Decoupling Inequalities for the Tail Probabilities of Multivariate U-statistics

Victor H. de la Peña¹ and S. J. Montgomery-Smith ²
Columbia University and University of Missouri, Columbia

Abstract

In this paper we present a decoupling inequality that shows that multivariate U-statistics can be studied as sums of (conditionally) independent random variables. This result has important implications in several areas of probability and statistics including the study of random graphs and multiple stochastic integration. More precisely, we get the following result:

**Theorem 1.** Let \( \{X_j\} \) be a sequence of independent random variables in a measurable space \((S, S)\), and let \( \{X_i^{(j)}\}, j = 1, ..., k \) be \(k\) independent copies of \(\{X_i\}\). Let \(f_{i_1i_2...i_k}\) be families of functions of \(k\) variables taking \((S \times ... \times S)\) into a Banach space \((B, ||\cdot||)\). Then, for all \(n \geq k \geq 2, t > 0\), there exist numerical constants \(C_k\) depending on \(k\) only so that,

\[
P(|| \sum_{1 \leq i_1 \neq i_2 \neq ... \neq i_k \leq n} f_{i_1...i_k}(X_{i_1}^{(1)}, X_{i_2}^{(1)}, ..., X_{i_k}^{(1)}) || \geq t) \leq C_k P(C_k || \sum_{1 \leq i_1 \neq i_2 \neq ... \neq i_k \leq n} f_{i_1...i_k}(X_{i_1}^{(1)}, X_{i_2}^{(2)}, ..., X_{i_k}^{(k)}) || \geq t).
\]

The reverse bound holds if in addition, the following symmetry condition holds almost surely

\[
f_{i_1i_2...i_k}(X_{i_1}, X_{i_2}, ..., X_{i_k}) = f_{i_{\pi(1)}i_{\pi(2)}...i_{\pi(k)}}(X_{i_{\pi(1)}}, X_{i_{\pi(2)}}, ..., X_{i_{\pi(k)}}),
\]

for all permutations \(\pi\) of \((1, ..., k)\).

1. Introduction

In this paper we provide the multivariate extension of the tail probability decoupling inequality for generalized U-statistics of order two and quadratic forms presented in de la Peña and Montgomery-Smith (1993). This type of inequality permits the transfer of some results for sums of independent random variables to the case of U-statistics. Our work builds mainly on recent work of Kwapien and Woyczynski (1992) as well as on results for U-statistics from Giné and Zinn (1992) and papers dealing with inequalities for multilinear forms of symmetric and hypercontractive random variables in de la Peña, Montgomery-Smith and Szulga (1992), and de la Peña (1992). It is to be remarked that the decoupling inequalities for multilinear forms introduced in McConnell and Taqqu (1986) provided us with our first exposure to this decoupling problem. For a more expanded list of references on the subject see, for example, Kwapien and Woyczynski (1992).

2. Main Result

**Theorem 1.** Let \( \{X_i\} \) be a sequence of independent random variables in a measurable space \((\mathcal{S}, S)\), and let \( \{X_i^{(j)}\}, j = 1, \ldots, k \) be \( k \) independent copies of \( \{X_i\} \). Let \( f_{i_1i_2\ldots i_k} \) be families of functions of \( k \) variables taking \((S \times \ldots \times S)\) into a Banach space \((B, \|\cdot\|)\). Then, for all \( n \geq k \geq 2, t > 0 \), there exist numerical constants \( C_k, \tilde{C}_k \) depending on \( k \) only so that,

\[
P(|\sum_{1 \leq i_1 \neq i_2 \neq \ldots \neq i_k \leq n} f_{i_1i_2\ldots i_k}(X_{i_1}^{(1)}, X_{i_2}^{(1)}, \ldots, X_{i_k}^{(1)})| \geq t) \leq C_k P(|\sum_{1 \leq i_1 \neq i_2 \neq \ldots \neq i_k \leq n} f_{i_1i_2\ldots i_k}(X_{i_1}^{(1)}, X_{i_2}^{(2)}, \ldots, X_{i_k}^{(k)})| \geq t).
\]

If in addition, the following symmetry condition holds almost surely

\[
f_{i_1i_2\ldots i_k}(X_{i_1}, X_{i_2}, \ldots, X_{i_k}) = f_{\pi(i_1)\pi(i_2)\ldots\pi(i_k)}(X_{\pi(i_1)}, X_{\pi(i_2)}, \ldots, X_{\pi(i_k)})
\]

for all permutations \( \pi \) of \((1, \ldots, k)\), then

\[
P(|\sum_{1 \leq i_1 \neq i_2 \neq \ldots \neq i_k \leq n} f_{i_1i_2\ldots i_k}(X_{i_1}^{(1)}, X_{i_2}^{(2)}, \ldots, X_{i_k}^{(k)})| \geq t) \leq \tilde{C}_k P(\tilde{C}_k |\sum_{1 \leq i_1 \neq i_2 \neq \ldots \neq i_k \leq n} f_{i_1i_2\ldots i_k}(X_{i_1}^{(1)}, X_{i_2}^{(1)}, \ldots, X_{i_k}^{(1)})| \geq t).
\]

**Note:** In this paper we use the notation \( \{i_1 \neq i_2 \neq \ldots \neq i_k\} \) to denote that all of \( i_1, \ldots, i_k \) are different.

3. Preliminary Results

Throughout this paper we will be using two results found in earlier work. The first one comes from de la Peña and Montgomery-Smith (1993). For completeness we reproduce the proof here.

**Lemma 1.** Let \( X, Y \) be two i.i.d. random variables. Then

\[
(1) \quad P(|X| \geq t) \leq 3P(|X + Y| \geq \frac{2t}{3}).
\]

**Proof:** Let \( X, Y, Z \) be i.i.d. random variables. Then

\[
P(|X| \geq t)
\]

\[
= P(|(X + Y) + (X + Z) - (Y + Z)| \geq 2t)
\]

\[
\leq P(|X + Y| \geq 2t/3) + P(|X + Z| \geq 2t/3) + P(|Y + Z| \geq 2t/3)
\]

\[
= 3P(|X + Y| \geq 2t/3).
\]

The second result comes from Kwapien and Woyczynski (1992) and can also be found in de la Peña and Montgomery-Smith (1993).
Proposition 1. Let $Y$ be any mean zero random variable with values in a Banach space $(B, || \cdot ||)$. Then, for all $a \in B$,

$$
(2) \quad P(||a + Y|| \geq ||a||) \geq \frac{\kappa}{4},
$$

where $\kappa = \inf_{x' \in B'} \frac{(E|x'(Y)|)^2}{E|x'(Y)|^2}$. (Here $B'$ denotes the family of linear functionals on $B$.)

Proof: Note first that if $\xi$ is a random variable for which $E\xi = 0$, then $P(\xi \geq 0) \geq \frac{1}{4} \frac{(E|\xi|^2)^2}{E|\xi|^2}$. From this, we deduce that $P(x'(Y) \geq 0) \geq \frac{1}{4} \frac{(E|x'(Y)|)^2}{E|x'(Y)|^2}$ The result then follows, because if $x' \in B'$ is such that $||x'|| = 1$ and $x'(a) = ||a||$, then $\{||a + Y|| \geq ||a||\}$ contains $\{x'(a + Y) \geq x'(a)\} = \{x'(Y) \geq 0\}$.

Lemma 2. Let $x, a_{i_1}, a_{i_1i_2}, ..., a_{i_1i_2...i_k}$ belong to a Banach space $(B, || \cdot ||)$. Let $\{\epsilon_i\}$ be a sequence of symmetric Bernoulli random variables. Then,

$$
P(||x + \sum_{r=1}^{k} \sum_{1 \leq i_1 \neq i_2 \neq ... \neq i_r \leq n} a_{i_1...i_r} \epsilon_{i_1}...\epsilon_{i_r}|| \geq ||x||) \geq c_k^{-1},
$$

for a universal constant $1 < c_k < \infty$ depending on $k$ only.

Proof: Suppose that $x, a_{i_1}, a_{i_1i_2}, ..., a_{i_1i_2...i_k}$ are in $R$, then since the $\epsilon$'s are hypercontractive, by equation (1.4) of Kwapien and Szulga (1991) and the easy argument of the proof of Lemma 3 in de la Peña and Montgomery-Smith (1993), for some $\sigma > 0$, we get

$$(E) \sum_{r=1}^{k} \sum_{1 \leq i_1 \neq i_2 \neq ... \neq i_r \leq n} a_{i_1...i_r} \epsilon_{i_1}...\epsilon_{i_r} |^4 \frac{1}{4}$$

$$(E) \sum_{r=1}^{k} \sum_{1 \leq i_1 < ... < i_r \leq n} b_{i_1...i_r} \epsilon_{i_1}...\epsilon_{i_r} |^4 \frac{1}{4}$$

$$(E) \sum_{r=1}^{k} \sum_{1 \leq i_1 < ... < i_k \leq n} b_{i_1...i_k} \epsilon_{i_1}...\epsilon_{i_k} |^2 \frac{1}{2}$$

$$= \sigma^{-k} \frac{1}{2}$$

where $b_{i_1...i_r} = \sum_{\pi \in S_r} a_{i_{\pi(1)}...i_{\pi(r)}}$ and $S_r$ denotes the set of all permutations of $\{1,...,r\}$.

Next, observe that $||\xi||_4 \leq \sigma^{-2}||\xi||_2$ implies that $||\xi||_2 \leq \sigma^{-4}||\xi||_1$. Take $x' \in B'$ so that $||x'|| = 1$ and $x'(x) = ||x||$, then

$$P(||x + \sum_{r=1}^{k} \sum_{1 \leq i_1 \neq i_2 \neq ... \neq i_r \leq n} a_{i_1...i_r} \epsilon_{i_1}...\epsilon_{i_r}|| \geq ||x||)$$

$$\geq P(x'(x) + \sum_{r=1}^{k} \sum_{1 \leq i_1 \neq i_2 \neq ... \neq i_r \leq n} x'(a_{i_1...i_r}) \epsilon_{i_1}...\epsilon_{i_r} \geq x'(x))$$

$$= \sigma^{-k} \frac{1}{2}$$

Note: Throughout this paper we will use $c_k$ and $C_k$ to denote numerical constants that depend on $k$ only and may change from application to application.

4. Proof of the Upper Bound:

Our proof of this result is obtained by applying the argument used in the proof of the upper bound in the bivariate case plus an inductive argument. Let $\{\sigma_i\}$ be a sequence of independent symmetric Bernoulli random variables, $P(\sigma_i = 1) = \frac{1}{2}$ and $P(\sigma_i = -1) = \frac{1}{2}$. Consider random variables $(Z_i^{(1)}, Z_i^{(2)})$ such that $(Z_i^{(1)}, Z_i^{(2)}) = (X_i^{(1)}, X_i^{(2)})$ if $\sigma_i = 1$ and $(Z_i^{(1)}, Z_i^{(2)}) = (X_i^{(2)}, X_i^{(1)})$ if $\sigma_i = -1$. Then $(1 + \sigma_i)$ and $(1 - \sigma_i)$ are either 0 or 2 and
these random variables can be used to transform the problem from one involving $X$’s to one involving $Z$’s. Let us first illustrate the argument in the case that $k = 3$. 

$$2^3 f_{i_1 i_2 i_3} (Z^{(1)}_{i_1}, Z^{(1)}_{i_2}, Z^{(2)}_{i_3}) = \left\{ \begin{array}{l} (1 + \sigma_{i_1})(1 + \sigma_{i_2})(1 + \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(1)}_{i_2}, X^{(2)}_{i_3}) \\
(1 + \sigma_{i_1})(1 + \sigma_{i_2})(1 - \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(1)}_{i_2}, X^{(1)}_{i_3}) \\
(1 + \sigma_{i_1})(1 - \sigma_{i_2})(1 + \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(2)}_{i_2}, X^{(2)}_{i_3}) \\
(1 - \sigma_{i_1})(1 + \sigma_{i_2})(1 + \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(1)}_{i_2}, X^{(1)}_{i_3}) \\
(1 + \sigma_{i_1})(1 - \sigma_{i_2})(1 - \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(2)}_{i_2}, X^{(1)}_{i_3}) \\
(1 - \sigma_{i_1})(1 + \sigma_{i_2})(1 - \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(2)}_{i_2}, X^{(1)}_{i_3}) \\
(1 - \sigma_{i_1})(1 - \sigma_{i_2})(1 + \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(2)}_{i_2}, X^{(2)}_{i_3}) \\
(1 - \sigma_{i_1})(1 - \sigma_{i_2})(1 - \sigma_{i_3}) f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(2)}_{i_2}, X^{(1)}_{i_3}) \right\},$$

(3)

where the sign “+” is chosen if the superscript of $X_i$ agrees with that of $Z_i$, and “−” otherwise. Next, set $T_{n, 3} = \sum_{1 \leq i_1 \neq i_2 \neq i_3 \leq n}$

$$\left\{ \begin{array}{l} f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(1)}_{i_2}, X^{(2)}_{i_3}) + f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(2)}_{i_2}, X^{(1)}_{i_3}) \\
f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(2)}_{i_2}, X^{(2)}_{i_3}) + f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(1)}_{i_2}, X^{(2)}_{i_3}) \\
f_{i_1 i_2 i_3} (X^{(1)}_{i_1}, X^{(2)}_{i_2}, X^{(1)}_{i_3}) + f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(2)}_{i_2}, X^{(1)}_{i_3}) \\
f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(2)}_{i_2}, X^{(2)}_{i_3}) + f_{i_1 i_2 i_3} (X^{(2)}_{i_1}, X^{(2)}_{i_2}, X^{(1)}_{i_3}) \right\}.$$ 

Letting $G_2 = \sigma(X^{(1)}_{i_1}, X^{(2)}_{i}, i = 1, \ldots, n)$ we get

$$T_{n, 3} = 2^3 \sum_{1 \leq i_1 \neq i_2 \neq i_3 \leq n} E(f_{i_1 i_2 i_3} (Z^{(1)}_{i_1}, Z^{(1)}_{i_2}, Z^{(2)}_{i_3}) | G_2).$$

More generally, for any $1 \leq l_1, \ldots, l_k \leq 2$, one can obtain the expansion

4
$$2^k f_{i_1...i_k}(Z_{i_1}^{(l_1)}, ..., Z_{i_k}^{(l_k)})$$

(4)  $$= \sum_{1 \leq j_1, ..., j_k \leq 2} (1 \pm \sigma_{i_1}) ... (1 \pm \sigma_{i_k}) f_{i_1...i_k}(X_{i_1}^{(j_1)}, ..., X_{i_k}^{(j_k)}).$$

The appropriate extension of $T_{n,3}$ is

$$T_{n,k} = \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} \sum_{1 \leq j_1, ..., j_k \leq 2} f_{i_1...i_k}(X_{i_1}^{(j_1)}, ..., X_{i_k}^{(j_k)}).$$

Again,

$$T_{n,k} = 2^k \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} E(f_{i_1...i_k}(Z_{i_1}^{(l_1)}, ..., Z_{i_k}^{(l_k)})|G_2).$$

From Lemma 1 we get,

$$P(|| \sum_{1 \leq i_1 \neq i_2 \neq ... \neq i_k \leq n} f_{i_1...i_k}(X_{i_1}^{(1)}, ..., X_{i_k}^{(1)}) || \geq t) \leq$$

$$3P(3|| \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} \{f_{i_1...i_k}(X_{i_1}^{(1)}, ..., X_{i_k}^{(1)}) + f_{i_1...i_k}(X_{i_1}^{(2)}, ..., X_{i_k}^{(2)})\} || \geq 2t) =$$

$$3P(3||T_{n,k} + \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} f_{i_1...i_k}(X_{i_1}^{(1)}, ..., X_{i_k}^{(1)}) + f_{i_1...i_k}(X_{i_1}^{(2)}, ..., X_{i_k}^{(2)}) - T_{n,k} || \geq 2t) \leq$$

$$\{3P(3||T_{n,k}|| \geq t) \leq \}

$$+ 3P(3|| \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} 1 \leq j_1, ..., j_k \leq 2, \text{not all j's equal}$$

$$f_{i_1...i_k}(X_{i_1}^{(j_1)}, ..., X_{i_k}^{(j_k)}) || \geq t) \}

(5)  $$+ \sum_{1 \leq i_1 \neq ... \neq i_k \leq n, 1 \leq j_1, ..., j_k \leq 2, \text{not all j's equal}} C_k P(C_k || \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} f_{i_1...i_k}(X_{i_1}^{(j_1)}, ..., X_{i_k}^{(j_k)}) || \geq t)\}.$$  

(Recall that $C_k, c_k$ are numerical constants that depend on $k$ only and may change from application to application.)

Observe also that using (4) and the fact that the $\sigma$'s are independent from the $X$'s, Lemma 2 with $x = T_{n,k}$ gives for any fixed $1 \leq l_1, ..., l_k \leq 2$,

$$P(2^k || \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} f_{i_1...i_k}(Z_{i_1}^{(l_1)}, ..., Z_{i_k}^{(l_k)}) || \geq ||T_{n,k}|| |G_2) \geq c_k^{-1}.$$  

Integrating over $\{||T_{n,k}|| \geq t\}$ and using the fact that $\{(X_{i_1}^{(1)}, X_{i_2}^{(2)}) : i = 1, ..., n\}$ has the same joint distribution as $\{(Z_{i_1}^{(1)}, Z_{i_2}^{(2)}) : i = 1, ..., n\}$ we obtain that

$$P(2^k || \sum_{1 \leq i_1 \neq ... \neq i_k \leq n} f_{i_1...i_k}(X_{i_1}^{(l_1)}, ..., X_{i_k}^{(l_k)}) || \geq t).$$

(7)
\[
P(2^k \| \sum_{1 \leq i_1 \neq \ldots \neq i_k \leq n} f_{i_1 \ldots i_k}(Z_{i_1}^{(l_1)}, \ldots, Z_{i_k}^{(l_k)}) \| \geq t) \geq c_k^{-1} P(\| T_{n,k} \| \geq t)
\]

It is obvious that the upper bound decoupling inequality holds for the case of U-statistics of order 1. Assume that it holds for U-statistics of orders 2, \ldots, \(k - 1\). Putting (5) and (7) together with \(1 \leq l_1, \ldots, l_k \leq 2\), not all \(l\)'s equal we get,
\[
P(\| \sum_{1 \leq i_1 \neq \ldots \neq i_k \leq n} f_{i_1 \ldots i_k}(X_{i_1}^{1}, \ldots, X_{i_k}^{1}) \| \geq t) \leq 3P(\| T_{n,k} \| \geq t)
\]
\[
\| \sum_{1 \leq j_1, \ldots, k \leq 2, \text{not all j's equal}} C_k P(C_k \| \sum_{1 \leq \bar{i}_1 \neq \ldots \neq \bar{i}_n \leq n} f_{\bar{i}_1 \ldots \bar{i}_k}(X_{\bar{i}_1}^{(j_1)}, \ldots, X_{\bar{i}_k}^{(j_k)}) \| \geq t)\|
\]
\[
\leq C_k P(C_k \| \sum_{1 \leq \bar{i}_1 \neq \ldots \neq \bar{i}_k \leq n} f_{\bar{i}_1 \ldots \bar{i}_k}(X_{\bar{i}_1}^{1}, \ldots, X_{\bar{i}_k}^{1}) \| \geq t),
\]
where again, the last line follows by the decoupling result for U-statistics of orders 2, \ldots, \(k - 1\) of the inductive hypothesis. Since the statement “not all j’s equal” means that there are less than \(k\) \(j\)’s equal, the variables whose \(j\)'s are equal can be decoupled using (conditionally on the other variables) the decoupling inequalities for U-statistics of order 2, \ldots, \(k - 1\).

Next we give the proof of the lower bound.

5. Proof of the Lower Bound

In order to show the lower bound we require the following result.

**Lemma 3.** Let \(1 \leq l \leq k\). Then there is a constant \(C_k\) such that

\[
P(\| \sum_{1 \leq \bar{i}_1 \neq \ldots \neq \bar{i}_k \leq n} f_{\bar{i}_1 \ldots \bar{i}_k}(X_{\bar{i}_1}^{(1)}, X_{\bar{i}_2}^{(1)}, \ldots, X_{\bar{i}_k}^{(1)}) \| \geq t) \geq C_k^{-1} P(\| \sum_{1 \leq \bar{i}_1 \neq \ldots \neq \bar{i}_k \leq n \leq j_1, \ldots, j_k \leq l} f_{\bar{i}_1 \ldots \bar{i}_k}(X_{\bar{i}_1}^{(j_1)}, X_{\bar{i}_2}^{(j_2)}, \ldots, X_{\bar{i}_k}^{(j_k)}) \| \geq C_k t).\]

**Proof:** Let \(\{\delta_r\}, r = 1, \ldots, l\), be a sequence of random variables for which \(P(\delta_r = 1) = \frac{1}{r}\) and \(P(\delta_r = 0) = 1 - \frac{1}{r}\), and \(\sum_{r=1}^{l} \delta_r = 1\). Set \(\epsilon_r = \delta_r - \frac{1}{r}\) for \(r = 1, \ldots, l\). Then, it is easy to see that there exists \(\sigma_l > 0\) depending only upon \(l\) such that for any real number \(x_0\) and any sequence of real constants \(\{a_i\}\)

\[
||x_0 + \sum_{r=1}^{l} a_r \epsilon_r||_4 \leq ||x_0 + \sigma_l^{-1} \sum_{r=1}^{l} a_r \epsilon_r||_2.
\]

One can also use the results of Section 6.9 of Kwapien and Woyczynski (1992) (Pg. 180, 181) to assert this since the \(\epsilon\)'s satisfy the conditions 1. through 3. stated there.
Let \( \{ (\delta_{i1}, \ldots, \delta_{il}), i = 1, \ldots, n \} \) be \( n \) independent copies of \( (\delta_1, \ldots, \delta_l) \). As before, we define
\[
\epsilon_{ij} = \delta_{ij} - \frac{1}{l}.
\]

(9)

Since the vectors \( E_i = (\epsilon_{i1}, \ldots, \epsilon_{il}) \) are independent, by an argument given in Kwapien and Szulga (1991), for \( i = 1, \ldots, n \), for all constants \( x_0, a_{ij} \) in \( R \),
\[
\| x_0 + \sum_{i=1}^{n} \sum_{r=1}^{l} a_{ir} \epsilon_{ir} \|_4 \leq \| x_0 + \sum_{i=1}^{n} \sum_{r=1}^{l} a_{ir} \epsilon_{ir} \|_2 \leq \sigma_l^{-1} \| x_0 + \sum_{i=1}^{n} \sum_{r=1}^{l} a_{ir} \epsilon_{ir} \|_2,
\]
and recentering, we obtain
\[
\| x_0 + \sum_{i=1}^{n} \sum_{r=1}^{l} a_{ir} \delta_{ir} \|_4 \leq \sigma_l^{-1} \| x_0 + \sum_{i=1}^{n} \sum_{r=1}^{l} a_{ir} \delta_{ir} \|_2.
\]

(10)

Next we use the sequence \( E_i, i = 1, \ldots, n \) in defining the analogue of the \( Z \)'s used in our proof of the upper bound.

For each \( i \), let \( Z_i = X_i^{(j)} \) if \( \delta_{ij} = 1 \). Then, \( \{ Z_i, i = 1, \ldots, n \} \) has the same joint distribution as \( \{ X_i^{(1)}, i = 1, \ldots, n \} \) and
\[
f_{i_1 \ldots i_k}(Z_{i_1}, \ldots, Z_{i_k}) = \sum_{1 \leq j_1, j_2, \ldots, j_k \leq l} \delta_{i_1 j_1} \ldots \delta_{i_k j_k} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}).
\]

The fact that \( E \delta_{i_r j_r} = \frac{1}{l} \) for all \( i_r, j_r \) gives,
\[
E(f_{i_1 \ldots i_k}(Z_{i_1}, \ldots, Z_{i_k}) \mid G_l) = \left( \frac{1}{l} \right)^k \sum_{1 \leq j_1, \ldots, j_k \leq l} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}),
\]
where \( G_l = \sigma((X_i^{(1)}, \ldots, X_i^{(l)}), i = 1, \ldots, n) \).

Let
\[
U_n = \sum_{1 \leq i_1 \neq i_2 \neq \ldots \neq i_k \leq n} f_{i_1 i_2 \ldots i_k}(Z_{i_1}, \ldots, Z_{i_k})
\]
\[
= \sum_{1 \leq i_1 \neq i_2 \neq \ldots \neq i_k \leq n} \sum_{1 \leq j_1, \ldots, j_k \leq l} \delta_{i_1 j_1} \ldots \delta_{i_k j_k} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}).
\]

Let \( D_i = (\delta_{i1}, \ldots, \delta_{il}) \). Since the \( D \)'s are independent of the \( X \)'s, if we let \( g_{i_1 \ldots i_k}(D_{i_1}, \ldots, D_{i_k}) \)
\[
= \sum_{1 \leq j_1, \ldots, j_k \leq l} \delta_{i_1 j_1} \ldots \delta_{i_k j_k} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}),
\]
then, since
\[
f_{i_1 \ldots i_k}(X_{i_1}, \ldots, X_{i_k}) = f_{\pi(i_1) \ldots \pi(i_k)}(X_{\pi(i_1)}, \ldots, X_{\pi(i_k)}),
\]

7
we have that,

\[ g_{i_1 \ldots i_k}(D_{i_1}, \ldots, D_{i_k}) = g_{i_1(\pi(1)) \ldots i_k(\pi(k))}(D_{i_1(\pi(1))}, \ldots, D_{i_k(\pi(k))}). \]

Therefore, the two sided decoupling inequality in de la Peña (1992) can be applied and, for every convex increasing function \( \Phi \), every \( G \)-measurable function \( T \), and \( k \) independent copies \( D^{(r)}_i \), \( r = 1, \ldots, k \) of \( D_i \) there exists numerical constants \( A_k, B_k \) so that

\[
E(\Phi(A_k||T + \sum_{1 \leq i_1 \neq i_2 \ldots \neq i_k \leq n} g_{i_1 \ldots i_k}(D_{i_1}, \ldots, D_{i_k})))|G_l) \\
\leq E(\Phi(||T + \sum_{1 \leq i_1 \neq i_2 \ldots \neq i_k \leq n} g_{i_1 \ldots i_k}(D^{(1)}_{i_1}, \ldots, D^{(k)}_{i_k})))|G_l) \\
\leq E(\Phi(B_k||T + \sum_{1 \leq i_1 \neq i_2 \ldots \neq i_k \leq n} g_{i_1 \ldots i_k}(D_{i_1}, \ldots, D_{i_k})))|G_l).
\]

This result with (11) shows that conditionally on \( G_l \)

\[ ||U_n - T_n||_4 \leq \sigma_1^{-k} B_k \cdot ||U_n - T_n||_2, \]

where

\[ T_n = E(U_n|G_l) = \left( \frac{1}{\ell} \right)^k \sum_{1 \leq i_1 \neq i_2 \ldots \neq i_k \leq n} \sum_{1 \leq j_1, \ldots, j_k \leq \ell} f_{i_1 \ldots i_k}(X^{(j_1)}_{i_1}, X^{(j_2)}_{i_2}, \ldots, X^{(j_k)}_{i_k}). \]

(See also the proofs of Lemma 2 and Lemma 6.5.1 of Kwapien and Woyczynski (1992)).

Thus we have that,

\[ P(||U_n|| \geq ||T_n|||G_l) \geq c_k^{-1}. \]

This follows from the use of (12) and Proposition 1 with \( a = T_n \) and \( Y = U_n - T_n \). We also use the fact that for any random variable \( \xi \) and positive constant \( c \), \( ||\xi||_4 \leq c||\xi||_2 \) implies that \( ||\xi||_2 \leq c^2||\xi||_1 \) (See also the proof of Lemma 2 for the approach to transfer the problem from one on Banach space valued random variables to one on real valued).

Integrating (13) over the set \{\{||T_n|| \geq t\} \}

\[ P(|| \sum_{1 \leq i_1 \neq i_2 \ldots \neq i_k \leq n} f_{i_1 \ldots i_k}(X^{(1)}_{i_1}, X^{(1)}_{i_2}, \ldots, X^{(1)}_{i_k}) || \geq t) \]

\[ = P(|| \sum_{1 \leq i_1 \neq i_2 \ldots \neq i_k \leq n} f_{i_1 \ldots i_k}(Z_{i_1}, Z_{i_2}, \ldots, Z_{i_k}) || \geq t) \]

\[ \geq c_k^{-1} P(C_k || \sum_{1 \leq i_1 \neq i_2 \ldots \neq i_k \leq n} \sum_{1 \leq j_1, \ldots, j_k \leq \ell} f_{i_1 \ldots i_k}(X^{(j_1)}_{i_1}, X^{(j_2)}_{i_2}, \ldots, X^{(j_k)}_{i_k}) || \geq t), \]

and Lemma 3 is proved.
The end of the proof of the lower bound follows by using induction and the iterative procedure introduced to obtain the proof of the lower bound multivariate decoupling inequality in de la Peña (1992). We give a different expression of the same proof, motivated by ideas from de la Peña, Montgomery-Smith and Szulga (1992). We will use $S_k$ to denote the set of permutations of \{1, \ldots, k\}.

The Mazur-Orlicz formula tells us that for any $1 \leq j_1, \ldots, j_k \leq k$ that

$$
\sum_{0 \leq \delta_1, \ldots, \delta_k \leq 1} (-1)^{k-\delta_1-\ldots-\delta_k} \delta_{j_1} \cdots \delta_{j_k}
$$

is 0 unless $j_1, \ldots, j_k$ is a permutation of $1, \ldots, k$, in which case it is 1. Hence

$$
\sum_{\pi \in S_k} f_{i_1 \ldots i_k}(X_{i_1}^{(\pi(1))}, \ldots, X_{i_k}^{(\pi(k))}) = \sum_{0 \leq \delta_1, \ldots, \delta_k \leq 1} (-1)^{k-\delta_1-\ldots-\delta_k} \sum_{1 \leq j_1, \ldots, j_k \leq k} \delta_{j_1} \cdots \delta_{j_k} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}).
$$

By the symmetry properties on $f$,

$$
\sum_{1 \leq i_1 \neq \ldots \neq i_k \leq n} f_{i_1 \ldots i_k}(X_{i_1}^{(1)}, \ldots, X_{i_k}^{(k)}) = \frac{1}{k!} \sum_{1 \leq i_1 \neq \ldots \neq i_k \leq n} \sum_{0 \leq \delta_1, \ldots, \delta_k \leq 1} (-1)^{k-\delta_1-\ldots-\delta_k} \sum_{1 \leq j_1, \ldots, j_k \leq k} \delta_{j_1} \cdots \delta_{j_k} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}).
$$

Therefore,

$$
\Pr\left(\left\| \sum_{1 \leq i_1 \neq \ldots \neq i_k \leq n} f_{i_1 \ldots i_k}(X_{i_1}^{(1)}, \ldots, X_{i_k}^{(k)}) \right\| \geq t\right)
\leq \sum_{0 \leq \delta_1, \ldots, \delta_k \leq 1} \Pr\left(\left\| \sum_{1 \leq i_1 \neq \ldots \neq i_k \leq n} \sum_{1 \leq j_1, \ldots, j_k \leq k} \delta_{j_1} \cdots \delta_{j_k} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}) \right\| \geq k!t/2^k\right)
\leq \sum_{l=1}^{k} \binom{k}{l} \Pr\left(\left\| \sum_{1 \leq i_1 \neq \ldots \neq i_k \leq n} \sum_{1 \leq j_1, \ldots, j_k \leq l} f_{i_1 \ldots i_k}(X_{i_1}^{(j_1)}, \ldots, X_{i_k}^{(j_k)}) \right\| \geq k!t/2^k\right),
$$

and this combined with Lemma 3 is sufficient to show the result.
