Abstract

Two species of *Acanthobothrium* (Onchoproteocephalidea: Onchobothriidae) are described from the spiral intestine of *Narcine entemedor* Jordan & Starks, 1895, in Bahía de Acapulco, Acapulco, Guerrero, Mexico. Based on the four criteria used for the identification of species of *Acanthobothrium*, *A. soniae* sp. nov. is a Category 2 species (less than 15 mm in total length with less than 50 proglottids, less than 80 testes, and with the ovary asymmetrical in shape). *Acanthobothrium vidali* sp. nov. is a Category 6 species (more than 15 mm in total length with more than 50 proglottids, fewer than 80 testes, and the ovary is asymmetrical). The new species differ from similar species from the Pacific Ocean by total length, the number of proglottids, diameter of the accessory sucker, the length of the cirrus sac, the number of testes per proglottid and the measurements of hooks. With the recognition of *A. soniae* sp. nov. and *A. vidali* sp. nov., 42 species of *Acanthobothrium* have been reported from the Pacific coast of the Americas. This is the first report of species of *Acanthobothrium* from a member of *Narcine* from Mexico and it brings the number of species reported from elasmobranchs from the Pacific Coast of Mexico to 13.

Introduction

Acanthobothrium Blanchard, 1848 is one of the richest genera within Onchoproteocephalidea (Maleki et al. 2013; Caira et al. 2017), but relatively few occurrences have been documented in Mexico. To date, the best-studied locality is the Gulf of California (Sea of Cortez; Mar de Cortés, Golfo de California) with the descriptions of 10 species (Appy and Dailey 1973; Caira and Burge 2001; Caira and Zahner 2001; Ghoshroy and Caira 2001). The only other species known from the Pacific Coast of Mexico was described from the more southern state of Jalisco (Monks et al. 1996) (see Merlo-Serna and García-Prieto 2016). More recently, A. cartagenensis Brooks & Mayes, 1980 was reported from Quintana Roo, Mexico (Caribbean) (Monks et al. 2015a) and A. marquesi was described from Campeche, Mexico (Gulf of Mexico) by Rodríguez-Ibarra et al. (2018). As part of a collaborative project to extend the knowledge of the helminth fauna of marine fishes in Mexico, rays were collected from the coastal waters off Acapulco, Guerrero, a region with few studies of the parasites of rays. There are six reports of parasites of rays from Acapulco, none for Acanthobothrium (see Merlo-Serna and García-Prieto 2016). In this paper, two new species of Acanthobothrium are described from Narcine entemedor Jordan & Starks, 1895 (Elasmobranchii: Torpediniformes: Narcinidae); one Category 2 species (Ghoshroy and Caira 2001) and one Category 6 species. The new species constitute the first records from the Southern Pacific Coast of Mexico and the first record of species of Acanthobothrium reported in Narcine entemedor from Mexico.

Materials and methods

Eleven recently killed specimens of Narcine entemedor Jordan & Starks, 1895 (Giant electric ray or Cortez Numbfish) were purchased from local fishermen at Playa Las Hamacas, Bahía de Acapulco, Guerrero (16°51’10.80”N, 99°53’59.02”W) in February, April, May, June 2011 and June 2012. Rays were transported to the laboratory (Universidad Autónoma de Guerrero, Unidad Académica de Ecología Marina) in ice chests containing ice where the spiral intestine was removed and opened by longitudinal incision. Collection, preservation and mounting follow Monks et al. (2015b). Stained specimens were examined using a compound photomicroscope (Leica DM-LB2) equipped with both normal light optics and differential interference contrast (DIC-Nomarski) optics. Figures were drawn with the aid of a drawing tube. Measurements are presented as ranges and number of specimens from which the measurements were taken is given in parentheses. Hook measurements follow Euzet (1959) as modified by Ghoshroy and Caira (2001). Measurements are in micrometers unless otherwise stated. Other hook terminology follows that of Caira (1985). Designation of proglottid apolysis follows Caira et al. (1999) and Franzese and Ivanov (2018). Microtriches on the scolex and peduncle were not examined using SEM, so they are referred to by the general name “microtriches” without qualifying them as proposed by
Chervy (2009). The categorical method suggested by Ghoshroy and Caira (2001) and Fyler and Caira 2006 was used to facilitate comparisons among species of Acanthobothrium from the Eastern Pacific Ocean and other congers with similar morphological characters described in the Pacific Ocean. Specimens from several museums were examined, the acronyms are as follows:

**CNHE** (Colección Nacional de Helmintos del Instituto de Biología, Universidad Nacional Autónoma de México, México);

**HWML** (University of Nebraska State Museum, Harold W. Manter Laboratory, Division of Parasitology, Lincoln, Nebraska, USA);

**CHE** (Colección de Helmintos, Centro de Investigaciones Biológicas, Universidad Autónoma del Estado de Hidalgo, Pachuca, México).

Type material was deposited in CNHE (holotype and paratypes), HWML (paratypes), and CHE (paratypes). Application and validity of scientific names, authorities, and common names of fish are in accord with Froese and Pauly (2018) and Last et al. (2016).

Figures 1A–E; 2A–D

**Type material.** Holotype (CNHE-11136), 3 paratypes (CNHE-11137), 3 paratypes (HWML-139978), and 1 paratype (CHE-P00081).

**Other material examined.** Acanthobothrium bullardi Ghoshroy & Caira, 2001 (CNHE–4046, México) paratype; A. campbelli Marques, Brooks & Monks, 1995 (CNHE–3033, Costa Rica; HWML–38546, Costa Rica) voucher and paratype; A. costarricense Marques, Brooks & Monks, 1995 (CNHE–3034, Costa Rica) 2 vouchers; A. dasi Ghoshroy & Caira, 2001 (CNHE–4044, México; HWML–15549, 15550, 15551, México) 4 paratypes; A. franus Marques, Centritto & Stewart, 1997 (CNHE–3140, Costa Rica) paratype; A. inbiorium Marques, Centritto & Stewart, 1997 (CNHE–3138, Costa Rica) paratype; A. puntarenasense Marques, Brooks & Monks, 1995 (CNHE–4176, Costa Rica) paratype; A. rajivi Ghoshroy & Caira, 2001 (CNHE–4039, México) paratype; A. vargasi Marques, Brooks & Monks, 1995 (HWML 38545, Costa Rica).
Figure 1. Holotype of *Acanthobothrium soniae* sp. nov. (CNHE-11136). A Scolex B hooks C mature proglottid D terminal proglottid E genitalia. Scale bars: 200 µm (A, D); 100 µm (B, E); 150 µm (C).

**Type host.** *Narcine entemedor* Jordan & Starks, 1895 (Elasmobranchii: Torpediformes: Narcinidae).

**Type locality.** Bahía de Acapulco (Playa Las Hamacas: 16°51'11"N, 99°53'59"W), Guerrero, México.

**Site of infection.** Spiral intestine.

**Quantitative descriptors of parasite populations (Bush et al. 1997).** Prevalence = 9.0% (1 ray of 11 was infected); abundance = 0.73 (8 helminths in 11 rays); mean intensity = 8 (8 helminths in 1 infected ray).

**Etymology.** The species is named in remembrance of Sonia Virginia Flores León, former player of the Pumas Club Women’s Basketball Team, UNAM, daughter of Virginia León-Régagnon and Martín Ignacio Flores-Carbajal and dear friend of SM and GP-F; she will not be forgotten.

**Diagnosis.** *Acanthobothrium soniae* sp. nov. is a Category 2 species. It is small, with a range of 10–13 acraspedote proglottids. The testes are wider than long with a range of
Two new species of Acanthobothrium in Narcine entemedor from Mexico

31–47 testes per proglottid. The arms of the ovary are unequal (asymmetrical). Finally, this species also can be distinguished from similar congeners by total length, number of proglottids, diameter of accessory sucker, the length of the cirrus sac, number of testes per proglottid, and size of the hooks.

**Description.** [Based on 5 complete worms and 3 partial specimens] Worms 2.9–6.7 mm (n = 5) long, euapolytic; 10–13 (n = 5) proglottids per worm. Scolex 380–420 (n = 6) long by 280–320 (n = 6) wide, with four bothridia. Maximum width of scolex at level of middle loculus (Figs 1A, 2A). Bothridia free posteriorly, tri-locular, 340–380 (n = 6) long by 140–160 (n = 6) wide, with anterior muscular pad (Figs 1A, 2A). Muscular pad 105–130 (n = 6) wide, with apical sucker 45–50 (n = 6) and one pair of bipronged hooks at posterior margin (Figs 1A, 2A). Anterior loculus of bothridia 175–205 (n = 6) long; middle loculus 60–90 (n = 6) long; posterior loculus 80–95 (n = 6) long (Figs 1A, 2A); loculus length ratio (anterior:middle:posterior) 1:0.38:0.46. Velum between medial margins of bothridia in dorsal or ventral pairs not seen (Figs 1A, 2A). Hooks bipronged, hollow, with tubercle on proximal surface of axial prong; internal channels of axial and abaxial prongs continuous, smooth, the base and anterior part of each hook embedded in musculature of scolex, tips of prongs free (Figs 1A, B, 2A). Bases (handles) of medial and lateral hooks articulate to one another (Figs 1B, 2A).
2A). Lateral hook measurements (n = 6): A 43–45, B 88–105, C 83–93, D 125–138; Medial hook measurements (n = 6): A’ 38–45, B’ 83–108, C’ 80–98, D’ 125–143. Cephalic peduncle 450–630 (n = 6) long by 70–95 (n = 6) wide, not all the cephalic peduncle is covered with prominent microtriches (Figs 1A, 2C). Scolex is covered with microtriches (Fig. 2B). Proglottids acraspedote. Immature proglottids 55–110 (n = 8) long by 60–115 (n = 8) wide, mature proglottids 225–800 (n = 8) long by 125–215 (n = 8) wide (Fig. 1C), terminal proglottids 585–1,425 (n = 7) long by 160–275 (n = 7) wide (Fig. 1D). Genital pore marginal, irregularly alternating, 56%–68% (n = 7) from anterior end of proglottid; genital atrium present (Fig. 1E). Testes in single layer, arranged in two irregular columns, one on each side of the uterus (Fig. 1C, D). Testes generally wider than long in mature proglottids, 25–63 (n = 8) long by 13–28 (n = 8) wide (Fig. 1C). Total number of testes 31–47 (n = 8), aporal 16–26 (n = 8), poral 15–21 (n = 8), preporal 11–17 (n = 8), and postporal 3–5 (n = 8); all testes located anterior to ovarian isthmus. Cirrus sac pyriform, extending anteriorly (Figs 1C, D, E, 2D), 55–90 (n = 6) long by 63–96 (n = 6) wide in mature proglottids, 85–140 (n = 6) long by 48–90 (n = 6) wide in terminal proglottids. Cirrus armed.

Vagina extending laterally from common genital atrium, following anterior margin of cirrus sac, weakly sinuose posteriorly along medial line of proglottid to oötype (Figs 1C, D, E, 2D); vaginal sphincter absent. Seminal receptacle not seen. Ovary inverted A-shaped in frontal view in mature and terminal proglottids (Fig. 1C, D). Arms of ovary unequal (Figs 1C, D); aporal arm always longer than poral arm. Aporal arm 78–275 (n = 7) long in mature proglottids, 243–625 (n = 7) long in terminal proglottids; poral arm 68–213 (n = 7) long in mature proglottids, 190–550 (n = 7) long in terminal proglottids and Mehlis’ gland posterior to ovarian isthmus. Vitellarium follicular form lateral bands, extending from near anterior margin of proglottid to near posterior margin of proglottid (Fig. 1C, D); follicles 15–23 (n = 6) long by 10–13 (n = 6). Uterus thick-walled, saccate, extending from anterior margin of proglottid to near posterior margin of proglottid. Excretory ducts laterally. Gravid proglottids and eggs not seen.

**Remarks.** There are 42 Category 2 species (sensu Ghoshroy and Caira 2001) of *Acanthobothrium* that have been described worldwide. Of these, 17 species have been found in the Pacific Ocean, 14 of which are amphi-American (Table 1).

*Acanthobothrium soniae* sp. nov. is a Category 2 species (sensu Ghoshroy and Caira 2001): Category 2 species have a total length ≤ 15 mm (the length of *A. soniae* sp. nov. is 2.9–6.7 mm), a strobila made up of ≤ 50 proglottids (*A. soniae* sp. nov. has 10–13 proglottids), the number of testes per proglottids ≤ 80 (*A. soniae* sp. nov. has 31–47 testes per proglottid), and the arms of the ovary are asymmetrical.

As presented in Table 1, the new species can be distinguished from similar Category 2 species of *Acanthobothrium* that have been described from the Pacific Coast of the Americas (amphi-American species), and from others parts of Pacific Ocean by the measurements given in the Table 1. The total length of the new species (2.9–6.7 mm) is shorter than that of *A. campbelli* (0.99–1.8 mm). The number of proglottids of the new species (10–13) is less than that of *A. annapinkiensis* Carvajal & Goldstein, 1971 (15–26), *A. cimari* Marques, Brooks & Monks, 1995 (14–33), *A. puntarenasense*
Table 1. Comparison of *Acanthobothrium soniae* sp. nov. vs. Category 2 species of the genus from the Pacific Ocean. Abbreviations: No. Number; A Base (handle) length; B Axial prong length; C Abaxial prong length; D Total hook length. Note: the use of “–” without numerical values are measurement ranges that overlap those of *A. soniae* sp. nov.

cirrus sac of the new species (55–90) is shorter than that of *A. brachyacanthum* Risen, 1955 (123–135), *A. bullardi* (113–175), *A. cimari* (148–180), *A. coquimbensis* (200–400), *A. costarricense* (100–236), *A. dasi* (100–153), *A. olsenii* (96–168), *A. puntarenasense* (151–183), *A. unilateralis* Alexander, 1953 (150–160), *A. guangbaitense* (95–132), and *A. popi* (108–152). The number of testes per proglottid of the new species (31–47) is less than that of *A. campbellii* (15–23), *A. rajivi* (9–13), *A. vargasi* (6–12), and *A. tetabuanense* (6–12). Finally the measurements of the hooks of the 18 species can be found in Table 1.

*Acanthobothrium vidali* sp. nov.

Figures 3A–D; 4A–D

**Type material.** Holotype (CNHE-11134), 7 paratypes (CNHE-11135), 3 paratypes (HWML-139979, 139980, 139981), and 7 paratypes (CHE-P00082).

**Other material examined.** *Acanthobothrium franus* Marques, Centritto & Stewart, 1997 (CNHE–3140, Costa Rica) paratype; *A. inbiorium* Marques, Centritto & Stewart, 1997 (CNHE–3138, Costa Rica) paratype; *A. obuncus* Marques, Brooks & Barriga, 1997 (CNHE–3032A, 3167B, Ecuador) holotype; *A. soberoni* Ghoshroy & Caira, 2001 (CNHE–4042, México).

**Type host.** *Narcine entemedor* Jordan & Starks, 1895 (Elasmobranchii: Torpediniformes: Narcinidae).

**Type locality.** Bahía de Acapulco (Playa Las Hamacas: 16°51’11"N, 99°53’59"W), Guerrero, México.

**Site of infection.** Spiral intestine.

**Quantitative descriptors of parasite populations** (Bush et al. 1997). Prevalence = 36.36% (4 of 11 rays were infected); abundance = 1.91 (21 helminths in 11 rays); mean intensity = 5.25 (21 helminths in 4 infected rays).

**Etymology.** The species is named in honor of Dr Victor Vidal Martínez (Departamento de Recursos del Mar, CINVESTAV-IPN, Merida, Yucatan, Mexico), for his contribution to our knowledge of helminths of fishes from Mexico.

**Diagnosis.** *Acanthobothrium vidali* sp. nov. is a Category 6 species. This species is large, with a range of 164–214 craspedote proglottids, with a range of 50–76 testes per proglottid, and the arms of ovary unequal in length (asymmetrical). This new species also can be distinguished from similar congeners by total length, number of proglottids, diameter of accessory sucker, the length of the cirrus sac, number of testes per proglottid, and size of the hooks.

**Description.** [Based on 5 complete worms and 16 partial specimens] Worms 26.5–70.9 mm (n = 5) long, greatest width at level of mature proglottids, euapolytic; 164–214 (n = 5) proglottids per worm. Scolex 880–1,400 (n = 20) long by 680–1,170 (n = 20) wide, with four bothridia; maximum width of scolex at level of posterior margin of anterior loculus (Figs 3A, 4A). Bothridia free posteriorly, tri-locular, 770–1,230
Two new species of *Acanthobothrium* in *Narcine entemedor* from Mexico

(n = 20) long by 320–570 (n = 20) wide, with anterior muscular pad (Figs 3A, 4A). Muscular pad 250–325 (n = 18) wide, with apical sucker 75–150 (n = 19) and one pair of bipronged hooks at posterior margin (Figs 3A, 4A). Anterior loculus of bothridia 400–650 (n = 20) long; middle loculus 170–310 (n = 20) long; posterior loculus 150–340 (n = 20) long (Figs 3A, 4A); loculus length ratio (anterior:middle:posterior) 1:0.48:0.50. Velum between medial margins of bothridia in dorsal or ventral pairs not seen (Figs 3A, 4A). Hooks bipronged, hollow, with tubercle on proximal surface of axial prong; internal channels of axial and abaxial prongs continuous, smooth, base and anterior part of each hook embedded in musculature of scolex, tips of prongs free (Figs 3A, B, 4A). Bases (handles) of medial and lateral hooks articulate with one another (Figs 3B, 4A). Lateral hook measurements (n = 15): A 140–170, B 200–285, C 140–305, D 360–465; Medial hook measurements (n = 15): A’ 100–165, B’ 225–300, C’ 200–270, D’ 300–425. Cephalic peduncle 2.38–9.13 mm (n = 15) long by 0.15–0.23 mm (n = 15) wide, microtriches not seen on the scolex or cephalic peduncle (Figs 3A, 4A, B, C). Proglottids craspedote. Immature proglottids 50–230 (n = 17) long by 240–520 (n = 17) wide, mature proglottids 260–700 (n = 10) long by 300–790 (n = 10) wide (Fig. 3C), terminal proglottids 1,120 (n = 1) long by 480 (n = 1) wide. Genital pore marginal, irregularly alternating, 49%–63% (n = 9) of proglottid length from anterior end in mature proglottids; genital atrium present (Figs 3C, D, 4D). Testes arranged in two to three irregular columns on each side of the uterus, in frontal view testes wider than long in mature proglottids, 50–125 (n = 6) long by 40–50 (n = 6) wide (Fig. 3C). In terminal proglottids, anteriormost testes wider than long and posteriormost testes longer than wide. Total number of testes 50–76 (n = 10), aporal 26–40 (n = 10), poral 23–36 (n = 10), preporal 17–26 (n = 10), postporal 5–11 (n = 10). All testes located anterior to ovarian isthmus. Cirrus sac pyriform, 125–175 (n = 6) long by 30–75 (n = 6) wide in mature proglottids (Figs 3C, D, 4D). Cirrus armed. Vagina anterior to cirrus sac (Figs 3C, D, 4D), walls relatively thick, covered with gland cells. Vagina extending laterally from common genital atrium, following anterior margin of cirrus sac, weakly sinuous posteriorly along medial line of proglottid to oötype (Fig. 3C); vaginal sphincter absent. Seminal receptacle not seen. Ovary in mature proglottids H-shaped in frontal view (Fig. 3C); posterior lobes wider than anterior lobes. Ovarian isthmus approximately 2/3 of the distance from anterior end of ovary. Arms of ovary unequal in length, aporal arm always longer than poral arm (Fig. 3C). Aporal arm 150–260 (n = 8) long, reaching to posterior margin of cirrus sac, poral arm 125–225 (n = 8) long in mature proglottids, not reaching posterior margin of cirrus sac. Mehlis’ gland posterior to ovarian isthmus. Vitiellarium follicular, forming lateral bands, extending from near anterior margin of proglottid to near posterior margin of proglottid (Fig. 3C); follicles 15–20 (n = 8) long by 10–15 (n = 8) wide. Uterus thin-walled, saccate, extending from anterior margin of proglottid to near posterior margin of proglottid. Excretory ducts lateral. Gravid proglottids and eggs not seen.

**Remarks.** There are 14 Category 6 species of *Acanthobothrium* that have been described worldwide. Of these, seven species have been found in the Pacific Ocean, four of which are amphi-American (Table 2). *Acanthobothrium vidali* sp. nov. also is a
Figure 3. Holotype of *Acanthobothrium vidali* sp. nov. (CNHE-11134). A Scolex B hooks C mature proglottid D genitalia. Scale bars: 400 µm (A); 200 µm (B–D).

Category 6 species, bringing the total number to 15. Category 6 species have a total length >15 mm (the length of *A. vidali* sp. nov. is 26.5–70.9 mm), a strobila made up of > 50 proglottids (*A. vidali* sp. nov. has 164–214 proglottids), number of testes per proglottids ≤ 80 (*A. vidali* sp. nov. has 50–76 testes per proglottid), and the arms of the ovary are asymmetrical.

As presented in Table 2, the new species can be distinguished from similar Category 6 species of *Acanthobothrium* that have been described from the Pacific Coast of the Americas (amphi-American species), and from others parts of Pacific Ocean by the measurementes given in Table 2. The total length of the new species (26.5–70.9 mm) is longer than that of *A. aetiobatidis* (Shipley, 1900) Southwell, 1925. The number of proglottids of the new species (164–214) is greater than that of *A. gonzalesmugaburoi* Severino & Sarmiento, 1979. The diameter of accessory sucker of the new species (75–150) is larger than that of *A. obuncus* (33–48) and *A. soberoni* (40–65). The length of the cirrus sac of the new species (125–175) is shorter than that of *A. obuncus* (258–322), *A. aetio-batidis* (200–250), and *A. rodmani* Fyler, Caira & Jensen, 2009 (190–234). | Jensen, 2009               |                  |                     |                                 |                          |                             | 335–357                  |
of testes per proglottid of the new species (50–76) is greater than that of *A. aetiobatidis* (23–28), *A. arlenae* Campbell & Beverage, 2002 (17–26), and *A. rodmani* (17–26). Finally, the measurements of the hooks of the eight species can be found in Table 2.

The new species is the fourth species of *Acanthobothrium* reported from *N. entemedor*, preceded by *A. franus* and *A. inbiorium* (Category 5 species), and *A. soniae* sp. nov. (Category 2 species) described above. All species have been reported from the Pacific Coast of the Americas. *Acanthobothrium vidali* sp. nov. can be distinguished from these other species by number of proglottids (164–214) is greater than that of *A. franus* (68–141) and *A. soniae* sp. nov. (10–13). The total length of the lateral hook of *A. vidali* sp. nov. (360–465) is longer than that of *A. inbiorium* (95–120 µm). The length of the axial prong of the lateral hook of *A. vidali* sp. nov. (200–285) is longer than that of *A. inbiorium* (65–75 µm) (Table 3).

### Discussion

To date, 190 valid species of *Acanthobothrium* have been reported from different regions of the world (Caira et al. 2017; Rodríguez-Ibarra et al. 2018; Franzese and Ivanov 2018). Forty species of *Acanthobothrium* have been described from the Pacific coast of the Americas (eleven species from USA, eleven from México, eight from Costa Rica, four from Ecuador, four from Peru, and three from Chile). With these descriptions of *A. soniae* sp. nov. and *A. vidali* sp. nov., 13 species of *Acanthobothrium* have been reported from the Pacific Coast of Mexico. A list of amphi-American species of *Acanthobothrium* from the Pacific coast, their hosts, and localities is given in Table 4.

Host specificity of most species of *Acanthobothrium* appears to be rather strict (Ivanov, 2005; Vardo-Zalik and Campbell 2011; Franzese and Ivanov 2018). According to the reports of species of the genus (type localities, additional localities, type host, and additional host), 82% of the species of *Acanthobothrium* show strict host specificity. In contrast, 33 of the 190 valid species of *Acanthobothrium* have been reported in more than one species of host (see the reports of Rudolphi 1819; Yoshida...
Two new species of *Acanthobothrium* in *Narcine entemedor* from Mexico

Table 4. Species of *Acanthobothrium* reported from the Pacific Ocean of the Americas (amphi-American species). ‡= Category designation obtained from Ghoshroy and Caira (2001). Category designations not included in Ghoshroy and Caira (2001) were calculated for this study using the original descriptions. Sources were as given by that author or the original descriptions used for this study.

Prior to de Carvalho and Last (2016), the genus *Narcine* Henle, 1834 was composed of 20 species. To date, those taxa have been divided into two genera; 15 species of *Narcine* (tail length about equal to disc length or width) and 5 species of *Narcinops* de Carvalho & Last, 2016 (tail much longer than disc length or width), this latter distributed only in...
Two new species of Acanthobothrium in Narcine entemedor from Mexico

Table 5. Species of Acanthobothrium reported in species of Narcine. † Data from Ghoshroy and Caira (2001); ‡ Data from Fyler and Caira (2006).

| Narcine                      | Species of          | Category | Habitat of host          | Type locality                  | Source                           |
|------------------------------|---------------------|----------|--------------------------|--------------------------------|----------------------------------|
| N. bancroftii (Griffith & Smith, 1834) [reported as N. brasiliensis] (Olfers, 1831) | A. intestini Goldstein, Henson & Schlicht, 1968 | † 1(8,9,5) | North Carolina to northeastern Brazil | Gulf of Mexico, Texas, USA         | Goldstein et al. (1969)          |
| N. brasiliensis              | A. electriculum Brooks & Mayes, 1978 | † 9      | Brazil to northern Argentina | Caribbean Sea, near Cartagena, Colombia | Marques et al. (1978)          |
| N. entemedor Jordan & Starks, 1895 | A. franus Marques, Centritto & Stewart, 1997 | † 5(8)   | Baja California to northern Peru | Cuaqiniquil Beach, Gulf of Santa Helena, Guanacaste, Costa Rica | Marques et al. (1997b)          |
|                             | A. inborium Marques, Centritto & Stewart, 1997 | † 5      | Baja California to northern Peru | Cuaqiniquil Beach, Gulf of Santa Helena, Guanacaste, Costa Rica | Marques et al. (1997b)          |
|                             | A. soniae sp. nov.  | 2        | Baja California to northern Peru | Playa las Hamacas, Bahía de Acapulco, Guerrero, Mexico | This study                        |
|                             | A. vidali sp. nov. | 6        | Baja California to northern Peru | Playa las Hamacas, Bahía de Acapulco, Guerrero, Mexico | This study                        |

Australia (Last et al. 2016). No helminths have been reported from the former members of Narcine that are now assigned to Narcinops. Five valid species of Acanthobothrium have been reported worldwide from three species of Narcine (Table 5) (Subhapradha, 1955; Goldstein et al. 1969; Brooks and Mayes 1978; Marques et al. 1997b), but no species of Acanthobothrium in Narcine have been reported from Mexico (Merlo-Serna and García-Prieto 2016). In Mexico, only two species of helminth have been reported previously from Narcine: Anaporrhutum euzeti Curran, Blend & Overstreet, 2003 and Nagmia rodmani Curran, Blend & Overstreet, 2009 (Curran et al. 2003; Curran et al. 2009).

The categorical method suggested by Ghoshroy and Caira (2001) and Fyler and Caira, (2006) was used to facilitate comparisons among the 190 valid species of Acanthobothrium. Ghoshroy and Caira (2001) proposed the categories to facilitate comparisons among taxa from the same geographic region. Because of the large number of species worldwide, it is necessary to focus only on those species from the same region that possessing the same combination of characters as the new species; thus, delimiting the comparison between similar species that could be confused with a new species and not comparing each new species to all of the 190 valid species currently described. We agree that comparisons with each species of this expanding group is unnecessary and, as the number of species increases, an exercise in futility. In agreement with previous authors, this categorical method is useful but does not reflect groupings from a rigorous phylogenetic hypothesis (i.e., is phenetic) (Campbell and Beveridge 2002; Ivanov 2005; Reyda and Caira 2006; Twohig et al. 2008; Fyler and Caira 2010; Yang et al. 2016).

Although not all species of the genus have been examined, Franzese and Ivanov (2018) suggest that the pattern of microthiches is quite uniform among species of Acanthobothrium; (i.e., all species have filitriches covering most surfaces of the worms,
interspersed with gladiate spinitriches on proximal bothridial surface, scolex proper and the cephalic peduncle). Because of insufficient material, it was not possible to make a study of this species using the SEM, so we cannot provide detailed information on the microtriches.

Acknowledgements

The authors thank all those who made possible the collection and examination of specimens. The authors would like to thank the curator Luis García-Prieto of the CNHE and Scott L Gardner and Gabor Racz (curator and collection manager, respectively) of the HWML, for providing access to laboratories and specimens. Students from the Laboratorio de Morfología Animal, Universidad Autónoma del Estado de Hidalgo, and the Unidad Académica de Ecología Marina, Universidad Autónoma de Guerrero, helped with the collection of specimens. This study was supported by funds from the project “Inventario Ambiental y Establecimiento de Indicadores Regionales de la Red Temática: Calidad Ambiental y Desarrollo Sustentable (PROMEP–SEP)”. The Consejo Nacional de Ciencia y Tecnología (CONACYT) provided a scholarship (no. 432427) to FZ–T.
