MULTISCALE FINITE ELEMENT METHODS FOR AN ELLIPTIC OPTIMAL CONTROL PROBLEM WITH ROUGH COEFFICIENTS

SUSANNE C. BRENNER, JOSÉ C. GARAY, AND LI-YENG SUNG

Abstract. We investigate multiscale finite element methods for an elliptic distributed optimal control problem with rough coefficients. They are based on the (local) orthogonal decomposition methodology of Målqvist and Peterseim.

1. Introduction

Let $\Omega$ be a polyhedral domain in $\mathbb{R}^d$ ($d = 1, 2, 3$) and $y_d \in L_2(\Omega)$. We consider the following elliptic distributed optimal control problem:

Find $((\bar{y}, \bar{u})) = \arg\min_{(y, u) \in K} \frac{1}{2} \left[ \|y - y_d\|^2_{L_2(\Omega)} + \gamma \|u\|^2_{L_2(\Omega)} \right],$

where $(y, u) \in H^1_0(\Omega) \times L_2(\Omega)$ belongs to $K$ if and only if

$$a(y, z) = \int_{\Omega} u z \, dx \quad \forall \ z \in H^1_0(\Omega),$$

and the bilinear form $a(\cdot, \cdot)$ is given by

$$a(y, z) = \int_{\Omega} (\mathcal{A}\nabla y) \cdot \nabla z \, dx.$$

Here $\bar{y}$ is the optimal state, $\bar{u}$ is the optimal control and $y_d$ is the desired state.

Remark 1.1. We will follow the standard notation for differential operators, function spaces and norms that can be found for example in [9, 7, 3].

We assume only that the components of the symmetric diffusion matrix $\mathcal{A}$ belong to $L_\infty(\Omega)$ and the eigenvalues of $\mathcal{A}$ are bounded below (resp., above) by the positive constant $\alpha$ (resp., $\beta$), which covers many multiscale optimal control problems.

Example 1.2. This example is from [21], where $\Omega$ is the unit square $(0, 1) \times (0, 1)$,

$$\mathcal{A}(x) = \begin{bmatrix} c(x) & 0 \\ 0 & c(x) \end{bmatrix},$$
and
\[
c(x) = \frac{2 + 1.8 \sin \left(\frac{2\pi x_1}{\epsilon}\right)}{2 + 1.8 \cos \left(\frac{2\pi x_2}{\epsilon}\right)} + \frac{2 + \sin \left(\frac{2\pi x_2}{\epsilon}\right)}{2 + 1.8 \sin \left(\frac{2\pi x_1}{\epsilon}\right)}
\]
is highly oscillatory for small $\epsilon$. Note that
\[
\alpha = \min_{0 \leq x \leq 1} c(x) \approx 1.248 \quad \text{and} \quad \beta = \max_{0 \leq x \leq 1} c(x) \approx 19.526
\]
for any $\epsilon \leq 1$.

**Example 1.3.** This example is from [6], where $\Omega$ is the unit square $(0, 1) \times (0, 1)$,
\[
\mathbb{A} = \begin{bmatrix}
A_{11} & 0 \\
0 & A_{22}
\end{bmatrix},
\]
and the components $A_{11}$ and $A_{22}$ are randomly generated piecewise constant functions with respect to a uniform partition of $\Omega$ into $40 \times 40$ small squares (cf. Figure 1.1). The values of $A_{11}$ and $A_{22}$ are between $\alpha = 1$ and $\beta = 1350$.

![Figure 1.1. $A_{11}$ (left) and $A_{22}$ (right)](image)

Due to the roughness of the coefficients in (1.3), a standard finite element method can only accurately capture the solution of (1.1) on a very fine mesh (cf. [5]), which can be too expensive, especially when the problem has to be solved repeatedly for different $y_d$. Our goal is to construct generalized finite element spaces that can produce approximate solutions of (1.1) with $O(H)$ (resp., $O(H^2)$) error in the energy (resp., $L^2$) norm, where $H$ is the mesh size and the dimensions of the generalized finite element spaces are $O(H^{-d})$. In other words the performance of these generalized finite element methods is similar to standard finite element methods for elliptic problems with smooth coefficients on smooth or convex domains.

Our constructions are based on the Localized Orthogonal Decomposition (LOD) approach in [18, 29] and the ideas in [26, 6] (cf. also [30, Section 4.3]). The basis functions of the generalized finite element spaces are obtained by a correction process that can be carried out offline. The online computation only involves solving a linear system of moderate size. Therefore these generalized finite element methods can also be viewed as reduced order methods that are particularly suitable for repeat solves.
There are many numerical methods for elliptic problems with rough coefficients besides
the LOD methods. They include the variational multiscale method (cf. [23, 24, 25] and
the references therein), the multiscale finite element method (cf. [21, 22, 13, 17] and the
references therein), the heterogeneous multiscale method (cf. [11, 12, 1, 2] and the references
therein), and the method of approximate component synthesis (cf. [20, 19] and the references
therein). We refer the readers to [31, 30] for the discussion of other methods.

On the other hand, as far as we know, there is only one paper [15] that solved the optimal
control problem (1.1)–(1.3) (with additional control constraints) by the heterogeneous mul-
tiscale method, where scale separation and periodic structure are assumed. In the context
of parabolic optimal control problems with rough coefficients, reduced order finite element
methods in the same spirit of the current paper are treated in [28, 33]. In particular, the
methodology in [28] is also based on the LOD approach. The distinctive feature of our work
in this paper is that the construction of the localized multiscale finite element space and its
analysis are based entirely on classical techniques from domain decomposition and numerical
linear algebra.

The rest of the paper is organized as follows. We recall relevant results for the optimal
control problem in Section 2. A multiscale finite element method based on orthogonal
decomposition is treated in Section 3. We introduce a localized multiscale finite element
space in Section 4 and analyze the corresponding Galerkin method in Section 5, where the
error estimates in Section 3 play a useful role. Numerical results are presented in Section 6
and we end with some concluding remarks in Section 7.

We will use \( \langle \cdot, \cdot \rangle \) to denote the canonical bilinear form on a finite dimensional vector space
\( V \) and its dual space \( V' \). A linear operator \( L : V \rightarrow V' \) is symmetric if
\[
\langle Lv_1, v_2 \rangle = \langle Lv_2, v_1 \rangle \quad \forall v_1, v_2 \in V,
\]
and it is symmetric positive definite (SPD) if additionally
\[
\langle Lv, v \rangle > 0 \quad \forall v \in V \setminus \{0\}.
\]
Given two finite dimensional vector spaces \( V \) and \( W \) and a linear transform \( T : V \rightarrow W \),
the transpose \( T^t : W' \rightarrow V' \) is defined by
\[
\langle T^t \mu, v \rangle = \langle \mu, Tv \rangle \quad \forall \mu \in W', v \in V.
\]

We also assume that all the unspecified positive constants in the paper are greater than
or equal to 1.

2. The Continuous Problem

By a standard result [27, Section 2.2], the convex minimization problem defined by (1.1)–
(1.3) has a unique solution determined by the following first order optimality conditions:
\[
a(\bar{y}, z) = \int_{\Omega} \bar{u} z \, dx \quad \forall z \in H^1_0(\Omega),
\]
\[
a(\bar{p}, q) = \int_{\Omega} (y_d - \bar{y}) q \, dx \quad \forall q \in H^1_0(\Omega),
\]
\[
\bar{p} = \gamma \bar{u},
\]
where the adjoint state \( \bar{p} \) belongs to \( H^1_0(\Omega) \).

After eliminating \( \bar{u} \), we have the following system for \( (\bar{p}, \bar{y}) \):

\[
\begin{align*}
(2.1) & \quad a(\bar{p}, q) + \int_{\Omega} \bar{y} q \, dx = \int_{\Omega} y q \, dx \quad \forall \ q \in H^1_0(\Omega), \\
(2.2) & \quad \int_{\Omega} \bar{p} z \, dx - \gamma a(\bar{y}, z) = 0 \quad \forall \ z \in H^1_0(\Omega).
\end{align*}
\]

**Remark 2.1.** Note that (2.1)–(2.2) is equivalent to

\[
\begin{align*}
\tilde{a}(\bar{p}, q) + \int_{\Omega} \tilde{y} q \, dx = & \quad \int_{\Omega} \tilde{y} q \, dx \quad \forall \ q \in H^1_0(\Omega), \\
\int_{\Omega} \bar{p} z \, dx - \tilde{\gamma} a(\tilde{y}, z) = & \quad 0 \quad \forall \ z \in H^1_0(\Omega),
\end{align*}
\]

where \( \tilde{a}(\cdot, \cdot) = \tau a(\cdot, \cdot), \ \tilde{y} = \tau \bar{y}, \ \tilde{y}_d = \tau y_d, \ \tilde{\gamma} = (\gamma/\tau^2) \) and \( \tau \) is any positive number. Therefore we can assume that the lower bound \( \alpha \) for the eigenvalues of \( A \) (cf. (1.3)) in the definition of the bilinear form \( a(\cdot, \cdot) \) in (2.1)–(2.2) is roughly 1, as in Example 1.2 and Example 1.3.

Since the dependence on \( \gamma \) is not our main concern here, we will take \( \gamma \) to be 1 in (2.2). We will also simplify the notation by dropping the bars over \( \bar{p} \) and \( \bar{y} \) and consider the problem of finding \( (p, y) \in H^1_0(\Omega) \times H^1_0(\Omega) \) such that

\[
\begin{align*}
(2.3) & \quad a(p, q) + \int_{\Omega} y q \, dx = \int_{\Omega} y_d q \, dx \quad \forall \ q \in H^1_0(\Omega), \\
(2.4) & \quad \int_{\Omega} p z \, dx - a(y, z) = 0 \quad \forall \ z \in H^1_0(\Omega).
\end{align*}
\]

We can write (2.3)–(2.4) concisely as

\[
(2.5) \quad B((p, y), (q, z)) = \int_{\Omega} y_d q \, dx \quad \forall \ (q, z) \in H^1_0(\Omega) \times H^1_0(\Omega),
\]

where

\[
(2.6) \quad B((p, y), (q, z)) = a(p, q) + \int_{\Omega} y q \, dx + \int_{\Omega} p z \, dx - a(y, z).
\]

We will use \( \| \cdot \|_a \) to denote the energy norm \( \sqrt{a(\cdot, \cdot)} \). Note that

\[
(2.7) \quad \sqrt{\alpha} \| v \|_{H^1(\Omega)} \leq \| v \|_a \leq \sqrt{\beta} \| v \|_{H^1(\Omega)} \quad \forall \ v \in H^1(\Omega)
\]

by our assumption on \( A \), and we have a Poincaré-Friedrichs inequality [3]

\[
(2.8) \quad \| v \|_{L^2(\Omega)}^2 \leq C_{PF} \| v \|_{H^1(\Omega)}^2 \quad \forall \ v \in H^1_0(\Omega).
\]

The following are the salient features of \( B(\cdot, \cdot) \) that follow immediately from (2.6)–(2.8) and the Cauchy-Schwarz inequality:

\[
(2.9) \quad B((q, z), (q, -z)) = \| (q, z) \|_{a \times a}^2 \quad \forall \ (q, z) \in H^1_0(\Omega) \times H^1_0(\Omega),
\]

and

\[
(2.10) \quad B((q, z), (r, s)) \leq [1 + (C_{PF}/\alpha)] \| (q, z) \|_{a \times a} \| (r, s) \|_{a \times a}
\]
for all \((q, z), (r, s) \in H^1_0(\Omega) \times H^1_0(\Omega)\), where the norm \(\| \cdot \|_{a\times a}\) is defined by
\[
\|(q, z)\|_{a\times a}^2 = \|q\|_a^2 + \|z\|_a^2.
\] (2.11)

From here on we will also use bold-faced letters to denote members of the product space \(H^1_0(\Omega) \times H^1_0(\Omega)\) in order to improve the readability of the formulas.

**Lemma 2.2.** Let \(V\) be a subspace of \(H^1_0(\Omega)\). We have
\[
\inf_{v \in V} \sup_{w \in V} \frac{B(v, w)}{\|v\|_{a\times a} \|w\|_{a\times a}} \geq 1.
\] (2.12)

**Proof.** Let \(v = (q, z) \in V \times V\) be arbitrary. According to (2.9), we have
\[
\|(q, z)\|_{a\times a}^2 = B((q, z), (q, -z))
\]
and consequently
\[
\|v\|_{a\times a} = \frac{B((q, z), (q, -z))}{\|(q, z)\|_{a\times a}} \leq \sup_{w \in V} \frac{B(v, w)}{\|w\|_{a\times a}}.
\] (2.13)

\[\Box\]

**Remark 2.3.** Let \(V\) be a closed subspace of \(H^1_0(\Omega)\) and \(V' = V \times V\). It follows from (2.10) that we can define a linear transformation \(T : V \rightarrow V'\) by
\[\langle Tz, w \rangle = B(z, w) \quad \forall z, w \in V.\]
Since the bilinear form \(B(\cdot, \cdot)\) is symmetric, the inf-sup condition (2.12) implies that \(T\) is an isomorphism and the operator norms of \(T\) and \(T^{-1}\) (with respect to \(\| \cdot \|_{a\times a}\) are bounded by 1 (cf. [4, 8]).

**Remark 2.4.** In view of Remark 2.3, one can solve (2.5) by a standard finite element method. Let \(V_h \subset H^1_0(\Omega)\) (resp., \(V_H \subset H^1_0(\Omega)\)) be the \(P_1\) or \(Q_1\) finite element space associated with the triangulation \(\mathcal{T}_h\) (resp., \(\mathcal{T}_H\)) of \(\Omega\), where \(\mathcal{T}_h\) is a refinement of \(\mathcal{T}_H\) and hence \(V_H\) is a subspace of \(V_h\).

We assume that \(h \ll 1\) so that \((p_h, y_h) \in V_h \times V_h\) determined by
\[
B((p_h, y_h), (q, z)) = \int_\Omega y_d q \, dx \quad \forall (q, z) \in V_h \times V_h
\] (2.14)
provides a good approximation of the solution \((p, y)\) of (2.5), but the dimension of \(V_h\) is so large that the computational cost is prohibitive, especially if we have to solve (2.14) repeatedly for different \(y_d\).

On the other hand, for \(H \gg h\), the solution \((p_H, y_H) \in V_H \times V_H\) defined by
\[
B((p_H, y_H), (q, z)) = \int_\Omega y_d q \, dx \quad \forall (q, z) \in V_H \times V_H
\] (2.15)
is computationally feasible but not sufficiently accurate. Therefore we need generalized finite element spaces to bridge the two scales.
Finite element solutions for the optimal states in Example 1.2 and Example 1.3 are displayed in Figure 2.1 and Figure 2.2. It can be observed for both examples that the LOD solutions from Section 5 capture the fine scale solutions while the coarse scale solutions fail to do so.

![Figure 2.1. Finite element solutions of the optimal state in Example 1.2 with $\epsilon = 0.025$: solution on a fine mesh with $h = 1/320$ (top left), solution on a coarse mesh with $H = 1/20$ (bottom), LOD solution with $H = 1/20$ and $h = 1/320$ (top right)](image)

**Remark 2.5.** It follows from (2.7), (2.8), (2.12) and (2.14) that

$$
\|(p_h, y_h)\|_{a \times a} \leq \|y_d\|_{L^2(\Omega)} \sup_{(q, z) \in V_h \times V_h} \frac{\|q\|_{L^2(\Omega)}}{\|(q, z)\|_{a \times a}} \leq \sqrt{C_{PF}/\alpha} \|y_d\|_{L^2(\Omega)}.
$$

3. The Ideal Multiscale Finite Element Method

In this Section we construct and analyze the ideal multiscale finite element method following the ideas in [29, 26], which begins with the construction of a projection operator. We will denote by $n$ (resp., $m$) the dimension of the finite element space $V_h$ (resp., $V_H$) in Remark 2.4.

3.1. The Projection Operator $\Pi_H$. The operator $\Pi_H : H_0^1(\Omega) \rightarrow V_H$ is defined by taking the nodal average of the local $L^2$ orthogonal projections of $\zeta \in H_0^1(\Omega)$ into $P_1$ or $Q_1$ polynomials. More precisely, we define $\Pi_H \zeta$ by

$$
(\Pi_H \zeta)(p) = \frac{1}{|T_p|} \sum_{T \in T_p} (Q_T \zeta_T)(p) \quad \forall p \in V_H,
$$
where $V_H$ is the set of all the (interior) vertices of $T_H$, $T_p$ is the set of the elements in $T_H$ that share $p$ as a common vertex, $|T_p|$ is the number of elements in $T_p$, $\zeta_T$ is the restriction of $\zeta$ to $T$, and $Q_T$ is the orthogonal projection from $L_2(T)$ onto $P_1(T)$ or $Q_1(T)$.

We have an obvious relation

\begin{equation}
\Pi_Hv = v \quad \forall v \in V_H
\end{equation}

and also an interpolation error estimate [6, Appendix A]

\begin{equation}
H^{-1}\|v - \Pi_Hv\|_{L_2(\Omega)} + \|\Pi_Hv|_{H^1(\Omega)} \leq C_\dagger \|v\|_{H^1(\Omega)} \quad \forall v \in H^1_0(\Omega),
\end{equation}

where the positive constant $C_\dagger$ depends only on the shape regularity of $T_H$.

**Remark 3.1.** We can use (2.7) to translate the estimate for $|\Pi_Hv|_{H^1(\Omega)}$ into

\begin{equation}
\|\Pi_Hv\|_{a} \leq C_\dagger \sqrt{\beta/\alpha} \|v\|_{a} \quad \forall v \in H^1_0(\Omega).
\end{equation}

We will denote the kernel of the restriction of $\Pi_H$ to $V_h$ by $K_{\Pi}^{Hh}$, i.e.,

\begin{equation}
K_{\Pi}^{Hh} = \{v \in V_h : \Pi_Hv = 0\}.
\end{equation}

It follows from (3.2) and (3.4) that

\begin{equation}
\dim K_{\Pi}^{Hh} = \dim V_h - \dim V_H = n - m.
\end{equation}

A basis for $K_{\Pi}^{Hh}$ is given in the following lemma.

**Lemma 3.2.** Let $\ell = n - m$ and $\varphi_1, \ldots, \varphi_\ell$ be the nodal basis functions in $V_h$ that vanish at the nodes of $V_H$ (cf. Figure 3.1 for a two dimensional example with the $Q_1$ finite element).
Then \((I - \Pi_H)\varphi_1, \ldots, (I - \Pi_H)\varphi_\ell\) form a basis of \(K_h^{\Pi_H}\), where \(I\) is the identity operator on \(V_h\).

**Proof.** It follows from (3.2) that \((I - \Pi_H)\varphi_i \in K_h^{\Pi_H}\) for \(1 \leq i \leq \ell\). In view of (3.5), it only remains to show that the functions \((I - \Pi_H)\varphi_1, \ldots, (I - \Pi_H)\varphi_\ell\) are linearly independent.

Suppose \(\sum_{i=1}^\ell c_i (I - \Pi_H)\varphi_i = 0\). Then the function \(\sum_{i=1}^\ell c_i \varphi_i = \sum_{i=1}^\ell c_i \Pi_H \varphi\) belongs to \(V_H\) and at the same time vanishes at the nodes of \(V_H\). It follows that \(\sum_{i=1}^\ell c_i \varphi_i = 0\) and hence \(c_i = 0\) for \(1 \leq i \leq \ell\) because the functions \(\varphi_1, \ldots, \varphi_\ell\) are linearly independent. \(\Box\)

**Figure 3.1.** The nodes for \(V_H\) are represented by the circles and the nodes for \(\varphi_1, \ldots, \varphi_\ell \in V_h\) are represented by the solid dots.

### 3.2. The Projection Operator \(C_h^{\Pi_H}\)

According to Remark 2.3, we can define a linear transformation

\[
C_h^{\Pi_H} : V_h \times V_h \rightarrow K_h^{\Pi_H} \times K_h^{\Pi_H}
\]

by

\[
B(C_h^{\Pi_H} v, w) = B(v, w) \quad \forall v \in V_h \times V_h, \ w \in K_h^{\Pi_H} \times K_h^{\Pi_H}.
\]

The elementary algebraic properties of \(C_h^{\Pi_H}\) that follow directly from (3.6) are collected in the following lemma.

**Lemma 3.3.** We have

\[
B(C_h^{\Pi_H} v, w) = B(v, C_h^{\Pi_H} w) \quad \forall v, w \in V_h \times V_h,
\]

\[
(\Pi_H \times \Pi_H)C_h^{\Pi_H} v = 0 \quad \forall v \in V_h \times V_h,
\]

\[
C_h^{\Pi_H} v = v \quad \forall v \in K_h^{\Pi_H} \times K_h^{\Pi_H}.
\]

**Remark 3.4.** It follows from (3.9) that \(C_h^{\Pi_H}\) is a projection from \(V_h \times V_h\) onto \(K_h^{\Pi_H} \times K_h^{\Pi_H}\), and that

\[
(I - C_h^{\Pi_H})(I - \Pi_H \times \Pi_H)v = 0 \quad \forall v \in V_h \times V_h,
\]

where \(I\) is the identity operator on \(V_h \times V_h\).
Lemma 3.5. We have
\[ \| C_h^{\Pi H} v \|_{a \times a} \leq [1 + (C_{PF}/\alpha)] \| v \|_{a \times a} \quad \forall v \in V_h \times V_h. \]

Proof. Let \((q, z) = C_h^{\Pi H} v\). Then \((q, z)\) (and hence \((q, -z)\)) belongs to \(K_h^{\Pi H} \times K_h^{\Pi H}\). It follows from (2.9), (2.10) and (3.6) that
\[ \| C_h^{\Pi H} v \|_{a \times a}^2 = \| (q, z) \|_{a \times a}^2 = B((q, z), (q, -z)) = B(v, (q, -z)) \leq [1 + (C_{PF}/\alpha)] \| v \|_{a \times a} \| C_h^{\Pi H} v \|_{a \times a}. \]

\[ \square \]

Corollary 3.6. The following relations are valid:
\[ (3.11) \quad \| v - C_h^{\Pi H} v \|_{a \times a} \leq [2 + (C_{PF}/\alpha)] \| v \|_{a \times a} \quad \forall v \in V_h \times V_h; \]
\[ (3.12) \quad \| v \|_{a \times a} \leq C_1\sqrt{\beta/\alpha} \| v - C_h^{\Pi H} v \|_{a \times a} \quad \forall v \in V_h \times V_H. \]

Proof. The inequality (3.11) follows from Lemma 3.5 and the triangle inequality, and the inequality (3.12) follows from (3.2), Remark 3.1 and (3.8):
\[ \| v \|_{a \times a} = \| (\Pi_H \times \Pi_H)(v - C_h^{\Pi H} v) \|_{a \times a} \leq C_1\sqrt{\beta/\alpha} \| v - C_h^{\Pi H} v \|_{a \times a}. \]

\[ \square \]

3.3. The Finite Element Space \(V_H^{ms,h}\). The ideal multiscale finite element space
\[ V_H^{ms,h} \subset V_h \times V_h \]
is defined by
\[ (3.13) \quad V_H^{ms,h} = \{ v \in V_h \times V_h : B(v, w) = 0 \quad \forall w \in K_h^{\Pi H} \times K_h^{\Pi H} \}. \]

Let \(v \in V_h \times V_h\) be arbitrary. It follows from Lemma 2.2 (with \(V = K_h^{\Pi H}\), (3.6) and (3.13) that
\[ (3.14) \quad v \in V_H^{ms,h} \iff B(C_h^{\Pi H} v, w) = 0 \quad \forall w \in K_h^{\Pi H} \times K_h^{\Pi H} \iff C_h^{\Pi H} v = 0. \]
Therefore we have \(V_H^{ms,h} = (I - C_h^{\Pi H})(V_h \times V_h)\) and
\[ (3.15) \quad \dim V_H^{ms,h} = 2n - 2\ell = 2m. \]

A basis for \(V_H^{ms,h}\) is given in the following lemma.

Lemma 3.7. Let \(\{\phi_1, \ldots, \phi_m\}\) be the nodal basis of \(V_H\), \(\psi_i = C_h^{\Pi H}(\phi_i, 0)\) and \(\xi_i = C_h^{\Pi H}(0, \phi_i)\). Then
\[ \{ (\phi_1, 0) - \psi_1, \ldots, (\phi_m, 0) - \psi_m, (0, \phi_1) - \xi_1, \ldots, (0, \phi_m) - \xi_m \} \]
is a basis for \(V_H^{ms,h}\).

Proof. In view of (3.15), it suffices to show that the \(2m\) functions \((\phi_i, 0) - \psi_i = (I - C_h^{\Pi H})(\phi_i, 0)\) and \((0, \phi_i) - \xi_i = (I - C_h^{\Pi H})(0, \phi_i)\) (\(1 \leq i \leq m\)) are linearly independent.

Suppose \(\sum_{i=1}^{m} [c_i(I - C_h^{\Pi H})(\phi_i, 0) + d_i(I - C_h^{\Pi H})(0, \phi_i)] = 0\). It then follows from (3.2) and (3.8) that \(\sum_{i=1}^{m} [c_i(\phi_i, 0) + d_i(0, \phi_i)] = 0\) and hence \(c_i = d_i = 0\) for \(1 \leq i \leq m\).

\[ \square \]
Remark 3.8. It follows from Lemma 3.7 that we also have \( V_{H,ms}^{m,s} = (I - C_{h,H}^{I}) (V_{H} \times V_{H}) \).

Remark 3.9. Let \( (\psi_{i,1}, \psi_{i,2}) = C_{h,H}(\phi_{i}, 0) \) and \( (\xi_{i,1}, \xi_{i,2}) = C_{h,H}(0, \phi_{i}) \). It follows from (3.6) and the relation (cf. (2.6))

\[
B((y, -p), (q, z)) = B((p, y), (z, -q)) \quad \forall (p, y), (q, z) \in H_{0}^{1}(\Omega) \times H_{0}^{1}(\Omega)
\]

that \( \psi_{i,1} = \xi_{i,2} \) and \( \psi_{i,2} = -\xi_{i,1} \).

![Figure 3.2. A basis function \( \phi_{i} \) of \( V_{H} \).](image)

The figure of a typical basis function \( \phi_{i} \) of \( V_{H} \) is given in Figure 3.2, and the figure of the corresponding basis function \( (\phi_{i}, 0) - C_{h,H}(\phi_{i}, 0) \) is displayed in Figure 3.3 for Example 1.2, and in Figure 3.4 for Example 1.3.

Remark 3.10. The exponential decay of \( \psi_{i} = C_{h,H}(\phi_{i}, 0) \) (and hence \( \xi_{i} = C_{h,H}(0, \phi_{i}) \) in view of Remark 3.9) are clearly observed in Figure 3.3 and Figure 3.4.

![Figure 3.3. The basis function \( (\phi_{i}, 0) - C_{h,H}(\phi_{i}, 0) \) of \( V_{H,ms}^{m,s} \) for Example 1.2 with \( H = 1/40, h = 1/320 \) and \( \epsilon = 0.0025 \): first component (left) and second component (right).](image)
3.4. The Discrete Problem. The approximate solution \((p_{ms}^{h}, y_{ms}^{h}) \in V_{ms, h}^{H}\) is defined by
\[
B((p_{ms}^{h}, y_{ms}^{h}), (q, z)) = \int_{\Omega} y dq dx \quad \forall (q, z) \in V_{ms, h}^{H}.
\]

The well-posedness of (3.16) is guaranteed by the following lemma.

**Lemma 3.11.** We have
\[
\inf_{v \in V_{ms, h}^{H}} \sup_{w \in V_{ms, h}^{H}} \frac{B(v, w)}{\|v\|_{a \times a} \|w\|_{a \times a}} \geq [2 + (C_{PF}/\alpha)]^{-1}.
\]

**Proof.** Let \(v = (q, z) \in V_{ms, h}^{H}\) be arbitrary. Then \((q, -z) - C_{h}^{H}(q, -z) \in V_{ms, h}^{H}\) and it follows from (2.9), (3.11) and (3.13) that
\[
\|v\|_{a \times a} = \frac{B((q, z), (q, -z))}{\|(q, -z)\|_{a \times a}} = \frac{B((q, z), (q, -z) - C_{h}^{H}(q, -z))}{\|(q, -z)\|_{a \times a}} \leq [2 + (C_{PF}/\alpha)] \frac{B((q, z), (q, -z) - C_{h}^{H}(q, -z))}{\|(q, -z) - C_{h}^{H}(q, -z)\|_{a \times a}} \leq [2 + (C_{PF}/\alpha)] \sup_{w \in V_{ms, h}^{H}} \frac{B(v, w)}{\|w\|_{a \times a}}.
\]

\(\square\)

3.5. Energy Error. It follows from (2.14) and (3.16) that
\[
B((p_{h}, y_{h}) - (p_{ms}^{h}, y_{ms}^{h}), (q, z)) = 0 \quad \forall (q, z) \in V_{ms, h}^{H}.
\]

We will use the Galerkin relation (3.18) to derive an error estimate for the ideal multiscale finite element method defined by (3.16).
Theorem 3.12. We have
\begin{equation}
\|(p_h, y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h})\|_{a \times a} \leq (C_{\dagger}/\sqrt{\alpha}) H \|y_d\|_{L_2(\Omega)}.
\end{equation}

Proof. In view of Remark 2.3, (3.13) and (3.18), we have \((p_h, y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h}) \in K_H^{\Pi H} \times K_H^{\Pi H}\) and consequently
\begin{equation}
p_h - p_H^{\text{ms}, h} \quad \text{and} \quad y_h - y_H^{\text{ms}, h} \quad \text{belong to} \quad K_H^{\Pi H}.
\end{equation}

Putting (2.7), (2.9), (2.14), (3.3), (3.13) and (3.20) together, we have
\begin{align*}
\|(p_h, y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h})\|_{a}^2 &= \mathcal{B}((p_h, y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h}), (p_h - y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h})) \\
&= \mathcal{B}((p_h, y_h), (p_h - y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h})) \\
&= \int_{\Omega} y_d(p_h - p_H^{\text{ms}, h}) dx \\
&= \int_{\Omega} y_d[(p_h - p_H^{\text{ms}, h}) - \Pi_H(p_h - p_H^{\text{ms}, h})] dx \\
&\leq C_{\dagger} H \|y_d\|_{L_2(\Omega)} \|p_h - p_H^{\text{ms}, h}\|_{H^1(\Omega)} \\
&\leq (C_{\dagger}/\sqrt{\alpha}) H \|y_d\|_{L_2(\Omega)} \|p_h - p_H^{\text{ms}, h}\|_{a},
\end{align*}
and (3.19) follows immediately.

Remark 3.13. In view of (3.9), (3.14) and (3.20), we can express the error of the ideal multiscale finite element method as
\begin{equation}
(p_h, y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h}) = C_H^{\Pi H} ((p_h, y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h})) = C_H^{\Pi H}(p_h, y_h).
\end{equation}

3.6. \(L_2\) Error. We will obtain an estimate for the \(L_2\) error by a duality argument.

Theorem 3.14. We have
\begin{equation}
\|(p_h, y_h) - (p_H^{\text{ms}, h}, y_H^{\text{ms}, h})\|_{L_2(\Omega) \times L_2(\Omega)} \leq [1 + (C_{\text{PF}}/\alpha)](C_{\dagger}^2/\alpha) H^2 \|y_d\|_{L_2(\Omega)}.
\end{equation}

Proof. In view of Remark 2.3, we can define \((q, z) \in V_h \times V_h\) by
\begin{equation}
\mathcal{B}((q, z), (r, s)) = \int_{\Omega} (p_h - p_H^{\text{ms}, h}) r dx + \int_{\Omega} (y_h - y_H^{\text{ms}, h}) s dx \quad \forall (r, s) \in V_h \times V_h.
\end{equation}

Let \(C_H^{\Pi H}(q, z) \in K_H^{\Pi H} \times K_H^{\Pi H}\) be denoted by \((\tilde{q}, \tilde{z})\). It follows from (2.7), (2.9), (3.3), (3.6), (3.7), (3.9), (3.22) and the Cauchy-Schwarz inequality that
\begin{align*}
\|\tilde{q} - \tilde{z}\|_{a \times a}^2 &= \mathcal{B}((\tilde{q}, \tilde{z}), (\tilde{q}, -\tilde{z})) \\
&= \mathcal{B}((q, z), (\tilde{q}, -\tilde{z})) \\
&= \int_{\Omega} (p_h - p_H^{\text{ms}, h}) \tilde{q} dx - \int_{\Omega} (y_h - y_H^{\text{ms}, h}) \tilde{z} dx \\
&= \int_{\Omega} (p_h - p_H^{\text{ms}, h}) (\tilde{q} - \Pi_H \tilde{q}) dx - \int_{\Omega} (y_h - y_H^{\text{ms}, h}) (\tilde{z} - \Pi_H \tilde{z}) dx \\
&\leq C_{\dagger} \|p_h - p_H^{\text{ms}, h}\|_{L_2(\Omega)} \|\tilde{q}\|_{H^1(\Omega)} + \|y_h - y_H^{\text{ms}, h}\|_{L_2(\Omega)} \|\tilde{z}\|_{H^1(\Omega)} \\
&\leq C_{\dagger} \|(p_h - p_H^{\text{ms}, h}, y_h - y_H^{\text{ms}, h})\|_{L_2(\Omega) \times L_2(\Omega)} (1/\sqrt{\alpha}) \|(\tilde{q}, \tilde{z})\|_{a \times a},
\end{align*}
and hence
\begin{equation}
\|C^H_{h}(q, z)\|_{a \times a} \leq (C_1 / \sqrt{\alpha})H(p_h, y_h) - (P^ms_h, y^ms_h)\|_{L_2(\Omega) \times L_2(\Omega)}.
\end{equation}

On the other hand, we have
\begin{equation}
\|(p_h - P^ms_h, y_h - y^ms_h)\|_{L_2(\Omega) \times L_2(\Omega)}^2 = B((q, z), (p_h - P^ms_h, y_h - y^ms_h)) \leq [1 + (C_{PF}/\alpha)]\|c^H_{h}(q, z)\|_{a \times a}\|(p_h - P^ms_h, y_h - y^ms_h)\|_{a \times a}
\end{equation}
by (2.10), (3.6), (3.20) and (3.22).

Putting (3.19), (3.23) and (3.24) together, we arrive at
\begin{equation}
\|(p_h, y_h) - (P^ms_h, y^ms_h)\|_{L_2(\Omega) \times L_2(\Omega)} \leq [1 + (C_{PF}/\alpha)](C_1 / \sqrt{\alpha})H(p_h - P^ms_h, y_h - y^ms_h)\|_{a \times a} \leq [1 + (C_{PF}/\alpha)](C_1^2 / \alpha)H^2\|y_d\|_{L_2(\Omega)}.
\end{equation}

\[\square\]

4. A Localized Multiscale Finite Element Space

The constructions of $\psi_i = C^H_{h}(\phi_i, 0) \in K^H_{h} \times K^H_{h}$ and $\xi_i = C^H_{h}(0, \phi_i) \in K^H_{h} \times K^H_{h}$ require solving the equations
\begin{equation}
B(\psi_i, (q, z)) = B((\phi_i, 0), (q, z)) \quad \forall (q, z) \in K^H_{h} \times K^H_{h},
\end{equation}
\begin{equation}
B(\xi_i, (q, z)) = B((0, \phi_i), (q, z)) \quad \forall (q, z) \in K^H_{h} \times K^H_{h},
\end{equation}
which are expensive. However the exponential decays of $\psi_i$ and $\xi_i$ observed in Figures 3.4, Figures 3.3 and Remark 3.10 indicate that it is possible to capture $\psi_i$ and $\xi_i$ by local approximations. (Note that in practice we only need to solve one of these equations because of the observation in Remark 3.9.)

We will construct a localized multiscale finite element space by replacing $\psi_i$ (resp., $\xi_i$) with an approximate solution of (4.1) (resp., (4.2)) obtained by a preconditioned minimum residual (P-MINRES) algorithm (cf. [16, Chapter 8] and [14, Section 4.1]). Our construction extends those in [26, 6] to symmetric indefinite problems.

4.1. An Additive Schwarz Preconditioner. Let $A^H_{h} : K^H_{h} \rightarrow (K^H_{h})'$ be the linear operator defined by
\begin{equation}
\langle A^H_{h}v, w \rangle = a(v, w) \quad \forall v, w \in K^H_{h},
\end{equation}
where $a(\cdot, \cdot)$ is given in (1.3). We begin by constructing an additive Schwarz preconditioner (cf. [10, 32, 7]) for $A^H_{h}$.

Let $x_1, \ldots, x_m$ be the (interior) nodes for $V_H$. We define the subspaces $K^H_{h; i}$ (1 ≤ i ≤ m) of $K^H_{h}$ by
\begin{equation}
K^H_{h; i} = \{(I - \Pi_H)v : v \in V_H \text{ and } v \text{ vanishes outside } \omega_{x_i}\},
\end{equation}
where $\omega_{x_i}$ is the union of the elements in $T_H$ that share $x_i$ as a common vertex (cf. Figure 4.1 for a two dimensional example with the $Q_1$ element). The functions in $K^H_{h; i}$ are supported
on the patch \( \tilde{\omega}_{x_i} \) obtained from \( \omega_{x_i} \) by adding one layer of elements in \( T_H \) (cf. Figure 4.1). Let \( \varphi_{i,1}, \ldots, \varphi_{i,m_i} \) be the nodal basis functions of \( V_h \) that vanish at \( x_i \) and outside \( \omega_{x_i} \) (cf. Figure 4.1). Then, as in Lemma 3.2, \( \{(I - \Pi_H)\varphi_{i,1}, \ldots, (I - \Pi_H)\varphi_{i,m_i}\} \) is a basis of \( K_{h,i}^{\Pi_H} \).

![Figure 4.1](image)

**Figure 4.1.** The patches \( \omega_{x_i} \) (left) and \( \tilde{\omega}_{x_i} \) (right), the node \( x_i \) is represented by the circle and the nodes for \( \varphi_{i,1}, \ldots, \varphi_{i,m_i} \) are represented by the solid dots.

Let \( I_i : K_{h,i}^{\Pi_H} \to K_{h,i}^{\Pi_H} \) be the natural injection. The SPD additive Schwarz preconditioner \( S_{h,i}^{\Pi_H} : (K_{h,i}^{\Pi_H})' \to K_{h,i}^{\Pi_H} \) for \( A_{h,i}^{\Pi_H} \) is given by

\[
S_{h,i}^{\Pi_H} = \sum_{i=1}^{m} I_i(A_{h,i}^{\Pi_H})^{-1} I_i,
\]

where \( A_{h,i}^{\Pi_H} : K_{h,i}^{\Pi_H} \to (K_{h,i}^{\Pi_H})' \) is defined by

\[
\langle A_{h,i}^{\Pi_H} v, w \rangle = a(v, w) \quad \forall v, w \in K_{h,i}^{\Pi_H}.
\]

According to the Raleigh quotient formulas, we have

\[
a(v, v) = \langle A_{h,i}^{\Pi_H} v, v \rangle \leq \lambda_{\text{max}}(S_{h,i}^{\Pi_H} A_{h,i}^{\Pi_H}) \langle (S_{h,i}^{\Pi_H})^{-1} v, v \rangle \quad \forall v \in K_{h,i}^{\Pi_H},
\]

\[
a(v, v) = \langle A_{h,i}^{\Pi_H} v, v \rangle \geq \lambda_{\text{min}}(S_{h,i}^{\Pi_H} A_{h,i}^{\Pi_H}) \langle (S_{h,i}^{\Pi_H})^{-1} v, v \rangle \quad \forall v \in K_{h,i}^{\Pi_H},
\]

and the following spectral estimates can be found in [6, Section 3]:

\[
\lambda_{\text{max}}(S_{h,i}^{\Pi_H} A_{h,i}^{\Pi_H}) \leq C_{\text{upper}} \quad \text{and} \quad \lambda_{\text{min}}(S_{h,i}^{\Pi_H} A_{h,i}^{\Pi_H}) \geq C_{\text{lower}}(\alpha/\beta),
\]

where the positive constants \( C_{\text{upper}} \) and \( C_{\text{lower}} \) only depend on the shape regularity of \( T_H \).

### 4.2. The Generalized Finite Element Space \( V_{H,k}^{\text{ms},h} \).

Let \( B_{h}^{\Pi_H} : K_{h}^{\Pi_H} \times K_{h}^{\Pi_H} \to (K_{h}^{\Pi_H} \times K_{h}^{\Pi_H})' \) be the linear operator defined by

\[
\langle B_{h}^{\Pi_H} v, w \rangle = B(v, w) \quad \forall v, w \in K_{h}^{\Pi_H} \times K_{h}^{\Pi_H}.
\]

We can then rewrite (4.1) and (4.2) as

\[
B_{h}^{\Pi_H} \psi_i = f_i,
\]

\[
B_{h}^{\Pi_H} \xi_i = g_i,
\]
where \( f_i, g_i \in (K_h^{1H} \times K_h^{1H})' \) are defined by
\[
\langle f_i, w \rangle = \mathcal{B}((\phi_i, 0), w) \quad \text{and} \quad \langle g_i, w \rangle = \mathcal{B}((0, \phi), w) \quad \forall w \in K_h^{1H} \times K_h^{1H}.
\]

Let \( \psi_{i,k} \in K_h^{1H} \times K_h^{1H} \) (resp., \( \xi_{i,k} \in K_h^{1H} \times K_h^{1H} \)) be the output of \( k \) steps of the MINRES algorithm applied to (4.11) (resp., (4.12)) with initial guess 0, where the SPD preconditioner
\[
\text{MINRES algorithm applied to (4.11) (resp., (4.12)) with initial guess 0, where the SPD}
\]
is given by
\[
\Sigma_h^{1H} : (K_h^{1H} \times K_h^{1H})' \longrightarrow K_h^{1H} \times K_h^{1H}
\]
is given by
\[
\Sigma_h^{1H}(\mu, \rho) = (\Sigma_h^{1H} \mu, \Sigma_h^{1H} \rho).
\]

Then the \( 2m \) functions
\[
(\phi_1, 0) - \psi_{1,k}, \ldots, (\phi_m, 0) - \psi_{m,k}, (0, \phi_1) - \xi_{1,k}, \ldots, (0, \phi_m) - \xi_{m,k}
\]
are linearly independent because the intersection of \( V_H \times V_H \) and \( K_h^{1H} \times K_h^{1H} \) is trivial, and we define the generalized finite element space \( V_{H,k}^{\text{ms}} \) by
\[
V_{H,k}^{\text{ms}} = \text{span}\{(\phi_1, 0) - \psi_{1,k}, \ldots, (\phi_m, 0) - \psi_{m,k}, (0, \phi_1) - \xi_{1,k}, \ldots, (0, \phi_m) - \xi_{m,k}\}.
\]

**Remark 4.1.** It follows from (2.6), (4.5) and (4.10) that the support of \( \Sigma_h^{1H} \mathcal{B}_h^{1H}(q, z) \) is a subset of the union of all the \( \tilde{\omega}_i \), whose intersection with the support of \( (q, z) \) have nonempty interiors. As the output of a preconditioned Krylov subspace method with initial guess 0, the function \( \psi_{i,k} \) belongs to
\[
\text{span}\{\Sigma_h^{1H}(\phi_i, 0), (\Sigma_h^{1H} \mathcal{B}_h^{1H}) \Sigma_h^{1H}(\phi_i, 0), \ldots, (\Sigma_h^{1H} \mathcal{B}_h^{1H})^k \Sigma_h^{1H}(\phi_i, 0)\},
\]
and hence is supported in a patch around \( x_i \) (with respect to \( \mathcal{H} \)) whose diameter is proportional to \( kH \). This is also true for the function \( \xi_{i,k} \). The functions in (4.14) are therefore locally corrected basis functions and \( V_{H,k}^{\text{ms}} \) defined by (4.15) is a localized multiscale finite element space.

**Remark 4.2.** In view of (2.6), we can express \( \mathcal{B}_h^{1H} \) in the matrix form
\[
\mathcal{B}_h^{1H} = \begin{bmatrix} A_h^{1H} & M_h^{1H} \\ M_h^{1H} & -A_h^{1H} \end{bmatrix},
\]
where \( M_h^{1H} : K_h^{1H} \longrightarrow (K_h^{1H})' \) is the (symmetric) linear operator defined by
\[
\langle M_h^{1H} r, z \rangle = \int_\Omega rz \, dx \quad \forall r, z \in K_h^{1H}.
\]

We can also write \( \Sigma_h^{1H} \) as the diagonal matrix
\[
\Sigma_h^{1H} = \begin{bmatrix} \Sigma_h^{1H} & 0 \\ 0 & \Sigma_h^{1H} \end{bmatrix}.
\]
4.3. Spectral Analysis of $S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h : K^{\Pi_H}_h \times K^{\Pi_H}_h \rightarrow K^{\Pi_H}_h \times K^{\Pi_H}_h$. A spectral analysis of the operator $S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h$ is provided in the following lemma, which is the key to the analysis of the localized multiscale finite element method in Section 5.

**Lemma 4.3.** The spectrum $\sigma(S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h)$ of $S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h$ satisfies

\[
\sigma(S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h) \subseteq [-d_s, -c_s] \cup [c_s, d_s],
\]

where

\[c_s = \lambda_{\min}(S^{\Pi_H}_h A^{\Pi_H}_h) \quad \text{and} \quad d_s = \lambda_{\max}(S^{\Pi_H}_h A^{\Pi_H}_h)[1 + (C_{PF}/\alpha)].\]

**Proof.** In view of (4.16) and (4.17), the eigenvalues of $S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h$ are real numbers. Let $\lambda$ be one of the eigenvalues and $(r, s) \in K^{\Pi_H}_h \times K^{\Pi_H}_h$ be a corresponding eigenvector. Given any $(q, z) \in K^{\Pi_H}_h \times K^{\Pi_H}_h$, we have, by (4.10),

\[
\mathcal{B}((r, s), (q, z)) = \langle (S^{\Pi_H}_h)^{-1}S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h (r, s), (q, z) \rangle = \lambda \langle (S^{\Pi_H}_h)^{-1}(r, s), (q, z) \rangle.
\]

It follows from (2.9), (4.3), (4.8) and (4.20) that

\[
\|(r, s)\|^2_{a \times a} = \mathcal{B}((r, s), (r, -s)) = \lambda \langle (S^{\Pi_H}_h)^{-1}(r, s), (r, -s) \rangle
\]

\[= \lambda \langle ((S^{\Pi_H}_h)^{-1}r, -s) - (S^{\Pi_H}_h)^{-1}s, s) \rangle \leq |\lambda| \langle ((S^{\Pi_H}_h)^{-1}r, r) + (S^{\Pi_H}_h)^{-1}s, s) \rangle
\]

\[= |\lambda|[1/\lambda_{\min}(S^{\Pi_H}_h A^{\Pi_H}_h)]\|(r, s)\|^2_{a \times a}
\]

and hence

\[|\lambda| \geq \lambda_{\min}(S^{\Pi_H}_h A^{\Pi_H}_h).\]

On the other hand we can deduce from (2.10), (4.7) and (4.20) that

\[|\lambda|\|(r, s)\|^2_{a \times a} \leq \lambda_{\max}(S^{\Pi_H}_h A^{\Pi_H}_h)|\lambda|\langle ((S^{\Pi_H}_h)^{-1}r, r) + (S^{\Pi_H}_h)^{-1}s, s) \rangle
\]

\[= \lambda_{\max}(S^{\Pi_H}_h A^{\Pi_H}_h)|\lambda|\langle (S^{\Pi_H}_h)^{-1}(r, s), (r, s) \rangle
\]

\[= \lambda_{\max}(S^{\Pi_H}_h A^{\Pi_H}_h)|\mathcal{B}((r, s), (r, s))|
\]

\[\leq \lambda_{\max}(S^{\Pi_H}_h A^{\Pi_H}_h)[1 + (C_{PF}/\alpha)]\|(r, s)\|^2_{a \times a}
\]

and hence

\[|\lambda| \leq \lambda_{\max}(S^{\Pi_H}_h A^{\Pi_H}_h)[1 + (C_{PF}/\alpha)].\]

\[\square\]

**Corollary 4.4.** The following relations hold for any $v \in K^{\Pi_H}_h \times K^{\Pi_H}_h$ :

\[
\left(\frac{c_s}{\lambda_{\min}(S^{\Pi_H}_h A^{\Pi_H}_h)^{\frac{1}{2}}}\right)\|v\|_{a \times a} \leq \langle \mathbb{B}^{\Pi_H}_h v, S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h v \rangle^{\frac{1}{2}} \leq \left(\frac{d_s}{\lambda_{\max}(S^{\Pi_H}_h A^{\Pi_H}_h)^{\frac{1}{2}}}\right)\|v\|_{a \times a}.
\]

**Proof.** Since the operator $S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h$ is symmetric with respect to the inner product defined by $\langle (S^{\Pi_H}_h)^{-1}, \cdot \rangle$, we have, by Lemma 4.3 and the spectral theorem,

\[c_s \langle (S^{\Pi_H}_h)^{-1}v, v \rangle^{\frac{1}{2}} \leq \langle \mathbb{B}^{\Pi_H}_h v, S^{\Pi_H}_h \mathbb{B}^{\Pi_H}_h v \rangle^{\frac{1}{2}} \leq d_s \langle (S^{\Pi_H}_h)^{-1}v, v \rangle^{\frac{1}{2}},\]

which together with (4.7) and (4.8) implies (4.21).

\[\square\]
5. The Localized Multiscale Finite Element Method

The localized multiscale finite element method is to find \((p_{ms,h}^{k}, y_{ms,h}^{k}) \in V_{ms,h}^{k}\) such that

\[
B((p_{ms,h}^{k}, y_{ms,h}^{k}), (q, z)) = \int_{\Omega} y q \, dx \quad \forall (q, z) \in V_{ms,h}^{k}.
\]

We will keep track of all the constants in the error analysis so that the constants that appear in the energy error estimate (cf. Theorem 5.11) and the \(L\) error estimate (cf. Theorem 5.13) are independent of the mesh sizes \((h, H)\) and the contrast \(\beta/\alpha\).

We begin the error analysis by comparing \(\psi_i\) and \(\psi_{i,k}\) (resp., \(\xi_i\) and \(\xi_{i,k}\)).

5.1. The Relation between \((\psi_i, \xi_i)\) and \((\psi_{i,k}, \xi_{i,k})\). It follows from Lemma 4.3 and the theory of the P-MINRES algorithm (cf. [14, Theorem 4.14]) that

\[
\langle B_h^{II}(\psi_i - \psi_{i,k}), S_h^{II} B_h^{II}(\psi_i - \psi_{i,k}) \rangle^{\frac{1}{2}} \leq 2q^{[k/2]} \langle B_h^{II} \psi_i, S_h^{II} B_h^{II} \psi_i \rangle^{\frac{1}{2}},
\]

\[
\langle B_h^{II}(\xi_i - \xi_{i,k}), S_h^{II} B_h^{II}(\xi_i - \xi_{i,k}) \rangle^{\frac{1}{2}} \leq 2q^{[k/2]} \langle B_h^{II} \xi_i, S_h^{II} B_h^{II} \xi_i \rangle^{\frac{1}{2}},
\]

where (cf. (4.19))

\[
q = \frac{d_s - c_s}{d_s + c_s} = \frac{\kappa(S_h^{II} A_h^{II})[1 + (\text{CPF}/\alpha)] - 1}{\kappa(S_h^{II} A_h^{II})[1 + (\text{CPF}/\alpha)] + 1}.
\]

**Remark 5.1.** It follows from (4.9) that the condition number \(\kappa(S_h^{II} A_h^{II})\) has the following (pessimistic) upper bound that is independent of the mesh sizes:

\[
\kappa(S_h^{II} A_h^{II}) = \frac{\lambda_{\max}(S_h^{II} A_h^{II})}{\lambda_{\min}(S_h^{II} A_h^{II})} \leq \left( \frac{C_{upper}}{C_{lower}} \right) \left( \frac{\beta}{\alpha} \right).
\]

Consequently we also have the bound

\[
q \leq \frac{\left( \frac{C_{upper}}{C_{lower}} \right) \left( \frac{\beta}{\alpha} \right)[1 + (\text{CPF}/\alpha)] - 1}{\left( \frac{C_{upper}}{C_{lower}} \right) \left( \frac{\beta}{\alpha} \right)[1 + (\text{CPF}/\alpha)] + 1}
\]

that is independent of the mesh sizes, but which may be too pessimistic.

**Lemma 5.2.** We have

\[
\| \psi_i - \psi_{i,k} \|_{a \times a} \leq C_* q^{[k/2]} \| \psi_i \|_{a \times a} \quad \text{for} \quad 1 \leq i \leq m
\]

and

\[
\| \xi_i - \xi_{i,k} \|_{a \times a} \leq C_* q^{[k/2]} \| \xi_i \|_{a \times a} \quad \text{for} \quad 1 \leq i \leq m,
\]

where the positive constant \(C_*\) is independent of the mesh sizes.

**Proof.** It follows from (4.21) and (5.2) that

\[
\| \psi_i - \psi_{i,k} \|_{a \times a} \leq \frac{\lambda_{\max}(S_h^{II} A_h^{II})^{\frac{1}{2}}}{C_*} \langle B_h^{II} (\psi_i - \psi_{i,k}), S_h^{II} B_h^{II} (\psi_i - \psi_{i,k}) \rangle^{\frac{1}{2}}
\]
\[
\leq 2q^{\lfloor k/2 \rfloor} \frac{\lambda_{\max}(S_{h}^{H} A_{h}^{H})^{1/2}}{c_{s}} \langle B_{h}, S_{h}^{H} B_{h} \psi_{i} \rangle^{1/2}
\]
\[
\leq 2q^{\lfloor k/2 \rfloor} \frac{\lambda_{\max}(S_{h}^{H} A_{h}^{H})^{1/2}}{c_{s}} \frac{d_{s}}{\lambda_{\min}(S_{h}^{H} A_{h}^{H})^{1/2}} \| \psi \|_{a \times a},
\]
which implies (5.7) with (cf. (4.19))

\[
C_{\ast} = 2\kappa(S_{h}^{H} A_{h}^{H})^{3/2}[1 + (C_{PF}/\alpha)].
\]

Similarly we can derive (5.8) from (4.21) and (5.3). \qed

**Remark 5.3.** It follows from Lemma 5.2 that the basis corrections \( C_{\Pi}^{H} \) and \( C_{\Pi}^{H}(0, \phi_{i}) = \xi_{i} \) (1 \( \leq \) \( i \leq \) \( m \)) used in the construction of \( V_{H}^{msh} \) decay exponentially, as observed in Figure 3.4, Figure 3.3 and Remark 3.10.

Let the linear operator:

\[
\begin{align*}
C_{\Pi}^{H,k} & : V_{H} \times V_{H} \longrightarrow K_{h}^{H} \times K_{h}^{H}
\end{align*}
\]

be defined by:

\[
C_{\Pi}^{H,k}(\phi_{i}, 0) = \psi_{i,k} \quad \text{and} \quad C_{\Pi}^{H,k}(0, \phi_{i}) = \xi_{i,k} \quad \text{for} \ 1 \leq i \leq m,
\]

where \( \phi_{1}, \ldots, \phi_{m} \) are the nodal basis functions of \( V_{H} \).

Our next goal is to understand the relation between the operators \( C_{\Pi}^{H} \) and \( C_{\Pi}^{H,k} \).

### 5.2. The Relation between \( C_{\Pi}^{H} \) and \( C_{\Pi}^{H,k} \)

We begin with the following lemma.

**Lemma 5.4.** There exist positive constants \( C_{\diamond} \) and \( C_{\heartsuit} \) depending only on the shape regularity of \( T_{H} \) such that:

\[
|\phi_{i}|_{H^{1}(\Omega)} \leq C_{\diamond} H^{-d} \quad \text{with} \quad \tau_{d} = \begin{cases} 
-\frac{1}{2} & d = 1 \\
0 & d = 2 \\
\frac{1}{2} & d = 3 
\end{cases}
\]

where \( d \) is the dimension of \( \Omega \), and

\[
\sum_{i=1}^{m} (|c_{i}| + |d_{i}|) \leq C_{\heartsuit} (1/\sqrt{\alpha}) H^{-d} \left\| \sum_{i=1}^{m} [c_{i}(\phi, 0) + d_{i}(0, \phi_{i})] \right\|_{a \times a}
\]

for any real numbers \( c_{1}, \ldots, c_{m}, d_{1}, \ldots, d_{m} \).

**Proof.** The estimate (5.11) follows from a scaling argument. For the estimate (5.12), we begin with an inverse estimate:

\[
\sum_{i=1}^{m} (|c_{i}| + |d_{i}|) \leq C_{2} H^{-d} \left\| \sum_{i=1}^{m} [c_{i}(\phi_{i}, 0) + d_{i}(0, \phi_{i})] \right\|_{L_{1}(\Omega) \times L_{1}(\Omega)}
\]

where the positive constant \( C_{2} \) depends only on the shape regularity of \( T_{H} \). The proof is then completed by the Poincaré-Friedrichs inequality:

\[
\| \zeta \|_{L_{1}(\Omega)} \leq C_{3} \| \zeta \|_{H^{1}(\Omega)} \quad \forall \zeta \in H_{0}^{1}(\Omega)
\]

and the estimate (2.7). \qed
Lemma 5.5. The following estimate is valid for any \( \mathbf{v} \in V_H \times V_H \):

\[
(C_h^{\Pi H} - C_{h,k}^{\Pi H}) \mathbf{v} \|_{a \times a} \leq C_{\bullet} (S_h^{\Pi H} A_h^{\Pi H})^{\frac{3}{2}} \left( \frac{\beta}{\alpha} \right)^{\frac{1}{2}} [1 + (C_{PF}/\alpha)]^2 H^{-d+\tau_d q[k/2]} \| \mathbf{v} \|_{a \times a},
\]

where the positive constant \( C_{\bullet} \) depends only on the shape regularity of \( \mathcal{T}_H \).

Proof. Let \( \sum_{i=1}^m [c_i(\phi_i, 0) + d_i(0, \phi_i)] \) be an arbitrary element of \( V_H \times V_H \). It follows from (2.7), Lemma 3.5, Lemma 5.2 and Lemma 5.4 that

\[
\left\| (C_h^{\Pi H} - C_{h,k}^{\Pi H}) \sum_{i=1}^m [c_i(\phi_i, 0) + d_i(0, \phi_i)] \right\|_{a \times a}
\leq \sum_{i=1}^m \left[ |c_i| \| \psi_i - \psi_{i,k} \|_{a \times a} + |d_i| \| \xi_i - \xi_{i,k} \|_{a \times a} \right]
\leq C_* q^{[k/2]} \sum_{i=1}^m \left[ |c_i| \| \psi_i \|_{a \times a} + |d_i| \| \xi_i \|_{a \times a} \right]
\leq C_* q^{[k/2]} [1 + (C_{PF}/\alpha)] \sum_{i=1}^m \left[ |c_i| \| \phi_i \|_a + |d_i| \| \phi_i \|_a \right]
\leq C_* q^{[k/2]} [1 + (C_{PF}/\alpha)] \sqrt{\beta} \sum_{i=1}^m (|c_i| + |d_i|) \| \phi_i \|_{H^1(\Omega)}
\leq C_* q^{[k/2]} [1 + (C_{PF}/\alpha)] \sqrt{\beta} C_\phi H^{\tau_d} \sum_{i=1}^m (|c_i| + |d_i|)
\leq C_* q^{[k/2]} [1 + (C_{PF}/\alpha)] \sqrt{\beta} C_\phi H^{\tau_d} C_\varphi (1/\sqrt{\alpha}) H^{-d} \left\| \sum_{i=1}^m \left[ c_i(\phi_i, 0) + d_i(0, \phi_i) \right] \right\|_{a \times a}
= C_* C_\phi C_\varphi \sqrt{\beta/\alpha} [1 + (C_{PF}/\alpha)] H^{-d+\tau_d q[k/2]} \left\| \sum_{i=1}^m \left[ c_i(\phi_i, 0) + d_i(0, \phi_i) \right] \right\|_{a \times a},
\]

which together with (5.9) implies (5.13) for \( C_{\bullet} = 2 C_\phi C_\varphi \).

We have an analog of Corollary 3.6.

Corollary 5.6. The following relations are valid for any \( \mathbf{v} \in V_H \times V_H \):

\[
\| \mathbf{v} - C_h^{\Pi H} \mathbf{v} \|_{a \times a} \leq C_{\bullet} (S_h^{\Pi H} A_h^{\Pi H})^{\frac{3}{2}} \left( \frac{\beta}{\alpha} \right)^{\frac{1}{2}} [1 + (C_{PF}/\alpha)]^2 H^{-d+\tau_d q[k/2]}
\]

\[
+ [2 + (C_{PF}/\alpha)] \| \mathbf{v} \|_{a \times a},
\]

\[
\| \mathbf{v} \|_{a \times a} \leq C_\dagger \sqrt{\beta/\alpha} \| \mathbf{v} - C_h^{\Pi H} \mathbf{v} \|_{a \times a}.
\]

Proof. The estimate (5.14) follows from (3.11), (5.13) and the triangle inequality. The proof of (5.15) is identical to the proof of (3.12).
5.3. The Well-posedness of (5.1). We will use Corollary 3.6, Lemma 5.5 and Corollary 5.6 to derive an analog of Lemma 3.11 under some assumptions on $k$.

**Assumption 1.** The number of P-MINRES steps $k$ is sufficiently large so that, by (5.14),

$$\|v - C_{h,k}^{I} v\|_{a \times a} \leq [3 + (C_{PF}/\alpha)] \|v\|_{a \times a} \quad \forall v \in V_H \times V_H.$$  

**Remark 5.7.** The following condition on $k$ guarantees (5.16):

$$C_{\wedge}^{\wedge} [S_{h}^{I} A_{h}^{I}]^{\frac{3}{2}} \left(\frac{\beta}{\alpha}\right)^{\frac{1}{2}} [1 + (C_{PF}/\alpha)]^{2} H^{-d+\tau_d} q^{[k/2]} \leq 1,$$

or equivalently

$$\ln C_{\wedge}^{\wedge} + \frac{3}{2} \ln \kappa(S_{h}^{I} A_{h}^{I}) + \frac{1}{2} \ln(\beta/\alpha) + 2 \ln[1+(C_{PF}/\alpha)] + (-d+\tau_d) \ln H + [k/2] \ln q \leq 0.$$  

It follows from Corollary 3.6, Corollary 5.6 and (5.16) that

$$\|v - C_{h,k}^{I} v\|_{a \times a} \leq C_{\wedge} C_{\wedge}^{\wedge} \|v - C_{h,k}^{I} v\|_{a \times a} \forall v \in V_H \times V_H,$$

where

$$C_{\wedge}^{\wedge} = [3 + (C_{PF}/\alpha)] C_{1} \sqrt{\beta/\alpha}.$$  

**Assumption 2.** The number of P-MINRES steps $k$ is sufficiently large so that, by (3.12), Lemma 5.5 and (5.15),

$$C_{\wedge} [2 + (C_{PF}/\alpha)]^{2} \|\{C_{h}^{I} - C_{h,k}^{I}\} v\|_{a \times a} \leq \frac{1}{3} \min(\|v - C_{h,k}^{I} v\|_{a \times a}, \|v - C_{h,k}^{I} v\|_{a \times a})$$

for all $v \in V_H \times V_H$.

**Remark 5.8.** The following condition on $k$ guarantees (5.21):

$$3C_{\wedge} C_{\wedge}^{\wedge} [3 + (C_{PF}/\alpha)]^{5} \kappa(S_{h}^{I} A_{h}^{I})^{\frac{3}{2}} \left(\frac{\beta}{\alpha}\right)^{\frac{3}{2}} H^{-d+\tau_d} q^{[k/2]} \leq 1,$$

or equivalently

$$\ln(3C_{\wedge} C_{\wedge}^{\wedge}) + 5 \ln[3 + (C_{PF}/\alpha)] + \frac{3}{2} \ln \kappa(S_{h}^{I} A_{h}^{I}) + \frac{3}{2} \ln(\beta/\alpha) + (-d+\tau_d) \ln H + [k/2] \ln q \leq 0.$$  

The well-posedness of (5.1) for a sufficiently large $k$ is addressed by the following lemma.

**Lemma 5.9.** The inf-sup condition

$$\inf_{v \in V_H \times V_H} \sup_{w \in V_H \times V_H} \frac{\mathcal{B}(v - C_{h,k}^{I} v, w - C_{h,k}^{I} w)}{\|v - C_{h,k}^{I} v\|_{a \times a} \|w - C_{h,k}^{I} w\|_{a \times a}} \geq \frac{1}{3C_{\wedge} [2 + (C_{PF}/\alpha)]}$$

holds under Assumption 1 and Assumption 2.
Proof. Let \( \mathbf{v} \in V_H \times V_H \) be arbitrary. We have, by (2.10), Remark 3.8, Lemma 3.11, (5.18), (5.19) and (5.21),

\[
\| \mathbf{v} - C_{h,k}^{\Pi_H} \mathbf{v} \|_{a \times a} \leq C_{\bullet} [2 + (C_{PF}/\alpha)] \frac{\mathcal{B}(\mathbf{v} - C_{h}^{\Pi_H} \mathbf{v}, \mathbf{w} - C_{h}^{\Pi_H} \mathbf{w})}{\| \mathbf{w} - C_{h}^{\Pi_H} \mathbf{w} \|_{a \times a}} 
\leq C_{\bullet} [2 + (C_{PF}/\alpha)] \frac{\mathcal{B}(C_{h,k}^{\Pi_H} \mathbf{v} - C_{h}^{\Pi_H} \mathbf{v}, \mathbf{w} - C_{h}^{\Pi_H} \mathbf{w})}{\| \mathbf{w} - C_{h}^{\Pi_H} \mathbf{w} \|_{a \times a}} 
\leq C_{\bullet} [2 + (C_{PF}/\alpha)] \frac{\mathcal{B}(\mathbf{v} - C_{h,k}^{\Pi_H} \mathbf{v}, \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w})}{\| \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w} \|_{a \times a}} 
+ C_{\bullet} [2 + (C_{PF}/\alpha)] \frac{\mathcal{B}(\mathbf{v} - C_{h,k}^{\Pi_H} \mathbf{v}, \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w})}{\| \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w} \|_{a \times a}} 
\leq \frac{1}{3} \| \mathbf{v} - C_{h,k}^{\Pi_H} \mathbf{v} \|_{a \times a} 
\leq C_{\bullet} [2 + (C_{PF}/\alpha)] \frac{\mathcal{B}(\mathbf{v} - C_{h,k}^{\Pi_H} \mathbf{v}, \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w})}{\| \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w} \|_{a \times a}} 
\leq \frac{2}{3} \| \mathbf{v} - C_{h,k}^{\Pi_H} \mathbf{v} \|_{a \times a} + C_{\bullet} [2 + (C_{PF}/\alpha)] \frac{\mathcal{B}(\mathbf{v} - C_{h,k}^{\Pi_H} \mathbf{v}, \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w})}{\| \mathbf{w} - C_{h,k}^{\Pi_H} \mathbf{w} \|_{a \times a}},
\]

which implies (5.23).

\[\square\]

Remark 5.10. In view of (4.15) and (5.10), we can rewrite the inf-sup condition (5.23) as

\[
\inf_{\mathbf{v} \in V_{H,k}^{\text{ms}}} \sup_{\mathbf{w} \in V_{H,k}^{\text{ms}}} \frac{\mathcal{B}(\mathbf{v}, \mathbf{w})}{\| \mathbf{v} \|_{a \times a} \| \mathbf{w} \|_{a \times a}} \geq \frac{1}{3C_{\bullet} [2 + (C_{PF}/\alpha)]}.
\]

5.4. Energy Error. Under the inf-sup condition (5.24) we have a standard quasi-optimal error estimate (cf. [8, Theorem 2.1]) for the solution \((p_{H,k}^{\text{ms}}, y_{H,k}^{\text{ms}})\) of (5.1):

\[
\|(p_h, y_h) - (p_{H,k}^{\text{ms}}, y_{H,k}^{\text{ms}})\|_{a \times a} \leq C_{\sharp} \inf_{(q, z) \in V_{H,k}^{\text{ms}}} \|(p_h, y_h) - (q, z)\|_{a \times a},
\]

where

\[
C_{\sharp} = 1 + 3C_{\bullet} [2 + (C_{PF}/\alpha)].
\]
It then follows from Remark 3.1, (3.10), Remark 3.13, (4.15), Lemma 5.5 and (5.25) that
\[
\|(p_h, y_h) - (p_{H,k}^{ms,h}, y_{H,k}^{ms,h})\|_{a \times a} \\
\leq C \| (p_h, y_h) - (I - C_{h,k}^{II})(\Pi_H \times \Pi_H)(p_h, y_h) \|_{a \times a} \\
= C \| (p_h, y_h) - (I - C_{h,k}^{II})(\Pi_H \times \Pi_H)(p_h, y_h) + (C_{h,k}^{II} - C_{h}^{II})(\Pi_H \times \Pi_H)(p_h, y_h) \|_{a \times a} \\
(5.27) \\
\leq C \left\| (p_h, y_h) - (p_{h,k}^{ms,h}, y_{h,k}^{ms,h}) \right\|_{a \times a} + \| (C_{h,k}^{II} - C_{h}^{II})(\Pi_H \times \Pi_H)(p_h, y_h) \|_{a \times a} \\
\leq C \left( \left\| (p_h, y_h) - (p_{h,k}^{ms,h}, y_{h,k}^{ms,h}) \right\|_{a \times a} + C_\phi C_1 \kappa(S_h^{II} A_h^{II})^{\frac{3}{2}} \beta/\alpha [1 + (C_{PF}/\alpha)]^2 H^{-d+\tau_d} q^{[k/2]} \right) \left\| (p_h, y_h) \right\|_{a \times a},
\]
that is, up to a term that decreases exponentially as \( k \) increases, the performance of the localized multiscale finite element method defined by (5.1) is similar to the performance of the ideal multiscale finite element method defined by (3.16).

**Assumption 3.** The number of P-MINRES steps \( k \) is sufficiently large so that
\[
q^{[k/2]} \leq \kappa(S_h^{II} A_h^{II})^{-\frac{3}{2}} (\beta/\alpha) H^{1+d-\tau_d}.
\]

**Theorem 5.11.** Under Assumptions 1–3, we have
\[
\| (p_h, y_h) - (p_{H,k}^{ms,h}, y_{H,k}^{ms,h}) \|_{a \times a} \leq C \| y_d \|_{L_2(\Omega)},
\]
where
\[
C \equiv C_\phi (C_1/\sqrt{\alpha}) \left( 1 + C_\phi [1 + (C_{PF}/\alpha)]^2 \sqrt{C_{PF}} \right)
\]
is independent of \( h, H \) and \( \beta/\alpha \).

**Proof.** The estimate (5.27) is valid under Assumption 1 and Assumption 2. It then follows from Remark 2.5, Theorem 3.12 and Assumption 3 that
\[
\| (p_h, y_h) - (p_{H,k}^{ms,h}, y_{H,k}^{ms,h}) \|_{a \times a} \\
\leq C \left( C_1/\sqrt{\alpha} H \| y_d \|_{L_2(\Omega)} + C_\phi C_1 [1 + (C_{PF}/\alpha)]^2 H \| (p_h, y_h) \|_{a \times a} \right) \\
\leq C (C_1/\sqrt{\alpha}) \left( 1 + C_\phi [1 + (C_{PF}/\alpha)]^2 \sqrt{C_{PF}} \right) H \| y_d \|_{L_2(\Omega)}.
\]

**Remark 5.12.** Note that (5.28) is equivalent to
\[
[k/2] \ln q + \frac{3}{2} \ln \kappa(S_h^{II} A_h^{II}) + \ln(\beta/\alpha) - (1 + d - \tau_d) \ln H \leq 0.
\]

By examining (5.17), (5.22) and (5.31), we see that the impacts of the mesh-independent quantities, including the condition number \( \kappa(S_h^{II} A_h^{II}) \) and the contrast \( \beta/\alpha \), are mitigated...
by the natural log function, and the dominating condition on \( k \) is roughly (cf. (5.31))

\[
k \geq 2(1 + d - \tau_d) \frac{\ln(1/H)}{\ln(1/q)}
\]

From (5.4) and the relation \(|\ln(1 + x)| \approx |x|\) (for \(|x|\) small), we can also see that

\[
\ln(1/q) \approx \frac{1}{\kappa(S_h^\Pi H A_h^\Pi H)}
\]

Therefore, provided \( \kappa(S_h^\Pi H A_h^\Pi H) \) is moderate, we can choose \( k = j[\ln(1/H)] \) for a moderate positive integer \( j \).

5.5. \( L_2 \) Error. We can use a duality argument to obtain an \( L_2 \) error estimate.

Observe that Assumption 3 and Lemma 5.5 imply

\[
(5.32) \quad \| (C_h^\Pi - C_{h,k}) v \|_{a \times a} \leq C_1 H \| v \|_{a \times a} \quad \forall v \in V_H \times V_H,
\]

where

\[
(5.33) \quad C_1 = C_{\bullet}[1 + (C_{PF}/\alpha)]^2.
\]

**Theorem 5.13.** Under Assumptions 1–3, we have

\[
(5.34) \quad \| (p_h, y_h) - (p_{ms, h}^{ms, h}, y_{ms, h}^{ms, h}) \|_{L_2(\Omega) \times L_2(\Omega)} \leq C_5 \sqrt{\beta/\alpha} H^2 \| y_d \|_{L_2(\Omega)},
\]

where

\[
(5.35) \quad C_5 = 2C_1 C_2 C_1^\star[1 + (C_{PF}/\alpha)]\sqrt{C_{PF}/\alpha}
\]

is independent of \( h \), \( H \) and \( \beta/\alpha \).

**Proof.** Let \((q, z) \in V_H \times V_H\) be defined by

\[
(5.36) \quad B((q, z), (r, s)) = \int_{\Omega} (p_h - p_{ms, h}^{ms, h}) r \, dx + \int_{\Omega} (y_h - y_{ms, h}^{ms, h}) s \, dx \quad \forall (r, s) \in V_H \times V_H.
\]

It follows from (2.7), (2.8), (2.12) and (5.36) that

\[
(5.37) \quad \| (q, z) \|_{a \times a} \leq \| (p_h, y_h) - (p_{ms, h}^{ms, h}, y_{ms, h}^{ms, h}) \|_{L_2(\Omega) \times L_2(\Omega)} \sup_{(r, s) \in H_0^1(\Omega) \times H_0^1(\Omega)} \| (r, s) \|_{a \times a} \| (r, s) \|_{L_2(\Omega) \times L_2(\Omega)}
\]

\[
\leq \sqrt{C_{PF}/\alpha} \| (p_h, y_h) - (p_{ms, h}^{ms, h}, y_{ms, h}^{ms, h}) \|_{L_2(\Omega) \times L_2(\Omega)}.
\]

By repeating the arguments in the proof of Theorem 3.14 that led to (3.23), we also have

\[
(5.38) \quad \| C_h^\Pi (q, z) \|_{a \times a} \leq (C_i/\sqrt{\alpha}) H \| (p_h, y_h) - (p_{ms, h}^{ms, h}, y_{ms, h}^{ms, h}) \|_{L_2(\Omega) \times L_2(\Omega)}.
\]

Let \((r, s) = (p_h, y_h) - (p_{ms, h}^{ms, h}, y_{ms, h}^{ms, h})\). Then the Galerkin relation

\[
(5.39) \quad B(v, (r, s)) = 0 \quad \forall v \in V_{H,k}^{ms, h}
\]

follows from (2.14) and (5.1).

Combining (3.10), (4.15), (5.36) and (5.39), we obtain

\[
\| (r, s) \|_{L_2(\Omega) \times L_2(\Omega)}^2 = B((q, z), (r, s))
\]

\[
= B((q, z) - (I - C_{h,k}^\Pi)(\Pi_{ms} \times \Pi_{ms})(q, z), (r, s))
\]
\begin{align}
(5.40) & \quad = B((C_{h,k}^{\Pi_H} - C_h^{\Pi_H})(\Pi_H \times \Pi_H)(q, z), (r, s)) \\
& \quad + B((q, z) - (I - C_h^{\Pi_H})(q, z), (r, s)) \\
& \quad = B((C_{h,k}^{\Pi_H} - C_h^{\Pi_H})(\Pi_H \times \Pi_H)(q, z), (r, s)) + B(C_h^{\Pi_H}(q, z), (r, s)).
\end{align}

Using (2.10), Remark 3.1, (5.32), (5.37), we can bound the first term on the right-hand side of (5.40) by

\begin{align}
B((C_{h,k}^{\Pi_H} - C_h^{\Pi_H})(\Pi_H \times \Pi_H)(q, z), (r, s)) \\
& \quad \leq [1 + (C_{PF}/\alpha)]\|C_{h,k}^{\Pi_H} - C_h^{\Pi_H}(\Pi_H \times \Pi_H)(q, z)\|_{a \times a}(r, s)_{a \times a}
\end{align}

(5.41)

\begin{align}
& \quad \leq [1 + (C_{PF}/\alpha)]C_4H\|((\Pi_H \times \Pi_H)(q, z)\|_{a \times a}(r, s)_{a \times a} \\
& \quad \leq [1 + (C_{PF}/\alpha)]C_4\sqrt{\beta/\alpha}H\|(q, z)\|_{a \times a}(r, s)_{a \times a} \\
& \quad \leq [1 + (C_{PF}/\alpha)]C_4\sqrt{\beta/\alpha}\sqrt{C_{PF}/\alpha}H\|(r, s)\|_{L_2(\Omega) \times L_2(\Omega)}\|(r, s)\|_{a \times a}.\end{align}

For the second term on the right-hand side of (5.40), we have the bound

\begin{align}
B(C_h^{\Pi_H}(q, z), (r, s)) & \leq [1 + (C_{PF}/\alpha)]\|C_h^{\Pi_H}(q, z)\|_{a \times a}(r, s)_{a \times a} \\
& \leq [1 + (C_{PF}/\alpha)](C_{\sqrt{\beta/\alpha}}H\|(r, s)\|_{L_2(\Omega) \times L_2(\Omega)}\|(r, s)\|_{a \times a})
\end{align}

(5.42)

by (2.10) and (5.38).

Putting (5.29) and (5.40)–(5.42) together, we arrive at the estimate

\begin{align}
\|(p_h, y_h) - (p_{h,k}^{ms}, y_{h,k}^{ms})\|_{L_2(\Omega) \times L_2(\Omega)} & \leq [1 + (C_{PF}/\alpha)] [C_{\sqrt{\beta/\alpha}}\sqrt{C_{PF}/\beta/\alpha} + 1]H\|(p_h, y_h) - (p_{h,k}^{ms}, y_{h,k}^{ms})\|_{a \times a} \\
& \leq [1 + (C_{PF}/\alpha)] [C_{\sqrt{\beta/\alpha}}\sqrt{C_{PF}/\beta/\alpha} + 1]C_{\sqrt{\beta}}H^2\|y_d\|_{L_2(\Omega)},
\end{align}

which implies (5.34) with \(C_\delta\) given by (5.35).

\section{Numerical Results}

The numerical results for Example 1.2 and Example 1.3 are presented in Section 6.1 and Section 6.2. We also describe briefly some computational aspects in Section 6.3.

### 6.1. Highly Oscillatory Problem

We solve the optimal control problem (1.1) on the unit square \((0, 1) \times (0, 1)\), where \(\gamma = 1\), \(y_d = -1\), and \(A\) is the matrix in Example 1.2 with \(\epsilon = 0.08, 0.04\) and 0.025. We use the localized multiscale finite element method from Section 5.

For this problem \(\alpha \approx 1\) and \(\beta \approx 20\), the magnitude of \(\kappa(S_h^{\Pi_H}A_h^{\Pi_H})\) is moderate by (5.6) and, according to Remark 5.12, we can choose the number of P-MINRES steps \(k\) to be \(j\log(1/H)\) for a moderate positive integer \(j\). The choices for \(h, H\) and \(j\) for different values of \(\epsilon\) are described in Table 6.1.

The relative errors in the \(\| \cdot \|_{a \times a}\) norm and the \(\| \cdot \|_{L_2(\Omega) \times L_2(\Omega)}\) norm are presented in Figure 6.1 and Figure 6.2. We observe \(O(H)\) convergence in the \(\| \cdot \|_{a \times a}\) norm and \(O(H^2)\) convergence in the \(\| \cdot \|_{L_2(\Omega) \times L_2(\Omega)}\) norm, which agree with Theorem 5.11 and Theorem 5.13.
### Table 6.1. Choices for $h$, $H$, and $j$ for different values of $\epsilon$.  

| $\epsilon$ | 0.08 | 0.04 | 0.025 |
|------------|------|------|-------|
| $1/h$      | 256  |       | 320   |
| $1/H$      | 8    | 16   | 32    |
| $j$        | 2    | 2    | 3     |

6.2. Highly Heterogeneous Problem. We solve the optimal control problem (1.1) on the unit square, where $\gamma = 1$, $y_d = 1$, and $A$ is the matrix from Example 1.3. We use the ideal multiscale finite element method from Section 3 and the localized multiscale finite element method from Section 5. The reference mesh size is $h = 1/320$.

For this problem we have $\alpha = 1$ and $\beta = 1350$. The value of the condition number $\kappa(S_h^{\Pi_h} A_h^{\Pi_h})$ is found computationally to be less than 10, which is much better than the pessimistic bound in (5.5). Therefore we can, according to Remark 5.12, choose the number of P-MINRES steps $k$ to be $j\lceil \log(1/H) \rceil$ for a moderate positive integer $j$. Here we take $j = 2$ for $H = 1/10$, $j = 3$ for $H = 1/20$, and $j = 4$ for $H = 1/40$.

The relative errors in the $\| \cdot \|_{a \times a}$ norm and the $\| \cdot \|_{L^2(\Omega) \times L^2(\Omega)}$ norm are displayed in Figure 6.3 and Figure 6.4. We observe that the errors for the ideal multiscale finite element method and the localized multiscale finite element method are indistinguishable. The order of convergence in the $\| \cdot \|_{a \times a}$ norm is 1, which agrees with Theorem 3.12 and Theorem 5.11. The convergence history for the $\| \cdot \|_{L^2(\Omega) \times L^2(\Omega)}$ norm is similar to the early stage of the history for the highly oscillatory but well-conditioned problem in Figure 6.2. Therefore it is reasonable to expect that the order of convergence in the $\| \cdot \|_{L^2(\Omega) \times L^2(\Omega)}$ norm for the ill-conditioned highly heterogeneous problem will also approach 2 at a later stage.
6.3. Some Computational Aspects. We will focus on the highly heterogeneous problem in Section 6.2, where the reference solution is obtained by a standard finite element method with $h = 1/320$. Below are some observations on the case where the coarse mesh size is $H = 1/20$ and the solution obtained by the localized multiscale method in Section 5 is quite reasonable (cf. Figure 2.2).
Relative $\| \cdot \|_{L_2(\Omega) \times L_2(\Omega)}$ errors of multiscale approximations of the highly heterogeneous problem, where $h = 1/320$, $k = j \lceil \log(1/H) \rceil$, with $j = 2$ for $H = 1/10$, $j = 3$ for $H = 1/20$, and $J = 4$ for $H = 1/40$.

The parallel computing was carried out on a cluster with 440 compute nodes running the Red Hat Enterprise Linux 6 operating system and has a 146 TFlops peak performance. Each compute node is equipped with two 8-core Sandy Bridge Xeon 64-bit processors operating at a core frequency of 2.6 GHz, 32GB 1666MHz RAM, 500GB HD, 40 Gigabit/sec Infiniband network interface and a 1 Gigabit Ethernet network interface.

We computed the reference solution with the PETSc library using 128 processors and an ILU(0) preconditioner in PGMRES. The solution time is 0.22 seconds. For comparison, we solved the smaller system (5.1) by Gaussian elimination in MATLAB on a MacBook Pro (2.8 Ghz Quad-Core Intel Core i7 processor and a 16GB 2133 Mhz LPDDR RAM). The solution time is 0.02 seconds.

The total (set-up and solution) time for computing the reference solution with PETSc using 128 processors is 0.47 seconds. For comparison, the total time for solving (5.1) with 128 different right-hand sides simultaneously using PETSc and Gaussian elimination is 1.36 seconds.

Using 1024 processors, it took 2104 seconds in the offline stage to construct the basis functions of the ideal multiscale finite element space $V_{H}^{ms,h}$ in Section 3.3, and 535 seconds to construct the basis functions of the localized multiscale finite element space $V_{H,k}^{ms,h}$ in Section 4.2.

7. Concluding Remarks

In this paper we have developed multiscale finite element methods for a linear-quadratic elliptic optimal control problem with rough coefficients, where scale separation and periodic structures are not assumed. These methods can be viewed as reduced order methods.
In particular, we have constructed a generalized finite element method with localized basis functions whose performance is similar to standard finite element methods for smooth problems. Both the construction of the generalized finite element space and the analysis of the resulting Galerkin method are based on basic finite element technology and two (by now) classical numerical linear algebra ingredients, namely the additive Schwarz preconditioner and the preconditioned minimum residual algorithm. Our work further illustrates the idea put forth in [26] that multiscale problems can be solved by combining finite element methods, domain decomposition algorithms and iterative Krylov subspace solvers.

The techniques developed in this paper and [6] can also be extended to elliptic variational inequalities with rough coefficients, such as the obstacle problem and the optimal control problem with control constraints.
