UNITARY SPHERICAL REPRESENTATIONS
OF DRINFELD DOUBLES

YUKI ARANO

ABSTRACT. We study irreducible spherical unitary representations of the Drinfeld double of a q-deformation of a connected simply connected compact Lie group, which can be considered as a quantum analogue of the complexification of the Lie group. In the case of SU_q(3), we give a complete classification of such representations. As an application, we show the Drinfeld double of the quantum group SU_q(2n + 1) has property (T), which also implies central property (T) of the dual of SU_q(2n + 1).

1. Introduction

As in many literature (e.g. [14], [17]), the Drinfeld double construction for a q-deformation of a compact Lie group can be regarded as a quantization of the complexification of the original Lie group. In this paper, we study irreducible spherical unitary representations of such Drinfeld double via its analogy to the complex Lie group, especially toward the classification in the case of SU_q(3). Our first main result is as follows. (cf. [8] for the classical case.)

Main Theorem 1. Fix 0 < q < 1 and let
\[ X := \{(\nu_1, \nu_2, \nu_3) \in (\mathbb{C}/2\pi i \log(q)^{-1}\mathbb{Z})^3 \mid \nu_1 + \nu_2 + \nu_3 = 0\}. \]
Consider the natural permutation group W = S_3-action on X. Then the irreducible unitary spherical representations of the Drinfeld double of SU_q(3) are parametrized by \( \nu \in X/W \) such that
(i) \( \nu \) is imaginary (unitary principal series),
(ii) \( \nu = (t + is, -t + is, -2is) \) modulo \( \pi i \log(q)^{-1}\mathbb{Z}^3 \times W \) for \( t \in [-1, 1] \) and \( s \in \mathbb{R} \) (complementary series) or
(iii) \( \nu = (2, -2, 0) \) modulo \( \pi i \log(q)^{-1}\mathbb{Z}^3 \times W \) (characters including the trivial).

We note that the classification of irreducible unitary representations of the Drinfeld double of a q-deformation is initiated by Pusz [18] in the case of SU_q(2). In [21], Voigt and Yuncken independently obtained similar constructions of irreducible unitary principal series also in nonspherical cases.

As another consequence, we show the isolation of the trivial representation in the case of SU_q(2n + 1).

Main Theorem 2. Fix 0 < q < 1. For \( n = 1, 2, \ldots \), the Drinfeld double of SU_q(2n + 1) has property (T).
the structures of the corresponding operator algebras, for example, [3], [10] and [11].

In [6], De Commer, Freslon and Yamashita pointed out that the approximation properties for the Drinfeld doubles of compact quantum groups appeared to be closely related to that of the dual discrete quantum group. In the same paper, they showed the central Haagerup property for the dual of SU_q(2). A main application of the result in this paper is to show central property (T), which is contrary to the central Haagerup property, for the dual of SU_q(2n + 1), although it is amenable and has commutative fusion rules.

Acknowledgement The author wishes to express his gratitude to Kenny De Commer, Hironori Oya and Makoto Yamashita for many fruitful discussions. He is grateful to Kenny De Commer, Yasuyuki Kawahigashi, Christian Voigt, Makoto Yamashita and Robert Yuncken for many valuable comments and pointing out mistakes and typos in the draft version of this paper. He also appreciates the supervision of Yasuyuki Kawahigashi. This work was supported by the Research Fellow of the Japan Society for the Promotion of Science and the Program for Leading Graduate Schools, MEXT, Japan.

2. Preliminaries

2.1. Quantized enveloping algebras. Throughout this paper, the field is C. By \( \mathbb{Z}_+ \), we mean \{1, 2, \ldots \}. We fix \( 0 < q < 1 \).

Let \( G \) be a connected simply connected compact Lie group, \( \mathfrak{g} \) the complexification of its Lie algebra, \( \mathfrak{h} \) a Cartan subalgebra of \( \mathfrak{g} \), \( \Delta \) the set of roots, \( Q \subset \mathfrak{h}^* \) the root lattice and \( P \subset \mathfrak{h}^* \) the weight lattice. Let \((\cdot, \cdot)\) be the natural bilinear form on \( \mathfrak{h} \), which is normalized as \((\alpha, \alpha) = 2\) for a short root \( \alpha \). For each \( \alpha \in \Delta \), let \( \alpha^\vee := 2\alpha/(\alpha, \alpha) \) be the coroot. We fix a set \( \Pi \) of simple roots and let \( \Delta^+ (Q^+, P^+) \) be the set of positive roots (positive elements in the root lattice, positive weights) with respect to \( \Pi \).

Put \( q_\alpha := q^{(\alpha, \alpha)/2} \),

\[
q_n := \frac{q^n - q^{-n}}{q - q^{-1}}, \\
q_n! := q_n(n - 1)_q \cdots 1_q, \\
\binom{n}{m}_q := \frac{q_n!}{m_q!(n - m)_q!}.
\]

Definition 2.1. The quantized enveloping algebra \( U_q(\mathfrak{g}) \) is the algebra defined by generators \( \{K_\lambda, E_\alpha, F_\alpha \mid \lambda \in P, \alpha \in \Pi \} \) and relations

\[
K_0 = 1, \quad K_\lambda K_\mu = K_{\lambda+\mu}, \\
K_\lambda E_\alpha K_{-\lambda} = q^{(\alpha, \lambda)} E_\alpha, \quad K_\lambda F_\alpha K_{-\lambda} = q^{- (\alpha, \lambda)} F_\alpha, \\
[E_\alpha, F_\alpha] = \frac{K_\alpha - K_{-\alpha}}{q_\alpha - q_\alpha} = 1, \\
\sum_{r=0}^{1-(\alpha, \beta)} (-1)^r \binom{1 - (\alpha, \beta)}{r} q_\alpha E_\beta E_\alpha E_{1-(\alpha, \beta)-r} = 0, \\
\sum_{r=0}^{1-(\alpha, \beta)} (-1)^r \binom{1 - (\alpha, \beta)}{r} q_\alpha F_\beta F_\alpha F_{1-(\alpha, \beta)-r} = 0.
\]
Quantum coordinate algebra.

One may define a Hopf \( \ast \)-algebra structure on \( U_q(\mathfrak{g}) \) by

\[
\hat{\Delta}(K_\lambda) = K_\lambda \otimes K_\lambda, \quad \hat{\varepsilon}(K_\lambda) = 1, \quad \hat{S}(K_\lambda) = K_{-\lambda},
\]

\[
\hat{\Delta}(E_\alpha) = E_\alpha \otimes 1 + K_\alpha \otimes E_\alpha, \quad \hat{\varepsilon}(E_\alpha) = 0, \quad \hat{S}(E_\alpha) = K_{-\alpha}E_\alpha,
\]

\[
\hat{\Delta}(F_\alpha) = F_\alpha \otimes K_{-\alpha} + 1 \otimes F_\alpha, \quad \hat{\varepsilon}(F_\alpha) = 0, \quad \hat{S}(F_\alpha) = F_\alpha K_\alpha,
\]

and the \( \ast \)-structure is given by

\[
K_\lambda^\ast = K_{-\lambda}, \quad F_\alpha^\ast = F_\alpha K_\alpha, \quad F_\alpha^* = K_{-\alpha}E_\alpha.
\]

Let \( U_q(n^+)(\text{resp. } U_q(h), U_q(n^-)) \) be the subalgebra of \( U_q(\mathfrak{g}) \) generated by \( E_\alpha \)'s (resp. \( K_\lambda \)'s, \( F_\alpha \)'s). Then the multiplication

\[
U_q(n^-) \otimes U_q(h) \otimes U_q(n^+) \rightarrow U_q(\mathfrak{g})
\]

is an isomorphism as vector spaces. Through this isomorphism, \( \mathcal{P} := \hat{\varepsilon}|_{U_q(n^-)} \otimes \text{id} \otimes \hat{\varepsilon}|_{U_q(n^+)} \) is a projection onto \( U_q(h) \).

For each \( \lambda \in \mathfrak{h}^* \), let \( V(\lambda) \) be the unique irreducible highest module of highest weight \( \lambda \), that is, there exists \( v_\lambda \in V(\lambda) \) such that

\[
K_\mu v_\lambda = q(\mu, \lambda)v_\lambda.
\]

We also denote the corresponding representation by \( \pi^\lambda \). If \( \lambda \in P_+ \), then \( V(\lambda) \) is finite dimensional. We say a \( U_q(\mathfrak{g}) \)-module is of type 1 if it decomposes into a direct sum of \( V(\lambda) \)'s for \( \lambda \in P_+ \). Notice that any subquotient of type 1 module is also of type 1.

On the other hand, if \( \mu \in \pi i \log(q)^{-1}P \), \( V(\mu) \) is 1-dimensional. Hence for \( \lambda \in \mathfrak{h}^* \) and \( \mu \in \pi i \log(q)^{-1}P \),

\[
V(\lambda + \mu) = V(\lambda) \otimes V(\mu).
\]

In particular, for \( \lambda \in P_+ + \pi i \log(q)^{-1}P \), \( V(\lambda) \) is finite dimensional. Notice that

\[
V(\lambda + \mu)^* \otimes V(\lambda + \mu) \simeq V(\lambda)^* \otimes V(\lambda)
\]

for \( \lambda \in P_+ \).

For any \( U_q(\mathfrak{g}) \)-module \( V \), we denote the isotypical component of \( V(\lambda) \) by \( V^\lambda \) and the weight space of weight \( \mu \) by \( V_\mu \). Let \( |V : V(\lambda)| \) be the multiplicity of \( V(\lambda) \) in \( V \).

### 2.2. Quantum coordinate algebra.

Let \( A, B \) be Hopf algebras. A skew pairing between \( A \) and \( B \) is a map

\[
A \times B \rightarrow \mathbb{C}
\]

such that

\[
(ab, c) = (a \otimes b, \Delta_B(c)),
\]

\[
(a, cd) = (\Delta_A(a), d \otimes c),
\]

\[
(1, c) = \varepsilon_A(c),
\]

\[
(a, 1) = \varepsilon_B(a),
\]

for \( a, b \in A \), \( c, d \in B \).

If \( A, B \) are Hopf \( \ast \)-algebras, we also assume

\[
(a^\ast, b) = (a, S(b)^\ast).
\]
For a pair of Hopf algebras with a skew pairing, one defines the following actions:

For \( a \in A \) and \( b \in B \)

\[
\begin{align*}
& a \triangleright b := (a, b_{(2)})b_{(1)}, & b \triangleright a := (a, b_{(1)})b_{(2)}, \\
& b \triangleright a := (a_{(2)}, b)a_{(1)}, & a \triangleright b := (a_{(2)}, b)a_{(1)}.
\end{align*}
\]

Here we used the sumless Sweedler notation:

\[
\Delta(x) = x_{(1)} \otimes x_{(2)}.
\]

**Definition 2.2.** Let \( \mathcal{O}(G_q) \subset U_q(\mathfrak{g})^\ast \) be the subspace of matrix coefficients of type 1 representations. Then \( \mathcal{O}(G_q) \) carries a unique Hopf \( * \)-algebra structure which makes the pairing \( \mathcal{O}(G_q) \times U_q(\mathfrak{g}) \to \mathbb{C} \) skew.

Now for each type 1 module \( V, v \in V \) and \( l \in V^\ast \),

\[
c^V_{v, l}(x) := (xv, l)
\]

defines an element in \( \mathcal{O}(G_q) \). In the case of \( V = V(\lambda) \), we shall write \( c^\lambda_{v, l} \) instead of \( c^V_{v, l} \). Then the map

\[
\bigoplus_{\lambda \in P_+} V(\lambda) \otimes V(\lambda)^\ast \to \mathcal{O}(G_q) : v \otimes l \mapsto c^\lambda_{v, l}
\]

is an isomorphism of \( U_q(\mathfrak{g}) \)-modules.

Let \( \Theta : C[K_{2\lambda} | \lambda \in P] \to \mathcal{O}(T) \) defined by

\[
(\Theta(K_{2\lambda}), K_\mu) = q^{(\lambda, \mu)}.
\]

**Definition 2.3.** Let \( \mathcal{U}(G_q) := \prod_{\lambda \in P_+} \text{End}(V(\lambda)) \) be the full dual of \( \mathcal{O}(G_q) \) and \( c^\lambda(\widehat{G}_q) := \bigoplus_{\lambda \in P_+} \text{End}(V(\lambda)) \subset \mathcal{U}(G_q) \). Then one can embed \( U_q(\mathfrak{g}) \) into \( \mathcal{U}(G_q) \) and \( c^\lambda(\widehat{G}_q) \) is an ideal of \( \mathcal{U}(G_q) \).

One can easily show that there is a one-to-one correspondence among

1. type 1 representations of \( U_q(\mathfrak{g}) \),
2. nondegenerate representations of \( c^\lambda(\widehat{G}_q) \) and
3. continuous representations of \( \mathcal{U}(\widehat{G}_q) \).

**Remark 2.4.** For any \( \nu \in \mathfrak{h}^\ast \), \( K_\nu \) makes sense as an element in \( \mathcal{U}(G_q) \) by the formula

\[
K_\nu v = q^{(\nu, \text{wt}(v))} v
\]

for each weight vector \( v \in V(\lambda) \). Then we again have

\[
K_\nu K_\mu = K_{\nu + \mu}
\]

for any \( \nu, \mu \in \mathfrak{h}^\ast \). Moreover \( K_{2\pi i \log(q)^{-1} \mu} = 1 \) for any \( \mu \in Q \) shows \( K_\nu \) actually makes sense for any \( \nu \in X := \mathfrak{h}^\ast / 2\pi i \log(q)^{-1}Q \). Then elements in \( X \) are in a one-to-one correspondence with 1-dimensional representations on \( \mathcal{O}(T) \). The character \( K_\nu \) is a \( * \)-character if and only if \( \nu \in \mathfrak{h}_R^\ast \). Notice that the Weyl group \( W \) acts on \( X \) in a natural way.
Let us define the following central projections on $\mathcal{O}(G_q)$
\[
p^\lambda := 1_\lambda \in \text{End}(V(\lambda)) \subset c_c(G_q)
\]
and let $\varphi := p^0$ be the Haar state. For a type 1 $U_q(\mathfrak{g})$-module $V$, $p^\lambda$ is nothing but the projection onto $V^\lambda$.

We have
\[
\varphi \omega = \omega \varphi = \omega(1) \varphi
\]
for any $\omega \in \mathcal{U}(\hat{G}_q)$.

(The universal C*-completion of) $\mathcal{O}(G_q)$ is a compact quantum group in the sense of \cite{23}. In our notation, the modular automorphism of $\mathcal{O}(G_q)$ is given by
\[
\sigma_t(x) = K_{-2it\rho} \triangleright x \triangleleft K_{-2it\rho},
\]
where $\rho$ is the half sum of positive roots: $\rho = \frac{1}{2} \sum_{\alpha \in \Delta^+} \alpha$. We also have
\[
S^2(x) = K_{-2\rho} \triangleright x \triangleleft K_{2\rho}.
\]
In particular,
\[
\sigma_i(x) = K_{2\rho} \triangleright x \triangleleft K_{2\rho} = S^2(K_{4\rho} \triangleright x)
\]
and hence
\[
\varphi(yx) = \varphi(S^2(K_{4\rho} \triangleright x)y),
\]
which can be rewritten as
\[
x \triangleright \varphi = \varphi \triangleleft (S^2(K_{4\rho} \triangleright x)).
\]

2.3. Adjoint actions. Let us recall some of the results which appeared in \cite{1} and \cite{12}. (Notice that their results are on the field $k(q)$, but the same proofs work for a fixed parameter $q \in \mathbb{C}^\times$ as long as $q$ is not a root of unity.)

Recall the adjoint action of $U_q(\mathfrak{g})$ on itself
\[
\text{ad}(\omega) \mu := \omega_{(1)}\mu \widehat{S}(\omega_{(2)})
\]
and the coadjoint action on $\mathcal{O}(G_q)$
\[
\text{ad}(\omega)x := \omega_{(2)} \triangleright x \triangleleft \widehat{S}(\omega_{(1)}).
\]
Let $R \in \mathcal{U}(G_q \times G_q) := \prod_{\lambda,\mu \in P_+} \text{End}(V(\lambda) \otimes V(\mu))$ be the $R$-matrix. Namely, $R$ is given by the formula
\[
R := q^{\sum_{\alpha,\beta \in \Pi(B^{-1})_{\alpha,\beta}H_{\alpha} \otimes H_{\beta}}} \prod_{\alpha \in \Delta^+} \exp_{q_{\alpha}}((1 - q_{\alpha}^2)F_{\alpha} \otimes E_{\alpha}).
\]
Here $B$ is the matrix $((\alpha^\vee, \beta^\vee))_{\alpha,\beta}$, $H_{\alpha}$ is the self-adjoint element in $\mathcal{U}(G_q)$ which satisfies $q_{\alpha}H_{\alpha} = K_{\alpha}$, $E_{\alpha}, F_{\alpha}$ are the PBW basis corresponding to $\alpha$ and
\[
\exp_{q}(x) := \sum_{n=0}^{\infty} q^n(n+1)/2 \frac{x^n}{n_q!}.
\]
For our purpose, we do not need the whole formula, but the fact that $R$ is a sum of elements in $U_q(b^-) \otimes U_q(b^+)$ and
\[
(id \otimes \mathcal{P})(R) = (\mathcal{P} \otimes id)(R) = q^{\sum_{\alpha,\beta \in \Pi(B^{-1})_{\alpha,\beta}H_{\alpha} \otimes H_{\beta}}}
\]
Define $I : \mathcal{O}(G_q) \to U_q(\mathfrak{g})$ by
\[
I(x) := (x \otimes id)(R_{21}R_{12}).
\]
Lemma 2.5. [12, Theorem 3] We have the following.

(i) The map $I$ is an injective $U_q(\mathfrak{g})$-module homomorphism.
(ii) $I(zz) = I(z)I(x)$ for $z \in \mathcal{O}(\text{Char}(G_q))$ and $x \in \mathcal{O}(G_q)$.
(iii) $P \circ I = \Theta^{-1} \circ \pi_T$.

Proof. For (i) and (ii), see [12].

For (iii), notice that

$$q^{\sum_{\alpha, \beta \in H_{\mathfrak{g}}} (B^{-1})_{\alpha, \beta} H_{\alpha} \otimes H_{\beta}} (v \otimes w) = q^{(w, w)} (v \otimes w)$$

shows

$$(c^\lambda_{i, v} \otimes \text{id}) (q^{\sum_{\alpha, \beta \in H_{\mathfrak{g}}} (B^{-1})_{\alpha, \beta} H_{\alpha} \otimes H_{\beta}}) = (I, v) K_{w(v)}.$$  

Here, by the definition of $P$, we have

$$P(ab) = P(a)P(b)$$

for $a \in U_q(b^-)$ and $b \in U_q(b^+)$. Hence

$$(P \circ I)(c^\lambda_{i, v}) = P(c^\lambda_{i, v} \otimes \text{id})(R_{21} R_{12})$$

$$= (c^\lambda_{i, v} \otimes \text{id}) (q^{\sum_{\alpha, \beta \in H_{\mathfrak{g}}} (B^{-1})_{\alpha, \beta} H_{\alpha} \otimes H_{\beta}})$$

$$= (v, l) K_{2w(v)}$$

$$= (\Theta^{-1} \circ \pi_T)(c^\lambda_{i, v}).$$

Set $F(U_q(\mathfrak{g})) := I(\mathcal{O}(G_q))$ and let $Z$ be its center. Now let us recall the separation theorem in [12].

Theorem 2.6. There exists an adjoint invariant subspace $\mathbb{H} \subset F(U_q(\mathfrak{g}))$ such that the multiplication map

$$Z \otimes \mathbb{H} \to F(U_q(\mathfrak{g}))$$

is isomorphic. Moreover the multiplicity of $V(\lambda)$ in $\mathbb{H}$ is $\dim V(\lambda)_{\mathbb{H}}$.

Put $m := \dim V(\lambda)_{\mathbb{H}}$.

Decompose $\mathbb{H}^\lambda$ into an $m$-fold direct sum of $V(\lambda)$’s. Fix a basis $(e_i)_{i=1}^{\dim V(\lambda)}$ of $V(\lambda)$ such that $e_i \in V(\lambda)_{\mathbb{H}}$ for $1 \leq i \leq m$. Take the corresponding basis $(a_{ij})_{i=1}^{m}$ of the $j$-th copy of $V(\lambda)$ inside $\mathbb{H}$.

Now we have an $m \times m$-matrix $(a_{ij})$ with coefficients in $F(U_q(\mathfrak{g}))$. The determinant of $P_\lambda := P(a_{ij})$ is called the quantum PRV determinant and computed in [12, Theorem 8.2.10].

Theorem 2.7. We have

$$\det P_\lambda = \prod_{n \in \mathbb{Z}_+, \alpha \in \Delta_+} (K_\alpha - q^{\dim V(\lambda)_{\mathbb{H}}}(n+1)(n+2))_{\alpha}$$

up to constant multiplication in $\mathbb{C}^\times$.

From this, we can estimate the rank of $P_\lambda(\nu)$ for certain cases. (See [12, Lemma 8.2.7]).

Corollary 2.8. Let $\nu \in \mathfrak{h}^*$.

(i) $\text{rank } P_\lambda(\nu) = [F(U_q(\mathfrak{g}))/\text{Ann}(V(\nu))] : V(\lambda)$.
(ii) The matrix $P_\lambda(\nu)$ is invertible if and only if $(\nu + \rho, \alpha^\vee) \notin \mathbb{Z}_+ + \pi i \log(q_\alpha)^{-1} \mathbb{Z}$ for any $\alpha \in \Delta_+$. 

As we shall see later, the twisted adjoint action
\[ \text{ad}^S(a)x := (S \circ \text{ad}(a) \circ S^{-1})(x) = a_{(1)} \triangleright x \lessdot S^{-1}(a_{(2)}) \]
is more relevant to the Drinfeld double construction. We call the vector space of fixed points the \textit{q-character algebra} and denote it by \( \mathcal{O}(\text{Char}_q(G_q)) \). Then this is an algebra and
\[
\chi_q(\lambda) := \sum_i (K_{-2i}v_i, l_i)c_i^\lambda
\]
forms a basis of \( \mathcal{O}(\text{Char}_q(G_q)) \), where \((v_i)\) is a basis of \( V(\lambda) \) and \((l_i)\) is the dual basis. One can show \( \mathcal{O}(\text{Char}_q(G_q)) \) is isomorphic to a usual character algebra of \( G \) as an algebra. In particular, this is commutative and its character space is \( X/W \); any character on \( \mathcal{O}(\text{Char}_q(G_q)) \) is of the form \( K_{\nu+2\rho} \) and these gives a same character if and only if \( \nu \)'s are in the same Weyl group orbit.

2.4. Drinfeld doubles. In this section, we collect some definitions and facts on Drinfeld doubles of \( \mathcal{O}(G_q) \).

\textbf{Definition 2.9.} For Hopf algebras \( A \) and \( B \) with a skew pairing, the \textit{Drinfeld double} \( B \bowtie A \) is the algebra generated by \( A \) and \( B \) with the commutation relation
\[
ab = (a_{(1)} \triangleright b \lessdot S(a_{(3)}))a_{(2)}
\]
for \( a \in A \) and \( b \in B \). As a vector space, the multiplication map gives an isomorphism \( B \otimes A \to B \bowtie A \).

If both \( A \) and \( B \) are Hopf \(*\)-algebras, \( B \bowtie A \) is again a Hopf \(*\)-algebra.

\textbf{Remark 2.10.} It is not necessary \( B \) to be a “genuine” Hopf algebra to define the Drinfeld double \( B \bowtie A \) as an algebra, as long as the bimodule action of \( A \) on \( B \) makes sense. For example, one can define \( D_c := c_c(G_q) \bowtie \mathcal{O}(G_q) \) and \( \tilde{D} := U(G_q) \bowtie \mathcal{O}(G_q) \) in a same manner.

Let \( U_q(b^+) \) (resp. \( U_q(b^-) \)) be the subalgebra of \( U_q(g) \) generated by \( E_\alpha \) and \( K_\lambda \) (resp. \( F_\alpha \) and \( K_\lambda \)).

Recall that there exists a unique skew-pairing
\[
U_q(b^-) \times U_q(b^+) \to \mathbb{C}
\]
such that
\[
(K_\lambda, K_\mu) = q^{(\lambda, \mu)},
\]
\[
(F_\alpha, E_\beta) = -\frac{\delta_{\alpha, \beta}}{q_\alpha - q_\beta}.
\]
Consider the following skew-pairing
\[
U_q(b^-) \otimes U_q(b^+) \times U_q(b^+) \otimes U_q(b^-) \to \mathbb{C} : (a \otimes b, c \otimes d) = (a, c)(\tilde{S}(d), b).
\]
Now one can embed \( \mathcal{O}(G_q) \) into \( U_q(b^-) \otimes U_q(b^+) \) as follows.

\textbf{Proposition 2.11.} \cite{12} Lemma 9.2.13] \textit{There is an algebra embedding } \Psi : \mathcal{O}(G_q) \to U_q(b^-) \otimes U_q(b^+) \text{ such that}
\[
(\Psi(x), a \otimes b) = (x, ba).
\]

For the later use, we prepare a technical lemma.

\textbf{Lemma 2.12.} For \( U_q(g) \)-module \( V, W, \lambda, \mu \in P, v \in V_\lambda \) and \( w \in W_\mu \),
\[
(\mathcal{P} \otimes \mathcal{P})(\Psi(x))(v \otimes w) = K_{\lambda-\mu}(x)v \otimes w.
\]
Lemma 3.2. Let $\mathcal{P}$ be an ideal of $\tilde{\mathcal{O}}$. Then the multiplicity of $\mathcal{P}$ is at most $\dim \mathcal{P}$.

The following result is first observed by Krähmer [14].

Theorem 2.13. The map

$$\Delta \times \Psi : U_q(\mathfrak{g}) \otimes \mathcal{O}(G_q) \rightarrow U_q(\mathfrak{g}) \otimes U_q(\mathfrak{g})$$

is injective.

2.5. The quantum group $SU_q(2)$. Through this section, let $\mathfrak{g} = sl_2$. In this case, the Cartan subalgebra $\mathfrak{h}$ is 1-dimensional. We identify $\mathfrak{h} = \mathbb{C}$ with $\mathfrak{h} = \{1\}$. Then $Q = \mathbb{Z}$ and $P = \mathbb{Z}/2\mathbb{Z}$. The Clebsch-Gordan formula asserts

$$V(s) \otimes V(t) \simeq V(s + t) \oplus V(s + t - 1) \oplus \cdots \oplus V(s - t).$$

Fix an orthonormal basis $(\xi_{\pm 1/2})$ of $V(1/2)$. Then we can fix generators $a, b, c, d$ of $\mathcal{O}(SU_q(2))$ by

$$(a, x) := (\pi^{1/2}(x)\xi_{1/2}, 1/2), \quad (b, x) := q(\pi^{1/2}(x)\xi_{1/2}, 1/2),$$

$$(c, x) := q^{-1}(\pi^{1/2}(x)\xi_{-1/2}, 1/2), \quad (d, x) := (\pi^{1/2}(x)\xi_{-1/2}, 1/2).$$

Then

$$ab = qba, ac = qca, bc = cb, ad = qbc = da - q^{-1}bc = 1,$$

$$\Delta(a) = a \otimes b + b \otimes c, \Delta(b) = a \otimes b + b \otimes d, \Delta(c) = c \otimes a + d \otimes c, \Delta(d) = d \otimes d + c \otimes b.$$ 

3. Admissible representations

Let $D := U_q(\mathfrak{g}) \otimes \mathcal{O}(G_q)$. We regard $D$ and $D_c$ as subalgebras of $\tilde{D}$. Then $D_c$ is an ideal of $\tilde{D}$, hence in particular $D_c$ is a $D$-bimodule in a natural way.

Definition 3.1. Let $V$ be a vector space and $\pi : D \rightarrow \text{End}(V)$ a representation. We say $\pi$ is admissible if $V$ is of type 1 as a $U_q(\mathfrak{g})$-module and $[V : V(\lambda)] < \infty$ for any $\lambda \in P_+$. We say $\pi$ is spherical if $\pi$ admits a nonzero $U_q(\mathfrak{g})$-fixed vector.

The following lemma has already appeared in the proof of [13, Theorem 8.1].

Lemma 3.2. Let $A$ be a $*$-algebra and $N \in \mathbb{Z}_{\geq 0}$. Suppose $A$ is a subalgebra (with the $*$-structure ignored) of $\prod_{i \in I} \text{End}(V_i)$, where $(V_i)_{i \in I}$ is a family of vector spaces with dimensions at most $N$. Then the dimension of any irreducible $*$-representation of $A$ is at most $N$.

Theorem 3.3. Let $\pi$ be an irreducible $*$-representation of $D_c$ on a Hilbert space $H$. Then the multiplicity of $V(\lambda)$ in $\pi|_{c_0(G_q)}$ is at most $\dim V(\lambda)$. In particular, $V := \bigoplus_{\lambda \in P_+} \pi(p^\lambda)H$ is an irreducible admissible $D$-module.
Lemma 3.4. We have the following.

\[ \pi^\mu = (\pi^\mu_1 \otimes \pi^\mu_2)(\overline{\Delta} \times \Psi). \]

Then since \( \overline{\Delta} \times \Psi \) is injective, we get an embedding

\[ \bigoplus_{\mu \in P_+ \times P_+} \pi^\mu : D \rightarrow \prod_{\mu \in P_+ \times P_+} \text{End}(V(\mu_1) \otimes V(\mu_2)). \]

Fix \( \lambda \in P_+ \). By cutting the embedding above by \( p^\lambda \), we get an embedding

\[ p^\lambda D_c p^\lambda \rightarrow \prod_{\mu \in P_+ \times P_+} \text{End}(\pi^\mu(p^\lambda)(V(\mu_1) \otimes V(\mu_2))). \]

Here since \( v_{\mu_1} \otimes v_{-\mu_2} \) is cyclic for the diagonal action of \( U_q(\mathfrak{g}) \) on \( V(\mu_1) \otimes V(\mu_2) \), the map

\[ \text{Hom}_{U_q(\mathfrak{g})}(V(\mu_1) \otimes V(\mu_2), V(\lambda)) \rightarrow V(\lambda) : f \mapsto f(v_{\mu_1} \otimes v_{-\mu_2}) \]

is injective. Hence we get

\[ [V(\mu_1) \otimes V(\mu_2) : V(\lambda)] \leq \text{dim } V(\lambda). \]

Therefore \( \text{dim } \pi^\mu(p^\lambda)(V(\mu_1) \otimes V(\mu_2)) \leq (\text{dim } V(\lambda))^2 \). Now we can apply Lemma 3.2 to get the desired conclusion. \( \square \)

Now we start to classify admissible \( D \)-modules.

**Lemma 3.4.** We have the following.

(i) Let \( V \) be an admissible \( D \)-module. Suppose \( V^\lambda \) is an irreducible \( p^\lambda D_c p^\lambda \)-module. Then \( V \) admits a unique irreducible subquotient containing a nonzero \( \lambda \)-isotypical component.

(ii) Let \( V, W \) be irreducible admissible \( D \)-modules. Suppose \( 0 \neq V^\lambda \simeq W^\lambda \) as \( p^\lambda D_c p^\lambda \)-modules. Then \( V \simeq W \).

**Proof.**

(i) Let \( K := DV^\lambda \). We only need to show \( K \) admits a unique maximal submodule. For any family of proper submodules \( (L_i)_i, V^\lambda \cap L_i = \{0\} \) since any nonzero vectors in \( V^\lambda \) is cyclic in \( K \). Then since

\[ L_i = \bigoplus_{\lambda \neq \lambda \in P_+} L_i^\lambda, \]

\( V^\lambda \cap \sum_i L_i = \{0\} \). Hence \( \sum_i L_i \) is again a proper \( D \)-submodule.

(ii) Both \( V \) and \( W \) are quotients of \( K := D_c p^\lambda \otimes_{p^\lambda D_c p^\lambda, \rho^\lambda} V^\lambda \simeq D_c p^\lambda \otimes_{p^\lambda D_c p^\lambda, \rho^\lambda} W^\lambda \). However since \( K^\lambda = p^\lambda D_c p^\lambda \otimes_{p^\lambda D_c p^\lambda, \rho^\lambda} V^\lambda \simeq V^\lambda \) is irreducible, \( K \) has a unique irreducible spherical subquotient by (i). Hence \( V \simeq W \).

\( \square \)

Let us restrict ourselves to the spherical cases. De Commer [5] pointed out \( \varphi D_c \varphi \) is actually isomorphic to the character algebra of \( G \) for a general compact quantum group \( G \). Let us state the result only in the case we need here.

First, \( D_c \varphi \) admits a \( U_q(\mathfrak{g}) \)-module structure by left multiplications. Since \( c_{\omega}(\hat{G}_q)\varphi = \mathbb{C}\varphi \), we have

\[ D_c \varphi = \mathcal{O}(G_q)\varphi. \]

Hence we get a \( U_q(\mathfrak{g}) \)-module structure on \( \mathcal{O}(G_q) \), but

\[ xa\varphi = a_{(2)}(S(a_{(3)}) \triangleright x \triangleleft a_{(1)})\varphi = a_{(2)}(x, S(a_{(3)}a_{(1)}))\varphi = \text{ad}^S(x)(a)\varphi \]
shows this is nothing but the twisted adjoint action $ad^S$.

Hence, $a \varphi \in p^\lambda D_c \varphi$ if and only if $a$ is in the $\lambda$-isotypical component with respect to $ad^S$. In particular, we get the following.

**Lemma 3.5.** Recall $X = h^*/2\pi i \log(q)^{-1}Q$. The map

$$\mathcal{O}(\text{Char}_q(G_q)) \to \varphi D_c \varphi : x \mapsto x \varphi$$

is an algebra isomorphism. In particular, $\varphi D_c \varphi$ is commutative and its character space is $X/W$.

**Proof.** Any elements of $\varphi D_c \varphi$ can be written as the form $a \varphi$ for $a \in \mathcal{O}(G_q)$. We also know $a \in \varphi D_c \varphi$ if and only if $a$ is $ad^S$-invariant, that is, $a \in \mathcal{O}(\text{Char}_q(G_q))$.

We have $a \varphi b \varphi = ab \varphi$ for $a \in \mathcal{O}(G_q)$ and $b \in \mathcal{O}(\text{Char}_q(G_q))$, since $\varphi b \varphi = b \varphi$. In particular, this is an algebra isomorphism. \qed

**Corollary 3.6.** Irreducible admissible spherical representations are parametrized by $X/W$.

**Proof.** Let $V$ be an irreducible admissible spherical representation. Then $V^0$ is an irreducible $\varphi D_c \varphi$-module, which is in a one-to-one correspondence with elements of $X/W$ by Lemma 3.5.

Thanks to Lemma 3.4, two irreducible admissible spherical representations are isomorphic if and only if the corresponding characters on $\varphi D_c \varphi$ are equal, hence they give the same elements $X/W$. \qed

### 4. PARABOLIC INDUCTIONS

In this section, we give another construction of irreducible admissible spherical representations corresponding to $\nu \in X/W$, which can be considered as an analogue of parabolic inductions.

Fix a subset $\Sigma \subset \Pi$ and let $(h^\Sigma)^*$ be the linear span of $\Sigma$. Then $\Sigma$ can be regarded as the set of simple roots of a Lie subalgebra $\mathfrak{g}^\Sigma \subset \mathfrak{g}$. Take a short root $\alpha$ in $\Sigma$ and set $q^\Sigma := q^{(\alpha, \alpha)/2}$. Let $P^\Sigma$ be the weight lattice of corresponding to $\Sigma$. Let $U_{q^\Sigma}(\mathfrak{g}^\Sigma)$ be the subalgebra of $U_q(\mathfrak{g})$ generated by $E_\alpha, F_\alpha, K_\lambda$’s where $\alpha \in \Sigma$ and $\lambda \in P^\Sigma$. Then we have a quotient map $\pi^\Sigma : \mathcal{O}(G_q) \to \mathcal{O}(G^\Sigma_q)$. We write elements associated to $\mathfrak{g}^\Sigma$ with superscript $\Sigma$, for example, $D^\Sigma, \rho^\Sigma$ etc. For each $\nu \in X$, one may decompose $\nu$ to an orthogonal sum

$$\nu = \nu^\Sigma + \nu^{\perp \Sigma},$$

where $\nu^\Sigma \in h^\Sigma$ and $\nu^{\perp \Sigma} \perp h^\Sigma$. Then $\rho^\Sigma$ is nothing but the half sum of positive roots in $\Delta^\Sigma$, which is compatible with our former notation.

**Lemma 4.1.** Set $B_\Sigma := (U_{q^\Sigma}(\mathfrak{g}^\Sigma)U_q(\mathfrak{h})) \triangleright \mathcal{O}(G_q) \subset D$. Take $\nu \in h^*$ such that $\nu \perp \alpha$ for any $\alpha \in \Sigma$. Then for each admissible $D^\Sigma := U_{q^\Sigma}(\mathfrak{g}^\Sigma) \triangleright \mathcal{O}(G^\Sigma_q)$-module $V$, one can equip a $B_\Sigma$-module structure on $V$ by

- For $x \in \mathcal{O}(G_q)$,
  $$xv := \pi^\Sigma(x \triangleleft K_\nu)v,$$
- For $a \in U_{q^\Sigma}(\mathfrak{g}^\Sigma)$,
  $$av := av,$$
• For $\lambda \in P$,
  \[
  K_\lambda v := q^{\langle \text{wt}(v), \lambda \rangle} v,
  \]
  when we regard $\text{wt}(v) \in P^\Sigma \subset P$.

**Proof.** We check each commutation relations. It is easy to show the above formula gives a $(U_q^\Sigma(g^\Sigma)U_q(h))$-module structure and an $O(G_q)$-module structure. Therefore, we only need to examine the commutation relation for $x \in O(G_q)$ and $a \in U_q^\Sigma(g^\Sigma)U_q(h)$.

First, for $a \in U_q^\Sigma(g^\Sigma)$, notice that $a$ commutes with $K_\nu$. Hence
\[
xav = \pi^\Sigma(x \rhd K_\nu)av = a(2)\pi^\Sigma(\hat{S}^{-1}(a(1)) \rhd x \rhd K_\nu a(3))v = a(2)(\hat{S}^{-1}(a(1)) \rhd x \rhd a(3))v.\]

On the other hand, to see the commutation relation with $K_\lambda$ for $\lambda \in P$, let us remark that
\[
K_\lambda v = K_\lambda^x v
\]
by definition. We also have $K_{-\lambda} \rhd \pi^\Sigma(x) \rhd K_\lambda = \pi^\Sigma(K_{-\lambda} \rhd x \rhd K_\lambda)$ since $\lambda^\perp \Sigma$ commutes with $a \in U_q^\Sigma(g^\Sigma)$. Hence the above calculation also shows
\[
xK_\lambda v = K_\lambda(K_{-\lambda} \rhd x \rhd K_\lambda)v,
\]
which is the desired relation. \qedhere

We denote the $B_\Sigma$-module given in the lemma above by $V_{(0,\nu)}$.

**Remark 4.2.** The former $0$ is used to show that we work with the spherical cases. One can also define $V_{(\lambda,\nu)}$ to get parabolic inductions in the nonspherical cases in a similar way, but in this paper, we do not treat representations of this type.

Now we define a quantum analogue of parabolic inductions. For an admissible $D^\Sigma$-module $V$, define a $D$-module $\text{Ind}^D_{D^\Sigma}(V,\nu)$ by
\[
\text{Ind}^D_{D^\Sigma}(V,\nu) := D_c \otimes_{B_\Sigma} V_{(0,\nu-2\rho^\perp \Sigma)}.
\]
In the case of $\Sigma = \emptyset$, $B := B_\emptyset$ is $U_q(h) \triangleright\triangleleft O(G_q)$. Since $D^\emptyset = \mathbb{C}$, $\mathbb{C}$ admits a unique $D^\emptyset$-module structure. Put
\[
L(0, \nu) := \text{Ind}^D_{\emptyset}(\mathbb{C}, \nu) = D_c \otimes_B \mathbb{C}_{(0,\nu-2\rho)}.
\]
Let $\Lambda$ be the map
\[
c_c(\hat{G}_q) \to L(0, \nu) : \omega \mapsto \omega \otimes 1.
\]
Then $\Lambda$ gives a $U_q(g)$-module isomorphism
\[
\{ \omega \in c_c(\hat{G}_q) \mid \omega K_\lambda = \omega, \forall \lambda \} \to L(0, \nu).
\]
In particular, all $L(0, \nu)$ are isomorphic to the same $U_q(g)$-module $L = \text{Im}(\Lambda)$ as $U_q(g)$-module and $[L(0, \nu) : V(\lambda)] = \dim V(\lambda)_0$. It is often convenient to think $L(0, \nu)$ as a family of representations $\pi^\nu$ on the same vector space $L$. Then by definition, for $\omega \in c_c(\hat{G}_q)$ and $x \in O(G_q)$,
\[
\pi^\nu(x)\Lambda(\omega) = K_{\nu-2\rho}(x(2))\Lambda(x(3) \rhd \omega \triangleleft S(x(1))).
\]

The importance of the module $L(0, \nu)$ is as follows.

**Corollary 4.3.** We have the following.

(i) The $D$-module $L(0, \nu)$ admits a unique irreducible spherical subquotient. We denote it by $V(0, \nu)$.

(ii) Any irreducible admissible spherical $D$-module isomorphic to one of $V(0, \nu)$.
(iii) \( V(0, \nu) \simeq V(0, \nu') \) if and only if \( \nu' \in W\nu \).

**Proof.** Thanks to Lemma 3.4, \( L(0, \nu) \) admits a unique irreducible spherical subquotient.

Notice that for each \( \nu \)

\[
x(\varphi = \varphi_\sigma(x) = \varphi(K_{2\rho} \triangleright x \triangleleft K_{2\rho})
\]

for \( x \in O(\text{Char}_q(G_q)) \).

Hence \( V(0, \nu) \) corresponds to \( \nu \in X/W \) in the classification of Corollary 3.6. \( \square \)

**Remark 4.4.** As we shall see in Proposition 6.1 with a suitable choice of \( \nu \) in the same Weyl group orbit, \( V(0, \nu) \) is actually a submodule of \( L(0, \nu) \).

We conclude this section with the following “induction-by-step” type lemma. Notice that for each \( \nu \in X \), \( L(0, \nu^\Sigma) \) and \( V(0, \nu^\Sigma) \) are \( D^\Sigma \)-modules.

**Lemma 4.5.** We have an isomorphism

\[
L(0, \nu) \simeq \text{Ind}_D^H(L(0, \nu, \Sigma), \nu^{\perp \Sigma}).
\]

In particular, the module \( \text{Ind}_D^H(V(0, \nu^\Sigma), \nu^{\perp \Sigma}) \) is a spherical subquotient of \( L(0, \nu) \).

**Proof.** By definition, we have

\[
\text{Ind}_D^H(L(0, \nu^\Sigma), \nu^{\perp \Sigma}) = D_c \otimes_{B_c} D_c^\Sigma \otimes_{B_c^\Sigma} C_{(0, \nu^\Sigma, -2\rho^\Sigma)}.
\]

(Notice that \( B^\Sigma = O(G^\Sigma_q) \rtimes U_q(\mathfrak{h}^\Sigma) \neq B_\Sigma \).) We claim

\[
D_c \otimes_{B_c} D_c^\Sigma \otimes_{B_c^\Sigma} C_{(0, \nu^\Sigma, -2\rho^\Sigma)} \rightarrow D_c \otimes B_c C_{(0, \nu^\Sigma, -2\rho^\Sigma)} : \omega \otimes \mu \otimes 1 \mapsto \omega \mu \otimes 1
\]

is an isomorphism.

To construct the inverse, for each \( \omega \in c_c(\hat{G}_q) \), we can find an idempotent \( \mu \in c_c(\hat{G}_q) \) such that \( \omega \mu = \omega \). Now one can define a map

\[
D_c \otimes_{B_c} C_{(0, \nu^\Sigma, -2\rho^\Sigma)} \rightarrow D_c \otimes_{B_c} D_c^\Sigma \otimes_{B_c^\Sigma} C_{(0, \nu^\Sigma, -2\rho^\Sigma)} : \omega \otimes 1 \mapsto \omega \otimes \mu \otimes 1
\]

where \( \mu \) is an idempotent in \( c_c(\hat{G}_q) \) such that \( \omega \mu = \omega \). Here we notice it does not depend on the choice of \( \mu \). In fact, for \( \mu_1, \mu_2 \in c_c(\hat{G}_q) \) with the property, one can find an idempotent \( \mu_0 \) such that \( \mu_i \mu_0 = \mu_i \) for \( i = 1, 2 \). Then

\[
\omega \otimes \mu_1 = \omega \otimes \mu_1 \mu_0 = \omega \mu_1 \otimes \mu_0 = \omega \otimes \mu_0 = \omega \otimes \mu_2.
\]

Therefore this map is well-defined.

These maps are inverses to each other, which finishes the proof. \( \square \)

5. **Invariant Form**

In this section, we construct an invariant sesquilinear pairing on certain pairs of parabolic inductions. Before that, we begin with the following standard observation.

Let \( V, W \) be \( D \)-modules. We say a pairing \( V \times W \rightarrow \mathbb{C} \) is **invariant** if

\[
(a v, w) = (v, a^* w)
\]

for \( a \in D, v \in V \) and \( w \in W \). We say \( V \) is **unitarizable** if it admits an invariant inner product.

**Lemma 5.1.** We have the following.
Lemma 5.2.  

(i) Let $V, W$ be admissible irreducible $D$-modules. Then the invariant sesquilinear pairing between $V$ and $W$ is unique up to scalar.

(ii) Let $V, W_i$ be admissible irreducible $D$-modules with invariant sesquilinear pairings between $V$ and $W_i$ for $i = 1, 2$. Then $W_1 \simeq W_2$.

Proof. For an admissible $D$-module $V$, consider the vector space $\mathbf{T}^V$ of all conjugate linear functionals on $V$. Then $\mathbf{T}^V$ carries a natural $D$-module structure by

$$(ax, y) := (x, a^*y)$$

for $x \in \mathbf{T}^V$, $y \in V$. Let $\overline{V}$ be the vector space of locally nilpotent elements in $\mathbf{T}^V$. Notice that if $V$ is admissible, then $\overline{V}$ is admissible. Also if $V$ is irreducible, then $\overline{V}$ is also admissible.

Now sesquilinear pairings between $V$ and $W$ in one-to-one correspondence to homomorphisms from $W$ to $V$. Now the results are direct consequences of Schur’s lemma.

Define a functional $\hat{\varphi} \in c_c(\widehat{G}_q)$ by

$$\hat{\varphi}(x) = \sum_{\lambda \in P_+} \text{Tr}_\lambda(K_{2\rho})\text{Tr}_\lambda(K_{2\rho}x),$$

where $\text{Tr}_\lambda$ is the unnormalized trace on $V(\lambda)$. In [19], it is shown that this is the left invariant weight on $c_c(\widehat{G}_q)$, that is, a positive functional on $c_c(\widehat{G}_q)$ such that

$$\hat{\varphi}(a \triangleright x) = \hat{\varphi}(x)K_{4\rho}(a),$$

$$\hat{\varphi}(x \triangleleft a) = \hat{\varphi}(x)\varepsilon(a).$$

Therefore we get

$$\hat{\varphi}(a \triangleright x) = \hat{\varphi}(a_2) \triangleright (x(S^{-1}(a_1) \triangleright y)) = K_{4\rho}(a_2)\hat{\varphi}(x(S^{-1}(a_1) \triangleright y)),$$

$$\hat{\varphi}(x \triangleleft a) = \hat{\varphi}(x \triangleleft S(a_1)) \triangleleft a_2 = \hat{\varphi}(x \triangleleft S(a)).$$

Put $P_{\Sigma, +} := \{ \lambda \in P \mid (\lambda, \alpha) \in \mathbb{Z}_{\geq 0} \text{ for } \alpha \in \Sigma \}$. In a similar way, one may consider irreducible representations $V(\lambda)$ of weight $\lambda \in P_{\Sigma, +}$ of the “reductive” quantum group $U_q(\mathfrak{g}^{\Sigma})U_q(\mathfrak{h})$ to construct a compact quantum group $\mathcal{O}(G_{\Sigma, q})$. Again from [19], the functional $\hat{\varphi}_\Sigma$ on $c_c(\widehat{G}_{\Sigma, q}) := \bigoplus_{\lambda \in P_{\Sigma, +}} \text{End}(V(\lambda))$.

$$\hat{\varphi}_\Sigma(x) = \sum_{\lambda \in P_{\Sigma, +}} \text{Tr}(K_{2\rho}x)\text{Tr}(K_{2\rho}x)$$

satisfies the same relations with $\hat{\varphi}$.

Now for each $x \in c_c(\widehat{G}_q)$, one can find a unique $E(x) \in \mathcal{U}(G_{\Sigma, q})$ such that

$$\hat{\varphi}(xy) = \hat{\varphi}_\Sigma(E(x)y).$$

In this way, we can define a linear map $E : c_c(\widehat{G}_q) \rightarrow \mathcal{U}(G_{\Sigma, q})$.

The following lemma can be considered as a simple consequence of the modular theory, but for convenience, we attach a purely algebraic proof.

Lemma 5.2.  

(i) The map $E$ is positive.

(ii) The map $E$ is a $\mathcal{U}(G_{\Sigma, q})$-bimodule homomorphism.

(iii) We have

$$E(a \triangleright x) = (a \triangleleft K_{-4\rho, x}) \triangleright E(x),$$

$$E(x \triangleleft a) = E(x) \triangleleft a.$$
Let \( V \) be admissible \( D \)-modules with an invariant sesquilinear pairing. Thanks to (ii) of the lemma above, one can define a sesquilinear pairing on \( \text{Ind}^D(V, \nu) \) and \( \text{Ind}^D(W, -\overline{\nu}) \) by
\[
(x \otimes v, y \otimes w) := (E(y^*x)v, w).
\]
If we start with \( V = W \), then the resulting sesquilinear form is an inner product if and only if the original form on \( V \) is positive definite.

**Proposition 5.3.** This sesquilinear pairing is invariant, i.e.
\[
(ax, y) = (x, a^*y)
\]
for any \( a \in D \), \( x \in \text{Ind}^D(V, \nu) \) and \( y \in \text{Ind}^D(W, -\overline{\nu}) \).

**Proof.** Trivial for \( a \in U_q(\mathfrak{g}) \).

The assertion follows for \( a \in \mathcal{O}(G_q) \) also by a calculation:
\[
(x \otimes v, a^*(y \otimes w)) = (x \otimes v, (a^*_3 \triangleleft y \triangleleft S(a^*_1)) \otimes \pi^\Sigma(a^*_2 \triangleleft K_{-2p^+\Sigma})w)
= (E((a^*_3 \triangleleft y \triangleleft S(a^*_1))^*x)v, \pi^\Sigma(a^*_2 \triangleleft K_{-2p^+\Sigma})w)
= \pi^\Sigma(a^*_2 \triangleleft K_{-2p^+\Sigma})E((S(a^*_3) \triangleleft y^* \triangleleft a^*_1)x)v, w)
= (((a^*_4 \triangleleft K_{v+2p^+\Sigma}) \triangleleft E((S(a^*_5) \triangleleft y^* \triangleleft a^*_1)x) \triangleleft S(a^*_2)) \triangleleft \pi^\Sigma(a^*_3)v, w)
= (E(y^*((a^*_3 \triangleleft K_{v-2p^+\Sigma}) \triangleleft x \triangleleft S(a^*_1))\pi^\Sigma(a^*_2)v, w)
= (E(y^*(a^*_3 \triangleleft x \triangleleft S(a^*_1)))\pi^\Sigma(x \triangleleft K_{v-2p^+\Sigma})v, w)
= ((S(a^*_3) \triangleleft x \triangleleft a^*_1) \otimes \pi^\Sigma(x \triangleleft K_{v-2p^+\Sigma}), y \otimes w)
= (a(x \otimes v), y \otimes w).
\]

Since the invariant sesquilinear form is unique, we get the following.

**Corollary 5.4.** Let \( \nu \in \mathfrak{h}^* \). Suppose \( \nu \) satisfies the following three conditions.
- \( V(0, \nu) = \text{Ind}^D(V(0, \nu^\Sigma), \nu^{\perp \Sigma}). \)
- \( V(0, \nu^{\perp \Sigma}) \) admits an invariant sesquilinear form and
- \( \nu^{\perp \Sigma} \) is imaginary.
Then $V(0, \nu)$ is unitarizable if and only if $V(0, \nu^\Sigma)$ is.

In the case of $\Sigma = \emptyset$, the pairing is given by

$$(\Lambda(x), \Lambda(y)) = \tilde{\varphi}(y^* x),$$

hence is an inner product on $L$ which satisfies

$$(\pi^\nu(a)v, w) = (v, \pi^{-\varpi}(a^*)w).$$

To conclude this section, we state an application of this sesquilinear pairing which plays an essential role in the next section.

Let $L^0(0, \nu)$ be the cyclic submodule of $L(0, \nu)$ generated by $\Lambda(\varphi)$.

Lemma 5.5. We have

$$V(0, \nu) = L^0(0, \nu) / \text{Ann} L^0(0, -\varpi).$$

In particular, if $\Lambda(\varphi)$ is cyclic both in $L(0, \nu)$ and $L(0, -\varpi)$, then $L(0, \nu)$ is irreducible.

Proof. Set $L^{00}(0, \nu) := L^0(0, \nu) / \text{Ann} L^0(0, -\varpi)$. Then this is an admissible spherical $D$-module with a $D$-invariant nondegenerate pairing

$$L^{00}(0, \nu) \times L^{00}(0, -\varpi) \to \mathbb{C}.$$  

Notice that $\Lambda(\varphi)$ is cyclic both in $L^{00}(0, \nu)$ and $L^{00}(0, -\varpi)$.

Take a $D$-submodule $K$ of $L^{00}(0, \nu)$. If $\Lambda(\varphi) \in K$, $K = L^{00}(0, \nu)$ since $\Lambda(\varphi)$ is cyclic. If $\Lambda(\varphi) \notin K$, since the pairing is $U_q(\mathfrak{g})$-invariant, $\Lambda(\varphi) \in \text{Ann} K$. Hence $\text{Ann} K = L^{00}(0, -\varpi)$. Since the pairing is nondegenerate, $K = 0$. Therefore $L^{00}(0, \nu)$ is irreducible.

Another consequence of the lemma above is that $V(0, \nu)$ and $V(0, -\varpi)$ admits an invariant sesquilinear pairing. In particular, together with Lemma 5.1 and Corollary 4.3, we get the following.

Corollary 5.6. The $D$-module $V(0, \nu)$ admits a sesquilinear form if and only if $-\varpi = w\nu$ for $w \in W$.

6. Irreducibility

In this section, we give a criterion for the irreducibility of $L(0, \nu)$. The results of this section deeply depend on those of Section 2.3.

As in the remark before Lemma 3.5, each elements in the $\lambda$-isotypical component of $\mathcal{O}(G_q)$ with respect to $\text{ad}^S$ transports $V^0$ to $V^\lambda$. In $L(0, \nu)$, we can say more,

$$x\Lambda(\varphi) = K_{\nu-2\rho}(x(2))\Lambda(x(3) \triangleright \varphi \triangleleft S(x(1)))$$

$$= K_{\nu-2\rho}(x(2))\Lambda(\varphi \triangleleft (S^2(K_{4\rho} \triangleright x(3))S(x(1))))$$

$$= K_{\nu+2\rho}(x(2))\Lambda(\varphi \triangleleft S(x(1))S(x(3))).$$

Notice that

$$\Gamma : x \mapsto x(1)S(x(3)) \otimes x(2)$$

is a coaction of $\mathcal{O}(G_q)$ on itself and

$$(a \otimes \text{id})\Gamma(x) = \text{ad}^S(a)(x).$$
Consider $H := S \circ I^{-1}(\mathbb{H})$. Due to Lemma 2.5, this is an $\operatorname{ad}^S$ invariant subspace of $\mathcal{O}(G_q)$ such that the multiplication map

$$H \otimes \mathcal{O}(\operatorname{Char}_q(G_q)) \to \mathcal{O}(G_q)$$

is isomorphic.

Fix $\lambda \in P_+$ and put $m := \dim V(\lambda)_0$. Recall $(a_{ij}) \subset \mathbb{H}$ in Section 2.3. Let $b_{ij} := S(I^{-1}(a_{ij}))$. Let $(f_i)$ be the dual basis of $(e_i)$ and $c^\lambda_{ik} := c^\lambda_{f_i,e_j}$. Then we have

$$\Gamma(b_{ij}) = \sum_{k=1}^m K_{\nu+2\rho}(b_{kj}) \Lambda(\varphi \circ S(c^\lambda_{ik})).$$

(For this, notice that $\Lambda(\varphi \circ S(c^\lambda_{ij})) = 0$ unless $e_j$ is of weight 0.)

Thus the multiplicity of $V(\lambda)$ in $L^0(0,\nu)$ is the rank of the matrix $(K_{\nu+2\rho}(b_{ij}))_{i,j=1}^m$.

$$(K_{\nu+2\rho}(b_{ij}))_{i,j} = (K_{\nu+2\rho}(S(I^{-1}(a_{ij}))))_{i,j} = (K_{-\nu-2\rho}(\pi_T(I^{-1}(a_{ij}))))_{i,j} = (K_{-\nu-2\rho}(\Theta \circ P(a_{ij})))_{i,j} = P_{\chi}(-\nu/2 - \rho).$$

Using this equality, we can reformulate Corollary 2.8 in our setting.

**Proposition 6.1.** Fix $\nu \in \mathfrak{h}^*$. We have the following.

(i) $[L^0(0,\nu) : V(\lambda)] = [F(U_q(\mathfrak{g}))/\operatorname{Ann} V(-\nu/2 - \rho) : V(\lambda)].$

(ii) If $\Re(\nu, \alpha^\vee) \not\in 2\mathbb{Z}_+ + 2\pi i \log(q)^{-1}\mathbb{Z}$ for any $\alpha \in \Delta_+$, then the spherical vector is cyclic in $L(0,\nu)$. In particular, any admissible spherical irreducible representation is a quotient of $L(0,\nu)$ for some $\nu \in \mathfrak{h}^*$.

(iii) If $\Re(\nu, \alpha^\vee) \not\in 2\mathbb{Z}_+ + 2\pi i \log(q)^{-1}\mathbb{Z}$ for any $\alpha \in \Delta_+$, then any nonzero submodule of $L(0,\nu)$ contains the spherical vector and $L^0(0,\nu) = V(0,\nu)$. In particular, any admissible spherical irreducible representation is a subrepresentation of $L(0,\nu)$ for some $\nu \in \mathfrak{h}^*$.

(iv) The $D$-module $L(0,\nu)$ is irreducible if and only if $(\nu, \alpha^\vee) \not\in (2\mathbb{Z} \setminus \{0\}) + 2\pi i \log(q_\alpha)^{-1}\mathbb{Z}$ for any $\alpha \in \Delta_+$.

**Remark 6.2.** Independently, Voigt and Yuncken observed a similar result in [21].

As corollaries, we get the irreducibility of certain $D$-modules we have constructed. First, we begin with the integral case.

**Corollary 6.3.** For $\mu \in P_+ + \pi i \log(q)^{-1}P$,

$$V(0, -2\mu - 2\rho) \simeq V(\mu) \otimes V(\mu)^*$$

as a $D$-module, where the module structure of the right hand side is equipped as in Theorem 6.1, namely,

$$a(v \otimes w) = a(1)v \otimes a(2)w,$$

$$x(v \otimes w) = \Psi(x)(v \otimes w)$$

for $\alpha \in U_q(\mathfrak{g})$, $x \in \mathcal{O}(G_q)$. 
Proof. First, the left hand side is a $U_q(g)$-module of type 1.

We claim

$$\Psi(x)v = K_{-2\mu}(x)v$$

for $x \in O(\text{Char}_q(G_q))$ and $v$ is the unique $U_q(g)$-invariant vector in $V(\lambda) \otimes V(\lambda)^*$. Here since $x \in O(\text{Char}_q(G_q))$ preserves 0-isotypical component, we know $\Psi(x)v$ is a multiple of $v$. Therefore we only need to show

$$(\Psi(x)v, l_\mu \otimes v_\mu) = K_{-2\mu}(x)(v, l_\mu \otimes v_\mu),$$

where $l_\mu \in V(\mu)^*$ such that $l_\mu(v_\mu) = 1$, $l_\mu(v) = 0$ for any weight vector $v$ which is not of highest weight. Now since $\Psi(x)$ is in $U_q(b^+) \otimes U_q(b^-)$, the left hand side is nothing but

$$((\mathcal{P} \otimes \mathcal{P})(\Psi(x))v, l_\mu \otimes v_\mu).$$

Now Lemma 2.12 asserts this is equal to

$$K_{-2\mu}(x)(v, l_\mu \otimes v_\mu),$$

which shows the claim.

Therefore from Corollary 6.3 $V(\mu) \otimes V(\mu)^*$ contains $V(0, -2\mu - 2\rho)$ as a subquotient. Since $F(U_q(g))/\text{Ann} V(\mu) \simeq \text{End}(V(\mu))$, the first assertion of the proposition above shows

$$[V(\mu) \otimes V(\mu)^*: V(\lambda)] = [V(0, -2\mu - 2\rho): V(\lambda)]$$

for any $\lambda \in P_+$. Hence

$$V(0, -2\mu - 2\rho) \simeq V(\mu) \otimes V(\mu)^*.$$ 

□

Consequently, we get a description of $V(0, \nu)$ in the case of $g = sl_2$.

Corollary 6.4. Let $g := sl_2$. Take $\nu \in \mathbb{C}/2\pi i \log(q)^{-1}\mathbb{Z}$.

(i) If $\nu \notin (\mathbb{Z} \setminus \{0\}) + \pi i \log(q)^{-1}\mathbb{Z}$, $V(0, \nu) \simeq L(0, \nu)$.

(ii) If $\nu \in \mathbb{Z}_- + \pi i \log(q)^{-1}\mathbb{Z}$, $V(0, \nu) = V\left(\frac{-\nu - 1}{2}\right) \otimes V\left(\frac{-\nu - 1}{2}\right)^*.$

We prepare an additional lemma.

Proposition 6.5. Let $\Sigma \subset \Pi$. Suppose that for any $\alpha \in \Delta$, if $(\nu, \alpha^\vee) \in 2\mathbb{Z} + 2\pi i \log(q_\alpha)^{-1}\mathbb{Z}$, then $\alpha \in \text{span}\Sigma$. Then

$$V(0, \nu) \simeq \text{Ind}^\Pi_{\Sigma}(V(0, \nu^\Sigma), \nu^{1\Sigma}).$$

Proof. By conjugating by a element in $W^\Sigma$ if necessary, we may assume $\text{Re}(\nu, \alpha^\vee) \leq 0$ for any $\alpha \in \Sigma$.

Let $w_0$ be the longest element of $W^\Sigma$. Notice that $\nu$ is in the case (iii) in Proposition 6.1 while $w_0\nu$ is in the case (ii).

We first claim $\text{Hom}_D(L(0, w_0\nu), L(0, \nu)) = 1$-dimensional.

Take $T \in \text{Hom}_D(L(0, w_0\nu), L(0, \nu))$. Consider the kernel $K$ of the quotient map $L(0, w_0\nu) \to V(0, w_0\nu)$. Then $TK$ is a submodule of $L(0, \nu)$ which does not contain the spherical vector. Thanks to Proposition 6.1 $TK = 0$. Therefore $T$ factors

$$L(0, w_0\nu) \to V(0, w_0\nu) \to L(0, \nu).$$

Since $T$ sends the spherical vector to the spherical vector, the image of $T$ is contained in $L^0(0, w_0\nu) = V(0, w_0\nu)$. As a consequence, $T$ factors

$$L(0, \nu) \to V(0, \nu) \to V(0, w_0\nu) \subset L(0, w_0\nu).$$
Now Schur’s lemma implies the claim.

Take a nonzero $T \in \text{Hom}_{D^c}(L(0, w_0 \nu^0), L(0, \nu^0))$. The claim shows such $T$ is unique up to scalar multiple. In particular, the image of $T$ is $V(0, w_0 \nu^0)$. Now using the isomorphism $L(0, \nu) \cong \text{Ind}_{B_c} B_c L(0, \nu^0)_{(0, (\nu - 2\rho)^+)}$,

$$1 \otimes_{B_c} T \in \text{Hom}_{D^c}(L(0, \nu), L(0, w_0 \nu)).$$

Hence

$$V(0, \nu) = \text{Im}(1 \otimes_{B_c} T) = \text{Ind}_{B_c} B_c L(0, \nu^0),$$

(We again used the claim for the first equality.)

7. **Intertwining operators**

In this section, we complete the classification of unitarizable admissible spherical irreducible $D$-modules for $g = \mathfrak{sl}_3$.

Let us begin with an easy obstruction for the unitarizability coming from the norm estimate which contains the case in Corollary 6.3.

**Lemma 7.1.** Let $\mu \in \mathfrak{h}^*$ such that $V(0, \mu)$ is unitarizable. Then for any $\lambda \in P_+$,

$$|\text{Tr}_\lambda(K_\mu)| \leq \text{Tr}_\lambda(K_{2\rho}).$$

In particular, if $\text{Re} \mu - 2\rho$ is nonzero and dominant, then $V(0, \mu + 2\rho)$ is not unitarizable.

**Proof.** Recall that for $v \in V(0, \mu)^0$,

$$\chi_\mu(\lambda)v = K_{\mu - 2\rho}(\chi_\mu(\lambda))v = \text{Tr}_\lambda(K_\mu)v.$$

Suppose $V(0, \mu)$ is unitarizable. Since $\|\chi_\mu(\lambda)\| \leq \text{Tr}_\lambda(K_{2\rho})$,

$$|K_\mu(\chi_\mu(\lambda))| \leq \text{Tr}_\lambda(K_{2\rho}).$$

□

In the rank 1 case, we have the following expression for the intertwining operator $T \in \text{Hom}_D(V(0, \nu), V(0, -\nu))$.

**Proposition 7.2.** Let $\mathfrak{g} = \mathfrak{sl}_2$. Fix $\nu \in \mathbb{C}/2\pi i \mathbb{Z}$. Suppose $\nu \notin (\mathbb{Z} \setminus \{0\}) + \pi i \log(q)^{-1} \mathbb{Z}$. Put

$$T^s = - \prod_{0 \leq r < s} \frac{q^{-r - \nu} - q^{-r + \nu}}{q^{-r + \nu} - q^{-r - \nu}}$$

and define $T \in \text{End}(L)$ by

$$T\omega := T^s \omega$$

for $\omega \in L^*$. Then with respect to the identification $L \cong V(0, \nu) \cong V(0, \nu)$,

$$T \in \text{Hom}_D(V(0, \nu), V(0, -\nu)).$$

**Proof.** From Theorem 4.3 there exists an intertwining operator $T \in \text{Hom}_D(V(0, \nu), V(0, -\nu))$. For $s \in \mathbb{Z}_{\geq 0}$, since $|V(0, \nu) : V(s)| = 1$, $T$ is a scalar on $V(0, \nu)^s$. Let $T^s := T|_{V(0, \nu)^s}$. Multiplying a scalar if necessary, we may assume $T_0 = 1$.

Notice that $0 \neq \phi \circ (c^r a^s) \in L^*$. We have

$$\pi^\nu(c)\Lambda(\phi \circ (c^r a^s)) = q^{-1 + r + \nu} \Lambda(a \triangleright \phi \circ (c^r a^s S(c))) + q^{1 - \nu} \Lambda(c \triangleright \phi \circ (c^r a^s S(d)))$$

$$= -q^r \Lambda(a \triangleright \phi \circ (c^r a^s c)) + q^{1 - \nu} \Lambda(c \triangleright \phi \circ (c^r a^{s + 1}))$$

$$= q^{r + 1}(-q^{r + 1 + \nu} + q^{r - 1 - \nu}) \Lambda(\phi \circ (c^{r + 1} a^{s + 1})).$$
Hence
\[ T_{r+1}q^{r+1}(-q^{r+1+\nu} + q^{-r-1-\nu})\Lambda(\varphi \trianglelefteq (c^{r+1}a^{r+1})) = T\pi^\nu(c)\Lambda(\varphi \trianglelefteq (c^r a^r)) = \pi^{-\nu}(c)T\Lambda(\varphi \trianglelefteq (c^r a^r)) = T_r q^{r+1}(-q^{r+1-\nu} + q^{-r-1+\nu})\Lambda(\varphi \trianglelefteq (c^r a^r)). \]

Therefore
\[ \frac{T_{r+1}}{T_r} = \frac{q^{r+1-\nu} - q^{-r-1+\nu}}{q^{r+1+\nu} - q^{-r-1-\nu}}. \]

Iterating use of this formula shows the conclusion. \(\square\)

One can classify all irreducible unitary spherical representations of the Drinfeld double of \(SU_q(2)\) as follows, which has already appeared in [18].

**Corollary 7.3.** Let \(g = \mathfrak{sl}_2\). Then \(V(0, \nu)\) is unitarizable if and only if \(\nu \in i\mathbb{R}\) or \(\nu \in \mathbb{R} + \pi i \log(q)^{-1} \mathbb{Z}\) such that \(|\Re \nu| \leq 1\).

**Proof.** In the case of \(\nu \notin (\mathbb{Z} \setminus \{0\}) + \pi i \log(q)^{-1} \mathbb{Z}\), Lemma 7.1 asserts \(V(0, \nu)\) is unitarizable if and only if \(|\Re \nu| = 1\).

Let \(\nu \notin (\mathbb{Z} \setminus \{0\}) + \pi i \log(q)^{-1} \mathbb{Z}\). Then \(V(0, \nu) = L(0, \nu)\). From Corollary 5.6 \(V(0, \nu)\) is not unitarizable unless there exists \(w \in W\) such that \(-\mathfrak{r} = w\nu\). Suppose \(\nu\) satisfies the condition. Take \(T \in \text{Hom}_D(V(0, \nu), V(0, w\nu))\) such that \(T^0 = 1\). Then the invariant sesquilinear form is given by
\[ (x, y)_0 := (Tx, y), \]
where the inner product on the left hand side is the canonical one on \(L\) given by
\[ (x, y) = \widehat{\varphi}(y^* x). \]

Since \((\varphi, \varphi)_0 = 1\), \(V(0, \nu)\) is unitarizable if and only if \(T\) is positive definite on \(L\).

In the case of \(w = 1\) (that is, \(\nu \in i\mathbb{R}\)), \(T = 1\). Hence this is a priori positive definite.

In the case of \(w = -1\) (that is, \(\nu \in \mathbb{R} + \pi i \log(q)^{-1} \mathbb{Z}\)), \(T\) is positive definite if and only if
\[ -\prod_{0 \leq r \leq n} q^{r+\nu} - q^{-r-\nu} \]
for any \(n\). This holds if and only if \(|\Re \nu| < 1\). \(\square\)

Finally, we get a classification of the unitary spherical irreducible representations of \(D\) for \(g = \mathfrak{sl}_3\).

**Theorem 7.4.** Let \(g = \mathfrak{sl}_3\) and take \(\nu \in X\). Then \(V(0, \nu)\) is unitarizable if and only if
(i) \(\nu \in i\mathbb{R}\),
(ii) \(\nu \in W(t\alpha + i\mu)\) for \(t \in [-1, 1]\), \((\alpha, \mu) \in \pi i \log(q)^{-1} \mathbb{Z}\) or
(iii) \(\nu \in W(2\rho + \pi i \log(q)^{-1} P)\).

**Proof.** Put \(\Pi = \{\alpha, \beta\}\).

Take \(\nu \in X\). If there is no \(w \in W\) such that \(-\mathfrak{r} = w\nu\), \(V(0, \nu)\) is not unitarizable. If \(-\mathfrak{r} = w\nu\) for some \(w \in W\), we can divide the case into the following.

(1) Suppose \(w = e\), that is, \(\nu \in i\mathbb{R}\). In this case, the intertwining operator is just identity, hence positive definite, so \(V(0, \nu)\) is unitarizable.
(2) Suppose \( w = s_\alpha \), that is, \( \nu = t\alpha + i\mu \) for \( t \in \mathbb{R} \) and \( (\mu, \alpha) \in \pi i \log(q)^{-1} \mathbb{Z} \).

First suppose \( \mu \not\in \pi i \log(q)^{-1} \mathbb{P} \) or \( t \not\in 2\mathbb{Z} \setminus \{0\} \). Then from Proposition 6.5

\[
V(0, \nu) = \text{Ind}_\mathfrak{a}^\mathfrak{h} V(0, t + (\alpha, \mu)).
\]

In this case, Corollary 5.3 implies \( V(0, \nu) \) is unitarizable if and only if \( V(0, t + (\alpha, \mu)) \) is. This holds if and only if \( |t| \leq 1 \).

Suppose \( \mu \in \pi i \log(q)^{-1} \mathbb{P} \) and \( t \in 2\mathbb{Z} \setminus \{0\} \). In this case, \( V(0, \nu) \) is finite dimensional. Thanks to Lemma 7.1, this is unitarizable if and only if \( \nu \in (2\alpha + \pi i \log(q)^{-1} \mathbb{P}) = W(2\rho + \pi i \log(q)^{-1} \mathbb{P}) \).

(3) For case of \( w = s_\beta \) or \( s_\alpha s_\beta s_\alpha \), there exists \( w' \in W \) such that \( w'\nu \) is in the case (2). Since \( V(0, \nu) \) is isomorphic to \( V(0, w'\nu) \), we already have done.

(4) In the case of \( w = s_\alpha s_\beta \) or \( s_\beta s_\alpha \), there is no \( \nu \in X \) satisfying \(-\mathfrak{p} = w\nu \) except for \( \nu = 0 \), which is already considered in the case (1).

Combining these cases, we get the desired conclusion. \( \square \)

**Remark 7.5.** In \([21]\), Voigt and Yuncken constructed a similar (possibly nonspherical) irreducible unitary representations.

We conclude the content of this paper with another application of the whole theory.

**Theorem 7.6.** The Drinfeld double of \( SU_q(2n + 1) \) has property (T) for any \( n \in \mathbb{Z}_+ \).

**Proof.** First notice that the restriction of the usual topology of \( X/W \) to the unitary dual is nothing but the Fell topology. Hence we only need to show \( V(0, \nu) \) is not unitarizable for any \( \nu \in X \) sufficiently close to \( 2\rho \).

Let \( \mathfrak{g} = \mathfrak{sl}_{2n+1} \). We identify \( \mathfrak{h}^* \) with

\[
\{ \nu = (\nu_n, \nu_{n-1}, \ldots, \nu_{-n}) \in \mathbb{C}^{2n+1} \mid \sum_{k=-n}^{n} \nu_k = 0 \}.\]

Let \((e_k)_{k=n, n-1, \ldots, -n}\) be the canonical basis of \( \mathbb{C}^{2n+1} \) and fix the set of simple roots by \( e_k := e_k - e_{k-1} \) \((k = n, n-1, \ldots, -n+1) \). Then the element \( 2\rho \) corresponds to the sequence \( (2n, 2n-2, \ldots, -2n) \).

For \( \nu \in \mathfrak{h}^* \), consider the following two conditions.

(1) \(|\nu_k - 2k| < \min\{1, \pi \log(q)^{-1}\} \) for any \( k \).

(2) For any proper subset \( p \subset \{n, n-1, \ldots, -n\} \) which contains \( n \) and is closed under \( k \mapsto -k \), we have

\[
\sum_{k \in p} |q^{\nu_k}| > \sum_{l=1}^{#p} q^{-#p + 2l - 1}.\]

It is easy to observe that \( 2\rho \) satisfies these conditions. Hence if \( \nu \in \mathfrak{h}^* \) is sufficiently close to \( 2\rho \), then \( \nu \) also satisfies the conditions. We show \( V(0, \nu) \) is not unitarizable for such \( 2\rho \neq \nu \in \mathfrak{h}^* \).

Suppose \( V(0, \nu) \) is unitarizable. Since \( -\mathfrak{p} \) is a permutation of \( \nu \), the condition (1) implies

\[
\nu_{-k} = -\nu_k.
\]

Let \( p \subset \{n, n-1, \ldots, -n\} \) be the set of all indices \( k \) such that

\[
\nu_k - \nu_n \text{ or } -\nu_k - \nu_n \in 2\mathbb{Z} + 2\pi i \log(q)^{-1} \mathbb{Z}.
\]
By definition, $k \in p$ if and only if $-k \in p$.

We claim $p \neq \{-n,-n+1,\ldots,n\}$. (For this, we use the assumption that the rank is odd.) Suppose $p = \{-n,-n+1,\ldots,n\}$. Since $\nu_0$ is imaginary, the definition of $p$ and the condition (1) imply

$$\nu_k - \nu_0 \in 2\mathbb{Z}$$

for any $k$. Again from the condition (1), $\nu$ is of the form

$$\nu = (2n + \nu_0, 2n - 2 + \nu_0, \ldots, -2n + \nu_0).$$

Combining with $\sum k \nu_k = 0$, we get $\nu_0 = 0$, which contradicts with $\nu \neq 2p$.

Now take a permutation $\tilde{\nu}$ of $\nu$ with the following property:

- $\tilde{\nu}_n = \nu_n$,
- the set of indices corresponding to $p$ is $\{n,n-1,\ldots,l\}$ and
- the sequence $\text{Re} \tilde{\nu}$ is decreasing on $\{n,n-1,\ldots,l\}$ and $\{l-1,l-2,\ldots,-n\}$.

Put $\Sigma_1 := \{\alpha_k \mid l + 1 \leq k \leq n\}$, $\Sigma_2 = \{\alpha_k \mid -n + 1 \leq k \leq l - 1\}$ and $\Sigma := \Sigma_1 \cup \Sigma_2$. Since $\Sigma$ satisfies the assumption in Proposition 6.5,

$$V(0, \tilde{\nu}) = \text{Ind}^{\mathbb{H}}_{\Sigma}(V(0, \tilde{\nu}^\Sigma), \tilde{\nu}^\perp \Sigma).$$

Put $\tilde{\nu}^i := \tilde{\nu}^{\Sigma_i}$ for $i = 1,2$. Then we have

$$V(0, \tilde{\nu}^\Sigma) = V(0, \tilde{\nu}^1) \otimes V(0, \tilde{\nu}^2)$$

as $D^\Sigma = D^{\Sigma_1} \otimes D^{\Sigma_2}$-module.

On the other hand, we compute

$$\tilde{\nu}^1 = (\tilde{\nu}_n - t, \tilde{\nu}_{n-1} - t, \ldots, \tilde{\nu}_l - t, 0, \ldots, 0),$$

$$\tilde{\nu}^2 = (0, \ldots, 0, \tilde{\nu}_{l-1} - s, \tilde{\nu}_{l-2} - s, \ldots, \tilde{\nu}_{-n} - s)$$

$$\tilde{\nu}^\perp \Sigma = (t, t, \ldots, t, s, s, \ldots s)$$

for $t := \frac{1}{n-l+1} \sum_{k=l}^n k \tilde{\nu}_k$ and $s := \frac{1}{l+n} \sum_{k=-n}^{l-1} k \tilde{\nu}_k$. Since $\nu_{-k} = -\nu_k$ and by definition of $p$, $t$ and $s$ are imaginary. Therefore Corollary 5.4 implies $V(0, \tilde{\nu}^\Sigma)$ is unitarizable. Hence each invariant sesquilinear form on $V(0, \tilde{\nu})$ is also positive definite.

To conclude the proof, we will show $V(0, \tilde{\nu}^1)$ is not unitarizable using of Lemma 7.1. Let $\lambda$ be the fundamental weight of $\tilde{\nu}^\Sigma$. Then the inequality

$$\text{Tr}_\lambda(K_{\tilde{\nu}^1}) > \text{Tr}_\lambda(K_{2\rho^1})$$

follows from the condition (2). Thanks to Lemma 7.1, $V(0, \tilde{\nu}^1)$ is not unitarizable. □

8. Appendix. Central property (T) for discrete quantum groups

In this appendix, we give a brief explanation of a reformulation of the results in [6] in the property (T) case. For basic definitions, we refer [6].

Let $G$ be a compact quantum group. Let $C^u(G)$ be the universal function algebra on $G$. We denote the character algebra in $C^u(G)$ by $C^u(\text{Char}(G))$.

**Definition 8.1.** We say $\hat{G}$ has *central property* (T) if the following hold:

If a net of central states $(\omega_i) \subset C^u(G)^*$ converges to $\varepsilon$ in the weak*-topology, then it converges in norm.
Remark 8.2. According to [15] Theorem 3.1, the property (T) in the sense of [9] is equivalent to the following:

If a net of states $(\omega_i)$ converges to $\varepsilon$ in the weak*-topology, then it converges in norm.

In particular, property (T) implies central property (T).

We start with the following standard observation. For a standard properties of the Fell topology on the unitary dual of a C*-algebra, we refer [7].

Lemma 8.3. Let $A$ be a C*-algebra and $\chi$ a *-character of $A$. Then the following are equivalent.

(i) The character $\chi$ is isolated in the unitary dual of $A$.
(ii) If a net of states $(\omega_i)$ converges to $\chi$ in the weak*-topology, then it converges in norm.
(iii) There exists a central projection $p^\chi$ in $A$ such that for any $a \in A$,

$$ap^\chi = \chi(a)p^\chi.$$ 

Proof. The equivalence between (i) and (ii) is immediate from the definition of the topology on the unitary dual. From (ii) to (iii), see [2, Theorem 17.2.4]. (The proof works for general C*-algebras.)

From (iii) to (i), applying [7, Proposition 3.2.1] to $A = p^\chi A \oplus (1 - p^\chi)A$, we can decompose the unitary dual of $A$ into a direct sum of those of $p^\chi A$ and $(1 - p^\chi)A$. Since the unitary dual of $p^\chi A$ is $\{\chi\}$, $\chi$ is isolated. □

For $\omega \in C^u(G)^*$, one can define a multiplier $T^u_\omega$ on $C^u(G)$

$$T^u_\omega := (\omega \otimes \text{id})\Delta^u.$$ 

Then since $\omega = \varepsilon \circ T^u_\omega$, we get

$$||\omega|| = ||T^u_\omega||.$$ 

If we start with a central multiplier $T^u$ on $C^u(G)$, that is, a completely bounded map from $C^u(G)$ to itself which is equivariant under the left-right action of $G$, then $\omega_T := \varepsilon \circ T^u$ is a central state. Hence we get a one-to-one correspondence between central completely bounded multipliers and central bounded functionals which preserves the norm.

In particular, we get the following.

Proposition 8.4. The following are equivalent.

(i) The quantum group $\hat{G}$ has central property (T).
(ii) If a net of central completely positive multipliers $(T^u_i)$ on $C^u(G)$ converges to the identity pointwisely, then it converges in norm.

As in the completely same way in [10] Proposition 6.3], we get the following.

Proposition 8.5. Let $G$ and $H$ compact quantum groups which are monoidally equivalent. Then we have a one-to-one correspondence between central completely bounded multipliers on $C^u(G)$ and $C^u(H)$ preserving the norm and the weak*-topology.

In particular, if $\hat{G}$ has central property (T), so is $\hat{H}$.

In the Kac type case, central property (T) is equivalent to original property (T).

Proposition 8.6. Let $G$ be a compact quantum group of Kac type. Then the following are equivalent.
(i) The quantum group \( \hat{G} \) has property (T).
(ii) The quantum group \( \hat{G} \) has central property (T).
(iii) If a net of states \( (\omega_i) \) on the character algebra \( C^u(\text{Char}(G)) \) converges to \( \varepsilon \) in the weak*-topology, it converges in norm.

**Proof.** As we observed, (i) implies (ii).

To show (ii) implies (iii), suppose \( \hat{G} \) has property (T). Take a net of states \( (\omega_i) \) on \( C^u(\text{Char}(G)) \) converging to \( \varepsilon \) in the weak*-topology. Since \( \hat{G} \) is of Kac type, there exists an conditional expectation \( E : C^u(G) \to C^u(\text{Char}(G)) \).

Then \( (\omega_i \circ E) \) is a net of central states on \( C^u(G) \) converging to \( \varepsilon \) in the weak*-topology. Hence \( (\omega_i \circ E) \) converges in norm.

We show (iii) implies (i). Take the projection \( p_\varepsilon \in C^u(\text{Char}(G)) \) as in Lemma 8.3. We claim \( xp_\varepsilon = p_\varepsilon x = \varepsilon(x)p_\varepsilon \).

Taking \( * \) of the formula, we get \( p_\varepsilon \) is central. Again from Lemma 8.3 \( \hat{G} \) has property (T).

**Proposition 8.7.** Suppose the Drinfeld double \( D(G) \) has property (T). Then \( \hat{G} \) has central property (T).

**Proof.** Thanks to Lemma 8.3 the assumption is equivalent to the following: If a net of states on \( \mathcal{O}(G) \cong c_c(G) \) converges to the counit \( \varepsilon_D \), then it converges in norm.

Take central states \( \omega, \mu \) on \( C^u(G) \). Let \( \pi : C^u(G) \to M(C^u(D(G))) \) be the \( * \)-homomorphism extending \( \mathcal{O}(G) \to M(\mathcal{O}(G) \otimes c_c(G)) \). Then since \( \omega = \text{Ind}\omega \circ \pi \),

\[
\|\omega - \mu\| = \|\text{Ind}\omega - \text{Ind}\mu\| < \|\text{Ind}\omega - \text{Ind}\mu\|.
\]

In particular, for a net of central states \( (\omega_i) \), if \( (\text{Ind}\omega_i) \) converges to \( \text{Ind}\omega \) in norm, \( (\omega_i) \) converges to \( \omega \) in norm.

Hence if we have a net of central states \( (\omega_i) \) converges to \( \varepsilon \) in the weak*-topology, then \( (\text{Ind}\omega_i) \) converges to \( \varepsilon_D = \text{Ind}\varepsilon \) in the weak*-topology. By assumption, it converges in norm, which turns out to be the convergence of \( (\omega_i) \) to \( \varepsilon \) in norm, which is desired.

**Corollary 8.8.** The discrete quantum group \( SU_q(2n + 1) \) has central property (T).
