/f_{\alpha,\beta}(b, zw)) \\
\tau_{\alpha,\beta}(b, z, w) = (b, wf_{\alpha,\beta}(b, zw), e^{i\theta_{\alpha,\beta}(b)}z/f_{\alpha,\beta}(b, zw)),
\end{cases}
$$

for some $f_{\alpha,\beta}(b, \cdot) \in \mathcal{O}^*(\mathbb{D})$ and $\theta_{\alpha,\beta}(b) \in \mathbb{R}$. Since $\tau_{\alpha,\beta}$ is holomorphic it follows that the mapping $\Omega_{\alpha} \cap \Omega_{\beta} \ni b \mapsto e^{i\theta_{\alpha,\beta}(b)} \in \partial \mathbb{D}$ is holomorphic and therefore locally constant.

Let $\tilde{\pi} : \tilde{E} \to B$ denote a holomorphic fiber bundle with the base $B$ and the fiber $\mathbb{D}$ whose transition functions are defined by $\tilde{\tau}_{\alpha,\beta}(b, \lambda) = (b, e^{i\theta_{\alpha,\beta}(b)}\lambda)$, $b \in \Omega_{\alpha} \cap \Omega_{\beta}$, $\lambda \in \mathbb{D}$. It follows from Theorem 9 that $\tilde{E}$ is Stein. Applying Lemma 8 to the family $\{\tilde{\pi}^{-1}(\Omega_{\alpha})\}$ we get a locally finite covering $\{\tilde{B}_j\}$ and a family of strictly plurisubharmonic continuous functions $\{h_j\}$ satisfying conditions (i)-(iii) of Lemma 11. Let

$$
p : E \ni [(b, z, w)] \mapsto [(b, zw)] \in \tilde{E}
$$

be a natural surjection between $E$ and $\tilde{E}$.

For $j \in \mathbb{N}$ choose $\alpha_j$ such that $\tilde{B}_j$ is relatively compact in $\tilde{\pi}^{-1}(\Omega_{\alpha_j})$. Let $\tau_j := \tau_{\alpha_j}$ denote any trivialization of the fiber bundle $\pi : E \to B$ defined on $p^{-1}(\tilde{\pi}^{-1}(\Omega_{\alpha_j}))$. Put

$$
l(b, z, w) = \max\{\log^+ |z|, \log^+ |w|\}, \quad (b, z, w) \in B \times \mathbb{C}^2.
$$

The choice of $\{\tilde{B}_j\}$ and a standard compactness argument guarantee that for any $i, j \in \mathbb{N}$

$$(5) \quad \sup\{l(\tau_i \circ \tau_j^{-1}(b, z, w)) - l(b, z, w) : [b, z, w] \in p^{-1}(B_i \cap B_j)\} < \infty.
$$

Put

$$
v_1(x) = \exp\left(h_1(p(x)) + l(\tau_1(x))\right), \quad x \in p^{-1}(B_1).
$$

Condition (5) allows us to choose constants $d \in (0, 1)$ and $M > 0$ such that

$$(6) \quad dM \exp\left(l(\tau_2(x))\right) \leq v_1(x) \leq 2M \exp\left(l(\tau_2(x))\right), \quad x \in p^{-1}(B_1 \cap B_2).
$$
Define
\[ \tilde{v}_2(x) = 2M \exp \left( l(\tau_2(x)) \right) \exp \left( (1 - h_2(p(x))) \log \frac{d'}{2} \right), \quad x \in p^{-1}(B_2). \]

It follows from the choice of \( d, M \) that if \( h_2(p(x)) < 0, x \in p^{-1}(B_1 \cap B_2) \), then \( \tilde{v}_2(x) < v_1(x) \). Moreover, if \( h_2(p(x)) > 1, x \in p^{-1}(B_1 \cap B_2) \), then \( \tilde{v}_2(x) > v_1(x) \). Therefore putting
\[ v_2(x) = \begin{cases} v_1(x), & x \in p^{-1}(B_1 \setminus B_2), \\ \max \{ v_1(x), \tilde{v}_2(x) \}, & x \in p^{-1}(B_1 \cap B_2), \\ \tilde{v}_2(x), & x \in p^{-1}(B_2 \setminus B_1), \end{cases} \]
we obtain a plurisubharmonic continuous function defined on \( p^{-1}(B_1 \cup B_2) = p^{-1}(C_2) \).

Similarly, let \( d' \in (0, 1), M' > 0 \) be such that
\[ dM \exp \left( l(\tau_3(x)) \right) \leq v_2(x) \leq 2M \exp \left( l(\tau_3(x)) \right), \quad x \in p^{-1}(B_3 \cap C_2) \]
Let us define
\[ \tilde{v}_3(x) = 2M' \exp \left( l(\tau_3(x)) \right) \exp \left( 1 - h_3(p(x)) \log \frac{d'}{2} \right) \quad \text{for} \quad x \in p^{-1}(B_3), \]
and
\[ v_3(x) = \begin{cases} v_2(x), & x \in p^{-1}(C_2 \setminus B_3), \\ \max \{ v_2(x), \tilde{v}_3(x) \}, & x \in p^{-1}(C_2 \cap B_3), \\ \tilde{v}_3(x), & x \in p^{-1}(B_3 \setminus C_2). \end{cases} \]

Exactly as before we check that \( v_3 \in \mathcal{PSH}(p^{-1}(C_3)) \).

Repeating this procedure inductively one may obtain a sequence of functions \( v_j \in \mathcal{PSH}(p^{-1}(C_j)) \) such that \( v_j \leq v_{j+1} \) on \( p^{-1}(C_j) \) and \( v_j = v_{j+1} \) on \( p^{-1}(C_j \setminus B_{j+1}) \).

Since the covering \( \{ B_j \} \) is locally finite, putting \( v = \lim_j v_j \) we define properly a plurisubharmonic function on \( E \).

Let \( \tilde{u} \) be a strictly plurisubharmonic continuous exhaustion function on \( \hat{E} \). It follows from the construction of the function \( v \) that
\[ u = \max \{ \tilde{u} \circ p, v \} \]
is a plurisubharmonic continuous exhaustion function on \( E \).

Now, in order to show the Steinness of \( E \) it suffices to repeat the argument used by N. Mok in the proof of the improvement of the Stehlé criterion (see [Mok2], Appendix III).

(b) Let us consider the case when the fiber \( D \) is of the form \( D = \{(z, w) \in \mathbb{C}^2 : |z|^p |w|^q < 1\} \) for some natural relatively prime \( p, q, (p, q) \neq (1, 1) \).
Let $\pi : E \to B$ be a holomorphic fiber bundle with the fiber $D$. Using Theorem 10 we infer that the transition functions are of the form

$$\tau_{\alpha,\beta}(b, z, w) = \left( b, a_{\alpha,\beta}(b, z^p w^q), e^{i\theta_{\alpha,\beta}(b)} \frac{w}{a_{\alpha,\beta}^{1/q}(b, z^p w^q)} \right),$$

where $a_{\alpha,\beta} \in \mathcal{O}^*((\Omega_{\alpha} \cap \Omega_{\beta}) \times \mathbb{D})$ and $\theta_{\alpha,\beta}(b) \in \mathbb{R}$. Moreover, it may be shown that $e^{i\theta_{\alpha,\beta}}$ is holomorphic and therefore locally constant.

Let $\tilde{\pi} : \tilde{E} \to B$ be a holomorphic fiber bundle with a fiber equal to $\tilde{D} = \{(z, w) \in \mathbb{C}^2 : ||z|| w < 1\}$ and whose transition functions are defined in the following way

$$\tilde{\tau}_{\alpha,\beta}(b, z, w) = \left( b, a_{\alpha,\beta}(b, zw), e^{i\theta_{\alpha,\beta}(b)} \frac{w}{a_{\alpha,\beta}(b, zw)} \right).$$

A direct computation allows us to observe that

$$E \in \{(b, z, w)\} \to \{(b, z^p, w^q)\} \in \tilde{E}$$

is a well defined proper holomorphic mapping. Therefore, by a result of Narasimhan in [Nar] (see also [Gra]) the manifold $E$ is Stein if and only if $\tilde{E}$ is Stein. However, the Steinness of $\tilde{E}$ follows from the previous case.

(c) Now we will show that $D \times C \in \mathcal{S}$ for $D \in \{\mathbb{D}, \mathbb{D}_\ast, \mathbb{A}(r)\}$.

Suppose that $E$ is a holomorphic fiber bundle with the fiber $D \times C$ and the Stein base $\Omega = \bigcup_{\alpha} \Omega_{\alpha}$. By Theorem 10 any transition function of $E$ is of the form

$$\tau_{\alpha,\beta}(b, \lambda, z) = (b, m_{\alpha,\beta}(b, \lambda), f_{\alpha,\beta}(b, \lambda, z)), \quad (b, \lambda, z) \in (\Omega_{\alpha} \cap \Omega_{\beta}) \times D \times C.$$

It follows from Theorem 10 that $m_{\alpha,\beta}(x, \cdot) \in \operatorname{Aut}(D)$ for any $x \in \Omega_{\alpha} \cap \Omega_{\beta}$ (it may be shown that $m_{\alpha,\beta}(x, \cdot)$ does not depend on $x$ on connected components of $\Omega_{\alpha} \cap \Omega_{\beta}$).

Let $\tilde{E}$ be a holomorphic fiber bundle with the base $\Omega$ and the fiber $D$, whose transition functions $\tilde{\tau}_{\alpha,\beta} \in \operatorname{Aut}((\Omega_{\alpha} \cap \Omega_{\beta}) \times D)$ are given by the formulas:

$$\tilde{\tau}_{\alpha,\beta}(b, \lambda) = (b, m_{\alpha,\beta}(b, \lambda)), \quad (b, \lambda) \in (\Omega_{\alpha} \cap \Omega_{\beta}) \times D.$$

By Theorem 10 $\tilde{E}$ is Stein.

Now it is sufficient to observe that

$$E \ni [(x, (\lambda, z))] \to [(x, \lambda)] \in \tilde{E}$$

forms a holomorphic fiber bundle with the base $\tilde{E}$ and the fiber equal to $C$. Using again Theorem 10 we get the Steinness of the bundle $E$.

(d) To finish the proof of the theorem it suffices to show that $D = \{(z, w) \in \mathbb{C}_* \times \mathbb{C} : ||z^p|| w^q < 1\} \in \mathcal{S}$, where $p, q \geq 1$ are relatively prime natural numbers, $(p, q) \neq (1, 1)$. We proceed similarly as in the case
(b). Namely, once again we aim at reducing situation to the already solved case (c).

Observe that $D = \{(z, w) \in \mathbb{C} \times \mathbb{C} : |z^p| |w| < 1\}$, $p \geq 2$ is algebraically equivalent to $\mathbb{D} \times \mathbb{C}_*$ (take the mapping $D \ni (z, w) \mapsto (z^p w, w) \in \mathbb{D} \times \mathbb{C}_*$). Therefore we may assume that $q \geq 2$.

Suppose that $\pi : E \to B$ is a holomorphic fiber bundle. Then its transition functions must be of the form

$$\tau_{\alpha, \beta}(b, z, w) = (b, za_{\alpha, \beta}^{1/p}(b, z^p w^q), e^{i\theta_{\alpha, \beta}(b)} wa_{\alpha, \beta}^{-1/q}(b, z^p w^q)), \quad (b, z, w) \in (\Omega_\alpha \cap \Omega_\beta) \times D,$$

for some $a_{\alpha, \beta} \in O^* ((\Omega_\alpha \cap \Omega_\beta) \times \mathbb{D})$ and $\theta_{\alpha, \beta}(b) \in \mathbb{R}$. It is seen that $e^{i\theta_{\alpha, \beta}}$ may be chosen to be constant on connected components of $\Omega_\alpha \cap \Omega_\beta$. Therefore, putting

$$\tilde{\tau}_{\alpha, \beta}(b, \lambda, z) = (b, e^{i\theta_{\alpha, \beta}(b)} \lambda, za_{\alpha, \beta}^{1/p}(b, \lambda)), \quad (b, \lambda, z) \in (\Omega_\alpha \cap \Omega_\beta) \times \mathbb{D} \times \mathbb{C}_*,$$

we obtain a holomorphic fiber bundle $\tilde{E}$ with the base $\Omega$ and the fiber $\mathbb{D} \times \mathbb{C}_*$ such that a mapping given by the formula

$$(14) \quad E \ni [(x, z, w)] \mapsto [(x, z^p w^q, z)] \in \tilde{E}$$

is proper and holomorphic.

The argument used in proof of (b) finishes the proof of this case. □

4. IRRATIONAL CASE

Geometry of Reinhardt domains have been investigated in several papers (see [Shi1], [Shi2] and references contained there).

In [Kos1], the author obtained a complete characterization of proper holomorphic mappings between Reinhardt domains of irrational type. This characterization is of the key importance for our considerations. Therefore, in Theorem 14 we collect the most crucial part of it.

Using Theorem 14 we shall obtain in the proof of Theorem 15 a full description of the group of automorphisms of Reinhardt domain of irrational type. As mentioned before, it turns out that this problem is connected with the famous Pell’s equation.

Recall that any Reinhardt domain of irrational type is equivalent to a domain of the type (a), (b) or (c).

**Theorem 14** ([Kos1], see also [Shi2]). (i)

(a) If $\alpha \in \mathbb{R} \setminus \mathbb{Q}$, then the set of proper holomorphic mappings between $D_{\alpha, r}$ and $D_{\beta, R}$ is non-empty if and only if

$$\frac{\log R}{\log r} \in \mathbb{Z} + \beta \mathbb{Z} \quad \text{and} \quad \frac{\alpha \log R}{\log r} \in \mathbb{Z} + \beta \mathbb{Z}.$$
(b) Let \( \alpha, \beta \in \mathbb{R} \setminus \mathbb{Q} \), and \( r, R > 1 \) be such that \( \frac{\log R}{\log r} = k_1 + l_1 \beta \) and \( \alpha \frac{\log R}{\log r} = k_2 + l_2 \beta \) for some integers \( k_i, l_i, i = 1, 2 \). Then any proper holomorphic mapping \( f : D_{\alpha,r} \to D_{\beta,R} \) is one of two following forms:

\[
\begin{cases}
  f(z) = (az_1^{k_1}z_2^{k_2}, bz_1^{l_1}z_2^{l_2}) & \text{or} \\
  f(z) = (az_1^{-k_1}z_2^{-k_2}, bz_1^{-l_1}z_2^{-l_2})
\end{cases}
\]

where \( a, b \in \mathbb{C} \) satisfy the equality \( |a||b|^\beta = 1 \).

(ii) Let \( \alpha, \beta \in \mathbb{R} \setminus \mathbb{Q} \). The set of proper holomorphic mappings between \( D_\alpha^* \) and \( D_\beta^* \) is non-empty if and only if \( \alpha = (k_2 + \beta l_2)/(k_1 + \beta l_1) \) for some \( k_i, l_i \in \mathbb{Z} \), \( i = 1, 2 \). Moreover, if \( \alpha = (k_2 + \beta l_2)/(k_1 + \beta l_1) \), where \( k_1 + l_1 \beta > 0 \), then any proper holomorphic mapping \( f : D_\alpha^* \to D_\beta^* \) is of the form

\[
f(z_1, z_2) = (az_1^{k_1}z_2^{k_2}, bz_1^{l_1}z_2^{l_2}), \quad (z_1, z_2) \in D_\alpha^*,
\]

where \( a, b \in \mathbb{C} \) satisfy the equality \( |a||b|^\beta = 1 \).

(iii) Let \( \alpha, \beta \in \mathbb{R} \setminus \mathbb{Q} \).

(a) If \( \alpha > 0, \beta > 0 \), then the set \( \text{Prop}(D_\alpha, D_\beta) \) is non-empty if and only if \( \alpha = p\beta \) for some \( p \in \mathbb{Q}_{>0} \). In this case all proper holomorphic mappings between \( D_\alpha \) and \( D_\beta \) are of the form

\[
(z_1, z_2) \to (z_1^k, z_2^l),
\]

where \( k, l \) are positive integers such that \( p = \frac{l}{k} \).

(b) If \( \alpha < 0, \beta < 0 \), then the set \( \text{Prop}(D_\alpha, D_\beta) \) is non-empty if and only if \( \alpha = p_1 + \beta p_2 \) for some rational \( p_1, p_2 \), \( p_2 \neq 0 \). In this case proper holomorphic mappings between \( D_\alpha \) and \( D_\beta \) are of the form

\[
(z_1, z_2) \to (z_1^{k_1}z_2^{k_2}, z_1^{l_1}z_2^{l_2}),
\]

where \( k_1, k_2, l, k_1 > 0 \), are integers such that \( p_1 = \frac{k_2}{k_1}, i p_2 = \frac{l}{k_1} \).

(c) If \( \alpha \beta < 0 \), then there is no proper holomorphic mapping between \( D_\alpha \) and \( D_\beta \).

Our aim in this part of the paper is to show the following

**Theorem 15.** Let \( \alpha \in \mathbb{R} \setminus \mathbb{Q} \). Then

(a) \( D_\alpha^* \notin \mathfrak{S} \) if and only if \( \alpha = p \pm \sqrt{q} \) for some \( p, q \in \mathbb{Q} \), \( q > 0 \),

(b) \( D_\alpha \in \mathfrak{S} \) for any \( \alpha \in \mathbb{R} \setminus \mathbb{Q} \),

(c) \( D_{\alpha,r} \in \mathfrak{S} \) for any \( \alpha \in \mathbb{R} \setminus \mathbb{Q} \), \( r > 1 \).

**Proof.** (a) It follows from Theorem 14 that every automorphism of the domain \( D_\alpha^* \) is of the form

\[
(z_1, z_2) \to (az_1^{k_1}z_2^{k_2}, bz_1^{l_1}z_2^{l_2}),
\]

\(^3\text{Prop}(D, G) \) denotes the set of proper holomorphic mappings between \( D \) and \( G \).
where \(|a|b|^\alpha = 1\) and \(k_1, k_2, l_1, l_2 \in \mathbb{Z}\) are such that \(k_1l_2 - k_2l_1 = \pm 1\), 
\(\alpha = (k_2 + l_2\alpha)/(k_1 + l_1\alpha)\) and \(k_1 + l_1\alpha > 0\).

These conditions imply that if \(\alpha\) is not of the form \(p\pm\sqrt{q}\) for any rational \(p, q\), then \(k_1 = l_2 = 1\) and \(k_2 = l_1 = 0\). In other words any automorphism of \(D_0^*\) is of the form \((z_1, z_2) \rightarrow (az_1, bz_2)\), \(a, b \in \mathbb{C}\), \(|a|b|^\alpha = 1\). Therefore, the plurisubharmonic function \(u\) given by the formula

\[
u(z_1, z_2) = \max \left\{ \frac{1}{1 - |z_1||z_2|^\alpha}, \log |z_1|, -\log |z_1|, \log |z_2|, -\log |z_2| \right\},
\]

\((z_1, z_2) \in D_0^*,\) satisfies the Stehlé criterion, hence \(D_0^* \in \mathcal{S}\).

Suppose now that \(\alpha = \frac{p}{n} \pm \sqrt{\frac{q}{n^2}}\) for some \(p, q \in \mathbb{Z}\), \(q > 0\), \(n \in \mathbb{N}\).

We are looking for \(k_i, l_i \in \mathbb{Z}\), \(k_1 + \alpha l_1 \geq 0\) such that (20) defines an automorphism of \(D_0^*\). Then the following equations are satisfied

(21)

\[
\begin{align*}
k_2 &= l_1 \left( \frac{q}{n^2} - \frac{p^2}{n^2} \right), \\
l_2 &= k_1 + 2 \frac{p}{n} l_1, \quad \text{and} \quad |k_1l_2 - k_2l_1| = 1.
\end{align*}
\]

Consider the so-called Pell’s equation of the following form:

(22)

\[n^2 q = \frac{x^2 - 1}{y^2}.\]

It was shown by Lagrange that (22) has infinitely many integer solutions (recall that \(q\) is not a square of a natural number). Let \(x, y, x, y > 0\), denote the arbitrary natural solution of this equation. Put

(23) \(l_1 = n^2 y, \quad k_1 = x - p n y, \quad k_2 = y(q - p^2), \quad \text{and} \quad l_2 = x + p n y.\)

It is a direct consequence of (22) that \(x \pm n y \sqrt{q} > 0\), hence \(k_1 + \alpha l_1 > 0\). An easy computation shows that each condition in (21) is satisfied by such chosen integers \(k_i, l_i, i = 1, 2.\)

Moreover \(\text{Tr} \begin{pmatrix} k_1 & k_2 \\ l_1 & l_2 \end{pmatrix} > 2\) so it follows from Theorem 1 in [Zaf] that \(D \not\in \mathcal{S}\).

(b) It follows from Theorem 14 that any automorphism of \(D_0\) is elementary algebraic. The automorphisms must also preserve the axis \(\{0\} \times \mathbb{C}_*\) (when \(\alpha > 0\) additionally the axis \(\mathbb{C} \times \{0\}\) is also preserved). From this piece of information one may conclude that any automorphism of domain \(D_0\) is of the form

(24) \((z_1, z_2) \rightarrow (az_1, bz_2), \quad (z_1, z_2) \in D_0,\)
Example 16. Put formulas (where $a, b \in \mathbb{D}$) of $i \in \mathbb{C}$ satisfy the criterion of Stehlé. Applying the Cauchy’s formula we infer that $(\text{25})$.

(c) Similarly as before we easily find from Theorem 14 that the group of automorphisms of $D_{\alpha,r}$ consists of the mappings of the form:

\[(z_1, z_2) \rightarrow (a z_1^\epsilon, b z_2^\epsilon), \quad (z_1, z_2) \in D_{\alpha,r},\]

where $\epsilon = \pm 1$ and $a, b \in \mathbb{C}$, $|a||b| = 1$. Thus the function

\[u(z_1, z_2) = \max \left\{ \frac{|z_1||z_2|^\alpha}{r|z_1||z_2|^\alpha - 1}, \frac{1}{r - |z_1||z_2|^\alpha}, \log|z_1|, \log|z_2| \right\},\]

$(z_1, z_2) \in D_{\alpha}$, satisfies the criterion of Stehlé. \[\Box\]

5. The case when $D \cap \mathbb{C}^n$ is hyperbolic

For a pseudoconvex Reinhardt domain $D$ in $\mathbb{C}^n$ let $I(D)$ denote the set of $i = 1, \ldots, n$, for which the intersection $(\mathbb{C}^{i-1} \times \{0\} \times \mathbb{C}^{n-i}) \cap D$ is not hyperbolic (viewed as a domain in $\mathbb{C}^{n-1}$). Put

\[(\text{26}) \quad D^{\text{hyp}} = D \setminus \left( \bigcup_{i \in I(D)} (\mathbb{C}^{i-1} \times \{0\} \times \mathbb{C}^{n-i}) \right).\]

With a Reinhardt domain $D$ we associate the following constant:

\[t(D) := \text{ the number of } i = 1, \ldots, n, \text{ such that } D \cap (\mathbb{C}^{i-1} \times \{0\} \times \mathbb{C}^{n-i}) \neq \emptyset.\]

Example 16. Put $D_1 := \{(z, w) \in \mathbb{C} \times \mathbb{C} : |z| < 1, |zw| < 1\}$ and $D_2 := \{(z, w) \in \mathbb{C} \times \mathbb{C} : |z| < 1, |zw| < 1\}$. Then both $D_1$ and $D_2$ are non-hyperbolic. Observe that $t(D_1^{\text{hyp}}) = 1$ and $t(D_2^{\text{hyp}}) = 0$.

For a non-hyperbolic pseudoconvex Reinhardt domain $D \subset \mathbb{C}^2$ such that $D^{\text{hyp}}$ is hyperbolic the number $t(D^{\text{hyp}})$ is equal either to 1 or to 0.

First we shall focus our attention on the case $t(D^{\text{hyp}}) = 1$. We start with the following

Lemma 17. Let $D$ be a non-hyperbolic, pseudoconvex Reinhardt domain in $\mathbb{C}^2$. Assume that the logarithmic image of $D$ contains no affine line and the group of automorphisms of $D^{\text{hyp}}$ is compact. Then $\text{Aut}(D)$ is also compact.

Proof. Take any sequence $(\varphi_n)_n \subset \text{Aut}(D)$. Since for any $\varphi \in \text{Aut}(D)$ the restriction $\varphi|_{D^{\text{hyp}}}$ is an automorphism of $D^{\text{hyp}}$ (see e.g. [Kos2], Theorem 8), we may assume that $(\varphi_n|_{D^{\text{hyp}}})_n$ is convergent locally uniformly on $D^{\text{hyp}}$.

Applying the Cauchy’s formula we infer that $(\varphi_n)_n$ is convergent to some
The problem of a characterization of automorphism groups of bounded Reinhardt domains was studied in [Shi1] (see also [Isa-Kra], [Isa-Kru] and papers quoted there).

The results obtained in [Shi1] and [Kru] together with remarks from [Pfl-Zwo] lead us to the description of pseudoconvex hyperbolic Reinhardt domains with \( t = 1 \) and non-compact automorphism group. For our future use we recall here the version formulated in [Pfl-Zwo].

**Theorem 18** (see [Kru], [Shi1] and [Pfl-Zwo], Theorem 4). Let \( D \) be a hyperbolic, pseudoconvex Reinhardt domain with \( t(D) = 1 \). Then \( \text{Aut}(D) \) is non-compact if and only if \( D \) is algebraically equivalent to one of the following domains:

(a)  \( D \times A(r,1) \), where \( 0 \leq r < 1 \). In this case the group of automorphisms consists of the mappings of the form \( D \ni (z_1,z_2) \mapsto (a(z_1),b(z_2)) \in D \), where \( a \in \text{Aut}(D) \) and \( b \in \text{Aut}(A(r,1)) \).

(b)  \( \{ (z_1,z_2) \in \mathbb{C}^2 : |z_1| < 1, 0 < |z_2| < (1 - |z_1|^2)^{p/2} \} \), \( p > 0 \). In this case the group of automorphisms consists of the mappings of the form \( D \ni (z_1,z_2) \mapsto (\alpha z_1 - \beta, \gamma (1 - |\beta|^2)^{p/2} z_2) \in D \), where \( |\alpha| = |\gamma| = 1 \), \( \beta \in \mathbb{C} \).

(c)  \( \{ (z_1,z_2) \in \mathbb{C}^2 : 0 < |z_2| < \exp(-|z_1|^2) \} \). In this case the group of automorphisms consists of the mappings of the form \( D \ni (z_1,z_2) \mapsto (\alpha z_1 + \beta, \gamma \exp(-2\alpha \bar{\beta} z_1 - |\beta|^2) z_2) \in D \), where \( |\alpha| = |\gamma| = 1 \), \( \beta \in \mathbb{C} \).

The following lemma will be also needed:

**Lemma 19** (see [Kos2], Theorem 2). Let \( D, G \) be pseudoconvex Reinhardt domains in \( \mathbb{C}^2 \). Let \( \varphi : D \to G \) be a proper holomorphic mapping. Assume that the logarithmic images of domains \( D \) and \( G \) contain no affine lines. Then

\[ \varphi(D^{\text{hyp}}) \subset G^{\text{hyp}} \]

and the restriction

\[ \varphi|_{D^{\text{hyp}}} : D^{\text{hyp}} \to G^{\text{hyp}} \]

is proper.

**Theorem 20.** Let \( D \subset \mathbb{C}^2 \) be a pseudoconvex non-hyperbolic Reinhardt domain with \( t(D^{\text{hyp}}) = 1 \). Assume additionally that the logarithmic image of the domain \( D^{\text{hyp}} \) contains no affine lines. Then the group of automorphism of domain \( D \) is compact. In particular, the answer to the Serre problem for the domain \( D \) is positive.

**Proof.** In view of Lemma 17 it suffices to prove the theorem for domain \( D \) under the additional assumption that \( \text{Aut}(D^{\text{hyp}}) \) is non-compact. Then it
is a consequence of Theorem 18 that up to a multiplying and a permutation of components $D$ must have the form:

(a) $\{ (z_1, z_2) \in \mathbb{C}^2 : |z_1 z_2^k| < 1, |z_2| < 1 \}$, where $k \in \mathbb{Z}_{>0}$.

(b) $\{ (z_1, z_2) \in \mathbb{C}^2 : |z_1 z_2^k| < 1, |z_2| < (1 - |z_1 z_2^k|^2)^{p/2} \}$, for some $p > 0$, $k \in \mathbb{Z}_{>0}$.

(c) $\{ (z_1, z_2) \in \mathbb{C}^2 : |z_2| < \exp(-|z_1 z_2^k|^2)) \}$, $k \in \mathbb{Z}_{>0}$.

Moreover (see Lemma 19) any automorphism of the domain of one of the forms presented above preserves the axis $\mathbb{C} \times \{0\}$. This fact and Theorem 18 lead to the statement that the group of automorphisms of the domain $D$ in all cases (a), (b) and (c) consists of the mappings of the form

$$D \ni (z_1, z_2) \rightarrow (az_1, bz_2) \in D,$$

where $|a| = |b| = 1$. Therefore $\text{Aut}(D)$ is compact in all cases; a contradiction.

Let us pass to the remaining case $t(D^{hyp}) = 0$. An important role in our approach is played by the following result

**Theorem 21** (see [Kru], [Shi]). $\text{Aut}(D) = \text{Aut}_{alg}(D)$ for any pseudoconvex hyperbolic Reinhardt domain $D \subset \mathbb{C}^n$.

**Theorem 22.** Let $D \subset \mathbb{C}^2$ be a non-hyperbolic pseudoconvex Reinhardt domain such that $D^{hyp}$ is hyperbolic and $t(D^{hyp}) = 0$. Then $D \in \mathcal{S}$.

Moreover, the group of automorphism of $D$ is non-compact if and only if, up to a permutation on components, $D$ is contained in $\mathbb{C} \times \mathbb{C}^*$, $\{0\} \times \mathbb{C}^* \subset D$ and

$$\log D = \{ (t, s) : t < \psi(s), \ s \in \mathbb{R} \},$$

where $\psi : \mathbb{R} \rightarrow \mathbb{R}$ is a concave function satisfying the property $\psi(\beta + s) - \psi(s) = \alpha + ks$, $s \in \mathbb{R}$ for some $\alpha, \beta \in \mathbb{R}$, $\beta \neq 0$, $k \in \mathbb{Z}_*$.

**Proof.** Using the inclusion $\text{Aut}(D) \mid_{D^{hyp}} \subset \text{Aut}(D^{hyp})$ (Lemma 19) and Theorem 21 we state that any automorphism of $D$ must be algebraic. Moreover, at least one of the axis $\{0\} \times \mathbb{C}^*$, $\mathbb{C}^* \times \{0\}$ must be contained in $D$ (otherwise $D$ would be hyperbolic).

Suppose that both axes are contained in $D$. Then, since any automorphism of $D$ maps the axes onto the axes (use Lemma 19), we see that the group $\text{Aut}(D)$ consists of the mappings of the form

$$D \ni (z_1, z_2) \rightarrow (az_1, bz_2) \in D \quad \text{or}$$

$$D \ni (z_1, z_2) \rightarrow (az_2, bz_1) \in D.$$

(29)

for suitable $a, b \in \mathbb{C}^*$. We shall show that $|a| = |b| = 1$ in the case (28). Moreover, we shall prove that there is $R > 0$ such that for any automorphism...
satisfying (29) $|a| = R$ and $|b| = 1/R$. This in particular means that $\text{Aut}(D)$ is compact.

Let us take any $\varphi \in \text{Aut}(D)$ of the form (28).

Assume a contrary, i.e. $(\log |a|, \log |b|) \neq (0,0)$. For $n \in \mathbb{N}$ put $\varphi^{(n)} = \varphi \circ \ldots \circ \varphi \in \text{Aut}(D)$ and $\varphi^{-(n)} = (\varphi^{-1})^{(n)}$. Since $\varphi^{(n)}(z_1, z_2) = (a^n z_1, b^n z_2) \in D$ for any $(z_1, z_2) \in D$ passing to the logarithmic image of the domain $D$ easily shows that $\mathbb{R}(\log |a|, \log |b|) + \log D \subset \log D$. This is in a contradiction with the hyperbolicity of $D^{hyp}$.

Assume that $\varphi : (z_1, z_2) \to (az_2, bz_1)$ is an automorphism of the domain $D$. Repeating the previous reasoning applied to an automorphism $\varphi^{(2)}(z_1, z_2) = (abz_1, abz_2)$ we immediately see that $|ab| = 1$. Therefore it suffices to show that for any other automorphism $\tilde{\varphi} : (z_1, z_2) \to (a_1 z_2, b_1 z_1)$ of $D$ the following relations holds: $|a_1| = |a|$ and $|b_1| = |b|$. However, these relations also follows from the above reasoning applied to $\tilde{\varphi} \circ \varphi(z_1, z_2) = (a_1 b z_1, a_1 b_1 z_2)$.

This finishes the proof of the compactness of $\text{Aut}(D)$ in this case.

Suppose that only one axis is contained in $D$, e.g. $\{0\} \times \mathbb{C}_* \subset D$. We use the idea applied by P. Pflug and W. Zwonek in [Pfl-Zwo].

Assume that the group $\text{Aut}(D)$ is non-compact. Note that $D \cap (\mathbb{C} \times \{0\}) = \emptyset$. As before, using the fact that automorphisms preserve the axis (Lemma 19), we see that $\text{Aut}(D)$ consists of the mappings of the form

(30) \[ \Phi = \Phi_{a,b,k,\epsilon} : (z_1, z_2) \to (az_1 z_2^k, b z_2^\epsilon) \]

for some $a, b \in \mathbb{C}_*, \epsilon = \pm 1$ and $k \in \mathbb{Z}$.

(†) We shall show that there exists an automorphism $\Phi_{a,b,k,\epsilon}$ of the domain $D$ with $|b| \neq 1$ and $\epsilon = 1$ (then also $k \neq 0$).

First observe that there is an automorphism of the domain $D$ of the form (30) with $k \neq 0$. To show it repeat the argument from the first part of the proof to observe that $|a| = |b| = 1$ for any automorphism $\Phi_{a,b,0,1}$. Moreover, there exists $R > 0$ such that $|a| = R, |b| = 1/R$ for any automorphism $\Phi_{a,b,0,-1}$. So if there were no automorphisms of the form (30) with $k \neq 0$, then the group $\text{Aut}(D)$ would be compact.

If there is an automorphism $\Phi$ of $D$ of the form (30) with $\epsilon = 1$ and $k \neq 0$, we are done. Actually, $\Phi^{(n)}(z_1, z_2) = (a^n b^{kn(n-1)/2} z_1 z_2^n, b^n z_2)$ and using the hyperbolicity of $D^{hyp}$ once again, we find that $|b| \neq 1$.

Thus, to prove (†) it suffices to consider the case when any automorphism of the form (30) with $k \neq 0$ satisfies $\epsilon = -1$. Since $\Phi^{(2n)}_{a,b,k,1}(z_1, z_2) = ((a^2 b^k)^n z_1, z_2)$, we see that $|a^2 b^k| = 1$. So there is an automorphism $\Phi_{a,b,k,-1}$ such that $|b| \neq |b|$ or $k \neq k$ (as $\text{Aut}(D)$ is non-compact). Let us compute

$\Phi_{a,b,k,-1} \circ \Phi_{a,b,k,1} = \Phi_{a a^2 b^k b^{-k}, k,k,1}$. 

If $|\tilde{b}| \neq |b|$, then the statement is clear. Otherwise $k \neq \tilde{k}$. But this is in a contradiction with the assumption that any automorphism of the form (30) with $k \neq 0$ satisfies $\epsilon = -1$.

So we have shown (~). Properties of pseudoconvex Reinhardt domains imply that for any $s \in \mathbb{R}$ there is (exactly one) $\psi(s) \in \mathbb{R}$ such that $(\psi(s), s) \in \partial \log D$. Moreover, it is an immediate consequence of the inclusion $\{0\} \times \mathbb{C}_* \subset D$ and convexity of $\log D$ that the function $\psi(s)$ is concave. Put

$$v(z_1, z_2) = \log |z_1| - \psi(\log |z_2|).$$

For fixed $(z_1, z_2) \in D \cap \mathbb{C}^2$ put $(t, s) = (\log |z_1|, \log |z_2|)$. Let $\Phi = \Phi_{a', b', k', \epsilon}$ be an arbitrary automorphism given by the formula (30).

Denote $(t', s') = (\log |\Phi_1(z)|, \log |\Phi_2(z)|)$. It is seen that $(t', s') = (\log |a'| + t + k's, \log |b'| + \epsilon s)$.

Since $\Phi((\partial D) \cap \mathbb{C}^2)) = (\partial \Phi(D)) \cap \mathbb{C}^2$, we see that

$$\psi(s') + t' = \psi(s) + t.$$ In other words,

$$v \circ \Phi = v \quad \text{for any} \quad \Phi \in \text{Aut}(D).$$

Define

$$u(z_1, z_2) = \max \left\{ \log |z_2|, -\log |z_2|, -(v(z_1, z_2))^{-1} \right\}, \quad (z_1, z_2) \in D.$$}

A direct calculation (approximate and compute the Levi form) shows that $u$ is plurisubharmonic. Moreover, $u$ is an exhausting function for $D$. In view of (32) $u$ satisfies the criterion of Stéhlé.

Using (~) and the property (31) once again we find that $\psi(\log |b| + s) - \psi(s) = \log |a| + ks$. From this we obtain a desired properties of the function $\psi$.

Conversely, having a domain $D \subset \mathbb{C} \times \mathbb{C}_*$ satisfying (27) one may easily see that the mapping $\Phi$ given by the formula (30) with $b = e^{\beta}$, $a = e^{\alpha}$, $\epsilon = 1$ is an automorphism of the domain $D$. The investigation of $\Phi(a)$ immediately proves a non-compactness of $\text{Aut}(D)$.

6. $\mathbb{C} \times \mathbb{C}_*$

In 1977 a negative answer to the Serre problem was given by H. Skoda who proved that $\mathbb{C}^2 \notin \mathcal{G}$. This construction was improved in [Dem1] by J.P. Demailly who proved that polynomial automorphisms of $\mathbb{C}^2$ may serve as the transition function. Later in [Dem2] J.P. Demailly constructed a counterexample to the Serre problem with a plane or a disc as a base.

Let us recall here this construction. The base $\Omega$ is a domain containing $3\mathbb{D}$. Put $\Omega_0 = \Omega \setminus \{-1, 1\}$, $\Omega_1 = \Omega_0 \cup \{1\}$, $\Omega_2 = \Omega_0 \cup \{-1\}$. The transition
functions $\tau_{i,j} : \Omega_i \times \mathbb{C}^2 \to \Omega_j \times \mathbb{C}^2$, $i \neq j$ of the fiber bundle $E$ are defined as follows:

\[
\tau_{0,1}(x; z_1, z_2) = (x; z_1, z_2 \exp(z_1 u(x))),
\]

\[
\tau_{0,2}(x; z_1, z_2) = (x, z_1 \exp(z_2 u(x))),
\]

and $\tau_{1,2} = \tau_{0,1}^{-1} \circ \tau_{0,2}$, where $u(x) = \exp(\frac{x}{x^2-1})$. It is clear that any plurisubharmonic function $V$ on $E$ induces plurisubharmonic $V_j$ such that $V_j = V_k \circ \tau_{k,j}$.

The idea of the proof relied upon comparing the maximum of the functions $V_j$ over the polidiscs $\frac{1}{2} \mathbb{D} \times (r \mathbb{D})^2$, $r \gg 1$. More precisely, it was shown that

\[
M(V_0, \frac{1}{2} \mathbb{D}, \exp(r/32)) \leq M(V_0, \frac{1}{2} \mathbb{D}, \exp(\log^3 r)) + C, \quad r \gg 1,
\]

where $M(V, \omega, r) = \max_{\omega \times (r \mathbb{D})^2} V$ and the constant $C$ does not depend on $r$. The key role was played by the logarithmic convexity of the functions $(\rho, r) \to M(V, \rho \mathbb{D}, r)$, $V \in \mathcal{PSH}(\Omega \times \mathbb{C}^2)$.

Direct computations allows us to obtain logarithmic convexity of the function $(\rho, r) \to \max_{\rho \mathbb{D} \times (r \mathbb{D} \times A(r))} \tilde{V}$ for any $\tilde{V} \in \mathcal{PSH}(\Omega \times \mathbb{C} \times \mathbb{C}_*)$. Therefore considering $\tilde{M}$ instead of $M$, where $\tilde{M}(V, \omega, r) = \max_{\omega \times (r \mathbb{D} \times A(r))} V$ and repeating the reasoning from Demailly’s paper we may replace $M$ by $\tilde{M}$ in the inequality (33). This, together with mentioned above logarithmic convexity of $\tilde{M}$ immediately shows that $\mathbb{C} \times \mathbb{C}_*$ does not belong to $\mathcal{G}$.

7. Proofs of the main theorems

Proof of Theorem 1. The result follows from Theorem 12, Theorem 15, Theorem 20 and Theorem 22.

Proof of Theorem 3. It is clear that if $\log D$ contains an affine line, then the group $\text{Aut}(D)$ is non-compact.

In the case when $\log D$ contains no affine lines (i.e. $D^{hyp}$ hyperbolic) the result follows immediately from Theorems 20 and 22.
