LITTLEWOOD IDENTITY AND CRYSTAL BASES

JAE-HOON KWON

Abstract. We give a new combinatorial model for the crystals of integrable highest weight modules over the classical Lie algebras of type $B$ and $C$ in terms of classical Young tableaux. We then obtain a new description of its Littlewood-Richardson rule and a maximal Levi branching rule in terms of classical Littlewood-Richardson tableaux, which extends in a bijective way the well-known stable formulas at large ranks. We also show that this tableau model admits a natural superization and it produces the characters of irreducible highest weight modules over orthosymplectic Lie superalgebras, which correspond to the integrable highest weight modules over the classical Lie algebras of type $B$ and $C$ under the Cheng-Lam-Wang’s super duality.

1. Introduction

1.1. Motivation. Let $\mathfrak{g}$ be a symmetrizable Kac-Moody algebra, and let $V_\lambda$ be an irreducible highest weight $\mathfrak{g}$-module with highest weight $\lambda$. For dominant integral weights $\lambda, \mu, \nu$, the multiplicity of $V_\lambda$ in the tensor product $V_\mu \otimes V_\nu$ is called a generalized LR (Littlewood-Richardson) coefficient.

When $\mathfrak{g} = \mathfrak{g}_n$, the multiplicity $c^\lambda_{\mu \nu}$ of $V_\lambda$ in $V_\mu \otimes V_\nu$ is called a (classical) LR coefficient and it is given by the number of certain semistandard Young tableaux of skew shape called LR tableaux (see [15, 43]). When $\mathfrak{g}$ is the classical Lie algebra of type $B, C, D$, the generalized LR coefficients and various branching coefficients can also be expressed in terms of classical LR coefficients. There are nice formulas, where the multiplicities are given as a sum of products of $c^\lambda_{\mu \nu}$’s when the highest weights of irreducible representations are in a certain stable range. The formulas of this type originated in the Littlewood’s restriction formula for the representations of orthogonal and symplectic groups to general linear groups [41, 42] (we refer the reader to [16, 54], which have nice survey on the related works). One may understand these formulas as stable limits of the generalized LR and branching coefficients at large ranks of $\mathfrak{g}$, where we fix partitions parametrizing highest weights and take the rank of $\mathfrak{g}$ to infinity. But the multiplicities outside a stable range are given

This work was partially supported by the National Research Foundation (NRF) grant funded by the Korean government (MEST) (No. 2011-0006735) and by LG Yonam foundation.
as an alternating sum of products of $c_{\mu \nu}^{\lambda}$’s, which may contain many cancellations \cite{14, 25, 33}, and it is not known in general how to extend these stable limits in a subtraction-free way for arbitrary dominant integral highest weights (see \cite{52} for a combinatorial extension of the Littlewood’s restriction formula in the symplectic case for arbitrary partitions).

One of our main motivations in this work is to find a new combinatorial model, which explains the stable limits of generalized LR and branching coefficients in type $B, C, D$, and also extends them to the case of arbitrary highest weights in a bijective or subtraction-free way. We will approach this problem using the Kashiwara’s crystal base theory \cite{20}, which provides a powerful combinatorial tool for computing the LR rule for the Drinfeld and Jimbo’s quantized enveloping algebra of $g$ (cf.\cite{4, 39, 40, 44}).

1.2. Littlewood identity and crystals. Let $\mathcal{P}$ be the set of partitions and $s_\lambda(x)$ the Schur function in $x = \{x_1, x_2, \ldots\}$. We start with considering the following Littlewood identity

\begin{equation}
\frac{1}{\prod_i(1 - x_i^e) \prod_{i<j}(1 - x_i x_j)} = \sum_{\tau \in \mathcal{P}} s_{\epsilon \tau}(x),
\end{equation}

where $\epsilon = 1, 2$ \cite{42}.

Let $b_\infty$ and $c_\infty$ be the affine Lie algebras of type $B_\infty$ and $C_\infty$, respectively, and let $l_\infty$ be a Levi subalgebra of type $A_{+\infty}$ obtained by removing a short (resp. long) simple root $\alpha_0$. Note that the identity (1.1) multiplied by $s_\lambda(x)$ is the character of a generalized Verma module over $U_q(f_{\infty})$ induced from a highest weight $l_\infty$-module with highest weight corresponding to $\lambda$, and it is also the character of the set of pairs of semistandard Young tableaux $(S,T)$ of shape $\epsilon \tau$ and $\lambda$, respectively. Here we assume $\epsilon = 1$ for $\tau = b$ and $\epsilon = 2$ for $\tau = c$.

Let $B(f_{\infty}, \Lambda)$ denote the crystal associated to the integrable highest weight $U_q(f_{\infty})$-module with highest weight $\Lambda$. We parametrize the dominant integral weights for $f_{\infty}$ by $(\lambda, n) \in \mathcal{P} \times \mathbb{Z}_{>0}$ such that $2\lambda_1 \leq \epsilon n$ (see Section \ref{section:crystals}), and denote by $\Lambda^f(\lambda, n)$ the corresponding dominant integral weight. Motivated by the above observation on the Littlewood identity multiplied by a Schur function, we consider a crystal structure on the set of bitableaux associated with a generalized Verma module with $l_\infty$-highest weight $\lambda$, and then characterize $B(f_{\infty}, \Lambda^f(\lambda, n))$ as its subcrystal. More precisely, we show as the main result in this paper (Theorem \ref{theorem:main_result}), that $B(f_{\infty}, \Lambda^f(\lambda, n))$ can be realized as the set of pairs of semistandard Young tableaux $(S,T)$ such that

1. $\text{sh}(S) = \epsilon \tau$ for some $\tau \in \mathcal{P}$ and $\text{sh}(T) = \lambda$,
2. $\Delta_f((T \rightarrow S)_R) \leq n$,
where \((T \rightarrow S)_R\) is the recording tableau of the insertion \(T \rightarrow S\) \([55]\) and \(\Delta_f((T \rightarrow S)_R)\) is a new combinatorial statistic on the set of LR tableaux (see Definition 3.7). The highest weight crystals of type \(B_k\) and \(C_k\) can be obtained by restricting the entries of \(S\) and \(T\) in \(B(f_x, L^f(\lambda, n))\) to \(\{1, \ldots, k\}\).

The statistic \(\Delta_f\) is an essential part in the realization of \(B(f_x, L^f(\lambda, n))\), and it can be viewed as a combinatorial realization of the crystal datum \(\varepsilon^\ast_0\) which comes from the Kashiwara’s \(\ast\)-crystal structure \([20]\) on the negative part of \(U_q(f_x)\) (see Remark 3.12). We remark that when \(\lambda\) is the empty partition (0), the tableau description of \(B(f_x, L^f((0), n))\) combined with its Jacobi-Trudi or Weyl-Kac character formula recovers partial Littlewood identities, which appeared in the study of symmetric plane partitions \([43, 50, 51]\) (see also \([36]\)).

We introduce another statistic \(\nabla_f\) on the set of LR tableaux (Definition 4.1), which is a combinatorial realization of the crystal datum \(\varepsilon_0\). Then as immediate consequences, we obtain a new description of the generalized LR coefficients and branching coefficients with respect to \(l_\infty\) (Theorems 4.2 and 4.8). The multiplicities are given by the number of pairs of classical LR tableaux with certain restrictions on the statistics \(\Delta_f\) and \(\nabla_f\), which are always satisfied by highest weights in a stable range. The stable limits of the generalized LR coefficients and branching coefficients (here we fix \(\lambda\) and take \(n\) of \(L^f(\lambda, n)\) to infinity) look different from but simpler than the known results. Also, in case of \(c_\infty\), we can recover and hence extends in a bijective way the well-known stable formulas using the reciprocity law via the \((c_\infty, \text{Sp}(2n))\)-Howe duality on a Fock space \([56]\) (Remarks 4.6 and 4.11).

We expect a similar description for the highest weight crystals of type \(D_\infty\), which is related with the product in \([4,1]\) when \(\epsilon = 0\). But our method of proof based on folding crystals of type \(A_\infty\) is no longer available for type \(D_\infty\) and hence a different method is required. We hope to find a new approach in the near future which does not depend on type.

1.3. **Super duality.** Lie superalgebras and their representations came from the study of super symmetries in theoretical physics. The problem of finding their finite dimensional irreducible characters was one of the most important problems in this area after the classification of finite dimensional simple Lie superalgebras by Kac\([17]\). In case of a general linear Lie superalgebra \(gl(m|n)\), it was solved by Serganova\([48]\) and Brundan\([5]\).

Recently, the finite dimensional irreducible character problem for general linear and orthosymplectic Lie superalgebras was solved by Cheng-Lam\([8]\) and Cheng-Lam-Wang\([10]\), respectively by a completely different method called **super duality**, which was conjectured in \([9, 11]\) in case of general linear Lie superalgebras. The
super duality is an equivalence between a parabolic category of classical Lie algebras and that of general linear and orthosymplectic Lie superalgebras, respectively, and it gives a new insight to the representations of Lie superalgebras. In particular, it reveals a natural connection with the Kazhdan-Lusztig theory of Lie algebras and therefore provides an irreducible character of a Lie superalgebra in these categories (including finite dimensional irreducible representations) in terms of classical Kazhdan-Lusztig polynomials.

Another main motivation of the work in this paper came from the study of a combinatorial model for irreducible characters of Lie superalgebras. A tableaux model is known for a special class of finite dimensional irreducible representations of \( \mathfrak{gl}(m|n) \) or a queer Lie superalgebra \( \mathfrak{q}(n) \) appearing in a tensor power of their natural representations \([3, 28, 17, 57, 19]\). But very little is known about the other classes of simple Lie superalgebra as far as we know. There have been several works on tableau description of characters of orthosymplectic Lie superalgebras, which however are not necessarily irreducible (see \([1]\) and also \([29]\) for a survey on the related works), and the previously known tableau models for the classical Lie algebras of type \(B, C, D\) \([2, 23, 27, 32, 46, 53]\) do not seem to have a natural super analogue which works for orthosymplectic Lie superalgebras.

We note that a super Schur function or super symmetric function (in infinite variables) is the character of an irreducible module over a general linear Lie superalgebra of infinite rank, which corresponds to an integrable highest weight module over the general linear Lie algebra of type \(A_{+\infty}\) under the super duality functor \([8]\). Hence one may understand super duality as a categorical interpretation of superization in combinatorics. Moreover, from a viewpoint of super duality, it is natural to define super Schur functions of type \(B, C, D\) by the characters of irreducible modules over orthosymplectic Lie superalgebras corresponding to integrable highest weight modules over the Kac-Moody algebras of type \(B_{\infty}, C_{\infty}, D_{\infty}\) under super duality, respectively.

We show that a superization of the bitableaux \((S, T)\) in \(B(\mathfrak{f}_{\infty}, A^f(\lambda, n))\) is compatible with super duality and therefore it gives a tableau model for the super Schur functions of type \(B\) and \(C\) (Theorem 5.8). This can be viewed as an orthosymplectic analogue of a hook Young tableau model for super symmetric functions \([3, 28]\). Also by restricting the entries of bitableaux to a finite \(\mathbb{Z}_2\)-graded set, we get a tableau model for infinite dimensional irreducible characters of orthosymplectic Lie superalgebras of finite rank, which were studied in \([7, 12]\) including unitarizable highest weight representations of Hermitian symmetric pairs.
We remark that we do not have a tableau description of finite dimensional irreducible representations of orthosymplectic Lie superalgebras of finite rank. By super duality, this problem is equivalent to finding a tableau description of infinite dimensional irreducible representations of classical Lie algebras of finite rank in parabolic categories, which is in general much more difficult than the case of integrable highest weight modules.

1.4. Organization. The paper is organized as follows. In Section 2, we recall necessary background on crystals, Young tableaux and LR tableaux. In Section 3, we state the main result, a new combinatorial model for highest weight crystals of type $B_\infty$ and $C_\infty$. In Section 4, we discuss its generalized LR rule and branching rule as a crystal of type $A_+\infty$. In Section 5, we give an application to Lie superalgebras. Finally in Section 6, we give a proof of the main theorem.

1.5. Acknowledgement. Most of this work was done while the author was visiting University of California, Berkeley during 2010-2011. He would like to thank N. Reshetikhin for his invitation and kind hospitality. He also thanks S.-J. Cheng and W. Wang who kindly explained their works on super duality, and A. Schilling for introducing SAGE which helped him with computation and drawing of crystal graphs.

2. Preliminary

2.1. Review on crystals. Let us briefly recall the notion of crystals (see [21] for a general review and references therein).

Let $I$ be an index set. Let $\mathfrak{g}$ be a symmetrizable Kac-Moody algebra associated with a generalized Cartan matrix $A = (a_{ij})_{i,j \in I}$. Denote the weight lattice of $\mathfrak{g}$ by $P$, the set of simple roots by $\Pi = \{ \alpha_i | i \in I \} \subset P$, and the set of simple coroots by $\Pi^\vee = \{ h_i | i \in I \} \subset P^\vee$ with $\langle \alpha_j, h_i \rangle = a_{ij}$, where $\langle \cdot, \cdot \rangle$ is a natural pairing on $P^\vee \times P$.

A $\mathfrak{g}$-crystal (or crystal for short) is a set $B$ together with the maps $\text{wt} : B \to P$, $\varepsilon_i, \varphi_i : B \to \mathbb{Z} \cup \{-\infty\}$ and $\tilde{e}_i, \tilde{f}_i : B \to B \cup \{0\} \ (i \in I)$ such that for $b \in B$ and $i \in I$

1. $\varphi_i(b) = \langle \text{wt}(b), h_i \rangle + \varepsilon_i(b),$
2. $\varepsilon_i(\tilde{e}_i b) = \varepsilon_i(b) - 1$, $\varphi_i(\tilde{e}_i b) = \varphi_i(b) + 1$, $\text{wt}(\tilde{e}_i b) = \text{wt}(b) + \alpha_i$ if $\tilde{e}_i b \neq 0$,
3. $\varepsilon_i(\tilde{f}_i b) = \varepsilon_i(b) + 1$, $\varphi_i(\tilde{f}_i b) = \varphi_i(b) - 1$, $\text{wt}(\tilde{f}_i b) = \text{wt}(b) - \alpha_i$ if $\tilde{f}_i b \neq 0$,
4. $\tilde{f}_i b = b'$ if and only if $b = \tilde{e}_i b'$ for $b, b' \in B$,
5. $\tilde{e}_i b = \tilde{f}_i b = 0$ if $\varphi_i(b) = -\infty$,
where $\mathbf{0}$ is a formal symbol. Here we assume that $-\infty + n = -\infty$ for all $n \in \mathbb{Z}$.

Note that $B$ is equipped with an $I$-colored oriented graph structure, where $b \xrightarrow{i} b'$ if and only if $b' = \tilde{f}_i b$ for $b, b' \in B$ and $i \in I$.

We call $B$ connected if it is connected as a graph, and call $B$ normal if $\epsilon_i(b) = \max\{k \mid \tilde{e}_i^k b \neq \mathbf{0}\}$ and $\varphi_i(b) = \max\{k \mid \tilde{f}_i^k b \neq \mathbf{0}\}$ for $b \in B$ and $i \in I$. The dual crystal $B^\vee$ of $B$ is defined to be the set $\{b^\vee \mid b \in B\}$ with $\text{wt}(b^\vee) = -\text{wt}(b)$, $\epsilon_i(b^\vee) = \varphi_i(b)$, $\varphi_i(b^\vee) = \epsilon_i(b)$, $\tilde{e}_i(b^\vee) = (\tilde{f}_i b)^\vee$ and $\tilde{f}_i(b^\vee) = (\tilde{e}_i b)^\vee$ for $b \in B$ and $i \in I$. We assume that $\mathbf{0}^\vee = \mathbf{0}$.

Let $B_1$ and $B_2$ be crystals. A morphism $\psi : B_1 \to B_2$ is a map from $B_1 \cup \{\mathbf{0}\}$ to $B_2 \cup \{\mathbf{0}\}$ such that

1. $\psi(\mathbf{0}) = \mathbf{0}$,
2. $\text{wt}(\psi(b)) = \text{wt}(b)$, $\epsilon_i(\psi(b)) = \epsilon_i(b)$, and $\varphi_i(\psi(b)) = \varphi_i(b)$ if $\psi(b) \neq \mathbf{0}$,
3. $\psi(\tilde{e}_i b) = \tilde{e}_i \psi(b)$ if $\psi(b) \neq \mathbf{0}$ and $\psi(\tilde{e}_i b) \neq \mathbf{0}$,
4. $\psi(\tilde{f}_i b) = \tilde{f}_i \psi(b)$ if $\psi(b) \neq \mathbf{0}$ and $\psi(\tilde{f}_i b) \neq \mathbf{0}$,

for $b \in B_1$ and $i \in I$. We call $\psi$ an embedding and $B_1$ a subcrystal of $B_2$ when $\psi$ is injective, and call $\psi$ strict if $\psi : B_1 \cup \{\mathbf{0}\} \to B_2 \cup \{\mathbf{0}\}$ commutes with $\tilde{e}_i$ and $\tilde{f}_i$ for all $i \in I$, where we assume that $\tilde{e}_i \mathbf{0} = \tilde{f}_i \mathbf{0} = \mathbf{0}$.

A tensor product $B_1 \otimes B_2$ of crystals $B_1$ and $B_2$ is defined to be $B_1 \times B_2$ as a set with elements denoted by $b_1 \otimes b_2$, where

\[
\text{wt}(b_1 \otimes b_2) = \text{wt}(b_1) + \text{wt}(b_2), \\
\epsilon_i(b_1 \otimes b_2) = \max\{\epsilon_i(b_1), \epsilon_i(b_2) - \langle \text{wt}(b_1), h_i \rangle\}, \\
\varphi_i(b_1 \otimes b_2) = \max\{\varphi_i(b_1) + \langle \text{wt}(b_2), h_i \rangle, \varphi_i(b_2)\}, \\
\tilde{e}_i(b_1 \otimes b_2) = \begin{cases} \\
\tilde{e}_i b_1 \otimes b_2, & \text{if } \varphi_i(b_1) \geq \epsilon_i(b_2), \\
b_1 \otimes \tilde{e}_i b_2, & \text{if } \varphi_i(b_1) < \epsilon_i(b_2), 
\end{cases} \\
\tilde{f}_i(b_1 \otimes b_2) = \begin{cases} \\
\tilde{f}_i b_1 \otimes b_2, & \text{if } \varphi_i(b_1) > \epsilon_i(b_2), \\
b_1 \otimes \tilde{f}_i b_2, & \text{if } \varphi_i(b_1) \leq \epsilon_i(b_2), 
\end{cases}
\]

for $i \in I$. Here we assume that $\mathbf{0} \otimes b_2 = b_1 \otimes \mathbf{0} = \mathbf{0}$. Then $B_1 \otimes B_2$ is a crystal. Note that $(B_1 \otimes B_2)^\vee \simeq B_2^\vee \otimes B_1^\vee$.

Let $P^+$ be the set of dominant integral weights for $\mathfrak{g}$. For $\Lambda \in P^+$, we denote by $B(\mathfrak{g}, \Lambda)$ the $\mathfrak{g}$-crystal associated with the highest weight module over the quantized enveloping algebra $U_q(\mathfrak{g})$ with highest weight $\Lambda$ and highest weight element $u_\Lambda$. Note that $B(\mathfrak{g}, \Lambda)$ is a connected normal $\mathfrak{g}$-crystal. For $\lambda \in P$, let $T_\lambda = \{t_\lambda\}$ be a $\mathfrak{g}$-crystal with $\text{wt}(t_\lambda) = \lambda$ and $\epsilon_i(t_\lambda) = \varphi_i(t_\lambda) = -\infty$ for $i \in I$. 

Let $Z[P]$ be the group ring of $P$ with a $\mathbb{Z}$-basis $\{ e^\lambda \mid \lambda \in P \}$. For a crystal $B$, we define the character of $B$ by $\text{ch} B = \sum_{b \in B} e^{\text{wt}(b)}$. Note that $\text{ch} B$ is well-defined if and only if $B_\lambda = \{ b \in B \mid \text{wt}(b) = \lambda \}$ is finite for $\lambda \in P$.

2.2. **Affine Lie algebras of infinite rank.** Let us recall affine Lie algebras of infinite rank (see \cite{IS} for detailed exposition). Let $\mathbb{Z}^\times = \mathbb{Z} \setminus \{ 0 \}$ and let $\mathfrak{g}_\infty$ be the Lie algebra spanned by complex matrices $(a_{i,j})_{i,j \in \mathbb{Z}^\times}$ with finitely many non-zero entries, which is spanned by the elementary matrix $E_{i,j} (i, j \in \mathbb{Z}^\times)$. Let $\mathfrak{h} = \bigoplus_{i \in \mathbb{Z}^\times} \mathbb{C} E_{i,i}$ and $\langle \cdot, \cdot \rangle$ denote the natural pairing on $\mathfrak{h}^* \times \mathfrak{h}$. Denote the set of simple coroots by $\Pi^\vee = \{ h_{-i} = E_{i-1,i-1} - E_{i,i}, \ h_i = E_{i,i} - E_{i+1,i+1} (i \in \mathbb{Z}_{>0}), \ h_0 = E_{-1,-1} - E_{1,1} \}$, and the set of simple roots by $\Pi = \{ \alpha_{-i} = \epsilon_{-i} - \epsilon_{-i}, \ \alpha_i = \epsilon_i - \epsilon_i+1 (i \in \mathbb{Z}_{>0}), \ \alpha_0 = \epsilon_{-1} - \epsilon_1 \}$, where $\epsilon_i \in \mathfrak{h}^*$ is given by $\langle \epsilon_i, E_{j,j} \rangle = \delta_{ij}$. The Dynkin diagram associated with the Cartan matrix $(\langle \alpha_j, h_i \rangle)_{i,j \in \mathbb{Z}^\times}$ is of type

\[
\begin{align*}
A_\infty : \quad & \cdots \circ \quad \cdots \circ \quad \cdots \circ \quad \cdots \\
\alpha_{-n} & \alpha_{-1} & \alpha_0 & \alpha_1 & \alpha_n & \cdots
\end{align*}
\]

The weight lattice of $\mathfrak{g}_\infty$ is $P = \mathbb{Z} \Lambda_0 \oplus \bigoplus_{i \in \mathbb{Z}} \mathbb{Z} \epsilon_i = \bigoplus_{i \in \mathbb{Z}} \mathbb{Z} \Lambda_i$, where $\Lambda_i$ is the $i$-th fundamental weight, that is $\langle \Lambda_i, h_j \rangle = \delta_{ij}$. Note that

\[
(2.1) \quad \Lambda_i = \begin{cases} 
\Lambda_0 - \epsilon_{-1} - \cdots - \epsilon_i, & \text{if } i < 0, \\
\Lambda_0 + \epsilon_1 + \cdots + \epsilon_i, & \text{if } i > 0.
\end{cases}
\]

For a subset $S$ of $\mathbb{Z}^\times$, we denote by $\mathfrak{g}_S$ the subalgebra of $\mathfrak{g}_\infty$ spanned by $E_{ij}$ for $i, j \in S$. For simplicity, we put $\mathfrak{g}_{\mathbb{Z}_{>0}} = \mathfrak{g}_{\mathbb{Z}_{>0}}$ and $\mathfrak{g}_{\mathbb{Z}_{<0}} = \mathfrak{g}_{\mathbb{Z}_{<0}}$, which are of type $A_{1+\infty}$.

Let us realize the root systems of type $B_\infty$ and $C_\infty$ by folding the diagram of $A_\infty$ \cite{FF}. From now on, we assume that $\epsilon \in \{ 1, 2 \}$ and the symbol $c$ denotes $c$ (resp. $\epsilon = 2$).

Let

\[
\begin{align*}
P_c &= \{ \lambda \in P \mid \frac{1}{2} \langle \lambda, h_0 \rangle \in \mathbb{Z}, \ \langle \lambda, h_i \rangle = \langle \lambda, h_{-i} \rangle (i \in \mathbb{Z}_{>0}) \}, \\
\Pi^\vee_c &= \{ \tilde{h}_0 = \frac{1}{c} h_0, \ \tilde{h}_i = h_i (i \in \mathbb{Z}_{>0}) \} \subset \Pi^\vee, \\
\Pi_c &= \{ \tilde{\alpha}_0 = c \alpha_0, \ \tilde{\alpha}_i = \alpha_i + \alpha_{-i} (i \in \mathbb{Z}_{>0}) \} \subset \Pi.
\end{align*}
\]

Then the Dynkin diagram associated with the Cartan matrix $A_\epsilon = (\langle \tilde{\alpha}_j, \tilde{h}_i \rangle)_{i,j \in \mathbb{Z}_{>0}}$ is of type

\[
\begin{align*}
B_\infty : \quad & \circ \quad \circ \quad \circ \quad \cdots \circ \quad \circ \quad \cdots \\
\tilde{\alpha}_0 & \tilde{\alpha}_1 & \tilde{\alpha}_2 & \tilde{\alpha}_{n-1} & \tilde{\alpha}_n & \tilde{\alpha}_{n+1} & \cdots \quad (\epsilon = 1)
\end{align*}
\]
Let $\mathfrak{x}_\infty$ be the Kac-Moody algebra associated with $(A, P, \Pi, \Pi_\vee)$ (see [18] or Section 5.2 for an explicit construction of $\mathfrak{x}_\infty$). The fundamental weights $\Lambda_i^x (i \in \mathbb{Z}_{\geq 0})$ for $\mathfrak{x}_\infty$ (that is, $\langle \Lambda_i^x, \hat{h}_j \rangle = \delta_{ij}$) are given by

\[
\Lambda_i^x = \begin{cases} 
\epsilon \Lambda_0, & \text{if } i = 0, \\
\Lambda_i + \Lambda_{-i} = 2\Lambda_0 + \hat{\epsilon}_1 + \cdots + \hat{\epsilon}_i, & \text{if } i \geq 1,
\end{cases}
\]

where $\hat{\epsilon}_i = \epsilon_i - \epsilon_{-i}$. Note that

\[
P_x = \mathbb{Z}\Lambda_0^x \oplus \bigoplus_{i \in \mathbb{Z}_{>0}} \mathbb{Z}\hat{\epsilon}_i.
\]

For $k \geq 2$, we denote by $\mathfrak{x}_k$ the subalgebra of $\mathfrak{x}_\infty$, which is a finite dimensional simple Lie algebra of type $B_k (\epsilon = 1)$ or $C_k (\epsilon = 2)$ associated to $\{\hat{\lambda}_i | 0 \leq i \leq k - 1\}$ and $\{\alpha_i | 0 \leq i \leq k - 1\}$. Also, let $\mathfrak{l}_\infty$ be the subalgebra of $\mathfrak{x}_\infty$ associated to $\{\hat{\lambda}_i | i \in \mathbb{Z}_{>0}\}$ and $\{\alpha_i | i \in \mathbb{Z}_{>0}\}$, which is isomorphic to $\mathfrak{gl}_{>0}$.

Let us introduce some notations. Let $\mathcal{P}$ denote the set of partitions. Following [43], we denote the length of $\lambda = (\lambda_i)_{i \geq 1} \in \mathcal{P}$ by $\ell(\lambda)$ and the conjugate of $\lambda$ by $\lambda' = (\lambda'_i)_{i \geq 1}$. We identify $\lambda$ with a Young diagram. But here we use a different convention for Young diagrams, where in each $i$-th row from the bottom there are $\lambda_i$'s boxes placed in a right-justified way. We assume that the rows (resp. columns) in a Young diagram are enumerated from the bottom (resp. right) unless otherwise specified. We denote by $\lambda/\mu$ the skew Young diagram for $\mu = (\mu_i)_{i \geq 1} \in \mathcal{P}$ with $\mu_i \leq \lambda_i$ ($i \geq 1$). We denote by $|\lambda/\mu|$ the number of boxes in $\lambda/\mu$. For example,

\[
(5, 3, 2) = \begin{array}{ccc}
\bullet & \bullet & \bullet \\
\bullet & \bullet & \bullet \\
\bullet & \bullet & \bullet \\
\end{array}
\quad \quad \quad (5, 3, 2)/(3, 1) = \begin{array}{ccc}
\bullet & \bullet & \bullet \\
\bullet & \bullet & \bullet \\
\end{array}.
\]

Now, let

\[
\mathcal{P}(\mathfrak{g}) = \{ (\lambda, n) | \lambda \in \mathcal{P}, n \in \mathbb{Z}_{\geq 0}, 2\lambda_1 \leq \epsilon n \}.
\]

For $(\lambda, n) \in \mathcal{P}(\mathfrak{g})$, define

\[
\Lambda^x(\lambda, n) = n\Lambda_0^x + \sum_{i \geq 1} \lambda_i \hat{\epsilon}_i.
\]

\[
C_\infty : \quad \begin{array}{cccccccc}
\circ & \circ & \circ & \circ & \circ & \circ & \cdots & \circ \\
\alpha_0 & \alpha_1 & \alpha_2 & \cdots & \alpha_n & \alpha_{n+1} & \cdots & 
\end{array} \quad (\epsilon = 2)
\]
Then \( P^+_f = \{ \lambda^f(\lambda, n) \mid (\lambda, n) \in \mathcal{P}(f) \} \) is the set of dominant integral weights for \( f_\infty \). Also, we put
\[
(2.7) \quad \mathcal{P}_x = \{ \epsilon \lambda = (\epsilon \lambda_i)_{i \geq 1} \mid \lambda = (\lambda_i)_{i \geq 1} \in \mathcal{P} \}. 
\]

2.3. Young tableaux. Let \((A, <)\) be a linearly ordered set with a \( \mathbb{Z}_2\)-grading \( A = A_0 \sqcup A_1 \). For \( a \in A_p \) (\( p \in \mathbb{Z}_2 \)), we put \(|a| = p\). Unless otherwise stated, we assume that \( Z \) or its subset is equipped with a usual linear ordering, where all the elements are of degree 0.

For a skew Young diagram \( \lambda/\mu \), a tableau \( T \) obtained by filling \( \lambda/\mu \) with entries in \( A \) is called \( A \)-semistandard if (1) the entries in each row (resp. column) are weakly increasing from left to right (resp. from top to bottom), (2) the entries in \( A_0 \) (resp. \( A_1 \)) are strictly increasing in each column (resp. row). When \( A = \mathbb{Z}_{>0} \), \( T \) is usually called a (semistandard) Young tableau. We say that \( \lambda/\mu \) is the shape of \( T \), and write \( \text{sh}(T) = \lambda/\mu \). For \( a \in A \), let \( m_a(T) \) be the number of occurrences of \( a \) in \( T \).

We denote by \( \text{SST}_A(\lambda/\mu) \) the set of all \( A \)-semistandard tableaux of shape \( \lambda/\mu \).

Let \( x_A = \{ x_a \mid a \in A \} \) be the set of formal commuting variables. We let \( S_\lambda/\mu(x_A) = \sum_{T \in \text{SST}_A(\lambda/\mu)} x_A^T \) be the super Schur function associated to \( \lambda \), where \( x_A^T = \prod_{a \in A} x_a^{m_a(T)} \). Note that \( S_\lambda(x_{\mathbb{Z}_{\geq 0}}) \) is the usual Schur function for \( \lambda \in \mathcal{P} \), which we will denote by \( s_\lambda(x) \) for simplicity.

Let \( \mathcal{W}_A \) be the set of finite words with letters in \( A \). For \( T \in \text{SST}_A(\lambda/\mu) \), we denote by \( w_{\text{col}}(T) \in \mathcal{W}_A \) the word obtained by reading the entries of \( T \) column by column from right to left, and from top to bottom in each column. Also, we denote by \( w_{\text{row}}(T) \in \mathcal{W}_A \) the word obtained by reading the entries of \( T \) row by row from top to bottom, and from right to left in each row. We will denote by \( w(T) \) the row or column word of \( T \) when a statement holds for both words of \( T \).

For \( a \in A \) and \( S \in \text{SST}_A(\mu) \), let us do the Schendsted’s row insertion of \( a \) starting from the bottom row of \( S \), and then proceed to the upper rows as far as possible. We denote the resulting tableau by \( a \rightarrow S \) (cf. [3][15]). For \( w = w_1 \cdots w_r \in \mathcal{W}_A \), we let \( (w \rightarrow S) = (w_r \rightarrow (\cdots (w_1 \rightarrow S) \cdots )) \). For \( T \in \text{SST}_A(\nu) \), we define \( (T \rightarrow S) = (w(T) \rightarrow S) \).

Note that \( \mathbb{Z}_\infty^\times \) is a normal \( \mathfrak{gl}_{\infty} \)-crystal given by
\[
(2.8) \quad \cdots \rightarrow -2 \rightarrow -1 \rightarrow 0 \rightarrow 1 \rightarrow 2 \rightarrow \cdots
\]
with \( \text{wt}(i) = \epsilon_i \). If \( A \) is a subset of \( \mathbb{Z}_\infty^\times \), we may regard \( A \) as a normal \( \mathfrak{gl}_A \)-crystal whose associated graph is induced from that of \( \mathbb{Z}_\infty^\times \) above by restricting the vertices to \( A \). Then by identifying \( w_1 \cdots w_r \in \mathcal{W}_A \) with \( w_1 \otimes \cdots \otimes w_r \in A^{\otimes r} \), \( \mathcal{W}_A \) is a
\( \mathfrak{gl}_A \)-crystal under tensor product of crystals. Also, the image of \( \text{SST}_A(\lambda/\mu) \) in \( \mathcal{W}_A \) under the map \( T \mapsto w(T) = w_1 \ldots w_\nu \) together with \( \{ 0 \} \) is invariant under \( e_i, f_i \) for all \( i \) such that \( \alpha_i \) is a simple root of \( \mathfrak{gl}_A \). Hence \( \text{SST}_A(\lambda/\mu) \) is a subcrystal of \( \mathcal{W}_A \) [23].

### 2.4. LR tableaux

For \( \lambda, \mu, \nu \in \mathcal{P} \) with \( |\lambda| = |\mu| + |\nu| \), let \( \text{LR}_{\mu\nu}^\lambda \) be the set of tableaux \( U \) in \( \text{SST}_{\mathbb{Z}_{>0}}(\lambda/\mu) \) such that

1. \( m_i(U) = \nu_i \) for \( i \geq 1 \),
2. the number of occurrences of each \( i \geq 1 \) in \( w_1 \ldots w_k \) is no less than that of \( i+1 \) in \( w_1 \ldots w_k \) for \( 1 \leq k \leq |\nu| \), where \( w(U) = w_1 \ldots w_{|\nu|} \).

We call \( \text{LR}_{\mu\nu}^\lambda \) the set of LR tableaux of shape \( \lambda/\mu \) with content \( \nu \) and put \( c_{\mu\nu}^\lambda = |\text{LR}_{\mu\nu}^\lambda| \). Our definition is not the same as that of a usual LR tableau [43], but there is a natural one-to-one correspondence between them. (For example, \( \text{LR}_{\mu\nu}^\lambda \) is in one-to-one correspondence with \( \text{LR}_{\mu\nu}^\lambda \) in [37] Section 3.2 under 180° rotation and replacing \( i \) with \( -i \). Then use [37, Proposition 3.2].)

For \( S \in \text{SST}_A(\mu) \) and \( T \in \text{SST}_A(\nu) \), suppose that \( \lambda = \text{sh}(T \rightarrow S) \) and \( w(T) = w_1 \ldots w_{|\nu|} \). Define \( (T \rightarrow S)_R \) to be the tableau of shape \( \lambda/\mu \) such that for \( 1 \leq k \leq |\nu| \) \( \text{sh}(w_1 \ldots w_k \rightarrow S)/\text{sh}(w_1 \ldots w_{k-1} \rightarrow S) \) is filled with \( i \) when \( w_k \) is an entry in the \( i \)-th row of \( T \). Then the map \( (S, T) \mapsto ((T \rightarrow S), (T \rightarrow S)_R) \) gives a bijection [55]

\[
\text{SST}_A(\mu) \times \text{SST}_A(\nu) \rightarrow \bigcup_{\lambda \in \mathcal{P}} \text{SST}_A(\lambda) \times \text{LR}_{\mu\nu}^\lambda.
\]

(2.9)

This implies that \( S_\mu(x_A)S_\nu(x_A) = \sum_\lambda c_{\mu\nu}^\lambda S_\lambda(x_A) \). Let \( \text{Sym}_A \) be the \( \mathbb{Q} \)-span of \( S_\lambda(x_A) \)'s and put \( \text{Sym} = \text{Sym}_{\mathbb{Z}_{>0}} \) for simplicity. Then \( \text{Sym}_A \) is a \( \mathbb{Q} \)-algebra with a basis \( \{ S_\lambda(x_A) | \lambda \in \mathcal{P} \text{ with } \text{SST}_A(\lambda) \neq \emptyset \} \) [3], and there is a surjective algebra homomorphism

\[
\omega_A : \text{Sym} \rightarrow \text{Sym}_A
\]

sending \( s_\lambda(x) \) to \( S_\lambda(x_A) \). Also \( \omega_A \) is an isomorphism when \( A \) is finite.

Let \( \text{LR}_{\mu\nu}^\lambda \) be the set of \( V \in \text{SST}_{\mathbb{Z}_{>0}}(\nu) \) such that \( (V \rightarrow H_\mu) = H_\lambda \), where \( H_\lambda \) denotes the highest weight element in a crystal \( \text{SST}_{\mathbb{Z}_{>0}}(\lambda) \) that is, the \( k \)-th entry from the top of each column is \( k \). There is a bijection

\[
\text{LR}_{\mu\nu}^\lambda \overset{(\cdot)\sharp}{\rightarrow} \text{LR}_{\mu\nu}^\lambda,
\]

(2.11)

where \( U^\sharp = V \) with \( U = (V \rightarrow H_\mu)_R \). Indeed, the number of \( k \)'s in the \( i \)-th row of \( V \) is equal to the number of \( i \)'s in the \( k \)-th row of \( U \) for \( i, k \geq 1 \) [44].

**Example 2.1.**
3. A Young tableau model for crystals of type $B$ and $C$

3.1. Crystals associated with Littlewood identities.

**Definition 3.1.** For $\lambda \in \mathcal{P}$, let

$$T_\lambda = \bigsqcup_{\tau \in \mathcal{P}} SSTZ_{>0}(\tau) \times SSTZ_{>0}(\lambda).$$

Let us define an $\mathfrak{g}_\infty$-crystal structure on $T_\lambda$. First, we may regard $T_\lambda = \bigsqcup_{\tau \in \mathcal{P}} SSTZ_{>0}(\tau) \otimes SSTZ_{>0}(\lambda)$ as an $\mathfrak{l}_\infty$-crystal (Recall that $\mathfrak{l}_\infty \simeq \mathfrak{gl}_{>0}$). We denote by $\tilde{E}_i$ and $\tilde{F}_i$ the operators corresponding to $\hat{\alpha}_i$ for $i \in \mathbb{Z}_{>0}$. As an $\mathfrak{l}_\infty$-crystal, $T_\lambda$ decomposes as follows:

$$T_\lambda \simeq \bigoplus_{\sigma \in \mathcal{P}} \bigotimes_{\tau \in \mathcal{P}} \mathcal{LR}_{\tau \lambda}^\sigma,$$

where the isomorphism is given by sending $(S,T)$ to $((T \to S), (T \to S)_R)$ and $\tilde{E}_i$, $\tilde{F}_i$ ($i \in \mathbb{Z}_{>0}$) act on the first component of the right-hand side (see for example [19, Proposition 4.17]).

Next, let us define the operators $\tilde{E}_0$ and $\tilde{F}_0$ on $T_\lambda$ corresponding to $\hat{\alpha}_0$.

**Case 1.** Suppose that $\tau = b$ and $(S,T) \in T_b(\lambda)$ is given with $\text{sh}(S) = \tau$ for some $\tau \in \mathcal{P}$. For each $k \geq 1$, let $s_k$ be the entry in the top of the $k$-th column of $S$. We put

$$\sigma_k = \begin{cases} +, & \text{if the } k\text{-th column is empty,} \\ +, & \text{if } s_k > 1, \\ -, & \text{if } s_k = 1. \end{cases}$$

In the sequence $\sigma = (\ldots, \sigma_2, \sigma_1)$, we replace a pair $(\sigma_{s'}, \sigma_s) = (-, +)$, where $s' > s$ and $\sigma_t = \cdot$ for $s' > t > s$, with $(\cdot, \cdot)$, and repeat this process as far as possible until we get a sequence with no $-$ placed to the left of $+$. We denote this sequence by $\tilde{\sigma}$.

We define $\tilde{E}_0(S,T) = (S', T)$, where $S'$ is the tableau obtained from $S$ by removing 1 in the column corresponding to the left-most $-$ in $\tilde{\sigma}$. We call this 1 removable. If there is no such $-$ sign or removable 1, then we define $\tilde{E}_0(S,T) = 0$.

We define $\tilde{F}_0(S,T) = (S'', T)$ where $S''$ is the tableau obtained from $S$ by adding 1 on top of the column corresponding to the right-most $+$ in $\tilde{\sigma}$. If there is no such $+$ sign, then we define $\tilde{F}_0(S,T) = 0$. 

\[
\begin{array}{c|c|c}
1 & 1 & 2 \\
1 & 2 & 3 \\
\end{array} \quad \in \mathcal{LR}^{(5,4,3,1)}_{(3,1) (4,3,2)} \quad \phantom{1} \begin{array}{c|c|c|c}
1 & 2 & 3 \\
2 & 3 & 3 & 4 \\
\end{array} \quad \in \mathcal{LR}^{(5,4,3,1)}_{(3,1) (4,3,2)}
\]
Case 2. Suppose that $x = c$ and $(S, T) \in \mathcal{T}(\lambda)$ is given with $\text{sh}(S) = 2\tau$ for some $\tau \in \mathcal{P}$. For each $k \geq 1$, consider $(s_{2k}, s_{2k-1})$ the pair of entries in the top of the $2k$-th and $(2k-1)$-st columns of $S$, respectively. Note that $s_{2k-1}$ and $s_{2k}$ are placed in the same row of $2\tau$ and $s_{2k} \leq s_{2k-1}$. We put

$$
\sigma_k = \begin{cases} 
+ & \text{if } s_{2k}, s_{2k-1} \geq 2 \text{ or the } (2k-1)\text{-st column is empty,} \\
- & \text{if } s_{2k} = s_{2k-1} = 1, \\
\cdot & \text{otherwise.}
\end{cases}
$$

(3.3)

As in Case 1, we obtain a reduced sequence $\tilde{\sigma}$ from $\sigma = (\ldots, \sigma_2, \sigma_1)$. We define $E_0(S, T) = (S', T)$, where $S'$ is the tableau obtained from $S$ by removing a domino $\begin{array}{c} 1 \hline 1 \end{array}$ in the pair of columns corresponding to the left-most $-$ in $\tilde{\sigma}$. We call this domino $\begin{array}{c} 1 \hline 1 \end{array}$ removable. If there is no such $-$ sign or removable domino $\begin{array}{c} 1 \hline 1 \end{array}$, then we define $E_0(S, T) = 0$.

We define $F_0(S, T) = (S'', T)$ where $S''$ is the tableau obtained from $S$ by adding a domino $\begin{array}{c} 1 \hline 1 \end{array}$ on top of the pair of columns corresponding to the right-most $+$ in $\tilde{\sigma}$. If there is no such $+$ sign, then we define $F_0(S, T) = 0$.

Lemma 3.2. $\mathcal{T}(\lambda) \cup \{0\}$ is invariant under $E_0$ and $F_0$.

Proof. It is straightforward to check from the definitions of $E_0$ and $F_0$. \hfill \Box

Example 3.3. Let

$$(S, T) = \left( \begin{array}{c} 1 \\ 1 \hline 1 \\ 1 \hline 3 \\ 1 \hline 3 \\ 1 \hline 2 \hline 1 \hline 3 \hline 4 \hline 5 \\ 2 \hline 3 \\ \end{array} \right) \in \mathcal{T}(2, 1).$$

Then

$$\sigma = (\cdots + + - + - + -),$$
$$\tilde{\sigma} = (\cdots + + - - - -).$$

Hence we have

$$E_0(S, T) = \left( \begin{array}{c} 1 \\ 1 \hline 1 \\ 1 \hline 3 \\ 1 \hline 3 \\ 1 \hline 3 \\ 1 \hline 2 \hline 1 \hline 3 \hline 4 \hline 5 \\ 2 \hline 3 \\ \end{array} \right),$$

$$F_0(S, T) = \left( \begin{array}{c} 1 \\ 1 \hline 1 \\ 1 \hline 1 \hline 1 \\ 1 \hline 2 \hline 1 \hline 3 \hline 4 \hline 5 \\ 2 \hline 3 \\ \end{array} \right).$$
Example 3.4. Let 

\[(S, T) = \begin{pmatrix} 1 & 1 & 3 & 3 \\ 1 & 1 & 2 & 3 & 4 & 5 \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \end{pmatrix}, \quad \begin{pmatrix} 2 \\ 2 \end{pmatrix} \in \mathcal{T}(2, 1).\]

Then

\[
\sigma = (\cdots + - \cdot - +),
\]

\[
\tilde{\sigma} = (\cdots + - \cdot \cdots ),
\]

and

\[
\tilde{E}_0(S, T) = \begin{pmatrix} 1 & 1 & 3 & 3 \\ 1 & 2 & 2 & 3 & 4 & 5 \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \end{pmatrix}, \quad \begin{pmatrix} 2 \\ 2 \end{pmatrix}, \quad \tilde{F}_0(S, T) = \begin{pmatrix} 1 & 1 & 3 & 3 \\ 1 & 1 & 1 & 1 & 2 & 2 & 3 & 4 & 5 \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \end{pmatrix}, \quad \begin{pmatrix} 2 \\ 2 \end{pmatrix}.
\]

Now, for \((S, T) \in \mathcal{T}(\lambda)\), we define

\[\text{wt}^f(S, T) = \sum_{i \geq 1} (m_i(S) + m_i(T)) \hat{e}_i,\]

(3.4)

\[\varepsilon_i^f(S, T) = \max\{ k \mid \tilde{E}_i^k(S, T) \neq 0 \},\]

\[\varphi_i^f(S, T) = \langle \text{wt}^f(S, T), \hat{h}_i \rangle + \varepsilon_i^f(S, T),\]

for \(i \in \mathbb{Z}_{\geq 0}\). Put

(3.5) \[\mathcal{H}_\lambda = (\emptyset, H_\lambda),\]

where \(\emptyset\) is the empty tableau.

Proposition 3.5. For \(\lambda \in \mathcal{P}\), \(\mathcal{T}(\lambda)\) is an \(\mathfrak{g}_\infty\)-crystal with respect to \(\text{wt}^f, \varepsilon_i^f, \varphi_i^f, \tilde{E}_i, \tilde{F}_i (i \in \mathbb{Z}_{\geq 0})\). Also we have

\[\mathcal{T}(\lambda) = \{ \tilde{F}_{i_1} \cdots \tilde{F}_{i_r} \mathcal{H}_\lambda \mid r \geq 0, i_1, \ldots, i_r \in \mathbb{Z}_{\geq 0} \} \setminus \{ \emptyset \}.
\]

In particular, \(\mathcal{T}(\lambda)\) is a connected \(\mathfrak{g}_\infty\)-crystal with a unique highest weight element \(\mathcal{H}_\lambda\).

Proof. By definition, \(\mathcal{T}(\lambda)\) is an \(\mathfrak{g}_\infty\)-crystal. Let us show that given \((S, T) \in \mathcal{T}(\lambda)\), there exist \(i_1, \ldots, i_r \in \mathbb{Z}_{\geq 0}\) such that \(\tilde{E}_{i_1} \cdots \tilde{E}_{i_r}(S, T) = \mathcal{H}_\lambda\). We will use induction on \(|\text{sh}(S)|\).

If \(|\text{sh}(S)| = 0\), then \(S\) is the empty tableau. Since \(SST_{\mathbb{Z}_{>0}}(\lambda)\) is a highest weight \(\mathfrak{g}_\infty\)-crystal, there exist \(i_1, \ldots, i_r \in \mathbb{Z}_{>0}\) such that \(\tilde{E}_{i_1} \cdots \tilde{E}_{i_r}(\emptyset, T) = H_\lambda\), and hence \(\tilde{E}_{i_1} \cdots \tilde{E}_{i_r}(S, T) = \mathcal{H}_\lambda\).
Suppose that $|\text{sh}(S)| > 0$. We may assume that $(S, T)$ is an $l_\infty$-highest weight element. Then by tensor product rule of crystals, we have $S = H_\tau$. Note that there is at least one removable $1$ or $1$ in $S$, and hence $E_0 S \neq 0$ with $|\text{sh}(E_0 S)| = |\text{sh}(S)| - \epsilon$. By induction hypothesis, there exist $i_1, \ldots, i_r \in \mathbb{Z}_{\geq 0}$ such that $\tilde{E}_{i_1} \cdots \tilde{E}_{i_r}(S, T) = H_\lambda$. □

Remark 3.6. Note that $\text{ch} \mathcal{F}(\lambda) = s_{\lambda}(x) \sum_{\tau \in \mathcal{P}} s_{\tau}(x) = \sum_{\sigma \in \mathcal{P}} \sum_{\tau \in \mathcal{P}} c_{\tau}^\sigma s_{\sigma}(x)$, where $x_i = e^{\hat{e}_i} \in \mathbb{Z}[P]$ for $i \in \mathbb{Z}_{\geq 0}$. By the Littlewood identity (1.1), we have $\text{ch} \mathcal{F}(\lambda) = s_{\lambda}(x) \prod_i (1-x_i^\epsilon) \prod_{i<j}(1-x_i x_j)$.

3.2. Crystals of integrable highest weight modules. For $w = w_1 \ldots w_r \in W_{\mathbb{Z}_{>0}}$, let us say that $w$ is weakly decreasing if $w_1 \geq \ldots \geq w_r$.

Definition 3.7. For $U \in \text{LR}^{\lambda}_{\mu \nu}$ with $\mu \in \mathcal{P}$, we define

$$\Delta_t(U) = \max \left\{ \frac{\mu_k + 2\ell(w)}{\epsilon} \middle| \begin{array}{l}
(1) \ w = w_1 \ldots w_r \text{ is a subword of } w(U), \\
(2) \ w \text{ is weakly decreasing}, \\
(3) \ w_1 \text{ is placed in the } k\text{-th row of } \lambda.
\end{array} \right\}$$

Remark 3.8. For $U \in \text{LR}^{\lambda}_{\mu \nu}$ let $w = w_1 \ldots w_r$ be a weakly decreasing subword of $w(U)$. Let $w_k$ be the entry of $U$ at the position $(i_k, j_k)$, that is, the $i_k$-th row and the $j_k$-th column. If $w(U)$ is a row word, then $i_1 \geq \ldots \geq i_r$. Also we have $j_1 < \ldots < j_r$. Suppose that $i_k < i_{k+1}$ for some $k$. Then we may replace $w_{k+1}$ with the entry of $U$ at $(i_k, j_{k+1})$ to obtain a new weakly decreasing subword of the same length. Repeating this process, we may also assume that $i_1 \geq \ldots \geq i_r$. Hence we may always assume that $i_1 \geq \ldots \geq i_r$ and $j_1 < \ldots < j_r$. Note that a subword of $w(U)$ which gives a maximal value $\Delta_t(U)$ is not necessarily unique.

Example 3.9. Consider

$$U = \begin{array}{c}
1 \\
1 2 \\
2 3 \\
1 4
\end{array} \in \text{LR}^{(5,4,2,1)}_{(3,2) (3,2,1,1)}.$$ 

The bold faced letters form a weakly decreasing subword of $w(U)$, which gives a maximal value $2 + 2 \cdot 3 = 8 = \Delta_b(U)$. And for

$$\begin{array}{c}
1 \\
1 2 \\
2 3 \\
1 4
\end{array} \in \text{LR}^{(5,4,2,1)}_{(3,2) (3,2,1,1)}.$$
we have $\Delta_c(U') = (4 + 2 \cdot 2) / 2 = 4$.

**Definition 3.10.** For $(\lambda, n) \in \mathcal{P}(\mathfrak{g})$, we define

$$\mathcal{F}(\lambda, n) = \left\{ (S, T) \mid (S, T) \in \mathcal{F}(\lambda), \Delta_f((T \to S)R) \leq n \right\}.$$  

Note that $\Delta_x(H_{\lambda}) = 2\lambda_1/\epsilon$, and hence $H_{\lambda} \in \mathcal{F}(\lambda, n)$. For $(S, T) \in \mathcal{F}(\lambda, n)$ we define

$$(3.6) \quad \text{wt}^f_{\lambda}(S, T) = \text{wt}(S, T) + n\Lambda^f_0.$$  

Then we may view $\mathcal{F}(\lambda, n)$ as an $\mathfrak{r}_\infty$-crystal with respect to $\text{wt}^f_{\lambda}, \varphi^f_i$ and $E_i, F_i (i \in \mathbb{Z}_{\geq 0})$, which is a subgraph of $\mathcal{F}(\lambda) \otimes T_{n\Lambda^f_0}$.

Now we are in a position to state the main result of this paper, which gives a new combinatorial realization of the crystal $B(\mathfrak{r}_\infty, \Lambda^f(\lambda, n))$. The proof will be given in Section 6.

**Theorem 3.11.** For $(\lambda, n) \in \mathcal{P}(\mathfrak{g})$, we have

$$\mathcal{F}(\lambda, n) \simeq B(\mathfrak{r}_\infty, \Lambda^f(\lambda, n)).$$

**Remark 3.12.** Let $B(\infty)$ be an $\mathfrak{r}_\infty$-crystal associated with the negative part of $U_q(\mathfrak{r}_\infty)$ with a highest weight element $u_\infty$. There exists a weight preserving involution $*$ on $B(\infty)$, which gives another crystal structure on $B(\infty)$ with respect to $E^*_i = * \circ E_i \circ *$ and $F^*_i = * \circ F_i \circ *$. Note that there exists a crystal embedding $B(\mathfrak{r}_\infty, \Lambda^f(\lambda, n)) \rightarrow B(\infty) \otimes T_{\Lambda^f(\lambda, n)}$ sending $u_{\Lambda^f(\lambda, n)}$ to $u_\infty \otimes t_{\Lambda^f(\lambda, n)}$, and its image is

$$(3.7) \quad \left\{ b \otimes t_{\Lambda^f(\lambda, n)} \mid \epsilon^*_i(b) \leq \langle \Lambda^f(\lambda, n), \hat{h}_i \rangle (i \in \mathbb{Z}_{\geq 0}) \right\},$$  

where $\epsilon^*_i(b) = \max \left\{ k \mid (E^*_i)^k b \neq 0 \right\}$ (see [21]).

Since $\mathcal{F}(\lambda, n) \subset \mathcal{F}(\lambda, n+1)$ for $n \geq 1$, we may regard $\bigcup_n \mathcal{F}(\lambda, n) = \mathcal{F}(\lambda) \otimes T_{\Lambda^f(\lambda, n)} \subset B(\infty) \otimes T_{\Lambda^f(\lambda, n)}$. Theorem 3.11 combined with (3.7) implies that

$$\Delta_f((T \to S)_R) - (2\lambda_1/\epsilon) = \epsilon^*_0(S, T)$$  

for $(S, T) \in \mathcal{F}(\lambda)$. Hence $\Delta_f$ can be viewed as a combinatorial realization of $\epsilon^*_0$. 

Figure 1. The subgraph of $T^b((1), 2)$ obtained by applying $\bar{F}_i$’s ($i = 0, 1, 2$) to the highest weight vector $H_{(1)}$ of weight $\Lambda^b_1$. 
Figure 2. The subgraph of $\mathcal{K}_c((0), 1)$ obtained by applying $\tilde{F}_i$’s ($i = 0, 1, 2$) to the highest weight vector $\mathcal{H}_c(0)$ of weight $\Lambda_c^0$. 
4. Decomposition rule

4.1. Generalized LR rule. Let us introduce another statistic on LR tableaux.

**Definition 4.1.**

1. For \( U \in \text{LR}^\lambda_{\mu,\nu} \) with \( \nu \in \mathcal{P}(x) \), we define
   
   \[
   \nabla_x(U) = \begin{cases}
   \text{the number of removable } 1 \text{'s in } U^x, & \text{if } x = b, \\
   \text{the number of removable } 1 \text{'s in } U^x, & \text{if } x = c.
   \end{cases}
   \]

2. For \((\lambda, m + n), (\mu, m), (\nu, n) \in \mathcal{P}(x)\), we define
   
   \[
   \text{LR}^{(\lambda,m+n)}_{(\mu,m),(\nu,n)}(x) = \begin{cases}
   (U, V) \mid (1) \ (U, V) \in \text{LR}^\eta_{\mu,\tau} \times \text{LR}^\lambda_{\eta,\rho} \text{ for some } \tau \in \mathcal{P}, \eta \in \mathcal{P}, \\
   (2) \ \nabla_x(U) \leq m - (2 \mu_1 / \epsilon) \text{ and } \Delta_x((V^x \rightarrow U^x)_R) \leq n.
   \end{cases}
   \]

   and let
   
   \[
   c^{(\lambda,m+n)}_{(\mu,m),(\nu,n)}(x) = \left| \text{LR}^{(\lambda,m+n)}_{(\mu,m),(\nu,n)}(x) \right|.
   \]

Then we have the following generalized LR rule of \( x_\infty \)-crystals.

**Theorem 4.2.** For \((\mu, m), (\nu, n) \in \mathcal{P}(x)\), we have

\[
B(x_\infty, \Lambda^I(\mu, m)) \otimes B(x_\infty, \Lambda^I(\nu, n)) \simeq \bigoplus_{(\lambda, m+n) \in \mathcal{P}(x)} B(x_\infty, \Lambda^I(\lambda, m+n)) \times \text{LR}^{(\lambda, m+n)}_{(\mu, m),(\nu, n)}(x),
\]

where \( E_i \) and \( F_i \) for \( i \in \mathbb{Z}_{\geq 0} \) act on the first component of the right-hand side.

**Proof.** Let \( m_1 \otimes m_2 \in B(x_\infty, \Lambda^I(\mu, m)) \otimes B(x_\infty, \Lambda^I(\nu, n)) \) be given. Suppose that \( m_1 \otimes m_2 \) is a highest weight element with highest weight \( \Lambda^I(\lambda, m+n) \) for some \((\lambda, m+n) \in \mathcal{P}(x)\). Then by tensor product rule of crystals, it is equivalent to saying that \( m_1 = u_{\Lambda^I(\mu, m)} \) and for \( i \in \mathbb{Z}_{\geq 0} \)

\[
(4.1) \quad \varepsilon_i^I(m_2) \leq \langle \Lambda^I(\mu, m), \hat{h}_i \rangle.
\]

By Theorem 3.11, we may identify \( m_1 = (\emptyset, H_\mu) \) and \( m_2 = (S, T) \in \text{SST}_{Z_{>0}}(\tau) \times \text{SST}_{Z_{>0}}(\nu) \) for some \( \tau \in \mathcal{P}, \eta \in \mathcal{P} \). Since \( \varepsilon_i^I(m_2) \leq \langle \Lambda^I(\mu, m), \hat{h}_i \rangle \) for \( i \in \mathbb{Z}_{>0} \), equivalently, \( \overline{E}_i(m_1 \otimes m_2) = 0 \) for \( i \in \mathbb{Z}_{>0} \) (that is, a highest weight element in an \( L_\infty \)-crystal), we have \( (S \rightarrow H_\mu) = H_\mu \) and \( (T \rightarrow H_\eta) = H_\lambda \) for some \( \eta \in \mathcal{P} \). Hence \( S \in \text{LR}^\eta_{\mu,\tau} \) and \( T \in \text{LR}^\lambda_{\eta,\rho} \).

Let \( U \in \text{LR}^\eta_{\mu,\tau} \) and \( V \in \text{LR}^\lambda_{\eta,\rho} \) be such that \( U^x = S \) and \( V^x = T \). Also by (4.1), we have

\[
\varepsilon_0^I(m_2) = \varepsilon_0^I(S, T) = \nabla_x(U) \leq \langle \Lambda^I(\mu, m), \hat{h}_0 \rangle = m - (2 \mu_1 / \epsilon).
\]
Finally, we have $\Delta_{\tau}(V^{\tau} \to U^{\tau})_{R} \leq n$ since $(S, T) \in \mathcal{T}(\nu, n)$. Hence $(U, V) \in \mathbf{LR}^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(\mathfrak{g})$.

Since $m_{1} \otimes m_{2}$ is uniquely determined by $(U, V)$ and the correspondence $m_{1} \otimes m_{2} \mapsto (U, V)$ is reversible, the connected component isomorphic to $B(\mathfrak{r}_{\infty}, \Lambda^{F}(\lambda, m+n))$ is parametrized by $\mathbf{LR}^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(\mathfrak{g})$. This completes the proof. □

**Corollary 4.3.** For $(\mu, m), (\nu, n) \in \mathcal{P}(\mathfrak{g})$, we have

$$
\text{ch} B(\mathfrak{r}_{\infty}, \Lambda^{F}(\mu, m)) \text{ch} B(\mathfrak{r}_{\infty}, \Lambda^{F}(\nu, n)) = \sum_{(\lambda, m+n) \in \mathcal{P}(\mathfrak{g})} c^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(\mathfrak{g}) \text{ch} B(\mathfrak{r}_{\infty}, \Lambda^{F}(\lambda, m+n)).
$$

**Example 4.4.** When $\mu = \nu = (0)$, it is straightforward to check that

$$
\mathbf{LR}^{(\lambda, m+n)}_{((0), m)(0, n)}(\mathfrak{g}) = \{ (H_{\lambda}, \emptyset) \}
$$

for $(\lambda, m+n) \in \mathcal{P}(\mathfrak{g})$, which implies that

$$
B(\mathfrak{r}_{\infty}, \Lambda^{F}((0), m)) \otimes B(\mathfrak{r}_{\infty}, \Lambda^{F}((0), n)) \simeq \bigsqcup_{(\lambda, m+n) \in \mathcal{P}(\mathfrak{g})} B(\mathfrak{r}_{\infty}, \Lambda^{F}(\lambda, m+n)).
$$

This recovers a multiplicity free decomposition of the product of rectangular shaped characters for $\mathfrak{sp}(2k)$ and $\mathfrak{so}(2k+1)$ by Okada [45, Theorem 2.5 (1) and (2)] (see Section 4.3). Also, a Krattenthaler’s generalization to nearly rectangular shaped characters [34, Theorem 3] can be deduced from Theorem 4.2 without difficulty.

The generalized LR coefficients $c^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(\mathfrak{g})$ has the following stable limit.

**Corollary 4.5.** Let $(\lambda, m+n), (\mu, m), (\nu, n) \in \mathcal{P}(\mathfrak{g})$ be given. If $(\lambda, m), (\lambda, n) \in \mathcal{P}(\mathfrak{g})$, then

$$
c^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(\mathfrak{g}) = \sum_{\eta \in \mathcal{P}} \sum_{\tau \in \mathcal{P}} c^{\eta}_{\mu \tau} c^{\lambda}_{\nu \eta}.
$$

**Proof.** Suppose that $(U, V) \in \mathbf{LR}^{\eta}_{\mu \tau} \times \mathbf{LR}^{\lambda}_{\nu \eta}$ is given for some $\tau \in \mathcal{P}_{\mathfrak{r}}$ and $\eta \in \mathcal{P}$. Note that $\tau_{1} + \mu_{1} \leq \eta_{1} \leq \lambda_{1}$. By hypothesis, we have $\tau_{1} + 2\mu_{1} \leq 2\lambda_{1} \leq \epsilon m$, which implies that

$$
\nabla_{\tau}(U) \leq \tau_{1}/\epsilon \leq m - (2\mu_{1}/\epsilon).
$$

Similarly, we have $\tau_{1} + 2\nu_{1} \leq 2\lambda_{1} \leq \epsilon n$, which implies that

$$
\Delta_{\tau} \left((V^{\tau} \to U^{\tau})_{R} \right) \leq \frac{\tau_{1} + 2\nu_{1}}{\epsilon} \leq n.
$$

Therefore, $(U, V) \in \mathbf{LR}^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(\mathfrak{g})$. We have

$$
\mathbf{LR}^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(\mathfrak{g}) = \bigsqcup_{\eta \in \mathcal{P}} \bigsqcup_{\tau \in \mathcal{P}} \mathbf{LR}^{\eta}_{\mu \tau} \times \mathbf{LR}^{\lambda}_{\nu \eta}.
$$

□
Remark 4.6. The stable limit formula in Corollary 4.5 also recovers and extends the known result in the following sense. Let $\ell = \min\{m, n\}$. Suppose that $2\lambda_1, 2\mu_1, 2\nu_1 \leq \epsilon \ell$. It is not difficult to check that

$$c^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(x) = \sum_{\eta \in \mathcal{P}} \sum_{\tau \in \mathcal{P}_t} c^\eta_{\mu \tau} c^\lambda_{\eta \tau} = \sum_{\eta \in \mathcal{P}} \sum_{\tau \in \mathcal{P}_t} c^\eta_{\mu \tau} c^\lambda_{\eta \tau},$$

If we apply the reciprocity law via the $(c_{\infty}, \text{Sp}(2k))$-Howe duality on the level $k$ fermionic Fock space $[56]$ Theorem 3.4], then it follows that $c^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(x)$ coincides with the stable branching coefficient with respect to $\text{Sp}(2m) \times \text{Sp}(2n) \subset \text{Sp}(2m+2n)$ given by Koike and Terada [33 Corollary 2.6]. Also by the $(b_{\infty}, \text{Pin}(2k))$-Howe duality $[56]$ Theorem 3.3], $c^{(\lambda, m+n)}_{(\mu, m)(\nu, n)}(x)$ gives a stable branching coefficient with respect to $\text{Pin}(2m) \times \text{Pin}(2n) \subset \text{Pin}(2m+2n)$, which seems to be new (cf. [56 Section 7]).

4.2. Branching rule as an $l_{\infty}$-crystal. Let us describe the decomposition of $B(\mathfrak{f}_{\infty}, \Lambda^f(\lambda, n))$ as an $l_{\infty}$-crystal.

Definition 4.7. For $(\lambda, n) \in \mathcal{P}(x)$ and $\sigma \in \mathcal{P}$, we define

$$\text{LR}^\sigma_{(\lambda, n)}(x) = \{ U \mid U \in \text{LR}^\sigma_{\tau \lambda} \text{ for some } \tau \in \mathcal{P}_t \text{ and } \Delta_t(U) \leq n \},$$

and let

$$c^\sigma_{(\lambda, n)}(x) = |\text{LR}^\sigma_{(\lambda, n)}(x)|.$$

For $\sigma \in \mathcal{P}$, let $B(\mathfrak{f}_{\infty}, \omega_\sigma)$ be the $l_{\infty}$-crystal associated to the highest weight $U_q(\mathfrak{l}_{\infty})$-module with highest weight $\omega_\sigma = \sum_{i \geq 1} \sigma_i \hat{e}_i$. Note that $B(\mathfrak{f}_{\infty}, \omega_\sigma) \simeq \text{ST}Z_{\infty}(\sigma)$. Then we have the following decomposition.

Theorem 4.8. For $(\lambda, n) \in \mathcal{P}(x)$, we have

$$B(\mathfrak{f}_{\infty}, \Lambda^f(\lambda, n)) \simeq \bigsqcup_{\sigma \in \mathcal{P}} B(\mathfrak{f}_{\infty}, \omega_\sigma) \times \text{LR}^\sigma_{(\lambda, n)}(x)$$

as an $l_{\infty}$-crystal, where $\tilde{E}_i$ and $\tilde{F}_i$ ($i \in \mathbb{Z}_{>0}$) act on the first component of the right-hand side.

Proof. Let $(S, T) \in B(\mathfrak{f}_{\infty}, \Lambda^f(\lambda, n))$ be such that $\tilde{E}_i(S, T) = 0$ for $i \in \mathbb{Z}_{>0}$. By tensor product of crystals, we have $S = H_\sigma$ for some $\tau \in \mathcal{P}_t$ and $(T \to H_\tau) = H_\sigma$ for some $\sigma \in \mathcal{P}$. Hence $U = (T \to H_\tau)_R \in \text{LR}^\sigma_{\tau \lambda}$ with $\Delta_t(U) \leq n$. Since the correspondence $(S, T) \mapsto U$ is reversible, we obtain the above decomposition.

Corollary 4.9. For $(\lambda, n) \in \mathcal{P}(x)$, we have

$$\text{ch}B(\mathfrak{f}_{\infty}, \Lambda^f(\lambda, n)) = e^{n\Lambda_0} \sum_{\sigma \in \mathcal{P}} c^\sigma_{(\lambda, n)}(x) s_\sigma(x).$$
The branching coefficient $c_{\tau}(\lambda,n)(\vec{r})$ has the following stable limit.

**Corollary 4.10.** Let $(\lambda,n) \in \mathcal{P}(\mathfrak{r})$ and $\sigma \in \mathcal{P}$ be given. If $(\sigma,n) \in \mathcal{P}(\mathfrak{r})$, then

$$c_{\sigma}(\lambda,n)(\mathfrak{r}) = \sum_{\tau \in \mathcal{P}} c_{\tau}^\mathfrak{r}.$$ 

**Proof.** Suppose that $U \in \text{LR}^\mathfrak{r}_{\tau\lambda}$ is given for some $\tau \in \mathcal{P}$. Since $\tau_1 + \lambda_1 \leq \sigma_1$, we have

$$\Delta_c(U) \leq \frac{\tau_1 + 2\lambda_1}{\epsilon} \leq 2\sigma_1/\epsilon \leq n,$$

which implies that $U \in \text{LR}^\mathfrak{r}_{\tau\lambda}(\vec{r})$. Hence, we have $\text{LR}^\mathfrak{r}_{\tau\lambda}(\vec{r}) = \bigcup_{\tau \in \mathcal{P}} \text{LR}^\mathfrak{r}_{\tau\lambda}$. \rightline{□}

**Remark 4.11.** When $\mathfrak{r} = \mathfrak{c}$, the formula in Theorem [LS] also recovers and extends the classical result in the following sense. Consider the the $(\mathfrak{e}_\infty, \text{Sp}(2n))$-Howe duality on a fermionic Fock space [56, Theorem 3.4]. We may consider $(\mathfrak{c}_\infty, \text{GL}(2n))$-duality on the same Fock space. Then by the reciprocity law associated to the see-saw pairs of $(\mathfrak{c}_\infty, \text{Sp}(2n))$ and $(\mathfrak{c}_\infty, \text{GL}(2n))$, we conclude that $c_{\tau}(\lambda,n)(\mathfrak{c})$ in Corollary 4.10 gives a branching coefficient with respect to $\text{Sp}(2n) \subset \text{GL}(2n)$, which coincides with the Littlewood’s restriction formula in the symplectic case [41, 42].

### 4.3. Restriction to $\mathfrak{so}(2k+1)$ and $\mathfrak{sp}(2k)$-crystals.

Fix $k \geq 2$. For $(\lambda,n) \in \mathcal{P}(\mathfrak{r})$ with $\ell(\lambda) \leq k - 1$, let

$$T^\mathfrak{r}_k(\lambda,n) = \left\{ (S,T) \left| \begin{array}{l} (1) (S,T) \in T^\mathfrak{r}(\lambda,n), \\ (2) \text{the entries in } S \text{ and } T \text{ are no more than } k. \end{array} \right. \right\}.$$ 

We regard $\Lambda^\mathfrak{r}(\lambda,n)$ as a dominant integral weight for $\mathfrak{r}_k$ and obtain the following realization of the crystal $B(\mathfrak{r}_k, \Lambda^\mathfrak{r}(\lambda,n)).$

**Proposition 4.12.** For $(\lambda,n) \in \mathcal{P}(\mathfrak{r})$ with $\ell(\lambda) \leq k - 1$, we have

$$T^\mathfrak{r}_k(\lambda,n) \simeq B(\mathfrak{r}_k, \Lambda^\mathfrak{r}(\lambda,n)),$$

as an $\mathfrak{r}_k$-crystal.

**Proof.** By restriction, we may regard $T^\mathfrak{r}_k(\lambda)$ as an $\mathfrak{r}_k$-crystal. Since

$$T^\mathfrak{r}_k(\lambda) = \{ F_{i_1} \cdots F_{i_r} \mathcal{H}(\lambda) \mid r \geq 0, \ i_1, \ldots, i_r \in \{0,1,\ldots,k-1\} \} \setminus \{0\},$$

we have $T^\mathfrak{r}_k(\lambda) \simeq B(\mathfrak{r}_k, \Lambda^\mathfrak{r}(\lambda,n))$. \rightline{□}

Note that $B(\mathfrak{r}_k, \Lambda^\mathfrak{r}(\lambda,n))$ is the dual of a highest weight crystal of type $B_k$ and $C_k$ in usual convention (see for example [23]). Let us explain it briefly for the reader’s convenience.

Let $\alpha_i = -\tilde{\alpha}_{k-i}$ for $1 \leq i \leq k$. If we put $\epsilon_i = \tilde{c}_{k-i+1}$ for $1 \leq i \leq k$, then $\alpha_i = \epsilon_i - \epsilon_{i+1}$ for $1 \leq i \leq k-1$ and $\epsilon_k = \epsilon$. Let us denote by $\mathfrak{r}_k$ the Lie algebra
isomorphic to \( \mathfrak{r}_k \) with the positive simple roots \( \{\alpha_i^\dagger \mid 1 \leq i \leq k\} \). The associated Dynkin diagrams are

\[
\begin{align*}
\mathfrak{b}_k^\dagger &= \mathfrak{so}(2k + 1) : \quad \begin{array}{c}
\alpha_1^\dagger \sim \cdots \sim \alpha_{k-2}^\dagger \sim \alpha_{k-1}^\dagger \sim \alpha_k^\dagger
\end{array} \quad (\epsilon = 1), \\
\mathfrak{c}_k^\dagger &= \mathfrak{sp}(2k) : \quad \begin{array}{c}
\alpha_1^\dagger \sim \cdots \sim \alpha_{k-2}^\dagger \sim \alpha_{k-1}^\dagger \sim \alpha_k^\dagger
\end{array} \quad (\epsilon = 2).
\end{align*}
\]

For \( 1 \leq i \leq k \), let \( \omega_i^\dagger \) be the \( i \)-th fundamental weight for \( \mathfrak{r}_k^\dagger \) with respect to \( \{\alpha_i^\dagger \mid 1 \leq i \leq k\} \). Recall that \( \omega_i^\dagger = \epsilon_1^\dagger + \cdots + \epsilon_i^\dagger \) for \( 1 \leq i \leq k - 1 \) and \( \omega_k^\dagger = (\epsilon/2)(\epsilon_1^\dagger + \cdots + \epsilon_k^\dagger) \). Then as an \( \mathfrak{r}_k^\dagger \)-weight, we have \( \omega_i^\dagger = -\Lambda_{i-1}^\dagger \) for \( 1 \leq i \leq k \), and \( \Lambda_i^\dagger = 0 \) for \( i \geq k \). Hence, for a dominant integral \( \mathfrak{r}_k^\dagger \)-weight \( \omega = \sum_{1 \leq i \leq k} a_i \omega_i^\dagger \) with \( a_i \in \mathbb{Z}_{\geq 0} \), we have

\[
(4.3) \quad \omega = -\Lambda^\dagger(\lambda(\omega), n(\omega)),
\]

where

\[
\lambda(\omega) = (a_1 + \cdots + a_{k-1}, a_1 + \cdots + a_{k-2}, \ldots, a_1),
\]

\[
(4.4) \quad n(\omega) = \begin{cases} 
2a_1 + \cdots + 2a_{k-1} + a_k, & \text{for } \mathfrak{r} = \mathfrak{b}, \\
2a_1 + \cdots + a_k, & \text{for } \mathfrak{r} = \mathfrak{c}.
\end{cases}
\]

Note that \( \lambda(\omega) \in \mathcal{P} \) with \( \ell(\lambda(\omega)) \leq k - 1 \) and \( (\lambda(\omega), n(\omega)) \in \mathcal{P}(\mathfrak{r}) \). Then the map sending \( \omega \) to \( (\lambda(\omega), n(\omega)) \) is a bijection from the set of dominant integral weights for \( \mathfrak{r}_k^\dagger \) to the set of \( (\lambda, n) \in \mathcal{P}(\mathfrak{r}) \) with \( \ell(\lambda) \leq k - 1 \).

Now, let \( B(\mathfrak{r}_k^\dagger, \omega) \) be the crystal associated to the highest weight \( U_q(\mathfrak{r}_k^\dagger) \)-module with highest weight \( \omega \). Then \( B(\mathfrak{r}_k^\dagger, \omega) \) is obtained from \( B(\mathfrak{r}_k^\dagger, \lambda(\omega), n(\omega)) \) by replacing an \( i \)-arrow with a \( (k - i) \)-arrow in opposite direction and negating the weight of each vertex modulo the weight lattice of \( \mathfrak{r}_k^\dagger \).

**Theorem 4.13.** We have

\[
B(\mathfrak{r}_k^\dagger, \omega') \otimes B(\mathfrak{r}_k^\dagger, \omega'') \cong \bigsqcup_{\omega} B(\mathfrak{r}_k^\dagger, \omega) \times LR_{\omega, \omega'}(\mathfrak{r}_k^\dagger),
\]

where \( \omega, \omega' \) and \( \omega'' \) are dominant integral \( \mathfrak{r}_k^\dagger \)-weights and

\[
LR_{\omega, \omega''}(\mathfrak{r}_k^\dagger) = \left\{ (U, V) \mid \begin{array}{l}
(1) \quad (U, V) \in LR_\tau^{\lambda(\omega)_{\mathfrak{r}}} \times LR_\eta^{\lambda(\omega')}_{\mathfrak{r}} \text{ for some } \tau, \eta \in \mathcal{P}, \text{ and } \eta \in \mathcal{P}, \\
(2) \quad \nabla_{\mathfrak{r}}(U) \leq n(\omega') - (2\lambda(\omega')_1/\epsilon) \text{ and } \Delta_{\mathfrak{r}}((V^2 \to U^2)_{\mathfrak{r}}) \leq n(\omega'').
\end{array} \right\}.
\]
Proof. This can be obtained by modifying the arguments in Theorem 4.2.

Let $I^\dagger_k$ be the subalgebra of $\mathfrak{l}^\dagger_k$ isomorphic to $\mathfrak{gl}_k$ with positive simple roots $\{\alpha_i^\dagger \mid 1 \leq i \leq k-1\}$. Let $(\frac{1}{\ell} \mathbb{Z})^k_+ = \{ (\mu_1, \ldots, \mu_k) \mid \mu_i \in \frac{1}{\ell} \mathbb{Z}, \mu_i - \mu_{i+1} \in \mathbb{Z}_{\geq 0} \}$. For $\mu \in (\frac{1}{\ell} \mathbb{Z})^k_+$, let $B(l^\dagger_k, \omega_\mu)$ be the $l^\dagger_k$-crystal associated to the highest weight $U_q(l^\dagger_k)$-module with highest weight $\omega_\mu = \mu_1 \epsilon_1^\dagger + \cdots + \mu_k \epsilon_k^\dagger$.

Theorem 4.14. For a dominant integral $l^\dagger_k$-weight $\omega$, we have as an $l^\dagger_k$-crystal

$$B(l^\dagger_k, \omega) \simeq \bigoplus_{\mu} B(l^\dagger_k, \omega_\mu) \times LR^\omega_{\mu}(l^\dagger_k),$$

where the sum runs over all $\mu \in (\frac{1}{\ell} \mathbb{Z})^k_+$ such that $\sigma := (\mu_1 + \frac{\ell n(\omega)}{2}, \ldots, \mu_k + \frac{\ell n(\omega)}{2})$ is a partition and

$$LR^\omega_{\mu}(l^\dagger_k) = \{ U \mid U \in LR^\sigma_{\tau, \lambda(\omega)} \text{ for some } \tau \in \mathcal{P}_k \text{ and } \Delta_\tau(U) \leq n(\omega) \}.$$

Proof. Note that an $l^\dagger_k$-highest (resp. lowest) weight element in $B(l^\dagger_k, \omega)$ corresponds to an $l_k$-lowest (resp. highest) weight element in $B(\mathfrak{l}_k, \Lambda^\ell(\lambda(\omega), n(\omega)))$, where $l_k$ is the subalgebra of $\mathfrak{l}_k$ isomorphic to $\mathfrak{gl}_k$ with positive simple roots $\{\alpha_i \mid 1 \leq i \leq k-1\}$.

Let $b$ be an $l_k$-lowest weight element in $B(\mathfrak{l}_k, \Lambda^\ell(\lambda(\omega), n(\omega)))$ of weight $n(\omega)\Lambda^\ell_0 + \sigma_1 \epsilon_1 + \cdots + \sigma_k \epsilon_k$ for some partition $\sigma$ with $\ell(\sigma) \leq k$. Then as an $l^\dagger_k$-weight,

$$n(\omega)\Lambda^\ell_0 + \sigma_1 \epsilon_1 + \cdots + \sigma_k \epsilon_k = -n(\omega)\omega^\dagger_k + \sigma_1 \epsilon_1^\dagger + \cdots + \sigma_k \epsilon_k^\dagger
\begin{align*}
&= -\frac{\ell n(\omega)}{2} (\epsilon_1^\dagger + \cdots + \epsilon_k^\dagger) + \sigma_1 \epsilon_1^\dagger + \cdots + \sigma_k \epsilon_k^\dagger \\
&= (\sigma_1 - \frac{\ell n(\omega)}{2}) \epsilon_1^\dagger + \cdots + (\sigma_k - \frac{\ell n(\omega)}{2}) \epsilon_k^\dagger.
\end{align*}$$

Hence $b$ corresponds to an $l^\dagger_k$-highest weight element in $B(l^\dagger_k, \omega_\mu)$ of weight $\omega_\mu$, where

$$\mu = \left(\sigma_1 - \frac{\ell n(\omega)}{2}, \ldots, \sigma_k - \frac{\ell n(\omega)}{2}\right).$$

By Theorem 4.8, the number of connected components in $B(l^\dagger_k, \omega)$ isomorphic to $B(l^\dagger_k, \omega_\mu)$ is equal to the number of $U \in LR^\sigma_{\tau, \lambda(\omega)}$ for some $\tau \in \mathcal{P}_k$ with $\Delta_\tau(U) \leq n(\omega)$.

Remark 4.15. The formulas in Theorems 4.13 and 4.14 have stable limits, but they are different from the known results (cf. [16] Remark 2.5 (a) and (c))
5. Character formula for orthosymplectic Lie superalgebras

5.1. Superization. Let $\mathcal{A}$ be a linearly ordered $\mathbb{Z}_2$-graded set. Let $R = \mathbb{Q}[\mathbb{C}]$ denote the group algebra of the additive group $\mathbb{C}$ with a $\mathbb{Q}$-basis $\{ q^z \mid z \in \mathbb{C} \}$. We put $Sym_{\mathcal{A},R} = R \otimes \mathbb{Q} Sym_{\mathcal{A}}$. The map $\omega_{\mathcal{A}}$ in (2.10) can be extended to an $R$-algebra homomorphism $Sym_{\mathbb{Z}_{\geq 0},R} \to Sym_{\mathcal{A},R}$. By abuse of notation, we still denote it by $\omega_{\mathcal{A}}$.

Let us introduce our main object in this section.

Definition 5.1. For $(\lambda,n) \in \mathcal{P}(\mathfrak{r})$, define

$$\tau^\mathfrak{r}_{\mathcal{A}}(\lambda,n) = \left\{ (S,T) \mid \right.$$

\begin{align*}
&1. S \in SST_{\mathfrak{r}}(\tau) \text{ for some } \tau \in \mathcal{P}_{\mathfrak{r}} \text{ and } T \in SST_{\mathcal{A}}(\lambda) \\text{ and } \Delta_{\mathfrak{r}}((T \to S)_R) \leq n \\
&2. \Delta_{\mathfrak{r}}((T \to S)_R) \leq n
\end{align*}

$$\left. \right\}.$$ Let $\mathcal{P}(\mathfrak{r})_{\mathcal{A}} = \{ (\lambda,n) \in \mathcal{P}(\mathfrak{r}) \mid \tau^\mathfrak{r}_{\mathcal{A}}(\lambda,n) \neq \emptyset \}$ and for $(\lambda,n) \in \mathcal{P}(\mathfrak{r})_{\mathcal{A}}$ define

$$S^\mathfrak{r}_{\mathcal{A}}(\lambda,n)(x_{\mathcal{A}}) = q^n \sum_{(S,T) \in \tau^\mathfrak{r}_{\mathcal{A}}(\lambda,n)} x_{\mathcal{A}}^S x_{\mathcal{A}}^T.$$

Proposition 5.2.

1. For $(\lambda,n) \in \mathcal{P}(\mathfrak{r})_{\mathcal{A}}$, we have

$$S^\mathfrak{r}_{\mathcal{A}}(\lambda,n)(x_{\mathcal{A}}) = \omega_{\mathcal{A}} \left( S^\mathfrak{r}_{\mathcal{A}}(\lambda,n)(x_{\mathbb{Z}_{\geq 0}}) \right),$$

$$S^\mathfrak{r}_{\mathcal{A}}(\lambda,n)(x_{\mathcal{A}}) = q^n \sum_{\sigma \in \mathcal{P}} c^\sigma(\lambda,n)(\mathfrak{r}) S_{\mathfrak{r}}(x_{\mathcal{A}}),$$

where $c^\sigma(\lambda,n)(\mathfrak{r})$ is given in Definition 4.7.

2. For $(\mu,m), (\nu,n) \in \mathcal{P}(\mathfrak{r})_{\mathcal{A}}$,

$$S^\mathfrak{r}_{\mathcal{A}}(\mu,m)(x_{\mathcal{A}}) S^\mathfrak{r}_{\mathcal{A}}(\nu,n)(x_{\mathcal{A}}) = \sum_{(\lambda,m+n) \in \mathcal{P}(\mathfrak{r})_{\mathcal{A}}} c^{(\lambda,m+n)}(\mu,m)(\nu,n) S^\mathfrak{r}_{\mathcal{A}}(\lambda,m+n)(x_{\mathcal{A}}),$$

where $c^{(\lambda,m+n)}(\mu,m)(\nu,n)$ is given in Definition 4.1.

Proof. By Theorem 3.11, $S^\mathfrak{r}_{\mathcal{A}}(\lambda,n)(x_{\mathbb{Z}_{\geq 0}})$ is the character of $B(\mathfrak{r}_{\infty}, \mathcal{N}(\lambda,n))$ where $q = e^{\lambda_0}$. Since $\omega_{\mathcal{A}}$ is an homomorphism of algebras, the identities in (1) follow from (2.9) and Corollary 4.9 respectively. The identity in (2) follows from Corollary 4.3.

Proposition 5.3. $\{ S^\mathfrak{r}_{\mathcal{A}}(\lambda,n)(x_{\mathcal{A}}) \mid (\lambda,n) \in \mathcal{P}(\mathfrak{r})_{\mathcal{A}} \}$ is linearly independent over $\mathbb{Q}$.

Proof. It suffices to show that $\{ S^\mathfrak{r}_{\mathcal{A}}(\lambda,n)(x_{\mathcal{A}}) \mid (\lambda,n) \in \mathcal{P}(\mathfrak{r})_{\mathcal{A}} \}$ is linearly independent, where $n$ is a fixed integer.
For $\mu, \nu \in \mathcal{P}$, define $\mu > \nu$ if and only if there exists $k$ such that $\mu_i = \nu_i$ for $1 \leq i \leq k$ and $\mu_k > \nu_k$. Then $>$ is a linear ordering on $\mathcal{P}$. By Proposition 5.2 (1), we have

$$S^f_{(\lambda, \mu)}(x_A) = q^n \sum_{\sigma \geq \lambda} a_{\lambda\sigma} S_\sigma(x_A)$$

for some $a_{\lambda\sigma} \in \mathbb{Z}_{\geq 0}$ with $a_{\lambda\lambda} = 1$. This together with the linear independence of $S_\sigma(x_A)$ implies the linear independence of $\{ S^f_{(\lambda, n)}(x_A) \mid (\lambda, n) \in \mathcal{P}(\mathfrak{f}) \}$. \hfill $\square$

The main goal of this section is to show that $S^f_{(\lambda, n)}(x_A)$ is the character of an irreducible module over an orthosymplectic Lie superalgebra using the Cheng-Lam-Wang’s super duality [10].

5.2. Orthosymplectic Lie superalgebras. Let $V = V_0 \oplus V_1$ be a complex superspace. For $v \in V_p$, we put $|v| = p$ ($p \in \mathbb{Z}_2$). Let $\mathfrak{gl}(V)$ be the general linear Lie superalgebra of linear endomorphisms on $V$ which vanishes on a subspace of finite codimension. We define $\mathfrak{osp}(V)$ to be the subalgebra of $\mathfrak{gl}(V)$ which preserves a non-degenerate skew-supersymmetric bilinear form $(\cdot | \cdot)$ on $V$, that is, $\mathfrak{osp}(V) = \mathfrak{osp}(V)_0 \oplus \mathfrak{osp}(V)_1$ with

$$(5.1) \quad \mathfrak{osp}(V)_p = \{ A \in \mathfrak{gl}(V)_p \mid (Av|w) + (-1)^{|v||w|}(v|Aw) = 0 \text{ for homogeneous } v, w \in V \}.$$ 

Similarly, we define $\mathfrak{spo}(V)$ to be the subalgebra of $\mathfrak{gl}(V)$ which preserves a non-degenerate skew-supersymmetric bilinear form $(\cdot | \cdot)$ on $V$ (cf. [17]).

Now, let us consider the following $\mathbb{Z}_2$-graded linearly ordered sets ($m \in \mathbb{Z}_{\geq 0}$):

- $\mathfrak{g}_m = \{ \kappa, -\kappa \mid 1 \leq k \leq m \} \cup \frac{1}{2} \mathbb{Z},$
- $\mathfrak{f}_m = \{ \kappa, -\kappa \mid 1 \leq k \leq m \} \cup \left( \frac{1}{2} + \mathbb{Z} \right) \cup \{ 0 \},$
- $\mathfrak{k}_m = \{ \kappa, -\kappa \mid 1 \leq k \leq m \} \cup \mathbb{Z},$
- $\mathfrak{g}_m^\times = \mathfrak{g}_m \setminus \{ 0 \}$, $\mathfrak{f}_m^\times = \mathfrak{f}_m \setminus \{ 0 \}$, $\mathfrak{k}_m^\times = \mathfrak{k}_m \setminus \{ 0 \},$

where

$$(5.2) \quad (\mathfrak{g}_m)_0 = \mathfrak{g}_m \setminus \left( \frac{1}{2} + \mathbb{Z} \right), \quad (\mathfrak{g}_m)_1 = \frac{1}{2} + \mathbb{Z},$$

$$\cdots < -\frac{3}{2} < -1 < -\frac{1}{2} < -\frac{1}{2} < \cdots < -\frac{m}{2} < 0 < \frac{m}{2} < \cdots < \frac{1}{2} < 1 < \frac{3}{2} < \cdots,$$

and the $\mathbb{Z}_2$-gradings and linear orderings on the other sets are induced from those of $\mathfrak{g}_m$. Here we assume that $\mathfrak{g}_0 = \frac{1}{2} \mathbb{Z}$, $\mathfrak{f}_0 = \left( \frac{1}{2} + \mathbb{Z} \right) \cup \{ 0 \}$ and $\mathfrak{k}_0 = \mathbb{Z}$. In the rest of this section, we assume the following:

- $\mathfrak{g}$ denotes one of $\mathfrak{g}_m$, $\mathfrak{f}_m$, $\mathfrak{k}_m$, $\mathfrak{g}_m^\times$, $\mathfrak{f}_m^\times$ and $\mathfrak{k}_m^\times$. 
\[ \cdot \mathcal{J}^+ = \{ a \mid a \in \mathcal{J}, a > 0 \}, \]
\[ \cdot V_{\mathcal{J}} \text{ is a superspace with basis } \{ v_a \mid a \in \mathcal{J} \}. \]

We identify \( \mathfrak{gl}(V_{\mathcal{J}}) \) with the Lie superalgebra of matrices \( (a_{i,j})_{i,j \in \mathbb{Z}} \) with \( a_{i,j} = 0 \) for all but finitely many \( a_{i,j} \)'s. Denote by \( E_{i,j} \) the elementary matrix with 1 at the \( i \)-th row and \( j \)-th column and zero elsewhere. Also, let \( \tilde{\mathfrak{gl}}(V_{\mathcal{J}_m}) = \mathfrak{gl}(V_{\mathcal{J}_m}) \oplus \mathbb{C}K \) the central extension of \( \mathfrak{gl}(V_{\mathcal{J}_m}) \) by a one-dimensional center \( \mathbb{C}K \) given by the 2-cocycle \( \beta(A, B) = \text{Str}([J, A]B) \), where \( \text{Str} \) is the supertrace and \( J = E_{0,0} + \sum_{r \leq -\frac{1}{2}} E_{r,r} \).

First, suppose that \( \mathcal{J} \) is one of \( \tilde{\mathcal{J}}_m, \mathfrak{J}_m \) and \( \mathfrak{J}_m \). Define a supersymmetric bilinear form \( \langle \cdot, \cdot \rangle \) on \( V_{\mathcal{J}} \) by
\[
\begin{align*}
\langle v_{\pm a} | v_{\pm b} \rangle &= 0, \quad \langle v_a | v_{-b} \rangle = (-1)^{|a||b|} \langle v_{-b} | v_a \rangle = \delta_{ab}, \\
\langle v_0 | v_0 \rangle &= 1, \quad \langle v_0 | v_{\pm a} \rangle = 0,
\end{align*}
\]
for \( a, b \in \mathcal{J}^+ \). Let \( \mathfrak{osp}(V_{\mathcal{J}}) \) be the subalgebra of \( \mathfrak{gl}(V_{\mathcal{J}}) \) preserving \( \langle \cdot, \cdot \rangle \). The Cartan subalgebra is spanned by \( \{ E_a = E_{a,a} - E_{-a,-a} \mid a \in \mathcal{J}^+ \} \). We choose a Borel subalgebra spanned by the upper triangular matrices. With respect to the corresponding dual basis \( \{ \delta_a \mid a \in \mathcal{J}^+ \} \), the set of simple roots are given by
\[
\begin{align*}
\tilde{\mathcal{J}}_m &: \{ -\delta_m, \delta_k - \delta_{k-1}, (2 \leq k \leq m), \delta_1 - \delta_\frac{1}{2}, \delta_r - \delta_{r+\frac{1}{2}} (r \in \frac{1}{2}\mathbb{Z}_{>0}) \}, \\
\mathfrak{J}_m &: \{ -\delta_m, \delta_k - \delta_{k-1}, (2 \leq k \leq m), \delta_1 - \delta_{\frac{1}{2}}, \delta_r - \delta_{r+1} (r \in \frac{1}{2} + \mathbb{Z}_{\geq 0}) \}, \\
\mathfrak{J}_m &: \{ -\delta_m, \delta_k - \delta_{k-1}, (2 \leq k \leq m), \delta_1 - \delta_{\frac{1}{2}}, \delta_r - \delta_{r+1} (r \in \mathbb{Z}_{>0}) \},
\end{align*}
\]
for \( m \geq 1 \), and
\[
\begin{align*}
\tilde{\mathfrak{J}}_0 &: \{ -\delta_{\frac{1}{2}}, \delta_r - \delta_{r+\frac{1}{2}} (r \in \frac{1}{2}\mathbb{Z}_{>0}) \}, \\
\mathfrak{J}_0 &: \{ -\delta_{\frac{1}{2}}, \delta_r - \delta_{r+1} (r \in \frac{1}{2} + \mathbb{Z}_{\geq 0}) \}, \\
\mathfrak{J}_0 &: \{ -\delta_{\frac{1}{2}}, \delta_r - \delta_{r+1} (r \in \mathbb{Z}_{>0}) \}.
\end{align*}
\]
Note that when \( \mathcal{J} = \mathfrak{J}_m \) \((m \geq 0)\), the set of simple roots is of type \( B_{\infty} \). The associated Dynkin diagrams are as follows.

\[
\tilde{\mathcal{J}}_m : \quad \begin{array}{cccccccc}
\circ & \circ & \cdots & \circ & \boxtimes & \boxtimes & \cdots & \boxtimes \\
\delta^* & = \delta_m & \delta_m - \delta_{m-1} & \delta_{m-1} - \delta_{m-2} & \delta_{m-2} - \delta_{m-3} & \cdots & \delta_{1} - \delta_{\frac{1}{2}} & \delta_{\frac{1}{2}} - \delta_{\frac{1}{2}} \\
\delta & = -\delta_m & \delta_{m-1} - \delta_{m-2} & \cdots & \delta_1 - \delta_{\frac{1}{2}} & \delta_{\frac{1}{2}} - \delta_{\frac{1}{2}} & \delta_{r} - \delta_{r+\frac{1}{2}} & \cdots
\end{array} \quad (m \geq 1)
\]

\[
\tilde{\mathfrak{J}}_0 : \quad \begin{array}{cccccc}
\circ & \circ & \cdots & \circ & \boxtimes & \boxtimes \\
\delta^* & = \delta_\frac{1}{2} & \delta_{\frac{1}{2}} - \delta_{\frac{1}{2}} & \delta_{\frac{1}{2}} - \delta_{\frac{1}{2}} & \delta_{r} - \delta_{r+\frac{1}{2}} & \cdots
\end{array}
\]
\[ \overline{J}_m : \quad \delta_m - \delta_{m+1} \quad \delta_{m+1} - \delta_{m+2} \quad \ldots \quad \delta_2 - \delta_3 \quad \delta_3 - \delta_4 \quad \ldots \quad (m \geq 1) \]

\[ \delta^* = -\delta_m \quad \delta_m - \delta_{m+1} \quad \ldots \quad \delta_2 - \delta_3 \quad \delta_3 - \delta_4 \quad \ldots \]

\[ \overline{J}_0 : \quad \delta_1 - \delta_2 \quad \delta_2 - \delta_3 \quad \ldots \]

\[ \delta^* = -\delta_1 \quad \delta_1 - \delta_2 \quad \delta_2 - \delta_3 \quad \ldots \]

\[ \overline{J}_m : \quad \delta_m - \delta_{m+1} \quad \delta_{m+1} - \delta_{m+2} \quad \ldots \quad \delta_2 - \delta_3 \quad \delta_3 - \delta_4 \quad \ldots \quad (m \geq 1) \]

\[ \delta^* = -\delta_m \quad \delta_m - \delta_{m+1} \quad \ldots \quad \delta_2 - \delta_3 \quad \delta_3 - \delta_4 \quad \ldots \]

\[ \overline{J}_0 : \quad \delta_1 - \delta_2 \quad \delta_2 - \delta_3 \quad \ldots \]

\[ \delta^* = -\delta_1 \quad \delta_1 - \delta_2 \quad \delta_2 - \delta_3 \quad \ldots \]

Here \( \delta^* \) and \( \delta^\times \) denote distinguished simple roots in each diagram, which are necessary for our later arguments.

Next, suppose that \( J \) is one of \( \overline{J}_m^\times, \overline{J}_m^\times \) and \( \overline{J}_m^\times \). Define a skew-supersymmetric bilinear form \( (\cdot | \cdot) \) on \( V_J \) by

\[ (v_{\pm a}|v_{\pm b}) = 0, \quad (v_a|v_{-b}) = -(a|b)(v_{-b}|v_a) = \delta_{ab}, \]

for \( a, b \in J^+ \). Let \( \mathfrak{sp}(V_J) \) be the subalgebra of \( \mathfrak{gl}(V_J) \) preserving \( (\cdot | \cdot) \). The Cartan subalgebra is spanned by \( \{ E_a = E_{a,a} - E_{-a,-a} \mid a \in J^+ \} \). We choose a Borel subalgebra spanned by the upper triangular matrices. With respect to the corresponding dual basis \( \{ \delta_a \mid a \in J^+ \} \), the set of simple roots are given by

\[ \overline{J}_m^\times : \quad \{-2\delta_m, \delta_k - \delta_{k-1} \mid 2 \leq k \leq m\}, \quad \delta_T - \delta_1, \quad \delta_r - \delta_{r+1} \quad (r \in \mathbb{Z}_{>0}) \}, \]

\[ \overline{J}_m^\times : \quad \{-2\delta_m, \delta_k - \delta_{k-1} \mid 2 \leq k \leq m\}, \quad \delta_T - \delta_1, \quad \delta_r - \delta_{r+1} \quad (r \in \mathbb{Z}_{>0}) \}, \]

\[ \overline{J}_m^\times : \quad \{-2\delta_m, \delta_k - \delta_{k-1} \mid 2 \leq k \leq m\}, \quad \delta_T - \delta_1, \quad \delta_r - \delta_{r+1} \quad (r \in \mathbb{Z}_{>0}) \}, \]

for \( m \geq 1 \), and

\[ \overline{J}_0^\times : \quad \{-\delta_1 - \delta_2, \quad \delta_r - \delta_{r+1} \quad (r \in \mathbb{Z}_{>0}) \}, \]

\[ \overline{J}_0^\times : \quad \{-\delta_1 - \delta_2, \quad \delta_r - \delta_{r+1} \quad (r \in \mathbb{Z}_{>0}) \}, \]

\[ \overline{J}_0^\times : \quad \{-2\delta_1, \quad \delta_r - \delta_{r+1} \quad (r \in \mathbb{Z}_{>0}) \}. \]
Note that when $I = J_m^\times (m \geq 0)$, the set of simple roots is of type $C_\infty$. The associated Dynkin diagrams are as follows.

\[ \tilde{J}_m^\times : \begin{array}{c}
\delta^* = -2\delta_m & \delta_\frac{m}{2} - \delta_{m-1} & \delta_\frac{m}{2} - \delta_{2m-2} \\
\delta^\times = \delta - \delta_1 & \delta_\frac{m}{2} - \delta_1 & \delta - \delta_{r+1} \\
\end{array} \quad (m \geq 1) \]

\[ \tilde{J}_0^\times : \begin{array}{c}
\delta^* = -\delta_2 - \delta_1 \\
\delta^\times = -\delta_2 - \delta_1 \\
\end{array} \]

\[ \tilde{J}_m^\times : \begin{array}{c}
\delta^* = -2\delta_m & \delta_\frac{m}{2} - \delta_{m-1} & \delta_\frac{m}{2} - \delta_{2m-2} \\
\delta^\times = \delta - \delta_1 & \delta_\frac{m}{2} - \delta_1 & \delta - \delta_{r+1} \\
\end{array} \quad (m \geq 1) \]

Here $\delta^*$ and $\delta^\times$ also denote distinguished simple roots.

Now we define $\tilde{b}_\infty$, $\tilde{c}_\infty$ and $b_\infty$ to be the central extensions of $\mathfrak{osp}(V_2)$ induced from $\hat{\mathfrak{gl}}(V_{\tilde{J}_m})$, where $J = \tilde{J}_m$, $\tilde{J}_m$ and $J_m$ respectively. Similarly, we define $\tilde{c}_\infty$, $\mathfrak{c}_\infty$ and $c_\infty$ to be the central extensions of $\mathfrak{osp}(V_2)$ induced from $\hat{\mathfrak{gl}}(V_{\tilde{J}_m})$, where $J = \tilde{J}_m^\times$, $\tilde{J}_m^\times$ and $\tilde{J}_m^\times$ respectively. For convenience, the $\mathbb{Z}_2$-graded set $J$ corresponding to a given Lie superalgebra is summarized in the table below.
We also assume the following notations:

- \( \tilde{\mathfrak{h}}, \mathfrak{h}, \mathfrak{b} : \) the Cartan subalgebra spanned by \( K \) and \( E_a \) \( (a \in \mathcal{J}^+) \),
- \( \tilde{\mathfrak{h}}^*, \mathfrak{h}^*, \mathfrak{b}^* : \) the dual Cartan subalgebra spanned by \( \Lambda_0^\mathfrak{b} \) and \( \delta_a \) \( (a \in \mathcal{J}^+) \),
- \( \tilde{\Pi}, \Pi, \Pi_\mathfrak{t} : \) the set of simple roots,

of \( \tilde{\mathfrak{r}}_\infty, \mathfrak{r}_\infty, \mathfrak{r}_\infty \), respectively. Here \( \Lambda_0^\mathfrak{b} \) is defined by \( \Lambda_0^\mathfrak{b}(E_a) = 0 \) for \( a \in \mathcal{J}^+ \). Note that \( \tilde{\mathfrak{r}}_\infty, \mathfrak{r}_\infty \subset \mathfrak{r}_\infty \) and \( \tilde{\mathfrak{h}}^*, \mathfrak{h}^* \subset \tilde{\mathfrak{h}}^* \).

**Remark 5.4.** For a positive simple root \( \delta \), denote by \( \delta^\vee \) the corresponding simple coroot. We can check that \( \Lambda_0^\mathfrak{b} \) is a fundamental weight of \( \tilde{\mathfrak{r}}_\infty \) with respect to \( \delta^\vee \), that is, \( \Lambda_0^\mathfrak{b}(\delta^\vee) = 1 \) if \( \delta = \delta^* \), and 0 otherwise. Hence \( \Lambda_0^\mathfrak{b} \) coincides with the one given in Section 2.2, and \( \hat{\epsilon}_i \) (resp. \( \hat{\epsilon}_{i-m} \)) corresponds to \( \hat{\epsilon}_m-i+1 \) for \( 1 \leq i \leq m \) (resp. \( \hat{\epsilon}_{i+m} \) for \( i \geq 1 \)). Also, note that in case of \( \tilde{\mathfrak{r}}_\infty \) with \( m = 0 \), \( \Lambda_0^\mathfrak{b} \) is the negative of the fundamental weight of \( \tilde{\mathfrak{r}}_\infty \) with respect to \( \delta^\vee \).

### Table 1

| Lie superalgebra | \( \tilde{\mathfrak{r}}_\infty \) | \( \tilde{\mathfrak{r}}_\infty \) | \( \mathfrak{r}_\infty \) | \( \tilde{\mathfrak{r}}_\infty \) | \( \mathfrak{r}_\infty \) |
|------------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| \( \mathfrak{J} \) | \( \tilde{\mathfrak{J}}_m \) | \( \tilde{\mathfrak{J}}_m \) | \( \mathfrak{J}_m \) | \( \tilde{\mathfrak{J}}_m \) | \( \mathfrak{J}_m \) |

**5.3. Super duality.** Let us briefly recall super duality in [10]. We should remark here that our exposition of super duality deals only with types \( \mathfrak{b} \) and \( \mathfrak{c} \), while there are two more cases of type \( \mathfrak{d} \) and \( \mathfrak{b}^\cdot \) in [10].

Fix an arbitrary subset \( Y_0 \) of \( \{ \delta^\vee, \delta_{m-1} - \delta_{m-2}, \ldots, \delta_2 - \delta_1 \} \). We assume that \( Y_0 \) is empty when \( m = 0 \). Let \( \tilde{Y}, Y \) and \( Y \) be the union of \( Y_0 \) and the simple roots which are placed to the right of \( \delta^\vee \) in the Dynkin diagram of \( \mathfrak{r}_\infty, \tilde{\mathfrak{r}}_\infty, \mathfrak{r}_\infty \), respectively, and let \( \tilde{\mathfrak{I}}, \mathfrak{I} \) and \( \mathfrak{I} \) be the standard Levi subalgebras of \( \tilde{\mathfrak{r}}_\infty, \mathfrak{r}_\infty, \mathfrak{r}_\infty \) corresponding to \( \tilde{Y}, Y \) and \( Y \), respectively.

Let \( \mathcal{P}_{Y_0} \) be the set of sequences \( \lambda = (\lambda_m, \ldots, \lambda_1; \lambda_1, \lambda_2, \ldots) \) such that

1. \( (\lambda_1, \lambda_2, \ldots) \in \mathcal{P} \),
2. \( \lambda_m, \ldots, \lambda_1 \in \mathbb{C} \) and \( \left( \sum_{a=m}^{1} \lambda_a \delta_a, \delta^\vee \right) \in \mathbb{Z}_{\geq 0} \) for \( \delta \in Y_0 \),

and put \( \lambda^+ = (\lambda_1, \lambda_2, \ldots) \) for \( \lambda \in \mathcal{P}_{Y_0} \). We assume that \( \lambda = \lambda^+ \) when \( m = 0 \). Also for \( \lambda \in \mathcal{P} \), let \( \theta(\lambda) = (\theta(\lambda)_r)_{r \in \frac{1}{2} \mathbb{Z}_{>0}} \) be a sequence determined by

\[
\theta(\lambda)_{r+\frac{1}{2}} = \max\{\lambda'_i - i + 1, 0\}, \quad \theta(\lambda)_i = \max\{\lambda_i - i, 0\}
\]
for \( i \in \mathbb{Z}_{>0} \). Let

\[
P_+^1 = \left\{ \Lambda = \sum_{a=\overline{m}}^{T} \lambda_a \delta_a + \sum_{b \in \mathbb{Z}_{>0}} \lambda_b^+ \delta_b + c \Lambda_0^+ \mid \lambda \in \mathfrak{B}_0, c \in \mathbb{C} \right\} \subset \mathfrak{h}^*,
\]

(5.10)

\[
P_+ = \{ \Lambda^0 \mid \Lambda \in P_+^1 \} \subset \mathfrak{h}^*,
\]

\[
P_+ = \{ \Lambda^2 \mid \Lambda \in P_+^1 \} \subset \mathfrak{h}^*,
\]

where

\[
\Lambda^0 = \sum_{a=\overline{m}}^{T} \lambda_a \delta_a + \sum_{b \in \frac{1}{2} \mathbb{Z}_{>0}} \theta(\lambda^+) b \delta_b + c \Lambda_0^+, \quad (5.11)
\]

\[
\Lambda^2 = \sum_{a=\overline{m}}^{T} \lambda_a \delta_a + \sum_{b \in \frac{1}{2} + \mathbb{Z}_{>0}} (\lambda^+) b \delta_b + c \Lambda_0^+.
\]

For \( \Lambda \in P_+^1 \), let \( L(I, \Lambda) \) be the irreducible \( I \)-module with highest weight \( \Lambda \), and \( L(\bar{\mathfrak{f}}_\infty, \Lambda) \) the irreducible quotient of \( K(\bar{\mathfrak{f}}_\infty, \Lambda) := \text{Ind}_p^{\mathfrak{f}_\infty} L(I, \Lambda) \), where \( \mathfrak{b} \) is the Borel subalgebra spanned by \( K \) and upper triangular matrices, \( \mathfrak{p} = \mathfrak{b} + I \) and \( L(I, \Lambda) \) is extended to a \( p \)-module in a standard way. We define \( L(\bar{\mathfrak{f}}_I, \Lambda^0) \), \( K(\bar{\mathfrak{f}}_\infty, \Lambda^0) \), \( L(\bar{\mathfrak{f}}_\infty, \Lambda^0) \) and \( L(\bar{\mathfrak{f}}_I, \Lambda^2) \), \( K(\bar{\mathfrak{f}}_\infty, \Lambda^2) \), \( L(\bar{\mathfrak{f}}_\infty, \Lambda^2) \) in the same way.

Let \( \mathfrak{O} \) be the category of \( \mathfrak{f}_\infty \)-modules \( M \) satisfying

1. \( M = \bigoplus_{\gamma \in \mathfrak{b}^*} M_\gamma \), where \( M_\gamma = \{ m \mid h \cdot m = \gamma(h)m \ (h \in \mathfrak{b}) \} \) and \( \dim M_\gamma < \infty \),
2. \( M \) decomposes into direct sum of \( L(I, \Lambda) \) for \( \Lambda \in P_+^1 \),
3. there exist \( \Lambda_1, \ldots, \Lambda_i \in P_+^1 \) such that if \( M_\gamma \neq \{0\} \), then \( \gamma \in \Lambda_i - \sum_{\alpha \in \Pi_\mathfrak{b}} b \alpha \) for some \( i \) and \( c_\alpha \in \mathbb{Z}_{>0} \).

Note that it is a parabolic analogue of Berstein-Gelfand-Gelfand category. In a similar way, we define the categories \( \mathfrak{O} \) and \( \mathfrak{O} \) of modules over \( \bar{\mathfrak{f}}_\infty \) and \( \mathfrak{f}_\infty \), respectively.

Now, for \( M = \bigoplus_{\gamma \in \mathfrak{b}^*} M_\gamma \) in \( \mathfrak{O} \), we define

\[
T(M) = \bigoplus_{\gamma \in \mathfrak{b}^*} M_\gamma, \quad \mathfrak{T}(M) = \bigoplus_{\gamma \in \mathfrak{b}^*} M_\gamma.
\]

(5.12)

Note that \( T(M), \mathfrak{T}(M) \subset M \). If \( f : M \rightarrow N \) is a homomorphism of \( \mathfrak{f}_\infty \)-modules for \( M, N \in \mathfrak{O} \), then \( T \) and \( \mathfrak{T} \) naturally induce homomorphisms \( T(f) : T(M) \rightarrow T(N) \) of \( \mathfrak{f}_\infty \)-modules and \( \mathfrak{T}(f) : \mathfrak{T}(M) \rightarrow \mathfrak{T}(N) \) of \( \mathfrak{f}_\infty \)-modules, respectively. Hence \( T \) and \( \mathfrak{T} \) define functors

\[
\mathfrak{O} \xrightarrow{T} \mathfrak{O} \xrightarrow{\mathfrak{T}} \mathfrak{O}.
\]

(5.13)

**Theorem 5.5** (Theorems 4.6 and 5.4 in [10]).
For $\Lambda \in P^+_{\mathfrak{l}}$, we have
\[
\begin{align*}
T(L(\bar{l}, \Lambda^0)) &= L(l, \Lambda), \\
T(K(\bar{x}_\infty, \Lambda^0)) &= K(x_\infty, \Lambda), \\
T(L(\bar{x}_\infty, \Lambda^0)) &= L(x_\infty, \Lambda),
\end{align*}
\]
\[
\begin{align*}
\mathcal{T}(L(\bar{l}, \Lambda^0)) &= L(\bar{l}, \Lambda^\natural), \\
\mathcal{T}(K(\bar{x}_\infty, \Lambda^0)) &= K(\bar{x}_\infty, \Lambda^\natural), \\
\mathcal{T}(L(\bar{x}_\infty, \Lambda^0)) &= L(\bar{x}_\infty, \Lambda^\natural).
\end{align*}
\]

(2) $T$ and $\mathcal{T}$ are equivalences of categories. Hence the categories $\mathcal{O}$ and $\bar{\mathcal{O}}$ are equivalent.

Remark 5.6. The equivalence between $\mathcal{O}$ and $\bar{\mathcal{O}}$ is called super duality, while $\tilde{\mathcal{O}}$ is used as an intermediate category to establish it. But in later arguments, we will consider a simple module in $\tilde{\mathcal{O}}$ together with one in $\mathcal{O}$ since both have a meaning for a representation theoretical interpretation of $S^f_{(\lambda, n)}(x_d)$.

Remark 5.7. For each $M$ in $\tilde{\mathcal{O}}$, $\mathcal{O}$ and $\bar{\mathcal{O}}$, we define the character of $M$ to be the trace of the operator $\prod_{a \in \mathbb{J}_+} q^{K_a} x_a^{E_a}$. By Theorem 5.5 if for $\Lambda \in P^+_{\mathfrak{l}}$
\[
\text{ch}L(x_\infty, \Lambda) = \sum_{\Lambda'} a_{\Lambda, \Lambda'} \text{ch}K(x_\infty, \Lambda'),
\]
for some $a_{\Lambda, \Lambda'}$, then we have
\[
\begin{align*}
\text{ch}L(\bar{x}_\infty, \Lambda^0) &= \sum_{\Lambda'} a_{\Lambda, \Lambda'} \text{ch}K(\bar{x}_\infty, (\Lambda')^0), \\
\text{ch}L(\bar{x}_\infty, \Lambda^\natural) &= \sum_{\Lambda'} a_{\Lambda, \Lambda'} \text{ch}K(\bar{x}_\infty, (\Lambda')^\natural).
\end{align*}
\]
Hence, the characters of $L(\bar{x}_\infty, \Lambda^0)$ and $L(\bar{x}_\infty, \Lambda^\natural)$ follow immediately from a Kazhdan-Lusztig type formula of $L(x_\infty, \Lambda)$ (see [10, Theorem 4.8 and Remark 4.9]).

5.4. Combinatorial character formula. Let us write $\lambda = (\lambda_m, \ldots, \lambda_1; \lambda_1, \lambda_2, \ldots)$ for $(\lambda, n) \in \mathcal{P}(\mathfrak{t})$, and put
\[
(\lambda, n) = \sum_{a=m} \lambda_a \delta_a + \sum_{b \in \mathbb{Z}_{>0}} \lambda_b \delta_b + n \Lambda_0^\natural,
\]
which is a dominant integral weight for $x_\infty$. Note that it coincides with our previous definition in (2.6) (see Remark 5.4). Let $\mathcal{O}_{\text{int}}$ be the full subcategory of $\mathcal{O}$, whose objects are integrable $x_\infty$-modules. It is well-known that $\mathcal{O}_{\text{int}}$ is a semisimple tensor category and every object in $\mathcal{O}_{\text{int}}$ is isomorphic to a direct sum of $L(x_\infty, \Lambda^f(\lambda, n))$ with finite multiplicity for each $(\lambda, n) \in \mathcal{P}(\mathfrak{t})$.

Let $N = \{m, \ldots, 1\} \cup \{1, 2, 3, \ldots\}$. We have
\[
\text{ch}L(x_\infty, \Lambda^f(\lambda, n)) = S^f_{(\lambda, n)}(x_N),
\]
for \((\lambda, n) \in \mathcal{P}(\mathfrak{g})\) by Theorem 3.11 and
\[
L(\mathfrak{g}_\infty, \Lambda^f(\mu, m)) \otimes L(\mathfrak{g}_\infty, \Lambda^f(\nu, n))
\]
\begin{equation}
(5.16) \quad \simeq \bigoplus_{(\lambda, m+n)} L(\mathfrak{g}_\infty, \Lambda^f(\lambda, m+n))(\otimes_{(\mu, m)(\nu, n)}\mathfrak{g}),
\end{equation}
for \((\mu, m), (\nu, n) \in \mathcal{P}(\mathfrak{g})\) by Theorem 4.2 \(\square\)

Let
\begin{equation}
(5.17) \quad \bar{N} = \{ m, \ldots, \overline{1} \} \cup \{ \overline{1}, \frac{1}{2}, 1, \frac{3}{2}, \ldots \}
\end{equation}
Then we obtain the following combinatorial character formula, which is the main result in this section.

**Theorem 5.8.** For \((\lambda, n) \in \mathcal{P}(\mathfrak{g})\), we have
\[
\text{ch} L(\mathfrak{g}_\infty, \Lambda^f(\lambda, n)^0) = S^g_{(\lambda, n)}(X_\bar{N}),
\]
\[
\text{ch} L(\mathfrak{g}_\infty, \Lambda^f(\lambda, n)^2) = S^g_{(\lambda, n)}(X_{\bar{N}}).
\]

**Proof.** We keep the notations in Section 5.3 and suppose that \(Y_0 = \{ \delta_m - \delta_{m-1}, \ldots, \delta_{\overline{1}} - \delta_{\overline{2}} \}\).

Let \((\lambda, n) \in \mathcal{P}(\mathfrak{g})\) be given. Note that \(L(\mathfrak{g}_\infty, \Lambda^f(\lambda, n))\) (resp. \(L(\mathfrak{g}_\infty, \Lambda^f(\lambda, n)^0)\)) is completely reducible as an \(l\)-module (resp. \(\bar{l}\)-module). By Theorem 5.5 (1), if
\[
\text{ch} L(\mathfrak{g}_\infty, \Lambda^f(\lambda, n)) = \sum_{\Lambda \in P_1^+} a_\Lambda \text{ch} L(\mathfrak{l}, \Lambda),
\]
for some \(a_\Lambda \in \mathbb{Z}_{\geq 0}\), then
\[
\text{ch} L(\mathfrak{g}_\infty, \Lambda^f(\lambda, n)^0) = \sum_{\Lambda \in P_1^+} a_\Lambda \text{ch} L(\bar{l}, \Lambda^0).
\]

Note that
\[
\text{ch} L(\mathfrak{g}_\infty, \Lambda^f(\lambda, n)) = S^g_{(\lambda, n)}(X_\Lambda) = q^n \sum_{\sigma \in \mathcal{P}} c^\sigma_{(\lambda, n)}(\mathfrak{g}) S_\sigma(x_{\mathfrak{g}}),
\]
\[
= q^n \sum_{\sigma \in \mathcal{P}} c^\sigma_{(\lambda, n)}(\mathfrak{g}) \sum_{\tau \subseteq \sigma} S_\tau(x_{(m, \ldots, \overline{1})}) S_{\mathfrak{g}/\tau}(x_{\mathfrak{g} > 0})
\]
\[
= q^n \sum_{\sigma \in \mathcal{P}} c^\sigma_{(\lambda, n)}(\mathfrak{g}) \sum_{\tau \subseteq \sigma} c^\tau_{\mathfrak{g}/\tau} S_\tau(x_{(m, \ldots, \overline{1})}) S_\gamma(x_{\mathfrak{g} > 0}),
\]
Since \(\text{ch} L(\mathfrak{l}, \Lambda) = q^n S_\tau(x_{(m, \ldots, \overline{1})}) S_\gamma(x_{\mathfrak{g} > 0})\) with \(\Lambda = \sum_{a=1}^m \tau_{m-a+1} \delta_{\overline{1}} + \sum_{b \in \mathbb{Z}_{\geq 0}} \gamma b \delta_b + n\Lambda_0^f\) and
\[
\text{ch} L(\bar{l}, \Lambda^0) = q^n S_\tau(x_{(m, \ldots, \overline{1})}) S_\gamma(x_{\frac{1}{2} \mathbb{Z}_{\geq 0}}),
\]
we have
\[ \text{ch} L(\bar{x}_\infty, \Lambda^I(\lambda, n)^\theta) = q^n \sum_{\sigma \in \mathcal{P}} c_{\sigma}^{\lambda}(n) \sum_{\tau \gamma} c_{\tau \gamma}^{\sigma} S_\tau(x_{\{m,...,1\}}) S_\gamma(x_{\mathbb{Z}^2}) \]
\[ = q^n \sum_{\sigma \in \mathcal{P}} c_{\sigma}^{\lambda}(n) \sum_{\tau \subset \sigma} S_\tau(x_{\mathbb{Z}^2}) S_{\sigma/\tau}(x_{\mathbb{Z}^2}) \]
\[ = q^n \sum_{\sigma \in \mathcal{P}} c_{\sigma}^{\lambda}(n) S_\sigma(x_{\bar{x}_\infty} \mathbb{Z}^2) = S_\lambda^I(x_{\bar{x}_\infty}). \]

By the same arguments, we also have \( \text{ch} L(\bar{x}_\infty, \Lambda^I(\lambda, n)^\theta) = S_\lambda^I(x_{\bar{x}_\infty}) \).

\[ \square \]

Corollary 5.9. For \((\mu, m), (\nu, n) \in \mathcal{P}(x)\), we have
\[ L(\bar{x}_\infty, \Lambda^I(\mu, m)^\theta) \otimes L(\bar{x}_\infty, \Lambda^I(\nu, n)^\theta) \]
\[ \simeq \bigoplus_{(\lambda, m+n)} L(\bar{x}_\infty, \Lambda^I(\lambda, m+n)^{\theta}) \otimes_{\mathcal{P}(x_{\{m,...,1\}})} L(\bar{x}_\infty, \Lambda^I(\lambda, m+n)^{\theta}) \]
\[ L(\bar{x}_\infty, \Lambda^I(\mu, m)^2) \otimes L(\bar{x}_\infty, \Lambda^I(\nu, n)^2) \]
\[ \simeq \bigoplus_{(\lambda, m+n)} L(\bar{x}_\infty, \Lambda^I(\lambda, m+n)^{2}) \otimes_{\mathcal{P}(x_{\{m,...,1\}})} L(\bar{x}_\infty, \Lambda^I(\lambda, m+n)^{2}). \]

**Proof.** It suffices to prove the first identity since the proof of the second one is identical. Write \( M = L(\bar{x}_\infty, \Lambda^I(\mu, m)^\theta) \) and \( N = L(\bar{x}_\infty, \Lambda^I(\nu, n)^\theta) \). Assume that
\[ \text{ch} M = q^n \sum_{\sigma} a_\sigma S_\sigma(x_{\bar{x}_\infty}), \quad \text{ch} N = q^n \sum_{\tau} b_\tau S_\tau(x_{\bar{x}_\infty}). \]

Then we have
\[ \text{ch} (M \otimes N) = q^{m+n} \sum_{\sigma, \tau} a_\sigma b_\tau \sum_{\gamma} c_{\sigma \tau \gamma}^{\lambda} S_\gamma(x_{\bar{x}_\infty}) \]

By the same arguments as in Theorem 5.8, we have
\[ \text{ch} T(M \otimes N) = q^{m+n} \sum_{\sigma, \tau} a_\sigma b_\tau \sum_{\gamma} c_{\sigma \tau \gamma}^{\lambda} S_\gamma(x_{\bar{x}_\infty}) \]

(5.18)

Since
\[ \text{ch} T(M) = \text{ch} (L(\bar{x}_\infty, \Lambda^I(\mu, m))) = q^m \sum_{\alpha} a_\alpha S_\alpha(x_{\bar{x}_\infty}), \]
\[ \text{ch} T(N) = \text{ch} (L(\bar{x}_\infty, \Lambda^I(\nu, n))) = q^n \sum_{\tau} b_\tau S_\tau(x_{\bar{x}_\infty}), \]

we have
\[ \text{ch} T(M \otimes N) = \text{ch} T(M) \text{ch} T(N) = \text{ch} (T(M) \otimes T(N)) \]

(5.19)
On the other hand, by definition of $T$, we have $T(M) \otimes T(N) \subset T(M \otimes N)$. Therefore, (5.19) implies that $T(M) \otimes T(N) = T(M \otimes N)$. Finally, (5.16) combined with the equivalence of $T$ implies that

\[ M \otimes N \cong \bigoplus_{(\lambda, m+n)} L(\check{\mathbb{F}}_\infty, \Lambda^t(\lambda, m+n)) \otimes S_{(\mu, m)\times (\nu, n)}(\mathfrak{gl}_0). \]

\[ \square \]

**Remark 5.10.** Let $A$ be an arbitrary $\mathbb{Z}_2$-graded linearly ordered set with infinitely many odd elements. Then $S^t_{(\lambda, n)}(x_A)$ is equal to one of the characters $S^t_{(\lambda, n)}(x_N)$ and $S^f_{(\lambda, n)}(x_N)$ since $S^f_{(\lambda, n)}(x_A)$ does not depend on the choice of a linear ordering on $A$. When $A$ is a finite set, $S^t_{(\lambda, n)}(x_A)$ is also an irreducible character of a finite dimensional orthosymplectic Lie superalgebra. This can be deduced by applying a truncation functor on $\overline{\mathfrak{g}}$ introduced in [10]. But we would like to remark that the irreducible representation associated to $S^t_{(\lambda, n)}(x_A)$ is infinite dimensional called an oscillator representation, which was also studied in [7] using Howe duality.

6. **Proof of Theorem 3.11**

6.1. **RSK correspondence.** Let $A$ and $B$ be two linearly ordered sets. Let $M_{A,B}$ be the set of $A \times B$ matrices $A = (a_{i,j})$ with entries in $\mathbb{Z}_{\geq 0}$ such that $\sum_{i \in A, j \in B} a_{i,j} < \infty$. Let $\Omega_{A,B}$ be the set of biwords $(i,j) \in W_A \times W_B$ with $i = i_1 \cdots i_r$ and $j = j_1 \cdots j_r$ for some $r \geq 0$ such that $(i_1, j_1) \leq \cdots \leq (i_r, j_r)$. Here, we assume that $(i,j) < (k,l)$ if and only if $(j < l)$ or $(j = l$ and $i > k)$ for $(i,j)$ and $(k,l) \in A \times B$. Then the map from $\Omega_{A,B}$ to $M_{A,B}$ sending $(i,j)$ to $A(i,j) = (a_{i,j})$ with $a_{i,j} = \{ k \mid (i_k, j_k) = (i,j) \}$ is a bijection. Note that the pair of empty words $(\emptyset, \emptyset)$ corresponds to zero matrix $\mathbb{O}$.

For $A \in M_{A,B}$, suppose that $A = A(i,j)$ and $A^t = A(k,l)$ for $(i,j) \in \Omega_{A,B}$ and $(k,l) \in \Omega_{B,A}$. Then we have a bijection called the Robinson-Schensted-Knuth (simply RSK) correspondence

\[ (6.1) \quad M_{A,B} \xrightarrow{\kappa} \bigsqcup_{\lambda \in \mathcal{P}} \text{SST}_A(\lambda) \times \text{SST}_B(\lambda), \]

where $\kappa(A) = ((i \to \emptyset), (k \to \emptyset))$ [30].

6.2. **RSK map as a $\mathfrak{gl}_\infty$-crystal isomorphism.** Let us recall a $\mathfrak{gl}_\infty$-crystal structure associated with the RSK correspondence [36] (with a slight modification of notations).

Let $M = M_{\mathbb{Z}_{\geq 0}, \mathbb{Z}_{>0}}$ and $\Omega = \Omega_{\mathbb{Z}_{\geq 0}, \mathbb{Z}_{<0}}$ where $\mathbb{Z}_{\leq 0} = \{ -k^v \mid k \in \mathbb{Z}_{>0} \}$ is the dual $\mathfrak{gl}_{\leq 0}$-crystal of $\mathbb{Z}_{\leq 0}$ with a linear ordering given by $-1^v < -2^v < \cdots$. Note that $M$ is a normal $\mathfrak{gl}_{\geq 0}$-crystal, where $\bar{x}_i A = A(\bar{x}_i i, j)$ for $A \in M$ with $A = A(i,j)$ ($x = e, f$
and \( i \in \mathbb{Z}_{>0} \). Here, we assume that \( \overline{x_i}A = 0 \) if \( \overline{x_i}i = 0 \). In a similar way, we may view \( M \) as a normal \( \mathfrak{gl}_{<0} \)-crystal with respect to \( \overline{e_i}, \overline{f_i} \, (i \in \mathbb{Z}_{<0}) \) by considering the transpose of \( A \in M \). (Note that \( M \) was defined as \( M_{\mathbb{Z}_{\ge 0} \mathbb{Z}_{>0}} \) in \cite{36}.) Then \( M \) is a \((\mathfrak{gl}_{<0}, \mathfrak{gl}_{>0})\)-bicrystal, that is, \( \overline{e_i}, \overline{f_i} \, (i \in \mathbb{Z}_{<0}) \) commute with \( \overline{e_j}, \overline{f_j} \, (j \in \mathbb{Z}_{<0}) \).

Let \( T = \bigsqcup_{\lambda \in \mathcal{P}} \text{SST}_{\mathbb{Z}_{>0}}(\lambda) \times \text{SST}_{\mathbb{Z}_{<0}}(\lambda) \). Then \( T \) is clearly a \((\mathfrak{gl}_{<0}, \mathfrak{gl}_{>0})\)-bicrystal, and \( \kappa \) is a \((\mathfrak{gl}_{<0}, \mathfrak{gl}_{>0})\)-bicrystal isomorphism \cite{13, 38}.

Now, for \( A = (a_{i,-j}) \in M \), we define

\[
\overline{e_0}A = \begin{cases} A - E_{1,-1}, & \text{if } a_{1,-1} \neq 0, \\ 0, & \text{otherwise}, \end{cases}
\]

and \( \overline{f_0}A = A + E_{1,-1} \),

where \( E_{i,-j} \in M \) denotes the elementary matrix with 1 at the position \((i,-j)\).

Put

\[
\text{wt}(A) = \sum_{i,j \ge 1} a_{i,-j}(\epsilon_i - \epsilon_{-j}),
\]

\[
\varepsilon_0(A) = a_{1,-1},
\]

\[
\varphi_0(A) = \langle \text{wt}(A), h_0 \rangle + \varepsilon_0(A).
\]

Then \( M \) is a connected \( \mathfrak{g}\mathfrak{l}_\infty \)-crystal with a unique highest weight element \( \emptyset \) \cite[Proposition 3.1]{36}.

Next, let us describe \( \overline{e_0} \) and \( \overline{f_0} \) on \( T \). Let \((S, T) \in T\) be given. For \( k \ge 1 \), let \( s_k \) and \( t_k \) be the entries in the top of the \( k \)-th column of \( S \) and \( T \), respectively. We assign

\[
\sigma_k = \begin{cases} +, & \text{if the } k\text{-th column is empty}, \\ +, & \text{if } s_k > -1 \text{ and } t_k > 1, \\ -, & \text{if } s_k = -1 \text{ and } t_k = 1, \\ -., & \text{otherwise}. \end{cases}
\]

Let \( \overline{\sigma} \) be the sequence obtained from \( \sigma = (\ldots, \sigma_2, \sigma_1) \) by the same method as in Section 3.1.

We define \( \overline{e_0}(S, T) \) to be the bitableaux obtained from \((S, T)\) by removing 1 and \(-1\) in the columns of \( S \) and \( T \) corresponding to the left-most \(-\) in \( \overline{\sigma} \). If there is no such \(-\) sign, then we define \( \overline{e_0}(S, T) = 0 \). We define \( \overline{f_0}(S, T) \) to be the bitableaux obtained from \((S, T)\) by adding 1 and \(-1\) on top of the columns of \( S \) and \( T \) corresponding to the right-most + in \( \overline{\sigma} \). If there is no such + sign, then we define \( \overline{f_0}(S, T) = 0 \).
Put
\[ \text{wt}(S, T) = \sum_{i \geq 1} (m_i(S)e_i - m_{-i^\vee}(T)e_{-i}), \]
\[ \varepsilon_0(S, T) = \max \{ k \mid \bar{e}_0^k(S, T) \neq 0 \}, \]
\[ \varphi_0(S, T) = \langle \text{wt}(S, T), h_0 \rangle + \varepsilon_0(S, T). \] (6.5)

Then \( \mathcal{I} \) is also a connected \( \mathfrak{gl}_\infty \)-crystal with a unique highest weight element \((\emptyset, \emptyset)\) [36, Proposition 3.5].

**Proposition 6.1** (Theorem 3.6 in [36]). \( \kappa : M \rightarrow \mathcal{I} \) is a \( \mathfrak{gl}_\infty \)-crystal isomorphism.

Given \( \mu, \nu \in \mathcal{P} \), we put
\[ M(\mu, \nu) = M \times \text{SST}_{\mathbb{Z}_{\geq 0}}(\mu) \times \text{SST}_{\mathbb{Z}_{< 0}}(\nu)^\vee \] (6.6)
where \( \text{SST}_{\mathbb{Z}_{< 0}}(\nu)^\vee \) is the dual \( \mathfrak{gl}_{< 0} \)-crystal of \( \text{SST}_{\mathbb{Z}_{< 0}}(\nu) \). For \( m = (A, S, T^\vee) \in M(\mu, \nu) \) and \( i \in \mathbb{Z} \), we define
\[ \bar{x}_i m = \begin{cases} (A', U, T^\vee), & \text{if } i > 0 \text{ and } \bar{x}_i(A \otimes S) = A' \otimes U, \\ (A'', S, V^\vee), & \text{if } i < 0 \text{ and } \bar{x}_i(A \otimes T^\vee) = A'' \otimes V^\vee, \\ (\bar{x}_0 A, S, T^\vee), & \text{if } i = 0, \end{cases} \] (6.7)
where \( x = e, f \), and \( \bar{x}_i(A, S, T^\vee) = 0 \) if any of its components is 0. Put
\[ \text{wt}(m) = \text{wt}(A) + \text{wt}(S) + \text{wt}(T^\vee), \]
\[ \varepsilon_i(m) = \max \{ k \mid \bar{e}_i^k m \neq 0 \}, \]
\[ \varphi_i(m) = \langle \text{wt}(m), h_i \rangle - \varepsilon_i(m), \] for \( i \in \mathbb{Z} \). Then \( M(\mu, \nu) \) is a connected \( \mathfrak{gl}_\infty \)-crystal with a unique highest weight element \( \mathcal{O}_{\mu, \nu} = (\emptyset, H_\mu, H_\nu^\vee) \in M(\mu, \nu) \) [36, Proposition 4.5].

For \( n \geq \ell(\mu) + \ell(\nu) \), let
\[ \Lambda(\mu, \nu, n) = n\Lambda_0 + \sum_{i \geq 1} \mu_i \varepsilon_i - \sum_{j \geq 1} \nu_j \varepsilon_{-j} \]
(6.9)
\[ = (n - \mu_1 - \nu_1)\Lambda_0 + \sum_{i=1}^{\mu_1} \Lambda_{\mu_i} + \sum_{j=1}^{\nu_1} \Lambda_{-\nu'_j}. \]

Then \( M(\mu, \nu) \) can be viewed as a crystal of the generalized Verma module in the following sense.

**Proposition 6.2** (Proposition 4.6 in [36]). For \( n \geq \ell(\mu) + \ell(\nu) \), there exists a unique embedding of a \( \mathfrak{gl}_\infty \)-crystal
\[ \Psi_{\mu, \nu, n} : B(\mathfrak{gl}_\infty, \Lambda(\mu, \nu, n)) \rightarrow M(\mu, \nu) \otimes T_n \Lambda_0 \]
Hence, \( M(6.14) \) gives a weight preserving bijection act on Lemma 6.4. \( M(6.11) \) \( M(6.13) \) \( M(6.12) \) \( M(6.10) \) for \( m \) \( T \) for \( \lambda \) \( \tau \). Let \( \kappa \) be given. Note that \( \kappa(A) = (S, S^*) \) for some \( S \in \text{SST}_{\mathbb{Z}^\geq 0}(\tau) \), with \( \tau \in \mathcal{P}_t \) (see [30]). Hence the map sending \( \kappa(A, T, T^*) \) to \( (S, T) \) gives a weight preserving bijection \( M^f(\lambda) \) is an \( \mathfrak{g}_\infty \)-analogue of \( \text{RSK} \) correspondence. Let us consider an \( \mathfrak{g}_\infty \)-anologue of \( \text{RSK} \) correspondence. Let \( \kappa^f_\lambda : M^f(\lambda) \to \mathcal{F}(\lambda) \). Since \( \kappa \) is a \( (\mathfrak{gl}_{\leq 0}, \mathfrak{gl}_{\geq 0}) \)-bicrystal isomorphism, it is not difficult to see that \( \kappa^f_{(0)} \) is a \( \mathfrak{gl}_{\geq 0} \)-crystal isomorphism with respect to \( E_i \) and \( F_i \) \( (i \in \mathbb{Z}^\geq 0) \), and hence so is \( \kappa^f_{\lambda} \).
Definition 6.6. Let \( \lambda \in \mathcal{M}_G^{\kappa} \) be the support of \( A \). Then it follows from Proposition 6.1 that \( \kappa_{\lambda}^\kappa \) commutes with \( \tilde{E}_0, \tilde{F}_0 \), and hence an \( \mathfrak{g}_\infty \)-crystal isomorphism.

Proposition 6.5. \( \kappa_{\lambda}^\kappa : \mathcal{M}^f(\lambda) \longrightarrow \mathcal{F}(\lambda) \) is an \( \mathfrak{g}_\infty \)-crystal isomorphism.

Proof. It suffices to show that \( \kappa_{\lambda}^\kappa \) commutes with \( \tilde{E}_0, \tilde{F}_0 \). Recall that \( \tilde{E}_0 = \tilde{f}_0 \) and \( \tilde{F}_0 = \tilde{f}_0 \), which act on \( \mathcal{M}^f \subset \mathcal{M} \). Let \( A, T \in \mathcal{M}^f \) be given with \( \kappa(A) = (S, S^*) \) for some \( S \in SST_{\mathbb{Z}_{>0}}^{\mathfrak{h}}(\tau) \). It is straightforward to check that \( \tilde{X}_0(S, S^*) = \tilde{X}_0(S, S^*) = (S', S^*) \) defined in Section 3.1 if and only if \( \tilde{X}_0 = S' \) defined in Section 3.1 for some \( S' \in SST_{\mathbb{Z}_{>0}}^{\mathfrak{h}}(x = e, f, X = E, F) \).

Then, it follows from Proposition 6.1 that \( \kappa_{\lambda}^\kappa \) commutes with \( \tilde{E}_0, \tilde{F}_0 \), and hence an \( \mathfrak{g}_\infty \)-crystal isomorphism.

6.4. A grading on \( \mathcal{M}^f(\lambda) \). In this subsection, we introduce a \( \mathbb{Z}_{\geq 0} \)-valued function on \( \mathcal{M}^f(\lambda) \), which is constant on each connected \( \mathfrak{g}_\infty \)-subcrystal of \( \mathcal{M}^f(\lambda) \).

Definition 6.6. Let \( m = (A, T) \in \mathcal{M}^f(\lambda) \) be given.

1. A word \( w = w_1 \cdot w_2 \) is called a weakly decreasing sequence for \( m \) if
   (a) \( w_1 = w(A') \) for some \( A' \in \mathcal{M}^f \) with \( A' \leq A \),
   (b) \( w_2 \) is a subword of \( w(T) \),
   (c) \( w_1 \cdot w_2 \) is weakly decreasing.

   Here, \( A' \leq A \) means \( a'_{i,j} \leq a_{i,j} \) for all \( i, j \), and \( w(A') = i \) when \( A' = A(1, j) \).

2. A weakly decreasing sequence \( w_1 \cdot w_2 \) for \( m \) is called maximal if \( \ell(w_1) + 2\ell(w_2) \) is maximal, where \( \ell(w) \) denotes the length of a word \( w \). In this case, we define
   \[
   L_\lambda(m) = \frac{\ell(w_1) + 2\ell(w_2)}{\epsilon}.
   \]

Remark 6.7. (1) Let \( A' \in \mathcal{M}^f \) be a matrix in Definition 6.6 (1) (a) with \( w_1 = w(A') \). Let
   \[
   \text{supp}(A') = \{ (i, j') \mid a'_{i,j'} \neq 0 \} \subset \mathbb{Z}_{>0} \times \mathbb{Z}_{<0}^\vee
   \]
   be the support of \( A' = (a'_{i,j}) \). Then (i) \( (i, j') \in \text{supp}(A') \) if and only if \( (j, i') \in \text{supp}(A') \), and (ii) if \( (i, j') \in \text{supp}(A') \), then \( (k, -i') \notin \text{supp}(A') \) for \( k < i \) and \( l < j \) since \( w_1 \) is weakly decreasing. Note that \( w_1 \) is a subword of \( w(A) \), and \( \ell(w_1) \) is even when \( \epsilon = 2 \) since \( A' \) is symmetric and its diagonal entries are even. Hence \( L_\lambda(m) \) is an integer.

(2) Let \( w_2 = w_1 \ldots w_r \) be a subword of \( w(T) \) as in Definition 6.6 (1) (b). Suppose that \( w_k \) is the entry of \( T \) at the \( (i_k, j_k) \) position. By the same arguments as in Remark 3.8, we may assume that \( j_1 < \ldots < j_r \) and \( i_1 \geq \ldots \geq i_r \).

Lemma 6.8. Let \( m = (A, T) \in \mathcal{M}^f(\lambda) \) be given with \( A = (a_{i,j}) \).

1. If \( \tilde{E}_0^k m \neq 0 \) for some \( k \geq 1 \), then \( L_\lambda(\tilde{E}_0^k m) \leq L_\lambda(m) \).
(2) If $\bar{F}_0^k \mathbf{m} \neq \mathbf{0}$ for some $k \geq 1$, then

$$L_t(\bar{F}_0^k \mathbf{m}) = \max \left\{ L_t(\mathbf{m}), \frac{1}{\epsilon} a_{1,-1^\nu} + \frac{2}{\epsilon} \sum_{i \geq 2} a_{1,-i^\nu} + \frac{2}{\epsilon} m_1(T) + k \right\}.$$

**Proof.** (1) It suffices to show for the case $k = 1$. Suppose that $\bar{E}_0 \mathbf{m} \neq \mathbf{0}$, that is, $a_{1,-1^\nu} \geq \epsilon$. Let $\tilde{w}_1 \cdot \tilde{w}_2$ be a maximal weakly decreasing sequence for $\bar{E}_0 \mathbf{m}$ with $\tilde{w}_1 = w(\bar{A})$ for some $\bar{A} \in \mathcal{M}$ with $\bar{A} \leq E_0 A$.

If $(1,-1^\nu) \notin \text{supp}(\bar{A})$, then $\tilde{w} = \tilde{w}_1 \cdot \tilde{w}_2$ is a weakly decreasing sequence for $\mathbf{m}$, which implies that $L_t(\bar{E}_0 \mathbf{m}) \leq L_t(\mathbf{m})$. If $(1,-1^\nu) \in \text{supp}(\bar{A})$, then choose $\tilde{w}'_1$ of maximal length such that $\tilde{w}'_1 = w(\bar{A}')$ for some $\bar{A}' \in \mathcal{M}$ with $\bar{A}' \leq A$ and $\text{supp}(\bar{A}') = \text{supp}(\bar{A})$. Then $\tilde{w}'_1 \cdot \tilde{w}_2$ is a weakly decreasing sequence for $\mathbf{m}$ and we have $L_t(\bar{E}_0 \mathbf{m}) + 1 \leq L_t(\mathbf{m})$ since $\ell(\tilde{w}_1') + \epsilon = \ell(\tilde{w}_1)$.

(2) Let $\mathbf{w}_1(k) \cdot \mathbf{w}_2$ be a weakly decreasing sequence for $\bar{F}_0^k \mathbf{m}$ ($k \geq 1$), where $\mathbf{w}_1(k) = w(\bar{A}'(k))$ for some $\bar{A}'(k) \in \mathcal{M}$ with

$$\text{supp}(\bar{A}'(k)) \subset \bigcup_{j \geq 1} \{ (1,j^\nu), (j,-1^\nu) \}$$

and $\mathbf{w}_2 = 1^{m_1(T)}$. If $\mathbf{w}_1(k)$ is of maximal length, then

$$\ell(k) := \frac{\ell(\mathbf{w}_1(k)) + 2\ell(\mathbf{w}_2)}{\epsilon} = \frac{1}{\epsilon} a_{1,-1^\nu} + \frac{2}{\epsilon} \sum_{i \geq 2} a_{1,-i^\nu} + \frac{2}{\epsilon} m_1(T) + k,$$

and $\ell(k) \leq L_t(\bar{F}_0^k \mathbf{m})$. Also by (1), $L_t(\mathbf{m}) \leq L_t(\bar{F}_0^k \mathbf{m})$. Hence we have

$$\max\{ L_t(\mathbf{m}), \ell(k) \} \leq L_t(\bar{F}_0^k \mathbf{m}).$$

Conversely, let $\tilde{w}_1 \cdot \tilde{w}_2$ be a maximal weakly decreasing sequence for $\bar{F}_0^k \mathbf{m}$, where $\tilde{w}_1 = w(\bar{A}')$ for some $\bar{A}' \in \mathcal{M}$. If $(1,-1^\nu) \in \text{supp}(\bar{A}')$, then $\tilde{w}_1 = \mathbf{w}_1(k)$ and $\tilde{w}_2 = 1^{m_1(T)}$, which implies that $L_t(\bar{F}_0^k \mathbf{m}) = \ell(k)$. If $(1,-1^\nu) \notin \text{supp}(\bar{A}')$, then $\tilde{w}_1 \cdot \tilde{w}_2$ is also a weakly decreasing sequence for $\mathbf{m}$, and $L_t(\bar{F}_0^k \mathbf{m}) \leq L_t(\mathbf{m})$. Therefore, we have

$$\max\{ L_t(\mathbf{m}), \ell(k) \} \geq L_t(\bar{F}_0^k \mathbf{m}).$$

\[\Box\]

**Lemma 6.9.** If $\bar{F}_i \mathbf{m} \neq \mathbf{0}$ for $\mathbf{m} \in \mathcal{M}(\lambda)$ and $i \in \mathbb{Z}_{>0}$, then $L_t(\bar{F}_i \mathbf{m}) \leq L_t(\mathbf{m})$.

**Proof.** Let $\mathbf{m} = (A,T) \in \mathcal{M}(\lambda)$ with $A = (a_{i,-j^\nu})$. 
CASE 1. Suppose that $\bar{F}_i \mathbf{m} = (\bar{F}_i A, T) \neq 0$ and $\bar{f}_i A = A - E_{i-j^\vee} + E_{i+1-j^\vee}$ for some $j$, equivalently $\bar{f}_{-i} A = A - E_{j_i-i^\vee} + E_{j_{i+1}-i^\vee}$. Note that

$$\bar{F}_i A = \bar{f}_i \bar{f}_{-i} A = \begin{cases} A - E_{i-i^\vee} + E_{i+1-(i+1)^\vee}, & \text{if } i = j \text{ and } a_{i_i-i^\vee} = 1, \\ A - E_{i-j^\vee} + E_{i+1-j^\vee} - E_{j_i-i^\vee} + E_{j_{i+1}-i^\vee}, & \text{otherwise.} \end{cases}$$

Let $\bar{w}_1 \cdot \bar{w}_2$ be a maximal weakly decreasing sequence for $\bar{F}_i \mathbf{m}$, where $\bar{w}_1 = w(\bar{A})$ for some $\bar{A} \in M^\ell$ with $\bar{A} \leq \bar{F}_i A$ and $\bar{w}_2 = \bar{w}_2, \ldots, \bar{w}_2$. Let $P = (i, -j^\vee)$ and $Q = (i+1, -j^\vee)$.

(i) Suppose that either $P, Q \notin \text{supp}(\bar{A})$ or $P, Q \in \text{supp}(\bar{A})$. In this case, $\bar{w}_1 \cdot \bar{w}_2$ is also a weakly decreasing sequence for $\mathbf{m}$. Hence we have $L_\ell(\bar{F}_i \mathbf{m}) \leq L_\ell(\mathbf{m})$.

(ii) Suppose that $P \in \text{supp}(\bar{A})$ and $Q \notin \text{supp}(\bar{A})$. Let $\bar{w}_1'$ be of maximal length such that $\bar{w}_1' = w(\bar{A'})$ for some $\bar{A'} \in M^\ell$ with $\bar{A'} \leq A$ and $\text{supp}(\bar{A'}) = \text{supp}(\bar{A})$. Then $\bar{w}_1' \cdot \bar{w}_2$ is a weakly decreasing sequence for $\mathbf{m}$ and

$$\ell(\bar{w}_1') = \begin{cases} \ell(\bar{w}_1) + 1, & \text{if } i = j \text{ and } a_{i_i-i^\vee} = 1, \\ \ell(\bar{w}_1) + 2, & \text{otherwise,} \end{cases}$$

which imply that $L_\ell(\bar{F}_i \mathbf{m}) \leq L_\ell(\mathbf{m}) - 1 < L_\ell(\mathbf{m})$.

(iii) Suppose that $P \notin \text{supp}(\bar{A})$ and $Q \in \text{supp}(\bar{A})$. Let $\text{supp}(\bar{A}) = \{ Q_1 = (i_1, -j_1^\vee), \ldots, Q_r = (i_r, -j_r^\vee) \}$, where $Q_1 < \ldots < Q_r$ with respect to the lexicographic ordering on $Z_{>0} \times Z_{>0}^\ell$ (see Section 6.1], and $Q_s = Q$ for some $1 \leq s \leq r$.

If $i_{s+1} < i_s = i + 1$ with $s < r$, then choose $\bar{w}_1'$ of maximal length such that $\bar{w}_1' = w(\bar{A'})$ for some $\bar{A'} \in M^\ell$ with $\bar{A'} \leq A$ and

$$\text{supp}(\bar{A'}) \subset \text{supp}(\bar{A}) \cup \{ (i, -j^\vee), (j, -i^\vee) \}.$$ 

Then $\bar{w}_1' \cdot \bar{w}_2$ is a weakly decreasing sequence for $\mathbf{m}$ and $\ell(\bar{w}_1) \leq \ell(\bar{w}_1')$, which imply that $L_\ell(\bar{F}_i \mathbf{m}) \leq L_\ell(\mathbf{m})$.

If $i_{s+1} = i + 1$ with $s < r$, then choose a maximal $t \geq s + 1$ such that $i_t = i + 1$. Consider the subword of $w(\bar{A})$ consisting of $i$ and $i + 1$. Then by tensor product rule of crystals with respect to $\bar{f}_i$ and $\bar{f}_{-i}$ (see [23, Proposition 2.1.1 (i)]) we necessarily have

$$\sum_{j_{s+1}+1 \leq k \leq j_t} a_{i_{s+1},-k^\vee} < \sum_{j_{s} \leq l \leq j_{t}-1} a_{i_i, -l^\vee},$$

$$\sum_{j_{s+1}+1 \leq k \leq j_t} a_{k_i, -(i+1)^\vee} < \sum_{j_{s} \leq l \leq j_{t}-1} a_{i_i, -i^\vee}. $$

(6.15)
If \( t < r \) or \( \bar{w}_{2,1} \leq i \), then choose \( \bar{w}_1' \) of maximal length such that \( \bar{w}_1' = w(\bar{A}') \) for some \( \bar{A}' \in M^\ell \) with \( \bar{A}' \leq A \) and

\[ \text{(6.16)} \quad \text{supp}(\bar{A}') \subset \left( \text{supp}(\bar{A}) \setminus X \right) \cup Y, \]

where
\[
X = \{ (i + 1, -k^\vee), (k, -(i + 1)^\vee) \mid j_s + 1 = j + 1 \leq k \leq j_t \},
\]
\[
Y = \{ (i, -l^\vee), (l, -i^\vee) \mid j_s = j \leq l \leq j_t - 1 \}.
\]

Then \( \bar{w}_1' \cdot \bar{w}_2 \) is a weakly decreasing sequence for \( m \) by (6.16), and \( \ell(\bar{w}_1) \leq \ell(\bar{w}_1') \) by (6.15), which imply that \( L_\ell(\bar{F}_\ell m) \leq L_\ell(m) \). If \( t = r \) and \( \bar{w}_{2,1} = i + 1 \), then choose a maximal \( u \) such that \( \bar{w}_{2,u} = i + 1 \), where \( \bar{w}_{2,u} = w_i \) for some \( 1 \leq v \leq p \). Also by considering the subword of \( w(A) \cdot w(T) \) consisting of \( i \) and \( i + 1 \) and then applying Proposition 2.1.1 (i), we necessarily have

\[ \text{(6.17)} \quad \sum_{j_s + 1 \leq k \leq l} a_{i+1,-k^\vee} + m_{i+1} < \sum_{j_s \leq l} a_{i,-l^\vee} + m_i, \]

where \( m_i \) is the number of occurrences of \( i \) in \( w_1 \ldots w_{v-1} \) and \( m_{i+1} \) is the number of occurrences of \( i + 1 \) in \( w_1 \ldots w_v \). Note that \( m_{i+1} = u \) by the maximality of \( \bar{w}_1 \cdot \bar{w}_2 \).

Choose \( \bar{w}_1' \) of maximal length such that \( \bar{w}_1' = w(\bar{A}') \) for some \( \bar{A}' \in M^\ell \) with \( \bar{A}' \leq A \) and

\[ \text{(6.18)} \quad \text{supp}(\bar{A}') \subset \left( \text{supp}(\bar{A}) \setminus X \right) \cup Y, \]

where
\[
X = \{ (i + 1, -k^\vee), (k, -(i + 1)^\vee) \mid j_s + 1 = j + 1 \leq k \},
\]
\[
Y = \{ (i, -l^\vee), (l, -i^\vee) \mid j_s = j \leq l \}.
\]

Let \( \bar{w}_2' \) be the subword obtained from \( \bar{w}_2 \) by replacing \( \bar{w}_{2,1} \ldots \bar{w}_{2,u} = (i + 1)^{m_{i+1}} \) with \( i^{m_i} \). Then \( \bar{w}_1' \cdot \bar{w}_2' \) is a weakly decreasing sequence for \( m \) by (6.18), and
\[
(\ell(\bar{w}_1') + 2\ell(\bar{w}_2')) - (\ell(\bar{w}_1) + 2\ell(\bar{w}_2))
\]
\[
= \sum_{j_s \leq l} (a_{i,-l^\vee} + a_{i,-i^\vee}) + 2m_i - 2 - \sum_{j_s + 1 \leq k} (a_{i+1,-k^\vee} + a_{k,-(i+1)^\vee}) - 2m_{i+1}
\]
\[
= 2 \sum_{j_s \leq l} a_{i,-l^\vee} + 2m_i - 2 \sum_{j_s + 1 \leq k} a_{i+1,-k^\vee} - 2m_{i+1} - 2 \geq 0.
\]

by (6.17). Hence \( L_\ell(\bar{F}_\ell m) \leq L_\ell(m) \).

Case 2. Suppose that \( \bar{F}_\ell m = (A, \bar{F}_\ell T) \neq 0 \). Let \( \bar{w}_1 \cdot \bar{w}_2 \) be a maximal weakly decreasing sequence for \( \bar{F}_\ell m \). Let \( w(T) = w_1 \ldots w_p \) and \( \bar{w}_2 = \bar{w}_{2,1} \ldots \bar{w}_{2,q} \). Assume that \( w_r = i \) for some \( 1 \leq r \leq p \) in \( T \) is replaced by \( w_r' = i + 1 \) by applying \( \bar{F}_\ell \) to
If \( \tilde{w}_2 \) does not contain \( i + 1 \) corresponding to \( w'_r \), then \( \tilde{w}_1 \cdot \tilde{w}_2 \) is also a weakly decreasing sequence for \( m \) and hence \( L_\tau(\tilde{F}_1 m) \leq L_\tau(m) \). Now we assume that \( \tilde{w}_2 \) contains \( i + 1 \) corresponding to \( w'_r \), say \( \tilde{w}_{2,s} = i + 1 \).

(i) Suppose that \( s = q \) or \( \tilde{w}_{2,s+1} < i + 1 \). Let \( \tilde{w}'_2 \) be obtained from \( \tilde{w}_2 \) by replacing \( \tilde{w}_{2,s} \) with \( i \). Then \( \tilde{w}_1 \cdot \tilde{w}'_2 \) is a weakly decreasing sequence for \( m \) and hence \( L_\tau(\tilde{F}_1 m) \leq L_\tau(m) \).

(ii) Suppose that \( \tilde{w}_{2,s+1} = i + 1 \). Choose a maximal \( t > s \) such that \( \tilde{w}_{2,t} = i + 1 \). If \( \tilde{w}_{2,t} = w_u \) for some \( u > r \), then by \( \{23\} \) Proposition 2.1.1 (i) we have \( u > r + 1 \) and there exists a subword \( \tilde{d}^i \) of \( w_{r+1} \ldots w_{u-1} \). Let \( \tilde{w}'_2 \) be obtained from \( \tilde{w}_2 \) by replacing \( \tilde{w}_{2,s} \ldots \tilde{w}_{2,t} = (i+1)^{t-s+1} \) with \( i^{t-s+1} \). Then \( \tilde{w}_1 \cdot \tilde{w}'_2 \) is a weakly decreasing sequence for \( m \), and hence \( L_\tau(\tilde{F}_1 m) \leq L_\tau(m) \).

\( \square \)

**Lemma 6.10.** If \( \tilde{E}_1 m \neq 0 \) for \( m \in \mathcal{M}^\tau(\lambda) \) and \( i \in \mathbb{Z}_{>0} \), then \( L_\tau(\tilde{E}_1 m) \leq L_\tau(m) \).

**Proof.** The proof is similar to that of Lemma 6.9. Let \( m = (A,T) \in \mathcal{M}^\tau(\lambda) \) with \( A = (a_i, -j^\nu) \).

**Case 1.** Suppose that \( \tilde{E}_1 m = (\tilde{E}_1 A, T) \neq 0 \) and \( \tilde{e}_i A = A + E_{i,-j^\nu} - E_{i+1,-j^\nu} \) for some \( j \), equivalently \( \tilde{e}_i A = E_{j,-i^\nu} - E_{j,-(i+1)^\nu} \). Let \( P = (i,-j^\nu) \) and \( Q = (i+1,-j^\nu) \).

Let \( \tilde{w}_1 \cdot \tilde{w}_2 \) be a maximal weakly decreasing sequence for \( \tilde{E}_1 m \), where \( \tilde{w}_1 = w(A) \) for some \( \tilde{A} \in \mathcal{M}^\tau(\lambda) \) with \( \tilde{A} \leq \tilde{E}_1 A \).

(i) Suppose that either \( P, Q \notin \text{supp}(\tilde{A}) \) or \( P, Q \in \text{supp}(\tilde{A}) \). In this case, \( \tilde{w}_1 \cdot \tilde{w}_2 \) is also a weakly decreasing sequence for \( m \), and hence \( L_\tau(\tilde{E}_1 m) \leq L_\tau(m) \).

(ii) Suppose that \( P \notin \text{supp}(\tilde{A}) \) and \( Q \in \text{supp}(\tilde{A}) \). Let \( \tilde{w}'_1 \) be of maximal length such that \( \tilde{w}'_1 = w(A') \) with \( A' \leq A \) and \( \text{supp}(A') = \text{supp}(A) \). Then \( \tilde{w}_1 \cdot \tilde{w}_2 \) is a weakly decreasing sequence for \( m \) and

\[
\ell(\tilde{w}'_1) = \begin{cases} 
\ell(\tilde{w}_1) + 1, & \text{if } i = j \text{ and } a_{i+1,-(i+1)^\nu} = 1, \\
\ell(\tilde{w}_1) + 2, & \text{otherwise},
\end{cases}
\]

which imply that \( L_\tau(\tilde{E}_1 m) \leq L_\tau(m) - 1 < L_\tau(m) \).

(iii) Suppose that \( P \in \text{supp}(\tilde{A}) \) and \( Q \notin \text{supp}(\tilde{A}) \). Let \( \text{supp}(\tilde{A}) = \{ P_1 = (i_1, -j_1^\nu), \ldots, P_r = (i_r, -j_r^\nu) \} \), where \( P_1 < \ldots < P_r \) with respect to the lexicographic ordering on \( \mathbb{Z}_{\geq 0} \times \mathbb{Z}_{<0}^\nu \), and \( P_s = P \) for some \( 1 \leq s \leq r \).

If \( i_{s-1} > i_s = i \) or \( s = 1 \), choose \( \tilde{w}'_1 \) of maximal length such that \( \tilde{w}'_1 = w(A') \) for some \( \tilde{A}' \in \mathcal{M}^\tau(\lambda) \) with \( \tilde{A}' \leq A \) and

\[
\text{supp}(\tilde{A}') \subseteq \text{supp}(\tilde{A}) \cup \{ (i+1,-j^\nu), (j,-(i+1)^\nu) \}
\]

Then \( \tilde{w}_1 \cdot \tilde{w}_2 \) is a weakly decreasing sequence for \( m \) and \( \ell(\tilde{w}_1) \leq \ell(\tilde{w}'_1) \), which imply that \( L_\tau(\tilde{E}_1 m) \leq L_\tau(m) \).
If $s \geq 2$ and $s_{s-1} = i$, then choose a minimal $t \leq s-1$ such that $i_t = i$. Considering the subword of $w(A) \cdot w(T)$ consisting of $i$ and $i+1$ and then applying [23], Proposition 2.1.1 (i)], we have

$$
\sum_{j_t \leq k \leq j_s-1} a_{i,k} \leq \sum_{j_t+1 \leq l \leq j_s} a_{i+1,l},
$$

(6.19)

$$
\sum_{j_t \leq k \leq j_s-1} a_{k,-i} \leq \sum_{j_t+1 \leq l \leq j_s} a_{t,-(i+1)},
$$

Choose $\tilde{w}_1'$ of maximal length such that $\tilde{w}_1' = w(A')$ for some $A' \in \mathcal{M}_E$ with $A' \leq A$ and

$$
supp(A') \subset \left(supp(A) \setminus X\right) \cup Y,
$$

(6.20)

where

$$
X = \{(i,-k), (k,-i) \mid j_t \leq k \leq j_s - 1 = j - 1 \},
$$

$$
Y = \{(i+1,-l), (l,-(i+1)) \mid j_t + 1 \leq l \leq j_s = j \}.
$$

Then $\tilde{w}_1' \cdot \tilde{w}_2$ is a weakly decreasing sequence for $m$ by (6.20), and $\ell(\tilde{w}_1) \leq \ell(\tilde{w}_1')$ by (6.19), which also imply that $L_\tau(\tilde{E}_i m) \leq L_\tau(m)$.

**Case 2.** Suppose that $\tilde{E}_i m = (A, \tilde{E}_i T) \neq 0$. Let $\tilde{w}_1 \cdot \tilde{w}_2$ be a maximal weakly decreasing sequence for $\tilde{E}_i m$ with $\tilde{w}_1 = \tilde{w}_{1,1} \ldots \tilde{w}_{1,r}$ and $\tilde{w}_2 = \tilde{w}_{2,1} \ldots \tilde{w}_{2,s}$. Assume that $w(T) = w_1 \ldots w_u$ and $w_v = i + 1$ ($1 \leq v \leq u$) in $T$ is replaced by $w_v' = i$ by applying $\tilde{E}_i$ to $T$. If $\tilde{w}_2$ does not contain $i$ corresponding to $w_v'$, then $\tilde{w}_1 \cdot \tilde{w}_2$ is also a weakly decreasing sequence for $m$ and hence $L_\tau(\tilde{E}_i m) \leq L_\tau(m)$. Now we assume that $\tilde{w}_2$ contains $i$ corresponding to $w_v'$, say $\tilde{w}_{2,p} = i$.

(i) Suppose that $\tilde{w}_{1,r} \geq i + 1$. If $p = 1$ or $\tilde{w}_{2,p-1} > i$, then $\tilde{w}_1 \cdot \tilde{w}_2'$ is a weakly decreasing sequence for $m$, where $\tilde{w}_2'$ is obtained from $\tilde{w}_2$ by replacing $\tilde{w}_{2,p}$ with $i+1$, and hence $L_\tau(\tilde{E}_i m) \leq L_\tau(m)$. Otherwise, we have $p \geq 2$ and $\tilde{w}_{2,p-1} = i$. In this case, choose a minimal $1 \leq q < p$ such that $\tilde{w}_{2,q} = i$. If $\tilde{w}_{2,q} = w_t$ for some $1 \leq t < v$, then by [23], Proposition 2.1.1 (ii)] there exists a subword $i+1)^{p-q}$ of $w_{t+1} \ldots w_{v-1}$. Let $\tilde{w}_2'$ be obtained from $\tilde{w}_2$ by replacing $\tilde{w}_{2,q} \ldots \tilde{w}_{2,p} = i^{p-q+1}$ with $(i+1)^{p-q+1}$. Then $\tilde{w}_1 \cdot \tilde{w}_2'$ is a weakly decreasing sequence for $m$. Hence $L_\tau(\tilde{E}_i m) \leq L_\tau(m)$.

(ii) Suppose that $\tilde{w}_{1,r} = i$. We have $\tilde{w}_{2,1} = \ldots = \tilde{w}_{2,p} = i$. Note that $p$ is the number of occurrences of $i$ in $w_1 \ldots w_{v-1}$ by the maximality of $\tilde{w}_1 \cdot \tilde{w}_2$. Next, let $supp(A) = \{ P_1 = (i_1, -i_1'), \ldots, P_a = (i_a, -i_a') \}$ with $P_1 < \ldots < P_a$ and let $b$ be the smallest such that $i_b = i$. Note that $i_k = i$ for $b \leq k \leq a$. Again by [23], Proposition 2.1.1 (ii)], we have

$$
\sum_{j_b \leq j} a_{i,-j} + m_i < \sum_{j_b \leq j} a_{i+1,-(j+1)} + m_{i+1},
$$

(6.21)
where $m_i$ is the number of occurrences of $i$ in $w_1 \ldots w_{v-1}$ and $m_{i+1}$ is the number of occurrences of $i+1$ in $w_1 \ldots w_v$. Choose $\bar{w}_1'$ of maximal length such that $\bar{w}_1' = w(A')$ for some $A' \in M^\ell$ with $A' \leq A$ and

\begin{equation}
(6.22)
\supp(A') \subset (\supp(A) \setminus X) \cup Y,
\end{equation}

where

$$X = \{ (i, -k^\vee), (k, -i^\vee) \mid j_b \leq k \},$$
$$Y = \{ (i+1, -l^\vee), (l, -(i+1)^\vee) \mid j_b + 1 \leq l \}.$$

Let $\bar{w}_2$ be obtained from $\bar{w}_2$ by replacing $\bar{w}_{2,1} \ldots \bar{w}_{2,p} = i^m_{i+1}$ with $(i+1)^{m+i}$. Then $\bar{w}_1', \bar{w}_2'$ is a weakly decreasing sequence for $m$ by (6.22), and

\begin{align*}
&\ell(\bar{w}_1') + 2\ell(\bar{w}_2') - \ell(\bar{w}_1) - 2\ell(\bar{w}_2) \\
&= \sum_{j_b+1 \leq l} (a_{i+1,-l^\vee} + a_{i,-(i+1)^\vee}) + 2m_{i+1} - \sum_{j_b \leq k} (a_{i,-k^\vee} + a_{k,-i^\vee}) - 2(m_i + 1) \\
&= 2\sum_{j_b+1 \leq l} a_{i+1,-l^\vee} + 2m_{i+1} - 2\sum_{j_b \leq k} a_{i,-k^\vee} - 2m_i - 2 \geq 0,
\end{align*}

by (6.21). Hence, $L_\ell(\bar{E}_i m) \leq L_\ell(m)$. \hfill \square

**Proposition 6.11.** $L_\ell(\cdot)$ is constant on each connected $1_\infty$-subcrystal of $M^\ell(\lambda)$.

**Proof.** Suppose that $m' = \bar{E}_i m \neq 0$ for $m, m' \in M^\ell(\lambda)$ and $i \in \mathbb{Z}_{>0}$. By Lemmas 6.9 and 6.10 it follows that

$$L_\ell(m) = L_\ell(\bar{E}_i m') \leq L_\ell(m') = L_\ell(\bar{F}_i m) \leq L_\ell(m).$$

Hence we have $L_\ell(m) = L_\ell(m')$. \hfill \square

6.5. Restriction of $M^\ell(\lambda)$ to a normal highest weight crystal.

**Definition 6.12.** For $(\lambda, n) \in \mathcal{P}(t)$, define

$$M^\ell(\lambda, n) = \{ m \otimes t_{nA_0^\ell} \in M^\ell(\lambda) \otimes T_{nA_0^\ell} \mid L_\ell(m) \leq n \}.$$

Regarding $T_{nA_0^\ell} = \{ t_{nA_0^\ell} \}$ as an $\varphi_\infty$-crystal with $wt^\ell(t_{nA_0^\ell}) = nA_0^\ell$, $e_i^\ell(t_{nA_0^\ell}) = \varphi_i^\ell(t_{nA_0^\ell}) = -\infty (i \in \mathbb{Z}_{\geq 0})$, we may view $M^\ell(\lambda, n)$ as an $\varphi_\infty$-subcrystal of $M^\ell(\lambda) \otimes T_{nA_0^\ell}$.

**Lemma 6.13.** $M^\ell(\lambda, n)$ is a connected normal $\varphi_\infty$-crystal with a unique highest weight element $\mathcal{O}_{(\lambda, n)}^\ell = (\varnothing, H_\lambda) \otimes t_{nA_0^\ell} \in M^\ell(\lambda, n)$ of weight $\Lambda(\lambda, n)$. 

Proof. Let us first show that $M^f(\lambda, n)$ is a normal $\mathfrak{r}_\infty$-crystal.

Let $b = m \otimes t_{n\Lambda_0^+} \in M^f(\lambda, n)$ be given, where $m = (A, T)$ with $A = (a_{i,j})$. Let $S_i(b) = \{ \tilde{X}_i^b \mid k \geq 0, X = E, F \} \setminus \{ 0 \}$ for $i \in \mathbb{Z}_{>0}$, where we regard $b$ as an element in the crystal $M^f(\lambda) \otimes T_{n\Lambda_0^+}$. Note that $\tilde{X}_i^b \neq 0$ if and only if $\tilde{X}_i^b m \neq 0$ ($X = E, F$) since $\tilde{X}_i^b = (\tilde{X}_i^b m) \otimes t_{n\Lambda_0^+}$.

Suppose that $i \neq 0$. Since $M^f(\lambda)$ (and hence $M^f(\lambda) \otimes T_{n\Lambda_0^+}$) is a normal $\mathfrak{r}_\infty$-crystal by (3.1) and $\varepsilon_i^f(b) = \varepsilon_i^f(m)$, $\varphi_i^f(b) = \varphi_i^f(m)$, we have

$$S_i(b) = \{ \tilde{E}_i^b, \tilde{F}_i^b \mid 0 \leq k \leq \varepsilon_i^f(b), 0 \leq l \leq \varphi_i^f(b) \}.$$ 

By Proposition 6.11 we have $S_i(b) \subset M^f(\lambda, n)$. Hence, $M^f(\lambda, n)$ is a normal $\mathfrak{r}_\infty$-crystal.

Suppose that $i = 0$. By Lemma 6.8 $\tilde{E}_0^b \in M^f(\lambda, n) \cup \{ 0 \}$ for $k \geq 0$ and $\varepsilon_0^f(b) = \max \{ k \mid \tilde{E}_0^b \neq 0 \} = \varepsilon_0^f(m)$. Next, consider $\tilde{F}_0^b$ for $l \geq 0$. Since

$$\text{wt}^f(b) = n\Lambda_0^+ + \sum_{i \geq 1} (m_i(i) + m_i(T)) \hat{\varepsilon}_i,$$

where $i = w(A)$ and $m_i(i)$ (resp. $m_i(T)$) is the number of occurrences of $i$ in $i$ (resp. $T$), we have

$$\langle \text{wt}^f(b), \hat{h}_0 \rangle = n - \frac{2}{\epsilon} (m_1(i) + m_1(T)) = n - \frac{2}{\epsilon} \left( \sum_{i \geq 1} a_{1, i\nu} + m_1(T) \right)$$

and

$$\varphi_0^f(b) = \langle \text{wt}^f(b), \hat{h}_0 \rangle + \varepsilon_0^f(b) = \langle \text{wt}^f(b), \hat{h}_0 \rangle + \frac{1}{\epsilon} a_{1, -1\nu}$$

$$= n - \frac{1}{\epsilon} a_{1, -1\nu} - \frac{2}{\epsilon} \sum_{i \geq 2} a_{1, i\nu} - \frac{2}{\epsilon} m_1(T).$$

By Lemma 6.8 we have

$$L_\ell(\tilde{F}_0^b m) = \max \left\{ L_\ell(m), \frac{1}{\epsilon} a_{1, -1\nu} + \frac{2}{\epsilon} \sum_{i \geq 2} a_{1, i\nu} + \frac{2}{\epsilon} m_1(T) + l \right\}.$$

Then

$$\tilde{F}_0^b \in M^f(\lambda, n) \iff L_\ell(\tilde{F}_0^b m) \leq n$$

$$\iff \frac{1}{\epsilon} a_{1, -1\nu} + \frac{2}{\epsilon} \sum_{i \geq 2} a_{1, i\nu} + \frac{2}{\epsilon} m_1(T) + l \leq n$$

$$\iff l \leq \varphi_0^f(b).$$

Therefore,

$$S_0(b) \cap M^f(\lambda, n) = \{ \tilde{E}_k^b, \tilde{F}_k^b \mid 0 \leq k \leq \varepsilon_0^f(b), 0 \leq l \leq \varphi_0^f(b) \}.$$
Theorem 6.14. For \(0 \leq m\) where \(A\) and in particular \(\tilde{\Psi}\) is a diagonal matrix with \(a_{i,-i^{v}} \geq a_{i+1,-(i+1)^{v}}\) for \(i \geq 1\). If \(a_{1,-1^{v}} \neq 0\), then we have \(\tilde{\Psi}_{0} \neq 0\), which is a contradiction. Hence we have \(A = 0\), and \(T = H_{\lambda}\), that is, \(b = \Omega_{\lambda}^{F}(\lambda, n)\). This implies that \(M^{\ell}(\lambda, n) = \{ \tilde{F}_{i_{1}} \cdots \tilde{F}_{i_{r}} \Omega_{\lambda}^{F}(\lambda, n) | r \geq 0, i_{1}, \ldots, i_{r} \in \mathbb{Z}_{\geq 0} \}\), and it is connected.

\[\square\]

**Theorem 6.14.** For \((\lambda, n) \in \mathcal{P}(x)\), we have

\[M^{\ell}(\lambda, n) \simeq B(\mathfrak{r}_{\infty}, \Lambda^{\ell}(\lambda, n)).\]

**Proof.** Consider the following diagram

\[
\begin{array}{ccc}
M^{\ell}(\lambda, n) & \cap & B(\mathfrak{gl}_{\infty}, \Lambda(\lambda, \epsilon n)) \\
\downarrow \Psi_{\lambda, \lambda, n} & & \\
M^{\ell}(\lambda) \otimes T_{n\Lambda_{0}} & \subset & M(\lambda, \lambda) \otimes T_{\epsilon n\Lambda_{0}}
\end{array}
\]

where \(\Psi_{\lambda, \lambda, n}\) is the embedding in Proposition 6.2. First, we claim that

\[M^{\ell}(\lambda, n) \subset \text{Im}\Psi_{\lambda, \lambda, n}\]

which implies that there exists an injective map

\[\psi_{\lambda, n} : M^{\ell}(\lambda, n) \longrightarrow B(\mathfrak{gl}_{\infty}, \Lambda(\lambda, \epsilon n))\]

such that \(\Psi_{\lambda, \lambda, n} \circ \psi_{\lambda, n}(b) = b\) for \(b \in M^{\ell}(\lambda, n)\).

Let \(b = \tilde{F}_{i_{r}} \cdots \tilde{F}_{i_{1}} \Omega_{\lambda}^{F}(\lambda, n) \in M^{\ell}(\lambda, n)\) be given for \(r \geq 0\) and \(i_{1}, \ldots, i_{r} \in \mathbb{Z}_{\geq 0}\). We use induction on \(r\). If \(r = 0\), then \(\Omega_{\lambda}^{F}(\lambda, n) = \Omega_{\lambda, \lambda} \otimes t_{n\Lambda_{0}} = \Psi_{\lambda, \lambda, n}(u_{\lambda}(\lambda, n))\). Suppose that \(r \geq 1\). Put \(b' = \tilde{F}_{i_{r-1}} \cdots \tilde{F}_{i_{1}} \Omega_{\lambda}^{F}(\lambda, n)\). By induction hypothesis, \(b' = \Psi_{\lambda, \lambda, n}(b)\) for some \(b \in B(\mathfrak{gl}_{\infty}, \Lambda(\lambda, \lambda, \epsilon n))\). Since \(\Psi_{\lambda, \lambda, n}\) preserves the weights, and commutes with \(\tilde{E}_{i}\) for \(i \in \mathbb{Z}_{\geq 0}\), we have

\[
\varphi_{i_{r}}^{\ell}(b') = \varphi_{i_{r}}^{\ell}(\Psi_{\lambda, \lambda, n}(b)) = \begin{cases} 
\varphi_{i_{r}}(b) = \varphi_{-i_{r}}(b), & \text{if } i_{r} > 0, \\
\frac{1}{\epsilon} \varphi_{0}(b), & \text{if } i_{r} = 0.
\end{cases}
\]

Equivalently,

\[\varphi_{0}^{\ell}(b) = \max\{ k | \tilde{E}_{0}^{k}b \neq 0 \text{ in } M^{\ell}(\lambda, n) \}, \]

\[\varphi_{0}^{\ell}(b) = \max\{ k | \tilde{E}_{0}^{k}b \neq 0 \text{ in } M^{\ell}(\lambda, n) \}.
\]

Hence \(M^{\ell}(\lambda, n)\) is a normal \(\mathfrak{r}_{\infty}\)-crystal.

Next, we claim that \(M^{\ell}(\lambda, n)\) is connected. Let \(b = m \otimes t_{n\Lambda_{0}} \in M^{\ell}(\lambda, n)\) be given, where \(m = (A, T)\) with \(A = (a_{i,-j^{v}})\). Since \(\tilde{E}_{i}b \in M^{\ell}(\lambda, n) \cup \{0\}\), we may assume that \(\tilde{E}_{i}b = 0\) for all \(i \in \mathbb{Z}_{\geq 0}\). Then \(\tilde{E}_{i}A = 0\) for \(i \in \mathbb{Z}_{\geq 0}\) by tensor product rule, and in particular \(A\) is a diagonal matrix with \(a_{i,-i^{v}} \geq a_{i+1,-(i+1)^{v}}\) for \(i \geq 1\). If \(a_{1,-1^{v}} \neq 0\), then we have \(\tilde{E}_{0}m \neq 0\), which is a contradiction. Hence we have \(A = 0\), and \(T = H_{\lambda}\), that is, \(b = \Omega_{\lambda}^{F}(\lambda, n)\). This implies that \(M^{\ell}(\lambda, n) = \{ \tilde{F}_{i_{1}} \cdots \tilde{F}_{i_{r}} \Omega_{\lambda}^{F}(\lambda, n) | r \geq 0, i_{1}, \ldots, i_{r} \in \mathbb{Z}_{\geq 0} \}\), and it is connected.

\[\square\]
We have $\varphi^x_{i^*}(b') \geq 1$ by Lemma 6.13 and $\wF_i b \neq 0$ since $\varphi_i(b) = \varphi_{-i}(b') \geq 1$ and $B(\mathfrak{gl}_\infty, \Lambda(\lambda, \lambda, \epsilon n))$ is normal. Hence
\[
b = \wF_i \psi_{\lambda, \lambda, n}(b) = \Psi_{\lambda, \lambda, n}(\wF_i b) \in \text{Im}(\Psi_{\lambda, \lambda, n}).
\]
This completes the induction, and proves the claim.

Recall that $\wF_i$ and $\wF_i$ ($i \in \mathbb{Z}_{\geq 0}$) on $B(\mathfrak{gl}_\infty, \Lambda(\lambda, \lambda, \epsilon n))$ are defined as in (6.11). Then we can check that $\psi_{\lambda, n}$ commutes with $\wF_i$ and
\[
\begin{align*}
\text{wt}(\psi_{\lambda, n}(b)) &= \text{wt}^\xi(b), \\
\epsilon_i(\psi_{\lambda, n}(b)) &= \epsilon_{-i}(\psi_{\lambda, n}(b)) = \epsilon_i^\xi(b) \quad (i > 0), \\
\varphi_i(\psi_{\lambda, n}(b)) &= \varphi_{-i}(\psi_{\lambda, n}(b)) = \varphi_i^\xi(b) \quad (i > 0), \\
\epsilon_0(\psi_{\lambda, n}(b)) &= \epsilon_{0i}^\xi(b),
\end{align*}
\]
for $b \in \mathcal{M}_\xi(\lambda, n)$ and $i \in \mathbb{Z}_{\geq 0}$. This implies that $\psi_{\lambda, n}$ commutes with $\wF_i$ ($i \in \mathbb{Z}_{\geq 0}$) since $\mathcal{M}_\xi(\lambda, n)$ and $B(\mathfrak{gl}_\infty, \Lambda(\lambda, \lambda, \epsilon n))$ are normal.

Therefore, as an $\mathfrak{gl}_\infty$-crystal we have
\[
\mathcal{M}_\xi(\lambda, n) \simeq C(u_{\Lambda(\lambda, \lambda, \epsilon n)}),
\]
where $C(u_{\Lambda(\lambda, \lambda, \epsilon n)})$ is the connected component in $B(\mathfrak{gl}_\infty, \Lambda(\lambda, \lambda, \epsilon n))$ generated by $u_{\Lambda(\lambda, \lambda, \epsilon n)}$ with respect to $\wF_i$ and $\wF_i$ for $i \in \mathbb{Z}_{\geq 0}$. On the other hand, by [22, Theorem 5.1],
\[
C(u_{\Lambda(\lambda, \lambda, \epsilon n)}) \simeq B(\mathfrak{f}_\infty, \Lambda^\xi(\lambda, n))
\]
as an $\mathfrak{gl}_\infty$-crystal. This completes the proof.

6.6. Proof of Theorem 3.11. Recall that we have an $\mathfrak{gl}_\infty$-crystal isomorphism
\[
\kappa^\xi_\lambda : \mathcal{M}_\Sigma(\lambda) \longrightarrow \mathcal{F}_\lambda
\]
by Proposition 6.5. The following lemma shows that $L_\Sigma$ and $\Delta_\Sigma$ coincide under $\kappa^\xi_\lambda$.

Lemma 6.15. For $\mathbf{m} = (A, T) \in \mathcal{M}_\Sigma(\lambda)$ with $\kappa^\xi_\lambda(\mathbf{m}) = (S, T)$, we have
\[
L_\Sigma(\mathbf{m}) = \Delta_\Sigma((T \rightarrow S)_R).
\]

Proof. Let $\mathbf{m}' \in \mathcal{M}_\Sigma(\lambda)$ be the highest weight element of the connected $\mathfrak{l}_\infty$-subcrystal of $\mathcal{M}_\Sigma(\lambda)$ including $\mathbf{m}$. By Proposition 6.11, $L_\Sigma(\mathbf{m}) = L_\Sigma(\mathbf{m}')$. On the other hand, the recording tableau $(T \rightarrow S)_R$ is invariant under the actions of $E_i$ and $F_i$ on $(S, T)$ for $i \in \mathbb{Z}_{\geq 0}$, that is $(T \rightarrow S)_R = (T' \rightarrow S')_R$, where $\kappa^\xi_\lambda(\mathbf{m}') = (S', T')$ (see for example [19, Proposition 4.17]). So, it suffices to show for the case when $\mathbf{m}$ is an $\mathfrak{l}_\infty$-highest weight element.
Since \(\mathfrak{m} = (A, T)\) is an \(l_{\infty}\)-highest weight element in \(M^\tau(\lambda)\), \(S = H_\tau\) for some \(\tau \in \mathcal{P}_n\) and \(A\) is a diagonal matrix with \(a_{i, -i'} = \tau_i\). Also \((T \to H_\tau) = H_\sigma\) for some \(\sigma \in \mathcal{P}_n\). This implies that \(T \in LR^\tau_{\lambda}\) or \(U = (T \to H_\tau)_R \in LR^\tau_{\lambda}\).

For a subword \(w\) of \(w(U)\), let us denote by \(w^\sharp\) the subword of \(w(T)\) corresponding to \(w\) under the insertion \(T \to S\). Suppose that \(w = w_1 \ldots w_r\) is weakly decreasing and \(w_1\) is in the \(k\)-th row of \(\tau\) such that \((\tau_k + 2\ell(w))/\epsilon = \Delta_\tau(U)\). Then by Remark 3.8, we may assume that \(w^\sharp = w_1^\sharp \ldots w_r^\sharp\) is a weakly decreasing subword of \(w(T)\) with \(w_1^\sharp = k\), and \(k^{\tau_k} \cdot w^\sharp\) forms a weakly decreasing sequence for \(\mathfrak{m}\), which implies that \(\Delta_\tau(U) \leq L_\tau(m)\).

Conversely, let \(w_1 \cdot w_2\) be a maximal weakly decreasing sequence for \(\mathfrak{m}\). Since \(A\) is a diagonal matrix, \(w_1 = k^{\tau_k}\) for some \(k\). Let \(w\) be a subword of \(w(U)\) such that \(w^\sharp = w_2^\sharp\). Then by Remark 6.7 (2), we may also assume that \(w = w_1 \ldots w_r\) is weakly decreasing and \(w_1\) is in the \(k\)-th row of \(\tau\). Since \(L_\tau(m) = (\tau_k + 2\ell(w_2))/\epsilon = (\tau_k + 2\ell(w))/\epsilon\), we have \(L_\tau(m) \leq \Delta_\tau(U)\).

By Lemma 6.15, the map \(m \otimes t_{nA^\lambda_0} \mapsto \nu^{\lambda}_\tau(m)\) gives an \(\tau_{\infty}\)-crystal isomorphism
\[
\mathcal{M}^\tau(\lambda, n) \longrightarrow \mathcal{J}^\tau(\lambda, n).
\]
Therefore by Theorem 6.14, we have
\[
\mathcal{J}^\tau(\lambda, n) \simeq B(\tau_{\infty}, \Lambda^\tau(\lambda, n)).
\]
This proves Theorem 3.11.
