EXPLICIT $p$-HARMONIC FUNCTIONS AND HARMONIC MORPHISMS ON THE REAL GRASSMANNIANS

ELSIA GHANDOUR AND SIGMUNDUR GUDMUNDSSON

Abstract. In this work we use the method of eigenfamilies to construct explicit complex-valued proper $p$-harmonic functions and harmonic morphisms on the compact real Grassmannians. We also find proper $p$-harmonic functions on the real flag manifolds which do not descend onto any of the real Grassmannians.

1. Introduction

Mathematicians and physicists have been studying biharmonic functions for nearly two centuries. Applications have been found within physics for example in continuum mechanics, elasticity theory, as well as two-dimensional hydrodynamics problems involving Stokes flows of incompressible Newtonian fluids. Until just a few years ago, with only very few exceptions, the domains of all known explicit proper $p$-harmonic functions have been either surfaces or open subsets of flat Euclidean space. A recent development has changed this situation and can be traced at the regularly updated online bibliography [4], maintained by the second author.

A natural habitat for the study of complex-valued $p$-harmonic functions $\phi : (M,g) \to \mathbb{C}$, on Riemannian manifolds, is found by assuming that the domain is a symmetric space. These were classified by the pioneering work of Élie Cartan in the late 1920s. For this we refer to the standard work [11] by Helgason. The irreducible Riemannian symmetric spaces come in pairs each consisting of a compact space $U/K$ and its non-compact dual $G/K$. In their recent article [9], the authors construct the first known explicit proper $p$-harmonic functions ($p \geq 2$) for the compact cases

$$\text{SO}(n), \quad \text{SU}(n), \quad \text{Sp}(n)$$

of Type II, see also [5] and [7] for the special case when $p = 2$. For compact symmetric spaces of Type I, the authors of [8] deal with the cases of

$$\text{SU}(n)/\text{SO}(n), \quad \text{Sp}(n)/\text{U}(n), \quad \text{SO}(2n)/\text{U}(n), \quad \text{SU}(2n)/\text{Sp}(n).$$

For complex-valued $p$-harmonic functions on symmetric spaces we have a duality principle first introduced for harmonic morphisms in [10] and later developed for $p$-harmonic functions in [5]. This means that a solution on

2020 Mathematics Subject Classification. 53C35, 53C43, 58E20.

Key words and phrases. $p$-harmonic functions, symmetric spaces.
the compact $U/K$ induces, in a natural way, a solution on its non-compact dual $G/K$ and vice versa. For this reason we here only discuss the compact cases.

It is the principal aim of this work to construct the first known explicit complex-valued proper $p$-harmonic functions on the real Grassmanians $\text{SO}(m+n)/\text{SO}(m) \times \text{SO}(n)$. Our method is inspired by the classical spherical harmonics on the standard round sphere $S^n = \text{SO}(n+1)/\text{SO}(n)$, see Remark 4.8.

2. Proper $p$-Harmonic Functions

In this section we describe a method for manufacturing complex-valued proper $p$-harmonic functions on Riemannian manifolds. This was recently introduced in [9].

Let $(M, g)$ be an $m$-dimensional Riemannian manifold and $T^CM$ be the complexification of the tangent bundle $TM$ of $M$. We extend the metric $g$ to a complex-bilinear form on $T^CM$. Then the gradient $\nabla \phi$ of a complex-valued function $\phi : (M, g) \rightarrow \mathbb{C}$ is a section of $T^CM$. In this situation, the well-known complex linear Laplace-Beltrami operator (alt. tension field) $\tau$ on $(M, g)$ acts locally on $\phi$ as follows

$$\tau(\phi) = \text{div}(\nabla \phi) = \sum_{i,j=1}^{m} \frac{1}{\sqrt{|g|}} \frac{\partial}{\partial x_i} \left( g^{ij} \sqrt{|g|} \frac{\partial \phi}{\partial x_i} \right).$$

For two complex-valued functions $\phi, \psi : (M, g) \rightarrow \mathbb{C}$ we have the following well-known relation

$$\tau(\phi \cdot \psi) = \tau(\phi) \cdot \phi + 2 \cdot \kappa(\phi, \psi) + \phi \cdot \tau(\psi), \quad (2.1)$$

where the complex bilinear conformality operator $\kappa$ is given by

$$\kappa(\phi, \psi) = g(\nabla \phi, \nabla \psi).$$

Locally this satisfies

$$\kappa(\phi, \psi) = \sum_{i,j=1}^{m} g^{ij} \cdot \frac{\partial \phi}{\partial x_i} \frac{\partial \psi}{\partial x_j}.$$

Definition 2.1. Let $(M, g)$ be a Riemannian manifold. Then a complex-valued function $\phi : M \rightarrow \mathbb{C}$ is said to be an eigenfunction if it is eigen both with respect to the Laplace-Beltrami operator $\tau$ and the conformality operator $\kappa$ i.e. there exist complex numbers $\lambda, \mu \in \mathbb{C}$ such that

$$\tau(\phi) = \lambda \cdot \phi \quad \text{and} \quad \kappa(\phi, \phi) = \mu \cdot \phi^2.$$ 

A set $\mathcal{E} = \{\phi_i : M \rightarrow \mathbb{C} \mid i \in I\}$ of complex-valued functions is said to be an eigenfamily on $M$ if there exist complex numbers $\lambda, \mu \in \mathbb{C}$ such that for all $\phi, \psi \in \mathcal{E}$ we have

$$\tau(\phi) = \lambda \cdot \phi \quad \text{and} \quad \kappa(\phi, \psi) = \mu \cdot \phi \cdot \psi.$$
In this work we are mainly interested in complex-valued proper $p$-harmonic functions. They are defined as follows.

**Definition 2.2.** Let $(M, g)$ be a Riemannian manifold. For a positive integer $p$, the iterated Laplace-Beltrami operator $\tau^p$ is given by

$$\tau^0(\phi) = \phi \text{ and } \tau^p(\phi) = \tau(\tau^{(p-1)}(\phi)).$$

We say that a complex-valued function $\phi : (M, g) \to \mathbb{C}$ is

(i) *$p$-harmonic* if $\tau^p(\phi) = 0$, and

(ii) *proper $p$-harmonic* if $\tau^p(\phi) = 0$ and $\tau^{(p-1)}(\phi)$ does not vanish identically.

Our construction of complex-valued proper $p$-harmonic functions, on the real Grassmannians, is based on the following method, recently introduced in [9].

**Theorem 2.3.** Let $\phi : (M, g) \to \mathbb{C}$ be a complex-valued function on a Riemannian manifold and $(\lambda, \mu) \in \mathbb{C}^2 \setminus \{0\}$ be such that the tension field $\tau$ and the conformality operator $\kappa$ satisfy

$$\tau(\phi) = \lambda \cdot \phi \text{ and } \kappa(\phi, \phi) = \mu \cdot \phi^2.$$

Then for any positive natural number $p$, the non-vanishing function

$$\Phi_p : W = \{x \in M \mid \phi(x) \notin (-\infty, 0]\} \to \mathbb{C}$$

with

$$\Phi_p(x) = \begin{cases} c_1 \cdot \log(\phi(x))^{p-1}, & \text{if } \mu = 0, \lambda \neq 0 \\ c_1 \cdot \log(\phi(x))^{2p-1} + c_2 \cdot \log(\phi(x))^{2p-2}, & \text{if } \mu \neq 0, \lambda = \mu \\ c_1 \cdot \phi(x)^{1-\frac{1}{p}} \log(\phi(x))^{p-1} + c_2 \cdot \log(\phi(x))^{p-1}, & \text{if } \mu \neq 0, \lambda \neq \mu \end{cases}$$

is a proper $p$-harmonic function. Here $c_1, c_2$ are complex coefficients, not both zero.

### 3. Lifting Properties

We shall now present an interesting connection between the theory of complex-valued $p$-harmonic functions and the notion of harmonic morphisms. Readers not familiar with harmonic morphisms are advised to consult the standard text [2] and the regularly updated online bibliography [3].

**Proposition 3.1.** Let $\pi : (\hat{M}, \hat{g}) \to (M, g)$ be a submersive harmonic morphism between Riemannian manifolds. Further let $f : (M, g) \to \mathbb{C}$ be a smooth function and $\hat{f} : (\hat{M}, \hat{g}) \to \mathbb{C}$ be the composition $\hat{f} = f \circ \pi$. If $\lambda : \hat{M} \to \mathbb{R}^+$ is the dilation of $\pi$ then the tension fields $\tau$ and $\hat{\tau}$ satisfy

$$\tau(f) \circ \pi = \lambda^{-2} \hat{\tau}(\hat{f}) \text{ and } \tau^p(f) \circ \pi = \lambda^{-2} \hat{\tau}(\lambda^{-2} \hat{\tau}^{(p-1)}(\hat{f}))$$

for all positive integers $p \geq 2$. 

Proof. The harmonic morphism $\pi$ is a horizontally conformal, harmonic map. Hence the well-known composition law for the tension field gives

$$\hat{\tau}(\hat{f}) = \hat{\tau}(f \circ \pi) = \text{trace}\nabla df (d\pi, d\pi) + df(\hat{\tau}(\pi)) = \lambda^2 \tau(f) + df(\hat{\tau}(\pi)) = \lambda^2 \tau(f) \circ \pi.$$  

For the second statement, set $h = \tau(f)$ and $\hat{h} = \lambda^{-2} \cdot \hat{\tau}(\hat{f})$. Then $\hat{h} = h \circ \pi$ and it follows from the first step that

$$\hat{\tau}(\lambda^{-2} \hat{\tau}(\hat{f})) = \hat{\tau}(\hat{h}) = \lambda^2 \tau(h) \circ \pi = \lambda^2 \tau^2(f) \circ \pi,$$

or equivalently,

$$\tau^2(f) \circ \pi = \lambda^{-2} \hat{\tau}(\lambda^{-2} \hat{\tau}(\hat{f})).$$

The rest follows by induction. \hfill \Box

Let $G$ be the special orthogonal group $\text{SO}(m + n)$, with subgroup $K = \text{SO}(m) \times \text{SO}(n)$. Then the standard biinvariant Riemannian metric on $G$, induced by the Killing form, is $\text{Ad}(K)$-invariant and induces a Riemannian metric on the symmetric quotient space $G/K$. Moreover, the natural projection $\pi : G \to G/K$ is a Riemannian submersion with totally geodesic fibres, hence a harmonic morphism satisfying the conditions in Proposition 3.1.4.

4. Eigenfamilies on the Real Grassmannians

The special orthogonal group $\text{SO}(m + n)$ is the compact subgroup of the real general linear group $\text{GL}_{m+n}(\mathbb{R})$ of invertible matrices satisfying

$$\text{SO}(m + n) = \{x \in \text{GL}_{m+n}(\mathbb{R}) \mid x \cdot x^t = I \text{ and det } x = 1\}.$$  

Its standard representation on $\mathbb{C}^{m+n}$ is denoted by

$$\pi : x \mapsto \begin{bmatrix} x_{11} & \cdots & x_{1,m+n} \\ \vdots & \ddots & \vdots \\ x_{m+n,1} & \cdots & x_{m+n,m+n} \end{bmatrix}.$$  

For this situation we have the following basic result from Lemma 4.1 of [6].

Lemma 4.1. For $1 \leq j, k, \alpha, \beta \leq m + n$, let $x_{j\alpha} : \text{SO}(m + n) \to \mathbb{R}$ be the real-valued matrix elements of the standard representation of $\text{SO}(m + n)$. Then the following relations hold

$$\hat{\tau}(x_{j\alpha}) = -\frac{(m + n - 1)}{2} \cdot x_{j\alpha},$$  

$$\hat{\kappa}(x_{j\alpha}, x_{k\beta}) = -\frac{1}{2} \cdot (x_{j\beta} x_{k\alpha} - \delta_{jk} \delta_{\alpha\beta}).$$
For $1 \leq j, \alpha \leq m + n$, we now define the real-valued functions $\hat{\phi}_{ja} : \SO(m + n) \to \mathbb{R}$ on the special orthogonal group $\SO(m + n)$ by

$$\hat{\phi}_{ja}(x) = \sum_{t=1}^{m} x_{jt} x_{at}.$$ 

These functions are $\SO(m) \times \SO(n)$-invariant and hence induce functions on the compact quotient space $\SO(m + n)/\SO(m) \times \SO(n)$ i.e. the real Grassmannian $G_m(\mathbb{R}^{m+n})$ of $m$-dimensional oriented subspaces of $\mathbb{R}^{m+n}$.

**Lemma 4.2.** The tension field $\hat{\tau}$ and the conformality operator $\hat{\kappa}$ on the special orthogonal group $\SO(m + n)$ satisfy

$$\hat{\tau}(\hat{\phi}_{ja}) = -(m + n) \cdot \hat{\phi}_{ja} + \delta_{ja} \cdot m$$

$$\hat{\kappa}(\hat{\phi}_{ja}, \hat{\phi}_{k\beta}) = -(\hat{\phi}_{j\beta} \cdot \hat{\phi}_{ka} + \hat{\phi}_{jk} \cdot \hat{\phi}_{\alpha\beta})$$

$$+ \frac{1}{2}(\delta_{jk} \hat{\phi}_{\alpha\beta} + \delta_{\alpha\beta} \hat{\phi}_{jk} + \delta_{j\beta} \hat{\phi}_{ka} + \delta_{ka} \hat{\phi}_{j\beta}).$$

**Proof.** The following calculations are based on the equation (2.1) and the formulae in Lemma 4.1. For the tension field $\hat{\tau}$ we have

$$\hat{\tau}(\hat{\phi}_{ja}) = \sum_{t=1}^{m} \left\{ \hat{\tau}(x_{jt}) \cdot x_{at} + 2 \cdot \hat{\kappa}(x_{jt}, x_{at}) + x_{jt} \cdot \hat{\tau}(x_{at}) \right\}$$

$$= -(m + n) \cdot \sum_{t=1}^{m} x_{jt} x_{at} - \sum_{t=1}^{m} (x_{jt} x_{at} - \delta_{ja})$$

$$= -(m + n) \cdot \hat{\phi}_{ja} + \delta_{ja} \cdot m.$$ 

For the conformality operator $\hat{\kappa}$ we then obtain

$$\hat{\kappa}(\hat{\phi}_{ja}, \hat{\phi}_{k\beta})$$

$$= \sum_{s,t=1}^{m} \hat{\kappa}(x_{js} x_{s\alpha}, x_{kt} x_{\beta t})$$

$$= \sum_{s,t=1}^{m} \left\{ x_{js} x_{kt} \cdot \hat{\kappa}(x_{s\alpha}, x_{\beta t}) + x_{js} x_{\beta t} \cdot \hat{\kappa}(x_{s\alpha}, x_{kt}) + x_{s\alpha} x_{kt} \cdot \hat{\kappa}(x_{js}, x_{\beta t}) \right\}$$

$$= - \frac{1}{2} \sum_{s,t=1}^{m} \left\{ x_{js} x_{kt} \cdot (x_{at} x_{\beta s} - \delta_{\alpha\beta} \delta_{st}) + x_{js} x_{\beta t} \cdot (x_{at} x_{ks} - \delta_{\alpha k} \delta_{st}) + x_{s\alpha} x_{kt} \cdot (x_{jt} x_{\beta s} - \delta_{j\beta} \delta_{st}) + x_{s\alpha} x_{\beta t} \cdot (x_{jt} x_{ks} - \delta_{j\beta} \delta_{st}) \right\}$$

$$= - (\hat{\phi}_{j\beta} \cdot \hat{\phi}_{ka} + \hat{\phi}_{jk} \cdot \hat{\phi}_{\alpha\beta})$$

$$+ \frac{1}{2} \cdot (\delta_{jk} \hat{\phi}_{\alpha\beta} + \delta_{\alpha\beta} \hat{\phi}_{jk} + \delta_{j\beta} \hat{\phi}_{ka} + \delta_{ka} \hat{\phi}_{j\beta}).$$

□
**Theorem 4.3.** Let $A$ be a complex symmetric $(m+n) \times (m+n)$-matrix such that $A^2 = 0$. Then the $\text{SO}(m) \times \text{SO}(n)$-invariant function $\hat{\Phi}_A : \text{SO}(m+n) \to \mathbb{C}$, given by

$$\hat{\Phi}_A(x) = \sum_{j,a=1}^{m+n} a_{ja} \cdot \hat{\phi}_{ja}(x),$$

induces an eigenfunction $\Phi_A : \text{SO}(m+n)/\text{SO}(m) \times \text{SO}(n) \to \mathbb{C}$ on the real Grassmannian with

$$\tau(\Phi_A) = -(m + n) \cdot \Phi_A \quad \text{and} \quad \kappa(\Phi_A, \Phi_A) = -2 \cdot \Phi_A^2$$

if rank $A = 1$ and trace $A = 0$.

**Proof.** It is an immediate consequence of Lemma 4.2 and the fact that $A$ is traceless that the tension field $\hat{\tau}$ satisfies

$$\hat{\tau}(\hat{\Phi}_A) = -(m + n) \cdot \hat{\Phi}_A + m \cdot \text{trace } A = -(m + n) \cdot \hat{\Phi}_A.$$

For the conformality operator $\hat{\kappa}$ we have

$$2 \cdot \hat{\Phi}_A^2 + \hat{\kappa}(\hat{\Phi}_A, \hat{\Phi}_A)$$

$$= 2 \cdot \hat{\Phi}_A^2 + \sum_{j,a,k,\beta=1}^{m+n} \hat{\kappa}(a_{ja} \hat{\phi}_{ja}, a_{k\beta} \hat{\phi}_{k\beta})$$

$$= 2 \cdot \hat{\Phi}_A^2 + \sum_{j,a,k,\beta=1}^{m+n} a_{ja} a_{k\beta} \cdot \hat{\kappa}(\hat{\phi}_{ja}, \hat{\phi}_{k\beta})$$

$$= 2 \cdot \hat{\Phi}_A^2 - \sum_{j,a,k,\beta=1}^{m+n} a_{ja} a_{k\beta} \{ \hat{\phi}_{j\beta} \cdot \hat{\phi}_{ka} + \hat{\phi}_{jk} \cdot \hat{\phi}_{\beta\alpha} \}$$

$$+ \frac{1}{2} \sum_{j,a,k,\beta=1}^{m+n} a_{ja} a_{k\beta} \{ \delta_{jk} \hat{\phi}_{\alpha\beta} + \delta_{\alpha\beta} \hat{\phi}_{jk} + \delta_{j\beta} \hat{\phi}_{ka} + \delta_{k\alpha} \hat{\phi}_{j\beta} \}$$

$$= 2 \cdot \hat{\Phi}_A^2 - \sum_{j,a,k,\beta=1}^{m+n} \{ a_{j\beta} a_{ka} + a_{jk} a_{\alpha\beta} \} \cdot \hat{\phi}_{ja} \hat{\phi}_{k\beta}$$

$$+ \frac{1}{2} \sum_{j,a,k,\beta=1}^{m+n} a_{ja} a_{k\beta} (\delta_{ks} \hat{\phi}_{jr} + \delta_{kr} \hat{\phi}_{js} + \delta_{js} \hat{\phi}_{kr} + \delta_{jr} \hat{\phi}_{ks})$$

$$= \sum_{j,a,k,\beta=1}^{m+n} \{ 2 a_{ja} a_{k\beta} - a_{j\beta} a_{ka} - a_{jk} a_{\alpha\beta} \} \cdot \hat{\phi}_{ja} \hat{\phi}_{k\beta} + 2 \sum_{j,a,t=1}^{m+n} a_{jt} a_{at} \hat{\phi}_{ja}$$

$$= \sum_{j,a,k,\beta=1}^{m+n} \{ \det \begin{bmatrix} a_{ja} & a_{j\beta} \\ a_{ka} & a_{k\beta} \end{bmatrix} + \det \begin{bmatrix} a_{ja} & a_{jk} \\ a_{\beta\alpha} & a_{\beta k} \end{bmatrix} \} \cdot \hat{\phi}_{ja} \hat{\phi}_{k\beta}$$

$$+ 2 \sum_{j,a=1}^{m+n} (a_j, a_\alpha) \cdot \hat{\phi}_{ja}.$$
$= 0$, since $A^2 = 0$ and rank $A = 1$. □

**Proposition 4.4.** Let $A$ be a complex $(m + n) \times (m + n)$ matrix such that

$$\Omega_{jk}(\alpha, \beta) = \det \begin{bmatrix} a_{j \alpha} & a_{j \beta} \\ a_{k \alpha} & a_{k \beta} \end{bmatrix} + \det \begin{bmatrix} a_{j \alpha} & a_{j k} \\ a_{\beta \alpha} & a_{\beta k} \end{bmatrix} = 0,$$

for all $1 \leq j, k, \alpha, \beta \leq m + n$. Then $A^2 = A \cdot \text{trace } A$ and rank $A = 1$.

**Proof.** The first statement is an immediate consequence of the relation

$$\sum_{\alpha = 1}^{m+n} \Omega_{jk}(\alpha, \alpha) = (a_j, a_k) - a_{jk} \cdot \text{trace } A.$$

The second statement follows from

$$\Omega_{jk}(\alpha, \beta) - \Omega_{jk}(\beta, \alpha) = 3 \{ a_{j \alpha} a_{k \beta} - a_{j \beta} a_{k \alpha} \} = 3 \cdot \det \begin{bmatrix} a_{j \alpha} & a_{j \beta} \\ a_{k \alpha} & a_{k \beta} \end{bmatrix}.$$

□

In Example 4.5, we now construct matrices satisfying the conditions in Theorem 4.3 and hence manufacture a multi-dimensional family of eigenfunctions on the real Grassmannian $\text{SO}(m + n)/\text{SO}(m) \times \text{SO}(n)$.

**Example 4.5.** Let $p = (p_1, \ldots, p_{m+n}) \in \mathbb{C}^{m+n}$ be a non-zero isotropic element i.e.

$$p_1^2 + p_2^2 + \cdots + p_{m+n}^2 = 0.$$

Then the complex $(m + n) \times (m + n)$ matrix $A = p^t \cdot p$ with $a_{jk} = p_j p_k$ satisfies the conditions $A^2 = 0$, trace $A = 0$ and rank $A = 1$. Furthermore the $\text{SO}(m) \times \text{SO}(n)$-invariant function $\hat{\Phi}_p : \text{SO}(m + n) \to \mathbb{C}$ with

$$\hat{\Phi}_p(x) = \sum_{j, \alpha = 1}^{m+n} p_j p_k \cdot (\sum_{t=1}^{m} x_{jt} x_{kt}),$$

induces an eigenfunction $\Phi_p : \text{SO}(m + n)/\text{SO}(m) \times \text{SO}(n) \to \mathbb{C}$ on the quotient space with

$$\tau(\Phi_p) = -(m + n) \cdot \Phi_p \text{ and } \kappa(\Phi_p, \Phi_p) = -2 \cdot \Phi_p^2.$$

This provides a complex $(m + n - 1)$-dimensional family of eigenfunctions on the real Grassmannian $\text{SO}(m + n)/\text{SO}(m) \times \text{SO}(n)$.

**Example 4.6.** Let $\alpha \in \mathbb{Z}^+$ be the integral part $\alpha = \lfloor (m + n)/2 \rfloor$ and define the orthogonal isotropic elements $z_1, \ldots, z_\alpha \in \mathbb{C}^{m+n}$ by

$$z_1 = e_1 + i \cdot e_2, \quad z_2 = e_3 + i \cdot e_4, \quad \ldots, \quad z_\alpha = e_{2\alpha-1} + i \cdot e_{2\alpha}.$$

Then the set $\mathcal{E} = \{ \Phi_{z_1}, \Phi_{z_2}, \ldots, \Phi_{z_\alpha} \}$ is an eigenfamily on the real Grassmannian $\text{SO}(m + n)/\text{SO}(m) \times \text{SO}(n)$.
such that
\[ \tau(\Phi z_j) = -(m + n) \cdot \Phi z_j \quad \text{and} \quad \kappa(\Phi z_j, \Phi z_k) = -2 \cdot \Phi z_j \Phi z_k. \]

The next result shows that eigenfamilies can be utilised to manufacture a variety of harmonic morphisms. The standard reference for the extensive theory of harmonic morphisms is the book [2], but we also recommend the updated online bibliography [3].

**Theorem 4.7.** [6] Let \((M, g)\) be a Riemannian manifold and \(E = \{\phi_1, \ldots, \phi_n\}\) be an eigenfamily of complex-valued functions on \(M\). If \(P, Q : \mathbb{C}^n \to \mathbb{C}\) are linearly independent homogeneous polynomials of the same positive degree then the quotient
\[ \frac{P(\phi_1, \ldots, \phi_n)}{Q(\phi_1, \ldots, \phi_n)} \]

is a non-constant harmonic morphism on the open and dense subset \(\{p \in M | Q(\phi_1(p), \ldots, \phi_n(p)) \neq 0\}\).

Next we explain how our construction method is inspired by the classical theory of spherical harmonics on \(S^n\), as the unit sphere in the Euclidean \(\mathbb{R}^{n+1}\). For this see the excellent text [1].

**Remark 4.8.** For \(m = 1\), we identify the first column of the generic matrix element
\[
\begin{bmatrix}
x_{11} & \cdots & x_{1,n+1} \\
\vdots & \ddots & \vdots \\
x_{n+1,1} & \cdots & x_{n+1,n+1}
\end{bmatrix}
\]
in \(\text{SO}(n + 1)\) with \(x = (x_1, x_2, \ldots, x_{n+1}) \in \mathbb{R}^{n+1}\). Then the linear space \(\mathcal{H}^2_{n+1}\) of second order harmonic polynomials in the coordinates of \(x \in \mathbb{R}^{n+1}\) is generated by the elements
\[
x_1^2 - x_2^2, x_2^2 - x_3^2, \ldots, x_n^2 - x_{n+1}^2, x_1x_2, x_1x_3, \ldots, x_nx_{n+1},
\]
forming a basis \(\mathcal{B}\) for \(\mathcal{H}^2_{n+1}\). Their restrictions to the unit sphere \(S^n\) are eigenfunctions of the Laplace-Beltrami operator, all of the same eigenvalue.

By assuming, in Theorem 4.3, that the matrix \(A\) is traceless we see that the \(\text{SO}(n)\)-invariant function \(\hat{\Phi}_A : \text{SO}(n + 1) \to \mathbb{C}\), given by
\[ \hat{\Phi}_A(x) = \sum_{j,\alpha=1}^{n+1} a_{j\alpha} \cdot \hat{\phi}_{j\alpha}(x), \]
is a linear combination of the basis elements in \(\mathcal{B}\). If \(\text{rank } A = 1\) and \(\text{trace } A = 0\), then these functions are eigen with respect to the conformality operator \(\kappa\).
5. Eigenfunctions on the Real Flag Manifolds

The standard Riemannian metric on the special orthogonal group \( \text{SO}(n) \) induces a natural metric on the real homogeneous flag manifolds

\[ \mathcal{F}(n_1, \ldots, n_t) = \text{SO}(n)/\text{SO}(n_1) \times \text{SO}(n_2) \times \cdots \times \text{SO}(n_t), \]

where \( n = n_1 + n_2 + \cdots + n_t \). For this we have the Riemannian fibrations

\[ \text{SO}(n) \to \mathcal{F}(n_1, \ldots, n_t) \to G_{n_k}(\mathbb{R}^n). \]

Let us now write the generic element \( x \in \text{SO}(n) \) of the form

\[ x = [x_1 \mid x_2 \mid \cdots \mid x_t], \]

where each \( x_k \) is an \( n \times n_k \) submatrix of \( x \). Following Theorem 4.3, we can now, for each block, construct a family \( \hat{E}_k \) of \( \text{SO}(n_k) \)-invariant complex-valued eigenfunctions on the special orthogonal group \( \text{SO}(n) \) such that for all \( \hat{\phi}, \hat{\psi} \in \hat{E}_k \)

\[ \tau(\hat{\phi}) = \lambda_k \cdot \hat{\phi} \quad \text{and} \quad \kappa(\hat{\phi}, \hat{\psi}) = \mu_k \cdot \hat{\phi} \cdot \hat{\psi}, \]

with \( \lambda_k = -n \) and \( \mu_k = -2 \). We denote by \( \hat{\phi}_k \) the generic element in \( \hat{E}_k \) and then, according to Theorem 2.3, each function

\[ \hat{\Phi}_{p,k}(x) = c_{1,k} \cdot \hat{\phi}_k(x)^{1-\frac{\lambda_k}{n_k}} \log(\hat{\phi}_k(x))^{p-1} + c_{2,k} \cdot \log(\hat{\phi}_k(x))^{p-1} \]

is proper \( p \)-harmonic on an open and dense subset of \( \text{SO}(n) \). The sum

\[ \hat{\Phi}_p = \sum_{k=1}^t \hat{\Phi}_{p,k} \]

constitutes a multi-dimensional family \( \hat{\mathcal{F}}_p \) of \( \text{SO}(n_1) \times \cdots \times \text{SO}(n_t) \)-invariant proper \( p \)-harmonic functions on an open dense subset of \( \text{SO}(n) \). Furthermore, each element \( \hat{\Phi}_p \in \hat{\mathcal{F}}_p \) induces a proper \( p \)-harmonic function \( \Phi^*_p \) defined on an open and dense subset of the real flag manifold

\[ \mathcal{F}(n_1, \ldots, n_t) = \text{SO}(n)/\text{SO}(n_1) \times \cdots \times \text{SO}(n_t), \]

which does not descend onto any of the real Grassmannians if \( t \geq 3 \).

6. Acknowledgements

The authors would like to thank Fran Burstall for useful discussions on this work.

The first author would like to thank the Department of Mathematics at Lund University for its great hospitality during her time there as a postdoc.
| $U/K$                  | $\lambda$        | $\mu$        | Eigenfunctions |
