THE ALTERNATING PRESENTATION OF $\hat{U}_q(\mathfrak{gl}_2)$
FROM FREIDEL-MAILLET ALGEBRAS

PASCAL BASEILHAC

Abstract. An infinite dimensional algebra denoted $\hat{A}_q$ that is isomorphic to a central extension of $U_q^+$ - the positive part of $U_q(\mathfrak{sl}_2)$ - has been recently proposed by Paul Terwilliger. It provides an ‘alternating’ Poincaré-Birkhoff-Witt (PBW) basis besides the known Damiani’s PBW basis built from positive root vectors. In this paper, a presentation of $\hat{A}_q$ in terms of a Freidel-Maillet algebra is obtained. Using this presentation: (a) finite dimensional tensor product representations for $\hat{A}_q$ are constructed; (b) explicit isomorphisms from $\hat{A}_q$ to certain Drinfeld type ‘alternating’ subalgebras of $U_q(\mathfrak{gl}_2)$ are obtained; (c) the image in $U_q^+$ of all the generators of $\hat{A}_q$ in terms of Damiani’s root vectors is obtained. A new tensor product decomposition of $U_q(\mathfrak{sl}_2)$ in terms of Drinfeld type ‘alternating’ subalgebras follows. The specialization $q \rightarrow 1$ of $\hat{A}_q$ is also introduced and studied in details. In this case, a presentation is given as a non-standard Yang-Baxter algebra. This paper is dedicated to Paul Terwilliger for his 65th birthday.

Keywords: Reflection equation; Drinfel’d second presentation; $U_q(\mathfrak{sl}_2)$; $q$-shuffle algebra

1. Introduction

Quantum affine algebras are known to admit at least three presentations. For $U_q(\mathfrak{sl}_2)$, the first presentation originally introduced in [JS5, DS8] - referred as the Drinfel’d-Jimbo presentation in the literature - is given in terms of generators $\{E_i, F_i, K_i^{\pm 1}\}$ and relations, see Appendix A. The so-called Drinfeld second presentation was found later on [DS8], given in terms of generators $\{x_k^\pm, b_\ell, K_\ell^{\pm 1/2}| k \in \mathbb{Z}, \ell \in \mathbb{Z}\{0\}\}$ and relations. The third one, obtained in [RS90], takes the form of a Faddeev-Reshetikhin-Takhtajan (FRT) presentation [FRT89]. In these definitions, note that the so-called derivation generator is omitted (see [CP91, Remark 2, page 393]). In the following, we denote respectively $\hat{U}_q^{DJ}$, $\hat{U}_q^{Dr}$ and $\hat{U}_q^{RS}$ these presentations of $U_q(\mathfrak{sl}_2)$. In addition, for $U_q(\mathfrak{sl}_2)$ note that a fourth presentation called ‘equitable’, denoted $U_q^{IT}$, has been introduced in [IT03]. It is generated by $\{y_i^\pm, k_i^\pm | i = 0, 1\}$. For the explicit isomorphism $U_q^+ \rightarrow \hat{U}_q^{DJ}$, see [IT03, Theorem 2.1].

The construction of a Poincaré-Birkhoff-Witt (PBW) basis for $U_q(\mathfrak{sl}_2)$ [Da93, Be94] on one hand, and the FRT presentation of Ding-Frenkel [DF93] on the other hand brought major contributions to the subject, by establishing the explicit isomorphisms between $\hat{U}_q^{DJ}$, $\hat{U}_q^{Dr}$ and $\hat{U}_q^{RS}$ (see also [Ji96, Da14]). To motivate the goal of the present paper, as a preliminary let us briefly review the main results of [Da93, Be94] and [DF93].

• To establish the isomorphism between $U_q^{DJ}$ and $U_q^{Dr}$, the main ingredient is the construction of a PBW basis. In [Da93], it is shown that the so-called positive part of $U_q(\mathfrak{sl}_2)$ denoted $U_q^{DJ,+}$ - cf. Notation 1.2 - is generated by positive (real and imaginary) root vectors [Da93, Section 3.1]. The root vectors are obtained using Lusztig’s braid group action on $U_q^{DJ}$ [L93]. Based on the structure of the commutation relations among the root vectors, a PBW basis for $U_q^{DJ,+}$ is first obtained [Da93, Section 4]. Then, introduce the subalgebras $U_q^{DJ,-}$, $U_q^{DJ,0}$ of $U_q^{DJ}$. Thanks to the tensor product decomposition $U_q^{DJ} \cong U_q^{DJ,+} \otimes U_q^{DJ,0} \otimes U_q^{DJ,-}$ [L93] and some automorphism of $U_q^{DJ}$, the PBW basis for $U_q^{DJ,+}$ induces a PBW basis for $U_q(\mathfrak{sl}_2)$ [Da93, Section 5]. Then, the explicit isomorphism $U_q^{Dr} \rightarrow U_q^{DJ}$ [Be94] maps Drinfel’d generators to root vectors. See [BCT98, Lemma 1.5], [Da14].

• To establish the explicit isomorphism between $U_q^{RS}$ and $U_q^{Dr}$, the main ingredient in [DF93] is the construction of a FRT presentation for $U_q(\mathfrak{gl}_2)$, which can be interpreted as a central extension of $U_q(\mathfrak{sl}_2)$ [FM02]. In this approach, the defining relations are written in the form of a Yang-Baxter algebra. Namely, two quantum Lax operators $L^\pm(z)$
which entries are generating functions with coefficients in two different subalgebras of \(U_q^{Dr}\) are introduced. They satisfy certain functional relations (the so-called ‘RTT’ relations) characterized by an R-matrix. The explicit isomorphism \(U_q^{RS} \rightarrow U_q^{Dr}\) is obtained as a corollary of the FRT presentation of \(U_q(\mathfrak{gl}_2)\).

In these works, Damiani’s root vectors (or equivalently the Drinfel’d generators), associated PBW bases and the Yang-Baxter algebra play a central role. Later on, these objects found several applications. For instance, the universal R-matrix is built from elements in PBW bases of \(U_q(\mathfrak{sl}_2)\) subalgebras \(\mathfrak{Da98}\). Also, irreducible finite dimensional representations of \(U_q(\mathfrak{sl}_2)\) are classified using \(U_q^{Dr}\) \(\mathfrak{CP91}\). A natural question is the following: for \(U_q(\mathfrak{sl}_2)\), is it possible to construct a different ‘triplet’ of presentations other than \(U_q^{DJ}\) (or \(U_q^{IT}\), \(U_q^{Dr}\) and \(U_q^{RS}\)?

Recent works by Paul Terwilliger bring a new light on this subject, and give a starting point for a precise answer. Indeed, in \(\mathfrak{IT18}, \mathfrak{IT19a}\) Terwilliger investigated the description of PBW bases of \(U_q(\mathfrak{sl}_2)\) from the perspective of combinatorics, using a \(q\)-shuffle algebra \(\mathcal{V}\) introduced earlier by Rosso \(\mathfrak{R98}\). Remarkably, using an injective algebra homomorphism \(U_q^{DJ, +} \rightarrow \mathcal{V}\) a closed form for the images in \(\mathcal{V}\) of Damiani’s root vectors of \(U_q^{DJ, +}\) - the basic building elements of Damiani’s PBW basis - was obtained in terms of Catalan words \(\mathfrak{IT18}\) Theorem 1.7. Then, in \(\mathfrak{IT19a}\), he introduced a set of elements \(\{W_{-k}, W_{k+1}, G_{k+1}, \mathring{G}_{k+1} | k \in \mathbb{N}\}\) into the \(q\)-shuffle algebra named ‘alternating’ words. It was shown that the alternating words form an algebra denoted \(\mathcal{U}\) \(\mathfrak{IT19a}\) Section 5) for which a PBW basis was constructed \(\mathfrak{IT19a}\) Theorem 10.1,10.2. Considering the preimage in \(U_q^{DJ, +}\) of the alternating words of \(\mathcal{U}\), a new PBW in basis - called alternating - for \(U_q^{DJ, +}\) arises, besides Damiani’s one \(\mathfrak{Da93}\) Theorem 2. A comparison between the images in \(\mathcal{V}\) of both PBW bases was done, see \(\mathfrak{IT19a}\) Section 11. More recently \(\mathfrak{IT19a}\), a central extension of the preimage of the algebra \(\mathcal{U}\) arising from the exchange relations between alternating words, denoted \(\mathcal{U}_q^\ast\), has been introduced. Its elements are in bijection with ‘alternating’ generators recursively built in \(U_q^{DJ, +}\) and form an ‘alternating’ PBW basis for the new algebra \(\mathcal{U}_q^\ast\) \(\mathfrak{IT19a}\) Section 10).

In this paper, we investigate further these new ‘alternating’ algebras motivated by the construction of a new triplet of presentations for \(U_q(\mathfrak{sl}_2)\). To this aim, following \(\mathfrak{IT19a}\), we introduce the algebra \(\tilde{\mathcal{A}}_q\) with generators \(\{W_{-k}, W_{k+1}, G_{k+1}, \mathring{G}_{k+1} | k \in \mathbb{N}\}\) - see Definition \(\mathfrak{2.1}\) Note that to enable a non-trivial specialization \(q \rightarrow 1\), the definitions of \(\tilde{\mathcal{A}}_q\) and \(\mathcal{U}_q\) slightly differ. However, for \(q \neq 1\) \(\tilde{\mathcal{A}}_q\) and \(\mathcal{U}_q\) are essentially the same object. Also, the center \(\mathcal{Z}\) of \(\tilde{\mathcal{A}}_q\) is introduced. Adapting the results of \(\mathfrak{IT19a}\), the ‘alternating’ PBW of \(\tilde{\mathcal{A}}_q\) is given, see Theorem \(\mathfrak{2.12}\). Following \(\mathfrak{IT19a}\), similarly we introduce the algebra \(\tilde{\mathcal{A}}_q\) with generators \(\{W_{-k}, W_{k+1}, G_{k+1}, \mathring{G}_{k+1} | k \in \mathbb{N}\}\). One has:

\[
\tilde{\mathcal{A}}_q \cong \tilde{\mathcal{A}}_q \otimes \mathcal{Z}.
\]

Let \(\langle W_0, W_1 \rangle\) denote the subalgebra of \(\tilde{\mathcal{A}}_q\). The simplest relations satisfied by \(W_0, W_1\) are the \(q\)-Serre relations \(\mathfrak{2.14}\) of \(U_q^{DJ, +}\) - see \(\mathfrak{A.1}\). Actually, according to \(\mathfrak{IT19a}\), \(\tilde{\mathcal{A}}_q \cong U_q^{DJ, +} \cong U_q^{DJ, -}\). So, having in mind the isomorphic pair consisting of \(U_q^{DJ, +}\) (or \(U_q^{DJ, -}\)) and certain subalgebras of \(U_q^{Dr}\) \(\mathfrak{Be94}\) \(\mathfrak{BCP98}\), an ‘alternating’ isomorphic pair is provided by \(\langle W_0, W_1 \rangle\) and \(\tilde{\mathcal{A}}_q\). Furthermore, by analogy with \(\mathfrak{Be94}\), the explicit isomorphism \(\tilde{\mathcal{A}}_q \rightarrow \langle W_0, W_1 \rangle\) follows from Lemma \(\mathfrak{2.36}\) using a map \(\gamma : \tilde{\mathcal{A}}_q \rightarrow \tilde{\mathcal{A}}_q\). Details are reviewed in Section \(\mathfrak{4}\). For completeness, the specialization \(q \rightarrow 1\) of \(\tilde{\mathcal{A}}_q\), denoted \(\mathcal{A}\), is also introduced.

The main result of this paper is a presentation for \(\tilde{\mathcal{A}}_q\) which sits into the family of Freidel-Maillet algebras \(\mathfrak{FM91}\) for generic \(q\), see Theorem \(\mathfrak{3.1}\). For the specialization \(\mathcal{A}\), a FRT type presentation is obtained. It sits into the family of non-standard Yang-Baxter algebras, see Proposition \(\mathfrak{3.6}\). This is done in Section \(\mathfrak{3}\). This Freidel-Maillet type presentation of \(\tilde{\mathcal{A}}_q\) gives an efficient framework for studying in more details this algebra and clarifying its relation with \(U_q^{DJ}\) (or \(U_q^{IT}\), \(U_q^{Dr}\) and \(U_q^{RS}\). The following results are obtained:

(a) Tensor product realizations of \(\tilde{\mathcal{A}}_q\) in \(U_q(\mathfrak{sl}_2)^\otimes N\) are explicitly constructed. They generate certain quotients of \(\tilde{\mathcal{A}}_q\), characterized by a set of linear relations satisfied by the fundamental generators. See Proposition \(\mathfrak{4.5}\). This is done in Section \(\mathfrak{4}\).
(b) Explicit isomorphisms between $\tilde{A}_q$ and certain ‘alternating’ subalgebras of $U_q(\widehat{gl}_2)$, denoted $U_q(\widehat{gl}_2)^{\sim,+}$ and $U_q(\widehat{gl}_2)^{\sim,-}$, are obtained. See Propositions 5.18, 5.20. The main ingredient in the analysis is the use of the Ding-Frenkel isomorphism [DF93]. As a corollary, similar results for $\tilde{A}_q$ and the ‘alternating’ subalgebras of $U_q(\widehat{sl}_2)$ follow. Also, it is shown that $\tilde{A}_q$ can be regarded as a left (or right) comodule of alternating subalgebras of $U_q(\widehat{gl}_2)$. An example of coaction map is given in Lemma 5.20. See Example 5.20.

(c) The explicit isomorphism $\iota : \langle W_0, W_1 \rangle \rightarrow U_q^{DJ,+}$ given by (2.46) is extended to the whole set of generators of $\tilde{A}_q$: a set of functional equations that determine the explicit relation between Damiani’s root vectors $\{E_{\alpha k + \alpha}, F_{\alpha k} | k = 0, 1\} \subset U_q^{DJ,+}$ (or $\{F_{\alpha k + \alpha}, F_{\alpha k} | k = 0, 1\} \subset U_q^{DJ,-}$) and the generators of $\tilde{A}_q$ is derived, see Proposition 5.27.

The results (b) and (c) are given in Section 5. All together, if we denote $\tilde{A}_q^{FM}$ as the Freidel-Maillet type presentation of $\tilde{A}_q$, we get the isomorphic ‘triplet’

$$U_q^{DJ,+} \cong \tilde{A}_q \cong \tilde{A}_q^{FM}.$$  

In the last section, we point out a straightforward application of [T19a, T19b] combined with the results of Section 6. One has the ‘alternating’ tensor product decomposition of $U_q(\widehat{sl}_2)$:

$$U_q(\widehat{sl}_2) \cong \tilde{A}_q^+ \otimes U_q^{DJ,0} \otimes \tilde{A}_q^-,$$

where $\tilde{A}_q^{\pm} (\cong U_q^{DJ,+(-)})$ are certain alternating subalgebras of $U_q^{DJ}$. The corresponding ‘alternating’ PBW basis is given in Theorem 6.1.

Let us conclude this introduction with some additional comments. In the literature, it is known that solutions of the Yang-Baxter equation find many applications in the theory of quantum integrable systems such as vertex models, spin chains, etc. They can be obtained by specializing solutions of the universal Yang-Baxter equation, the so-called universal R-matrices. As already mentioned, the construction of a universal R-matrix for $U_q(\widehat{sl}_2)$ (and similarly for higher rank cases) essentially relies on the tensor product decomposition

$$U_q(\widehat{sl}_2) \cong U_q^{DJ,+} \otimes U_q^{DJ,0} \otimes U_q^{DJ,-},$$

and the use of root vectors [Kir90, [KT91, Da98, FM02, JLM19, JLM20]. Now, the ‘alternating’ tensor product decomposition (1.2) raises the question of an ‘alternating’ universal R-matrix built from a product of solutions to a universal Freidel-Maillet algebra. See [CG92, Balk15, AV20] for related problems. In view of the importance of the R-matrix in mathematical physics, it looks as an interesting problem that might be considered elsewhere.

It should be also mentioned that the analysis here presented is also motivated by the subject of the $q$-Onsager algebra $O_q$ [T99, B01]. The original presentation of $O_q$ is given in terms of generators $A, B$ satisfying a pair of $q$-Dolan-Grady relations. The algebra $\tilde{A}_q$ studied in this paper can be viewed as a limiting case of the algebra $A_q$ introduced in [BS10, BB17]. For $A_q$, the original presentation [BK05a] takes the form of a reflection algebra introduced by Skylanin [Ske88], see [BS10]. Let us denote this presentation by $A_q^S$. Using $A_q^S$, it has been conjectured that $A_q$ is a central extension of $O_q$. Supporting evidences are based on a comparison between the ‘zig-zag’ PBW basis of $O_q$ [T09] and the one conjectured for $A_q$ [BB17, Conjecture 1]. So, using a surjective homomorphism $A_q \rightarrow O_q$, one can conjecture a triplet of isomorphic algebras $O_q \cong A_q \cong A_q^S$. Independently, more recently the analog of Lusztig’s automorphism and Damiani’s root vectors denoted $B_{\alpha k + \alpha}, B_{\alpha k}, B_{\alpha}$ for the $q$-Onsager algebra have been obtained [BK17] (see also [PL17]). In terms of the root vectors, a PBW basis has been constructed. In addition, a Drinfel’d type presentation is now identified [MW20]. However, at the moment the precise relation between the presentation of $O_q$ given in [BK17] or its Drinfel’d type presentation denoted $O_q^{Dr}$ [MW20] and $A_q$ is yet to be clarified. To prove $O_q \cong A_q \cong A_q^S$ provides an ‘alternating’ triplet of presentation for the $q$-Onsager algebra and $O_q^{Dr} \cong A_q$, the analysis here presented sketches the strategy that may be considered elsewhere.

Clearly, alternating subalgebras for higher rank affine Lie algebras and corresponding generalizations of (1.2) may be considered as well following a similar approach.
Notation 1.1. Recall the natural numbers $\mathbb{N} = \{0, 1, 2, \cdots \}$ and integers $\mathbb{Z} = \{0, \pm 1, \pm 2, \cdots \}$. Let $\mathbb{K}$ denote a field. $\mathbb{K}(q)$ denotes the field of rational functions in $q$, where $q$ is an indeterminate. The $q$-commutator $[X, Y]_q = qXY - q^{-1}YX$ is introduced. We denote $[x] = (q^x - q^{-x})/(q - q^{-1})$. We assume $q$ is not a root of unity.

Notation 1.2. $U^D_J$ is the Drinfeld-Jimbo presentation of $U_q(\mathfrak{sl}_2)$. $U^D_{J, +}, U^D_{J, 0}, U^D_{J, -}$ are the subalgebras of $U^D_J$ generated respectively by $\{E_0, E_1\}$, $\{K_0, K_1\}$, $\{F_0, F_1\}$. We also introduce the subalgebras $U^D_{J, +, 0}$ (resp. $U^D_{J, -, 0}$) generated by $\{E_0, E_1, K_0, K_1\}$ (resp. $\{F_0, F_1, K_0, K_1\}$).

2. The algebra $\mathcal{A}_q$ and its specialization $q \to 1$

In this section, the algebra $\mathcal{A}_q$ and its specialization $q \to 1$ denoted $\mathcal{A}$ are introduced. The algebra $\mathcal{A}_q$ is nothing but a slight modification of the algebra $\mathcal{U}_q^+$ introduced in [T19a] Section 3. Compared with $\mathcal{U}_q^+$, the modification here considered aims to ensure that the specialization $q \to 1$ of $\mathcal{A}_q$ is non-trivial. Also, the parameter $\bar{\rho}$ is introduced for normalization convenience. So, part of the material in this section is mainly adapted from [T19a]. Besides, Lemma 2.3 and Lemma 2.4 solve [T19a] Problem 13.1. At the end of this section, we prepare the discussion for Sections 3 and 5.

2.1. Defining relations. We refer the reader to [T19a] Definition 3.1 for the definition of $\mathcal{U}_q^+$. We now introduce the algebra $\mathcal{A}_q$.

Definition 2.1. Let $\bar{\rho} \in \mathbb{K}(q)$. $\mathcal{A}_q$ is the associative algebra over $\mathbb{K}(q)$ generated by $\{W_{-k}, W_{k+1}, G_{k+1}, \tilde{G}_{k+1} | k \in \mathbb{N}\}$ subject to the following relations:

\begin{align}
(2.1) \quad & [W_0, W_{k+1}] = [W_{-k}, W_1] = \frac{(\tilde{G}_{k+1} - G_{k+1})}{q + q^{-1}}, \\
(2.2) \quad & [W_0, G_{k+1}] = [\tilde{G}_{k+1}, W_0] = \bar{\rho}W_{-k-1}, \\
(2.3) \quad & [G_{k+1}, W_1] = [W_1, \tilde{G}_{k+1}] = \bar{\rho}W_{k+2}, \\
(2.4) \quad & [W_{-k}, W_{-\ell}] = 0, \quad [W_{k+1}, W_{\ell+1}] = 0, \\
(2.5) \quad & [W_{-k}, W_{\ell+1}] + [W_{k+1}, W_{-\ell}] = 0, \\
(2.6) \quad & [W_{-k}, G_{\ell+1}] + [\tilde{G}_{k+1}, W_{-\ell}] = 0, \\
(2.7) \quad & [W_{-k}, \tilde{G}_{\ell+1}] + [\tilde{G}_{k+1}, W_{-\ell}] = 0, \\
(2.8) \quad & [W_{k+1}, G_{\ell+1}] + [G_{k+1}, W_{\ell+1}] = 0, \\
(2.9) \quad & [W_{k+1}, \tilde{G}_{\ell+1}] + [\tilde{G}_{k+1}, W_{\ell+1}] = 0, \\
(2.10) \quad & [G_{k+1}, G_{\ell+1}] = 0, \quad [\tilde{G}_{k+1}, \tilde{G}_{\ell+1}] = 0, \\
(2.11) \quad & [\tilde{G}_{k+1}, G_{\ell+1}] + [G_{k+1}, \tilde{G}_{\ell+1}] = 0.
\end{align}

Remark 2.2. The defining relations of $\mathcal{A}_q$ coincide with the defining relations (30)-(40) in [T19a] of the algebra $\mathcal{U}_q^+$ for the identification:

\begin{align}
(2.12) \quad & W_{-k} \mapsto W_{-k}, \quad W_{k+1} \mapsto W_{k+1}, \\
(2.13) \quad & G_{k+1} \mapsto q^{-1}(q^2 - q^{-2})G_{k+1}, \quad \tilde{G}_{k+1} \mapsto q^{-1}(q^2 - q^{-2})\tilde{G}_{k+1}, \\
(2.14) \quad & \bar{\rho} \mapsto q^{-1}(q^2 - q^{-2})(q - q^{-1}).
\end{align}

Note that there exists an automorphism $\sigma$ and an antiautomorphism $S$ (for $\mathcal{U}_q^+$, see [T19a] Lemma 3.9) such that:

\begin{align}
(2.15) \quad & \sigma : \quad W_{-k} \mapsto W_{k+1}, \quad W_{k+1} \mapsto W_{-k}, \quad G_{k+1} \mapsto \tilde{G}_{k+1}, \quad \tilde{G}_{k+1} \mapsto G_{k+1}, \\
(2.16) \quad & S : \quad W_{-k} \mapsto W_{-k}, \quad W_{k+1} \mapsto W_{k+1}, \quad G_{k+1} \mapsto \tilde{G}_{k+1}, \quad \tilde{G}_{k+1} \mapsto G_{k+1}.
\end{align}
The Alternating Presentation of \( U_q(gl_2) \)

For completeness (see [119, Note 2.6]) and the discussion in the next section, a set of additional relations can be derived from the defining relations \((2.1)-(2.11)\), given in Lemmas 2.3-2.4 below.

**Lemma 2.3.** In \( \tilde{A}_q \), the following relations hold:
\[(2.17) \quad [W_{-k}, G_k]_q = [W_{-\ell}, G_\ell]_q, \quad [G_k, W_{\ell+1}]_q = [G_\ell, W_{k+1}]_q, \]
\[(2.18) \quad [\tilde{G}_k, W_{-\ell}]_q = [\tilde{G}_\ell, W_{-k}]_q, \quad [W_{\ell+1}, \tilde{G}_k]_q = [W_{k+1}, \tilde{G}_\ell]_q. \]

**Proof.** Consider the first equation in \((2.17)\). For convenience, substitute \( \ell \rightarrow \ell + 1 \) and multiply by \( \tilde{\rho} \) the equality. From the r.h.s. of the resulting equation, using \((2.2)\) one has:
\[
\left[ \tilde{\rho} W_{-\ell - 1}, G_k \right]_q = q^2 W_0 G_{\ell+1} - G_{\ell+1} W_0 G_k - G_k W_0 G_{\ell+1} + q^{-2} G_k G_{\ell+1} W_0 = \left[ W_0, G_k \right]_q, \]
which coincides with the l.h.s. The three other equations are shown similarly. \(\square\)

**Lemma 2.4.** In \( \tilde{A}_q \), the following relations hold:
\[(2.19) \quad [G_k, \tilde{G}_{\ell+1}] - [G_\ell, \tilde{G}_{k+1}] = \tilde{\rho}(q + q^{-1}) ([W_{-\ell}, W_{k+1}]_q - [W_{-k}, W_{\ell+1}]_q), \]
\[(2.20) \quad [\tilde{G}_k, G_{\ell+1}] - [\tilde{G}_\ell, G_{k+1}] = \tilde{\rho}(q + q^{-1}) ([W_{\ell+1}, W_{-k}]_q - [W_{k+1}, W_{-\ell}]_q), \]
\[(2.21) \quad [G_{k+1}, \tilde{G}_{\ell+1}]_q - [G_{\ell+1}, \tilde{G}_{k+1}]_q = \tilde{\rho}(q + q^{-1}) ([W_{-\ell}, W_{k+2}]_q - [W_{-k}, W_{\ell+2}]_q), \]
\[(2.22) \quad [\tilde{G}_{k+1}, G_{\ell+1}]_q - [\tilde{G}_{\ell+1}, G_{k+1}]_q = \tilde{\rho}(q + q^{-1}) ([W_{\ell+1}, W_{-k-1}]_q - [W_{k+1}, W_{-\ell-1}]_q). \]

**Proof.** Consider \((2.19)\). One has:
\[
[G_k, \tilde{G}_{\ell+1}] = [G_k, \tilde{G}_{\ell+1} - G_{\ell+1}] = (q + q^{-1})[G_k, [W_0, W_{\ell+1}]] \quad \text{by} \quad (2.1) \]
\[
= (q + q^{-1}) \left( G_k W_0 W_{\ell+1} - G_k W_{\ell+1} W_0 - W_0 W_{\ell+1} G_k + W_{\ell+1} W_0 G_k \right) \quad \text{by} \quad (2.17) \]
\[
= (q + q^{-1}) \left( q^{-2} W_0 G_k W_{\ell+1} + q^{-2} G_k W_0 W_{\ell+1} \right). \]

It follows:
\[
[G_k, \tilde{G}_{\ell+1}] - [G_\ell, \tilde{G}_{k+1}] = \tilde{\rho}(q + q^{-1}) ([W_{-\ell}, W_{k+1}]_q - [W_{-k}, W_{\ell+1}]_q) + (q + q^{-1})[W_0, [G_k, W_{\ell+1}]_q - [G_\ell, W_{k+1}]_q]_q \]
\[
= 0 \quad \text{by} \quad (2.17) \]
which reduces to \((2.19)\). One shows \((2.20)\) similarly.

Consider \((2.22)\). One has:
\[
[\tilde{G}_{\ell+1}, W_{-k-1}] = [\tilde{G}_{\ell+1}, [W_0, G_{k+1}]_q] = q W_0 [W_{\ell+1}, G_{k+1}]_q + q^{-1} [G_{k+1}, W_{\ell+1}]_q W_0 \]
\[
+ \frac{q^{-1}}{q + q^{-1}} G_{k+1} \tilde{G}_{\ell+1} - \frac{q}{q + q^{-1}} \tilde{G}_{\ell+1} G_{k+1} + \frac{(q - q^{-1})}{(q + q^{-1})} G_{k+1} G_{\ell+1}, \]
where (2.2), (2.1) and (2.10) have been used successively. Using (2.8) it follows:

\[
(2.23) \quad \tilde{\rho} ([W_{\ell+1}, W_{-k-1}] - [W_{k+1}, W_{-\ell-1}]) = \frac{q^{-1}}{(q + q^{-1})} (G_{k+1} \tilde{G}_{\ell+1} - G_{\ell+1} \tilde{G}_{k+1}) - \frac{q}{(q + q^{-1})} (\tilde{G}_{\ell+1} G_{k+1} - \tilde{G}_{k+1} G_{\ell+1}).
\]

From (2.11), note that:

\[
\tilde{G}_{\ell+1} G_{k+1} - \tilde{G}_{k+1} G_{\ell+1} = G_{k+1} \tilde{G}_{\ell+1} - G_{\ell+1} \tilde{G}_{k+1}
\]

which implies:

\[
(q - q^{-1}) (G_{\ell+1} \tilde{G}_{k+1} - G_{k+1} \tilde{G}_{\ell+1}) = [\tilde{G}_{k+1}, G_{\ell+1}]_q - [\tilde{G}_{\ell+1}, G_{k+1}]_q.
\]

Using this last equality in the r.h.s. of (2.23), eq. (2.22) follows. The other relation (2.21) is shown similarly. □

**Remark 2.5.** The relations (41)-(46) in \[T19b\] follow from Lemmas 2.3, 2.4 using the identification (2.12)-(2.14).

### 2.2. The center \( \mathcal{Z} \)

For the algebra \( \mathcal{U}_q^+ \), central elements denoted \( Z_{n+1}^\vee \) are known \[T19b\] eq. (52) and Lemma 5.2] (see also equivalent expressions \[T19b\] Corollary 8.4]). With minor modifications using the correspondence (2.12)-(2.14), central elements in \( \tilde{A}_q \) are obtained in a straightforward manner. Thus, we omit the proof of the following lemma and refer the reader to \[T19b\] Section 13] for details.

**Lemma 2.6.** For \( n \in \mathbb{N} \), the element

\[
(2.24) \quad Y_{n+1} = G_{n+1} q^{n-1} + \tilde{G}_{n+1} q^{n+1} - (q^2 - q^{-2}) \sum_{k=0}^{n} q^{-n+2k} W_{-k} W_{n+1-k} + \frac{(q - q^{-1})}{\tilde{\rho}} \sum_{k=0}^{n-1} q^{-n+1+2k} \tilde{G}_{k+1} G_{n-k}
\]

is central in \( \tilde{A}_q \).

**Remark 2.7.** Central elements for the algebra \( \mathcal{U}_q^+ \) \[T19b\] Lemma 5.2, Corollary 8.4] are obtained using the identification (2.12)-(2.14):

\[
(2.25) \quad Y_{n+1} \mapsto q^{-1} (q^2 - q^{-2}) Z_{n+1}^\vee.
\]

Note that the central elements are fixed under the action of (anti)automorphisms of \( \tilde{A}_q \). Applying \( \sigma \) and \( S \) according to (2.13), (2.10), three other expressions for \( Y_{n+1}^\vee \) follow (for \( \mathcal{U}_q^\vee \), see \[T19b\] Corollary 8.4]). In particular, for further convenience, define the combination:

\[
(2.26) \quad \Delta_{n+1} = \frac{1}{q^{n+1} + q^{-n-1}} (Y_{n+1} + \sigma(Y_{n+1})).
\]

Using (2.26), one has \( S(\Delta_{n+1}) = \Delta_{n+1} \). Thus, \( \Delta_{n+1} \) is invariant under the action of \( \sigma, S \).

**Example 2.8.**

\[
(2.27) \quad \Delta_1 = G_1 + \tilde{G}_1 - (q - q^{-1})(W_0 W_1 + W_1 W_0),
\]

\[
(2.28) \quad \Delta_2 = G_2 + \tilde{G}_2 - \frac{(q^2 - q^{-2})}{(q^2 + q^{-2})} (q^{-1} W_0 W_2 + q W_2 W_0 + q^{-1} W_1 W_{-1} + q W_{-1} W_1)
\]

\[
+ \frac{(q - q^{-1})}{(q^2 + q^{-2})} \left( \frac{G_1 G_1 + \tilde{G}_1 \tilde{G}_1}{\tilde{\rho}} \right).
\]
(2.29) \[ \Delta_3 = G_3 + \tilde{G}_3 - \frac{(q - q^{-1})}{(q^2 + q^{-2} - 1)} (q^{-2}W_0W_3 + q^2W_3W_0 + q^{-2}W_1W_{-2} + q^2W_{-2}W_1) \]
\[ - \frac{(q - q^{-1})}{(q^2 + q^{-2} - 1)} (W_2W_{-1} + W_{-1}W_2) \]
\[ + \frac{(q - q^{-1})}{(q^2 + q^{-2} - 1)} \left( \frac{G_2G_1 + G_2\tilde{G}_1}{\rho} \right). \]

By construction, the elements \( \Delta_{n+1} \) are central in \( \hat{A}_q \). Let \( Z \) denote the subalgebra of \( \hat{A}_q \) generated by \( \{ \Delta_{n+1} \}_{n \in \mathbb{N}} \).

By [T19b] Proposition 6.2, combining the defining relations (2.1)-(2.3) together with (2.29) it follows:

**Lemma 2.9.** In \( \hat{A}_q \), the following recursive relations hold:

(2.30) \[ G_{n+1} = \frac{(q^2 - q^{-2})}{2(q^n + 1 + q^{-n})} \sum_{k=0}^{n} q^{-n+2k} (W_{-k}W_{n+1-k} + W_{k+1}W_{-n}) \]
\[ - \frac{(q - q^{-1})}{2\rho(q^n + 1 + q^{-n})} \sum_{k=0}^{n-1} q^{-n+2k} \left( G_{k+1}G_{n-k} + \tilde{G}_{k+1}\tilde{G}_{n-k} \right) \]
\[ + \frac{(q + q^{-1})}{2} [W_{n+1}, W_0] + \frac{1}{2} \Delta_{n+1}, \]

(2.31) \[ \tilde{G}_{n+1} = G_{n+1} + (q + q^{-1}) [W_0, W_{n+1}], \]

(2.32) \[ W_{-n-1} = \frac{1}{\rho} [W_0, G_{n+1}]_q, \]

(2.33) \[ W_{n+2} = \frac{1}{\rho} [G_{n+1}, W_1]_q. \]

Iterating the recursive formulae (2.30), (2.31), (2.32), (2.33), given \( n \) fixed, the corresponding generator is a polynomial in \( W_0, W_1 \) and \( \{ \Delta_{k+1} \}_{k=0, \ldots, n} \).

**Example 2.10.** The first generators read:

(2.34) \[ G_1 = qW_1W_0 - q^{-1}W_0W_1 + \frac{1}{2} \Delta_1, \]

(2.35) \[ W_{-1} = \frac{1}{\rho} \left( (q^2 + q^{-2})W_0W_1W_0 - W_0^2W_1 - W_1W_0^2 + \frac{1}{2} \Delta_1 (q - q^{-1}) \right) W_0, \]

(2.36) \[ G_2 = \frac{1}{\rho(q^2 + q^{-2})} \left( (q^{-3} + q^{-1})W_0^2W_1^2 - (q^3 + q)W_1^{-2}W_0^2 + (q^{-3} - q^3)(W_0W_1^{-2}W_0 + W_1W_0^{-2}W_1) \right) \]
\[ - \left( -q^{-5} + q^{-3} + 2q^{-1} \right) W_0W_1W_0W_1 + (q^5 + q^3 + 2q)W_1W_0W_1W_0 \]
\[ + \frac{1}{2} \frac{\Delta_1 (q - q^{-1})}{\rho} (qW_1W_0 - q^{-1}W_0W_1) - \frac{1}{4} \frac{\Delta_1^2 (q - q^{-1})}{\rho(q^2 + q^{-2})} + \frac{1}{2} \Delta_2. \]

**Expressions of \( \tilde{G}_1, W_2, \tilde{G}_2 \) are obtained using the automorphism \( \sigma \).**

**Corollary 2.11.** The algebra \( \hat{A}_q \) is generated by \( W_0, W_1 \) and \( Z \).
2.4. PBW basis. Following [19b] Lemma 3.10, the algebra $\bar{A}_q$ has an $\mathbb{N}^2$-grading. Define $\text{deg} : \bar{A}_q \to \mathbb{N} \times \mathbb{N}$. For the alternating generators one has:

$$\text{deg}(W_{-k}) = (k + 1, k), \quad \text{deg}(W_{k+1}) = (k, k + 1),$$

$$\text{deg}(\bar{G}_{k+1}) = \text{deg}(\bar{G}_{k+1}) = (k + 1, k + 1).$$

Note that the expressions in Lemma 2.9 are homogeneous with respect to the grading assignment. The dimension series in the indeterminates $\lambda, \mu$ of the vector space spanned by linearly independent vectors of the same degree $(i, j)$ is obtained from the formal power series in the indeterminates $\lambda, \mu$:

$$\Phi(\lambda, \mu) = \mathcal{H}(\lambda, \mu)Z(\lambda, \mu),$$

$$= \sum_{(i,j) \in \mathbb{N}} d_{i,j} \lambda^i \mu^j \quad \text{for } |\lambda|, |\mu| < 1$$

with

$$\mathcal{H}(\lambda, \mu) = \prod_{\ell = 1}^{\infty} \frac{1}{1 - \lambda^\ell \mu^\ell}, \quad Z(\lambda, \mu) = \prod_{\ell = 1}^{\infty} \frac{1}{1 - \lambda^\ell \mu^\ell}.$$

In [19b] Section 10], a PBW basis for $U_q^+$ is obtained. The proof solely uses the defining relations corresponding to (2.1)-(2.11). The following theorem is a straightforward adaptation of [19b] Theorem 10.2.

**Theorem 2.12.** (see [19b]) A PBW basis for $\bar{A}_q$ is obtained by its alternating generators

$$\{W_{-k}\}_{k \in \mathbb{N}}, \quad \{\bar{G}_{\ell+1}\}_{\ell \in \mathbb{N}}, \quad \{\bar{G}_{m+1}\}_{m \in \mathbb{N}}, \quad \{W_{n+1}\}_{n \in \mathbb{N}}$$

in any linear order $< \text{that satisfies}$

$$W_{-k} < \bar{G}_{\ell+1} < \bar{G}_{m+1} < W_{n+1}, \quad k, \ell, m, n \in \mathbb{N}.$$

Note that combining $\sigma, S$ given by (2.10), (2.11), other PBW bases can be obtained.

2.5. The algebra $\bar{A}_q$. By construction [19b], the algebra $U_q^+$ studied in [19a] is a quotient of the algebra $U_q^+$. This quotient is characterized by the fact that the images of all the central elements $Z^\ell_n$ of [19b] Definition 5.1] in $U_q^+$ are vanishing, see [19b] Lemma 2.8. Recall (2.25), (2.26).

**Definition 2.13.** The algebra $\bar{A}_q$ is defined as the quotient of the algebra $\bar{A}_q$ by the ideal generated from the relations $\{\Delta_{k+1} = 0| \forall k \in \mathbb{N}\}$. The generators are $\{W_{-k}, W_{k+1}, \bar{G}_{k+1}, \bar{G}_{k+1} | k \in \mathbb{N}\}$.

Following [19a] Lemma 3.3], let us denote by $\gamma : \bar{A}_q \to \bar{A}_q$ the corresponding surjective homomorphism. It is such that:

$$\gamma : \begin{align*}
W_{-k} &\mapsto W_{-k}, \\
W_{k+1} &\mapsto W_{k+1}, \\
G_{k+1} &\mapsto G_{k+1}, \\
\bar{G}_{k+1} &\mapsto \bar{G}_{k+1}.
\end{align*}$$

So, they can be obtained as polynomials in $W_0, W_1$ applying $\gamma$ to the expressions given in Lemma 2.9 where $\gamma(\Delta_{k+1}) = 0$ for all $k$.

In [19a], [19b], the embedding of $U_q^{DJ,+}$ into a $q$-shuffle algebra leads to the $\bar{A}_q$, providing an ‘alternating’ presentation for $U_q^{DJ,+}$. Adapting this result to our conventions, it follows:

**Proposition 2.14.** (see [19a], [19b]) $\bar{A}_q \cong U_q^{DJ,+} \cong U_q^{DJ,-}$.

In [19a] Section 10], an alternating’ PBW basis for $U_q^{DJ,+}$ is obtained. We refer to [19a] Theorem 10.1.

**Theorem 2.15.** (see [19a]) A PBW basis for $\bar{A}_q$ is obtained by its alternating generators

$$\{W_{-k}\}_{k \in \mathbb{N}}, \quad \{G_{\ell+1}\}_{\ell \in \mathbb{N}}, \quad \{W_{n+1}\}_{n \in \mathbb{N}}.$$
in any linear order \( \prec \) that satisfies
\[
W_{-k} < G_{\ell+1} < W_{n+1}, \ k, \ell, n \in \mathbb{N}; \\
W_{k+1} < G_{\ell+1} < W_{-n}, \ k, \ell, n \in \mathbb{N}.
\]

Using automorphisms of \( \bar{A}_q \), other PBW bases can be obtained.

### 2.6. The specialization \( q \to 1 \) and the algebra \( \bar{A} \)

For the specialization \( q \to 1 \), according to the identification (2.13), (2.14), the defining relations (1.19b) of the algebra \( U_q^+ \) drastically simplify to those of a commutative algebra. Instead, the specialization \( q \to 1 \) of the defining relations of the algebra \( A_q \) lead to an associative algebra called \( \bar{A} \), as explained below. To define properly the specialization, we follow the method described in e.g. \( \text{[K12]} \) Section 10 (see also references therein).

Let \( A = \mathbb{K}[q]_{q^{-1}} = S^{-1}\mathbb{K}[q] \) where \( S = \mathbb{K}[q)(q - 1) \). Let \( U_A \) be the \( A \)-subalgebra of \( \bar{A}_q \) generated by the elements \( \{W_{-k}, W_{k+1}, G_{k+1}, \tilde{G}_{k+1} | k \in \mathbb{N}\} \). Note that contrary to \( U_q(sl_2) \) (\( \text{[CP91]} \) page 289), according to the structure of the defining relations (2.1), (2.11) for the specialization \( q \to 1 \) of \( A_q \) there is no need to introduce other elements. One has the natural isomorphism of \( A \)-algebras \( U_A \otimes_{\mathbb{K}} \mathbb{K}(q) \to \bar{A}_q \). Consider \( \mathbb{K} \) as an \( A \)-module via evaluation at \( q = 1 \). The algebra
\[
U_1 = U_A \otimes_{\mathbb{K}} \mathbb{K}
\]
is the specialization of \( \bar{A}_q \) at \( q = 1 \). Similarly, one defines \( Z_A \), and \( Z_1 = Z_A \otimes_{\mathbb{K}} \mathbb{K} \).

**Definition 2.16.** \( \bar{A} \) is the associative algebra over \( \mathbb{K} \) with unit and generators \( \{w_{-k}, w_{k+1}, \tilde{G}_{k+1}, \tilde{g}_{k+1} | k \in \mathbb{N}\} \) satisfying the following relations:
\[
\begin{align*}
[w_{-\ell}, w_{k+1}] &= \frac{1}{2}(\tilde{g}_{k+\ell+1} - \tilde{g}_{k+\ell+1}), \\
[\tilde{g}_{k+1}, w_{-\ell}] &= [w_{-\ell}, \tilde{g}_{k+1}] = 16w_{-\ell-1}, \\
[w_{\ell+1}, \tilde{g}_{k+1}] &= [\tilde{g}_{k+1}, w_{\ell+1}] = 16w_{\ell+k+2}, \\
w_{-k}, w_{-\ell} &= 0, \quad [w_{k+1}, w_{\ell+1}] = 0, \quad [\tilde{g}_{k+1}, \tilde{g}_{\ell+1}] = 0, \quad [\tilde{g}_{k+1}, \tilde{g}_{\ell+1}] = 0.
\end{align*}
\]

**Remark 2.17.** An overall parameter \( \tilde{\rho}_c \in \mathbb{K}^+ \) may be introduced in the r.h.s. of (2.39), (2.40).

**Proposition 2.18.** There exists an algebra isomorphism \( U_1 \to \bar{A} \) such that:
\[
W_{-k} \mapsto w_{-k}, \quad W_{k+1} \mapsto w_{k+1}, \quad G_{k+1} \mapsto g_{k+1}, \quad \tilde{G}_{k+1} \mapsto \tilde{g}_{k+1}, \quad \tilde{\rho} \mapsto 16, \quad q \mapsto 1.
\]

**Proof.** First, we show how to obtain the defining relations for \( \bar{A} \) from those of \( \bar{A}_q \) at \( q = 1 \) and \( \tilde{\rho} = 16 \). From eqs. (2.4), (2.10), one immediately obtains the four equations in (2.41). From (2.26), one gets
\[
\delta_{k+1} = g_{k+1} + \tilde{g}_{k+1},
\]
where \( \{\delta_k \}_{k \in \mathbb{N}} \) are central with respect to the algebra generated by \( \{w_{-k}, w_{k+1}, g_{k+1}, \tilde{g}_{k+1} | k \in \mathbb{N}\} \). This implies the first equalities in (2.39), (2.40). The second equalities in (2.39), (2.40) are obtained from elementary computation using the Jacobi identity together with (2.26), (2.10) and (2.4), (2.24). For instance:
\[
[w_{-1}, w_{k+1}] = \frac{1}{16}([w_0, g_1], w_{k+1}) = -\frac{1}{16}([g_1, w_{k+1}], w_0) = \frac{1}{16}([w_{k+1}, w_0], g_1) = [w_0, w_{k+2}]
\]
\[
= \frac{1}{2}(g_{k+1}, w_0) = 16w_{k+2} = -\frac{1}{2}(\tilde{g}_{k+1} - \tilde{g}_{k+1})
\]
\[
= \frac{1}{2}(\tilde{g}_{k+2} - \tilde{g}_{k+2}).
\]
By induction, it follows:
\[
[w_{-\ell}, w_{k+1}] = [w_{-\ell+1}, w_{k+2}] = \cdots = [w_0, w_{k+\ell+1}] = \frac{1}{2}(\tilde{g}_{k+\ell+1} - \tilde{g}_{k+\ell+1}).
\]
Similarly, by induction one easily finds:
\[
\begin{aligned}
[\hat{g}_{k+1}, w_{-\ell}] &= [\hat{g}_{k+2}, w_{-\ell+1}] = \cdots = [\hat{g}_{k+\ell+1}, w_0] = 16w_{-k-\ell-1}, \\
w_{\ell+1}, \hat{g}_{k+1}] &= [w_{\ell}, \hat{g}_{k+2}] = \cdots = [w_1, \hat{g}_{k+\ell+1}] = 16w_{+k+2}.
\end{aligned}
\]
Thus, the defining relations (2.38)–(2.41) of \( \tilde{A} \) are recovered from the specialization \( q \to 1, \tilde{p} \to 16 \) of the defining relations (2.1)–(2.11) of \( \hat{A} \).

In the following, we call \( \hat{A} \) the specialization \( q \to 1 \) of \( \tilde{A} \).

2.7. Relation with \( U_q^{DJ,\pm} \) and specialization. The following comments give some motivation for Sections 3 and 4. We first describe the relation between \( \hat{A}_q \) and \( U_q (\hat{sl}_2) \) with respect to the Drinfel’d-Jimbo presentation, adapting directly the results of [T19b]. On one hand, recall that the defining relations for \( U_q^{DJ,+}, U_q^{DJ,-} \) are respectively given by (A.1), (A.2). On the other hand, inserting (2.43) in (2.40) for \( k = 0, \ell = 1 \) one finds that \( W_0, W_1 \) satisfy the \( q \)-Serre relations:
\[
\begin{aligned}
(2.44) & \quad [W_0, [W_0, [W_0, W_1]]_{q^{-1}}] = 0, \\
(2.45) & \quad [W_1, [W_1, [W_1, W_0]]_{q^{-1}}] = 0.
\end{aligned}
\]
Let \( \langle W_0, W_1 \rangle \) denote the subalgebra of \( \hat{A}_q \) generated by \( W_0, W_1 \). According to [T19b] Proposition 6.4] combined with Remark 2.2 it follows that the map \( \langle W_0, W_1 \rangle \to U_q^{DJ,+} \):
\[
W_0 \mapsto E_1, \quad W_1 \mapsto E_0
\]
is an algebra isomorphism. Obviously, a similar statement holds for \( U_q^{DJ,-} \). Let \( \mathcal{Z}^+ \) denote the image of \( \mathcal{Z} \) by the map (2.46), and similarly \( \mathcal{Z}^- \) the image associated with the negative part. In both cases, it is a polynomial algebra [T19b] Section 4]. Adapting [T19b] Proposition 6.5] and using Remark 2.2 by Corollary 2.11 one concludes:
\[
\tilde{A}_q \cong U_q^{DJ,+} \otimes \mathcal{Z}^+ \cong U_q^{DJ,-} \otimes \mathcal{Z}^-. 
\]
For this reason, \( \tilde{A}_q \) is called the central extension of \( U_q^{DJ,+} \) (or \( U_q^{DJ,-} \)).

Let us also add the following comment. In view of the isomorphism (2.46), \( \tilde{A}_q \) can be equipped with a comodule structure [CP94]. For instance, examples of left (or right) coaction maps can be considered for the subalgebra \( (W_0, W_1) \). Define the ‘left’ coaction such that
\[
(2.48) \quad \tilde{A}_q \to U_q^{DJ,+} \otimes \tilde{A}_q.
\]
Consider its restriction to \( \langle W_0, W_1 \rangle \cong U_q^{DJ,+} \). As an example of coaction, we may consider:
\[
\begin{aligned}
(2.49) & \quad W_0 \mapsto E_0 \otimes 1 + K_0 \otimes W_0, \\
(2.50) & \quad W_1 \mapsto E_1 \otimes 1 + K_1 \otimes W_1.
\end{aligned}
\]

A ‘right’ coaction could be introduced similarly, as well as a coaction \( \tilde{A}_q \to U_q^{DJ,-} \otimes \tilde{A}_q \). In Section 3 a comodule algebra homomorphism \( \delta \) is obtained, see Lemma 2.22.

The relation between \( \tilde{A} \) and the Lie algebra \( \hat{sl}_2^{SC} \) can be considered through specialization. Recall the isomorphism \( \mathcal{U}_A \otimes_A K(q) \to \hat{A}_q \) and similarly for \( \langle W_0, W_1 \rangle \) and \( \mathcal{Z} \). One has the injection \( \langle W_0, W_1 \rangle_A \otimes_A \mathcal{Z}_A \to \mathcal{U}_A \) by [K12] Lemma 10.6]. By Lemma 2.9 the latter map is also surjective. Using the fact that \( \langle W_0, W_1 \rangle_A \) and \( \mathcal{Z}_A \) are free \( A \)-modules, one calculates:
\[
\mathcal{U}_1 = \mathcal{U}_A \otimes_A K = (\langle W_0, W_1 \rangle_A \otimes_A \mathcal{Z}_A) \otimes_A K = (\langle W_0, W_1 \rangle_A \otimes_A K) \otimes (\mathcal{Z}_A \otimes_A K).
\]
Let \( \langle w_0, w_1 \rangle \) denote the subalgebra of \( \hat{A} \). By Proposition 2.13 one has \( \langle w_0, w_1 \rangle \cong (W_0, W_1) \otimes_A A \). The elements \( w_0, w_1 \) satisfy the Serre relations (i.e. (2.44)–(2.45) for \( q = 1 \)). Recall the Lie algebra \( \hat{sl}_2^{SC} \) in the Serre-Chevalley presentation of \( \hat{sl}_2 \) with defining relations reported in Appendix A. Denote \( \hat{sl}_2^{SC,+} \) (resp. \( \hat{sl}_2^{SC,-} \)) the subalgebra generated by
\{e_0, e_1\} (resp. \{f_0, f_1\}). Combining the isomorphism (2.40) and the well-known result about the specialization \(q \to 1\) of \(U^D1_2\) given by \(U(\hat{sl}_2^{SC,+})\), it follows that the map \(\langle w_0, w_1 \rangle \to U(\hat{sl}_2^{SC,+})\) is an isomorphism. Also, \(Z\) is a polynomial ring in the \(\{\Delta_k\}_{k \in \mathbb{N}}\). \(Z_1 = Z_{\mathbb{R}} \otimes \mathbb{R} = U(z)\) where \(z\) is the linear span of \(\{\delta_{k+1}\}_{k \in \mathbb{N}}\), see (2.43). Denote \(z^\pm\) the images of \(z\) in \(\hat{sl}_2^{SC,\pm}\). It follows:

\[
(2.51) \quad \hat{\mathcal{A}} \cong U\left(\hat{sl}_2^{SC,+} \oplus z^+\right) \cong U\left(\hat{sl}_2^{SC,-} \oplus z^-\right).
\]

The structure of the isomorphisms (2.44) and (2.51) suggests a close relationship between \(\hat{\mathcal{A}}_q\) (resp. \(\hat{\mathcal{A}}\)) and certain subalgebras of the quantum universal enveloping algebra \(U_q(\hat{gl}_2)\) (resp. its specialization \(U(\hat{gl}_2))\). To clarify this relation in Section 3, a new presentation for \(\hat{\mathcal{A}}_q\) (and \(\hat{\mathcal{A}}\)) is given in the next section.

3. A Freidel-Maillet Presentation for \(\hat{\mathcal{A}}_q\) and its Specialization \(q \to 1\)

In this section, it is shown that the algebra \(\hat{\mathcal{A}}_q\) introduced in Definition 2.1 admits a presentation in the form of a \(K\)-matrix satisfying the defining relations of a quadratic algebra introduced by Freidel and Maillet \([FM91]\), see Theorem 3.1. In this framework, by Theorem 3.1 and Proposition 3.3 several results obtained in \([T19b]\) for \(U^q(\hat{gl}_2)\) are derived in a straightforward manner. For the specialization \(q \to 1\), a presentation of the Lie algebra \(\mathcal{A}\) - see Definition 2.10 - is obtained in terms of a non-standard classical Yang-Baxter algebra, see Proposition 3.6.

3.1. A quadratic algebra of Freidel-Maillet type. Let \(\mathcal{V}\) be a finite dimensional vector space. Let \(R(u)\) be the intertwining operator (called quantum \(R\)-matrix) between the tensor product of two fundamental representations \(\mathcal{V} = \mathbb{C}^2\) associated with the algebra \(U_q(\hat{sl}_2)\). The element \(R(u)\) depends on the deformation parameter \(q\) and is defined by [BaS2]

\[
(3.1) \quad R(u) = \begin{pmatrix}
  uq - u^{-1}q^{-1} & 0 & 0 & 0 \\
  0 & u - u^{-1} & q - q^{-1} & 0 \\
  0 & q - q^{-1} & u - u^{-1} & 0 \\
  0 & 0 & 0 & uq - u^{-1}q^{-1}
\end{pmatrix},
\]

where \(u\) is an indeterminate, called ‘spectral parameter’ in the literature on integrable systems. It is known that \(R(u)\) satisfies the quantum Yang-Baxter equation in the space \(\mathcal{V}_1 \otimes \mathcal{V}_2 \otimes \mathcal{V}_3\). Using the standard notation

\[
(3.2) \quad R_{ij}(u) \in \text{End}(\mathcal{V}_i \otimes \mathcal{V}_j),
\]

the Yang-Baxter equation reads

\[
(3.3) \quad R_{12}(u/v)R_{13}(u)R_{23}(v) = R_{23}(v)R_{13}(u)R_{12}(u/v) \quad \forall u, v.
\]

As usual, introduce the permutation operator \(P = R(1)/(q - q^{-1})\). Here, note that \(R_{12}(u) = PR_{12}(u)P = R_{21}(u)\).

We now show that the algebra \(\hat{\mathcal{A}}_q\) is isomorphic to a quadratic algebra of Freidel-Maillet type \([FM91]\), which can be viewed as a limiting case of the standard quantum reflection equation (also called the boundary quantum Yang-Baxter equation) introduced in the context of boundary quantum inverse scattering theory \([CS1, Sk88]\). Consider the \(U_q(\hat{sl}_2)\) \(R\)-matrix given by (3.1) and define:

\[
(3.4) \quad R^{(0)} = \text{diag}(1, q^{-1}, q^{-1}, 1).
\]

Define the generating functions:

\[
(3.5) \quad \mathcal{W}_+(u) = \sum_{k \in \mathbb{N}} W_{-k} U^{-k-1}, \quad \mathcal{W}_-(u) = \sum_{k \in \mathbb{N}} W_{k+1} U^{-k-1},
\]

\[
(3.6) \quad \mathcal{G}_+(u) = \sum_{k \in \mathbb{N}} G_{k+1} U^{-k-1}, \quad \mathcal{G}_-(u) = \sum_{k \in \mathbb{N}} G_{k+1} U^{-k-1},
\]
where the shorthand notation $U = \frac{q u^2}{q + q^{-1}}$ is used. Let $k_\pm$ be non-zero scalars in $\mathbb{K}(q)$ such that
\begin{equation}
\tilde{\rho} = k_+ k_-(q + q^{-1})^2.
\end{equation}

**Theorem 3.1.** The algebra $\widetilde{\mathcal{A}}_q$ has a presentation of Freidel-Maillet type. Let $K(u)$ be a square matrix such that
\begin{equation}
K(u) = \begin{pmatrix}
\frac{u q W_+(u)}{k_+ (q + q^{-1})} & \frac{1}{k_-(q + q^{-1})} \frac{1}{(q-q^{-1})} \frac{k_+ (q + q^{-1})}{q}
\end{pmatrix}
\end{equation}
with (3.5)-(8.6). The defining relations are given by:
\begin{equation}
(3.9) \quad R(u/v) (K(u) \otimes I) R(0) (I \otimes K(v)) = (I \otimes K(v)) R(0) (K(u) \otimes I) R(u/v).
\end{equation}

**Proof.** Inserting (3.8) into (3.9), the system of (sixteen in total) independent equations for the entries $(K(u))_{ij}$ coming from the Freidel-Maillet quadratic algebra (8.9) leads to a system of commutation relations between the generating functions $W_\pm(u), G_\pm(u)$. Using the identification (3.7), after simplifications these commutation relations read:
\begin{align*}
(3.10) & \quad [W_\pm(u), W_\pm(v)] = 0, \\
(3.11) & \quad [W_+(u), W_+(v)] + [W_-(u), W_-(v)] = 0, \\
(3.12) & \quad (U - V)[W_+(u), W_+(v)] = \frac{(q - q^{-1})}{\tilde{\rho}(q + q^{-1})} (G_+(u)G_+(v) - G_-(v)G_+(u)) \\
& \quad + \frac{1}{(q + q^{-1})} (G_+(u) - G_+(v) + G_+(v) - G_+(u)), \\
(3.13) & \quad (U - V)[G_+(u), G_+(v)] = \tilde{\rho}(q^2 - q^{-2}) U V (W_+(u)W_+(v) - W_+(v)W_+(u)), \\
(3.14) & \quad U [G_+(v), W_+(u)]_q - V [G_+(u), W_+(v)]_q + \tilde{\rho}(U W_+(u) - V W_+(v)) = 0, \\
(3.15) & \quad U [W_+(u), G_+(v)]_q - V [W_+(v), G_+(u)]_q + \tilde{\rho}(U W_+(u) - V W_+(v)) = 0, \\
(3.16) & \quad [G_+(u), W_+(v)] + [W_+(u), G_+(v)] = 0, \quad \forall \epsilon = \pm, \\
(3.17) & \quad [G_+(u), G_\pm(v)] = 0, \\
(3.18) & \quad [G_+(u), G_-(v)] + [G_-(u), G_+(v)] = 0.
\end{align*}

The commutation relations among the generators of $\widetilde{\mathcal{A}}_q$ are now extracted. Inserting (3.5), (3.6) into (3.10)-(3.18), expanding and identifying terms of same order in $U^{-l}V^{-l}$ one finds equivalently the set of defining relations (2.21)-(2.24), together with the set of relations (24.17), (24.18) and (24.19)-(24.22) as we now show in details. Precisely, inserting (3.5) into (3.11), (3.11), one gets (2.4), (2.5), respectively. Inserting (3.5), (3.6) into (3.12), one gets (2.11), (2.21), (2.24). Inserting (3.5), (3.6) into (3.13), one gets (2.19), (2.20). Inserting (3.5), (3.6) into (3.14) and (3.15), one gets (2.19), (2.23) as well as (2.17), (2.18). Inserting (3.5), (3.6) into (3.16)-(3.18), one gets (2.16), (2.19) and (2.22). As the relations (2.17), (2.18) and (2.19)-(2.22) follow from the defining relations (2.21)-(2.24) by Lemmas 2.3, 2.4 it follows that the Freidel-Maillet algebra (8.9) is isomorphic to $\widetilde{\mathcal{A}}_q$. 

**Remark 3.2.** The relations (3.10)-(3.18) coincide with the relations [11916, Lemmas 13.3.3.4] in the algebra $\mathcal{U}_q^+$ for the identification:
\begin{align*}
(3.19) & \quad U \mapsto t^{-1}, \quad V \mapsto s^{-1}, \\
(3.20) & \quad W_\pm(u) \mapsto t W^\mp(t), \quad W_\pm(v) \mapsto s W^\mp(s), \\
(3.21) & \quad G_+(u) \mapsto q^{-1}(q^2 - q^{-2})(G(t) - 1), \quad G_-(u) \mapsto q^{-1}(q^2 - q^{-2})(G(t) - 1), \\
(3.22) & \quad G_+(v) \mapsto q^{-1}(q^2 - q^{-2})(G(s) - 1), \quad G_-(v) \mapsto q^{-1}(q^2 - q^{-2})(G(s) - 1), \\
(3.23) & \quad \tilde{\rho} \mapsto q^{-1}(q^2 - q^{-2})(q - q^{-1}).
\end{align*}
Applying the transformation:

\[ W_\pm(u) \mapsto -W_\pm(u^{-1}q^{-1}) , \quad G_\pm(u) \mapsto -G_\pm(u^{-1}q^{-1}) , \]

and similarly for \( u \to v \), one finds that

\[ K'(u) = \left( \frac{1}{u} - 4q^{-1} \right) W_-(u^{-1}q^{-1}) + \frac{1}{u - 4q^{-1}} G_-(u^{-1}q^{-1}) \]

satisfies the Freidel-Maillet equation:

\[ R(u/v) (K'(u) \otimes I) (R_0^{-1})(I \otimes K'(v)) = (I \otimes K'(v)) (R_0^{-1})(K'(u) \otimes I) R(u/v) . \]

This second presentation of \( \tilde{A}_q \) will be used in Section 5.

3.2. Central elements. For a Freidel-Maillet algebra \([53]\), central elements can be derived from the so-called Sklyanin determinant by analogy with \([Sk88, Proposition 5]\). Indeed, define \( P_{12} = (1 - P)/2 \).

Proposition 3.3. Let \( K(u) \) be a solution of \([53]\). The quantum determinant

\[ \Gamma(u) = tr_{12}(P_{12}^{-1}(K(u) \otimes I) R_0(II \otimes K(uq))) , \]

is such that \([\Gamma(u), (K(v))_{ij}] = 0 \).

Proof. Recall the notation \([53]\). Introduce the vector space \( V_0 \). With respect to the tensor product \( V_0 \otimes V_1 \otimes V_2 \), we denote:

\[ K_0(u) = K(u) \otimes I \otimes I , \quad K_1(u) = I \otimes K(u) \otimes I , \quad K_2(u) = II \otimes K(u) . \]

Consider the product \((a) = K_0(v)\Gamma(u)\):

\[ (a) = K_0(v)tr_{12}(P_{12}^{-1}K_1(u) R_{12}^{-1}K_2(uq)) , \]

\[ = qK_0(v)tr_{12}(P_{12}^{-1}R_{12}^{-1}K_1(u) R_{12}^{-1}K_2(uq)) \quad \text{(using } P_{12} = qP_{12}^{-1}R_{12}^{-1}R_{02} \text{)} \]

\[ = qtr_{12}(P_{12}^{-1}K_0(v) R_{12}^{-1}K_1(u) R_{12}^{-1}K_2(uq)) \quad \text{(using } [K_0(v), P_{12}] = 0 \text{)} \]

\[ = qtr_{12}(P_{12}^{-1}K_0(v) R_{12}^{-1}K_1(u) R_{12}^{-1}K_2(uq)) \quad \text{(using } [K_1(u), R_{02}] = 0 \text{)} \]

\[ = qtr_{12}(P_{12}^{-1}(u/v)K_1(u) R_{12}^{-1}K_0(v) R_{01}(v/u) R_{02} R_{12}^{-1}K_2(uq)) \quad \text{(using } \text{)} \]

Then we use \([K_0(v), R_{02}] = 0, [K_2(uq), R_{01}(v/u)] = 0 \) and

\[ R_{01}(v/u)R_{02} R_{12}^{-1} = R_{12}^{-1}R_{02} R_{01}(v/u) \]

to show:

\[ K_0(v)tr_{12}(P_{12}^{-1}K_1(u) R_{12}^{-1}K_2(uq)) = qtr_{12}(P_{12}^{-1}(v/u)K_1(u) R_{12}^{-1}K_0(v) R_{12}^{-1}R_{02} R_{01}(v/u)K_2(uq)) \]

\[ = qtr_{12}(P_{12}^{-1}(v/u)K_1(u) R_{12}^{-1}K_0(v) R_{12}^{-1}K_2(uq) R_{02} R_{01}(v/u)) \]

Applying again \([53]\) to the combination \( K_0(v)R_{02}^{-1}K_2(uq) \) and using \( R_{02}(v/uq)R_{01} R_{12}^{-1} = R_{12}^{-1}R_{01} R_{02}(v/uq) \), it follows:

\[ (a) = qtr_{12}(P_{12}^{-1}(v/u)K_1(u) R_{12}^{-1}R_{02}^{-1}(v/uq)K_2(uq) R_{02} R_{01}(v/u)R_{02} R_{01}(v/u)) \]

\[ = qtr_{12}(P_{12}^{-1}(v/u)K_1(u) R_{12}^{-1}R_{02}^{-1}(v/uq) R_{12}^{-1}R_{01}(v/uq) K_2(uq) R_{02} R_{01}(v/u)) \]

\[ = qtr_{12}(P_{12}^{-1}(v/u)R_{02}^{-1}(v/uq) K_1(u) R_{12}^{-1}R_{02}^{-1}(v/uq) K_2(uq) R_{02} R_{01}(v/u) R_{02} R_{01}(v/u)) . \]
Then, using $P_{12}^2 = (P_{12})^2$, the cyclicity of the trace and (3.3), the last expression simplifies to:

\[
\begin{align*}
(a) \quad & = qtr_{12}(P_{12}K_1(u)R_{12}^0K_2(uq)R_{01}^0R_{02}^0K_0(v)P_{12}) \\
& = tr_{12}(P_{12}K_1(u)R_{12}^0K_2(uq))K_0(v) \\
& = \Gamma(u)K_0(v) .
\end{align*}
\]

Now, define:

\[
\Gamma(u) = \frac{1}{2(q - q^{-1})}\left(\Delta(u) - \frac{2\tilde{\rho}}{(q - q^{-1})}\right) .
\]

Using the entries of (3.8), by Proposition 3.3 it implies $[\Delta(u), W_\pm(v)] = [\Delta(u), G_\pm(v)] = 0$. Using (3.5), (3.6), it follows:

**Corollary 3.4.**

(3.28) $\Delta(u) = (q - q^{-1})u^2q^2(W_+(u)W_-(uq) + W_-(u)W_+(uq)) - \frac{(q - q^{-1})}{\tilde{\rho}}(G_+(u)G_-(uq) + G_-(u)G_+(uq))$

provides a generating function for central elements in $\bar{A}_q$.

Expanding $\Delta(u)$ in power series of $U = q\rho^2/\rho(q + q^{-1})$, the coefficients produce the central elements of $\bar{A}_q$ given by (2.20). Namely, by straightforward calculations one gets:

\[
\Delta(u) = -\sum_{n=0}^{\infty} U^{-n-1}q^{-n-1}(q^{n+1} + q^{-n-1})\Delta_{n+1} .
\]

**Remark 3.5.** In [T19b] Lemma 13.8, a generating function for central elements is given. By [T19b] Corollary 8.4 and [T19b] Definition 13.1, alternatively three other generating functions may be considered. For instance:

\[
\begin{align*}
Z^\vee(t) & = G(qt)\bar{G}(q^{-1}t) - qtW^+(qt)W^-(q^{-1}t) , \\
\sigma(Z^\vee(t)) & = \bar{G}(qt)G(q^{-1}t) - qtW^-(qt)W^+(q^{-1}t) .
\end{align*}
\]

Using the identification (3.20)-(3.24), the image of the generating function $\Delta(u)$ in the algebra $U_q^+$ follows:

\[
\Delta(u) \mapsto -q^{-1}(q^2 - q^{-2})\left(Z^\vee(q^{-1}t) + \sigma(Z^\vee(q^{-1}t))\right) .
\]

### 3.3. Specialization $q \to 1$. Due to the presence of poles at $q = 1$ in the off-diagonal entries of $K(u)$ in (3.8), the relations (3.9) are not suitable for the specialization $q \to 1$. However, it is possible to solve this problem within the framework of the non-standard classical Yang-Baxter algebra [C83, S83, BV90, Skr06] in order to obtain an alternative presentation of $\bar{A}_q$ besides Definition 2.16, viewed as a specialization $q \to 1$ of the Freidel-Maillet algebra (3.10).

Introduce the $r$-matrix

(3.29) $\bar{r}(u, v) = \frac{1}{(u^2/v^2 - 1)} \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & -1 & 2u/v & 0 \\ 0 & 2u/v & -1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$

solution of the non-standard classical Yang-Baxter equation [BV90]:

(3.30) $\begin{bmatrix} \bar{r}_{13}(u_1, u_3) \ , \ \bar{r}_{23}(u_2, u_3) \end{bmatrix} = \begin{bmatrix} \bar{r}_{21}(u_2, u_1) \ , \ \bar{r}_{13}(u_1, u_3) \end{bmatrix} + \begin{bmatrix} \bar{r}_{23}(u_2, u_3) \ , \ \bar{r}_{12}(u_1, u_2) \end{bmatrix} ,$

\footnote{Note that this $r$-matrix can be obtained from a limiting case of a $r$-matrix considered in [BBF17].}
where \( r_{21}(u, v) = Fr_{12}(u, v)P \) (= \( \tilde{r}_{12}(u, v) \) for (3.29)). Define the generating functions:

\[
\begin{align*}
(3.31) & \quad w_+(u) = \sum_{k=0}^{\infty} w_{-k} U^{-k-1} , \quad w_-(u) = \sum_{k=0}^{\infty} w_{k+1} U^{-k-1} , \\
(3.32) & \quad g_+(u) = \sum_{k=0}^{\infty} \tilde{g}_{k+1} U^{-k-1} , \quad g_-(u) = \sum_{k=0}^{\infty} \tilde{g}_{k+1} U^{-k-1} \text{ with } U = u^2/2 .
\end{align*}
\]

**Proposition 3.6.** The algebra \( \mathcal{A} \) admits a FRT presentation given by

\[
(3.33) \quad B(u) = \frac{1}{2} \left( \frac{1}{4} g_-(u) u w_+(u) \right)
\]

that satisfies the non-standard classical Yang-Baxter algebra

\[
(3.34) \quad [ B_1(u) , B_2(v) ] = [ \tilde{r}_{21}(v, u) , B_1(u) ] + [ B_2(v) , \tilde{r}_{12}(u, v) ] .
\]

**Proof.** Insert (3.33) into (3.34) with (3.29). Define the formal variables \( U = u^2/2 \) and \( V = v^2/2 \). One obtains equivalently:

\[
\begin{align*}
(U - V) \left[ w_+(u), w_+(v) \right] &= \frac{1}{2} (g_+(u) - g_+(v) + g_+(v) - g_+(v)) , \\
(U - V) \left[ g_+(u), w_+(v) \right] &= 16(U w_+(u) - V w_+(v)) = 0 , \quad \epsilon = \pm 1 , \\
\left[ g_+(u), g_+(v) \right] &= 0 , \\
\left[ w_+(u), w_+(v) \right] &= 0 , \quad \left[ g_+(u), g_+(v) \right] = 0 .
\end{align*}
\]

These relations are equivalent to the specialization \( q \to 1 \) of (3.10)-(3.18) \( (\tilde{r} \to 16) \). Expanding the currents as (3.31), the above equations are equivalent to (2.38)-(2.41).

\[\square\]

**Remark 3.7.** For the specialization \( q \to 1 \), the generating function (3.33) reduces to \( \delta(u) = -2(g_+(u) + g_-(u)) \).

### 4. Quotients of \( \mathcal{A}_q \) and Tensor Product Representations

In this section, a class of solutions - so-called ‘dressed’ solutions - of the Freidel-Maillet equation \( (3.9) \) are constructed and studied in details by adapting known technics of the so-called reflection equation \( \text{Sk88} \), see Proposition 4.1. By Lemma 4.3 it is shown that the entries of the dressed solutions can be written in terms of the ‘truncated’ generating functions \( (4.25)-(4.29) \), whose generators act on \( N \)-fold tensor product representations of \( U_q(sl_2) \) according to \( (4.19) \). Realizations of \( \mathcal{A}_q \) in \( U_q(sl_2)^{\otimes N} \) are obtained, see Proposition 4.5.

#### 4.1. Dressed solutions of the Freidel-Maillet equation

The starting point of the following analysis is an adaptation of \( \text{Sk88} \) Proposition 2] to the Freidel-Maillet equation \( (3.9) \), thus we skip the proof of the proposition below. Let \( K_0(u) \) be a solution of the Freidel-Maillet equation \( (3.9) \). Assume there exists a pair of quantum Lax operators satisfying the exchange relations:

\[
\begin{align*}
(4.1) & \quad R(u/v) \left( L(u) \otimes \mathbb{I} \right) \left( \mathbb{I} \otimes L(v) \right) = \left( \mathbb{I} \otimes L(v) \right) \left( L(u) \otimes \mathbb{I} \right) R(u/v) , \\
(4.2) & \quad R(u/v) \left( L_0(u) \otimes \mathbb{I} \right) \left( \mathbb{I} \otimes L_0(v) \right) = \left( \mathbb{I} \otimes L_0(v) \right) \left( L_0(u) \otimes \mathbb{I} \right) R(u/v) , \\
(4.3) & \quad R^{(0)} \left( L_0(u) \otimes \mathbb{I} \right) \left( \mathbb{I} \otimes L_0(v) \right) = \left( \mathbb{I} \otimes L_0(v) \right) \left( L_0(u) \otimes \mathbb{I} \right) R^{(0)} , \quad \forall u, v .
\end{align*}
\]

Using \( (4.1)-(4.3) \), it is easy to show that \( L_0(wv_1)K_0(u)L(u/v) \) with \( v_1 \in \mathbb{K}^* \) is also a solution of (3.9) (similar to \( \text{Sk88} \) Proposition 2]). More generally, by induction it follows \(^2\)

\[
(4.4) \quad \left( \begin{array}{cc} a & b \\ c & d \end{array} \right) \otimes \left( \begin{array}{cc} a' & b' \\ c' & d' \end{array} \right) = \left( \begin{array}{cc} a \otimes a' + b \otimes c' & a \otimes b' + b \otimes d' \\ c \otimes a' + d \otimes c' & c \otimes b' + d \otimes d' \end{array} \right) .
\]
Proposition 4.1. Let $K_0(u)$ be a solution of the Freidel-Maillet equation (3.9). Let $N$ be a positive integer and $\{v_i\}_{i=1}^N \in \mathbb{K}^*$. Let $L(u), L_0(u)$ be such that (4.1)-(4.5) hold. Then

\[(4.5)\quad K^{(N)}(u) = L_0(uv_N) \otimes \cdots \otimes L_0(uv_1)K_0(u)L(u/v_1) \otimes \cdots \otimes L(u/v_N)\]

satisfies (3.9).

This proposition provides a tool for the explicit construction of so-called ‘dressed’ solutions of the Freidel-Maillet equation (3.9). Below, we construct explicit examples of such solutions. To this end, we first introduce some known basic material. Recall the algebra $U_q(sl_2)$ consists of three generators denoted $S_\pm, s_3$. They satisfy

\[(4.6)\quad [s_3, S_\pm] = \pm S_\pm \quad \text{and} \quad [S_+, S_-] = \frac{q^{2s_3} - q^{-2s_3}}{q - q^{-1}}.\]

The central element of $U_q(sl_2)$ is the so-called Casimir operator:

\[(4.7)\quad \Omega = \frac{q^{-1}q^{2s_3} + qq^{-2s_3}}{(q - q^{-1})^2} + S_+ S_- = \frac{q^{2s_3} + q^{-1}q^{-2s_3}}{(q - q^{-1})^2} + S_- S_+.

Let $\mathcal{V}$ be the spin-$j$ irreducible finite dimensional representation of $U_q(sl_2)$ of dimension $2j + 1$. The eigenvalue $\omega_j$ of $\Omega$ is such that

\[(4.8)\quad \omega_j \equiv \frac{v_0^{(j)}}{(q - q^{-1})^2} \quad \text{with} \quad v_0^{(j)} = q^{2j+1} + q^{-2j-1}.

Define the so-called quantum Lax operators

\[(4.9)\quad L_0(u) = \begin{pmatrix} uq^{1/2}q^{s_3} & 0 \\ 0 & uq^{-1/2}q^{-s_3} \end{pmatrix} \quad \text{and} \quad L(u) = \begin{pmatrix} uq^{1/2}q^{s_3} - u^{-1}q^{1/2}q^{-s_3} \\ (q - q^{-1})S_- \end{pmatrix} \begin{pmatrix} uq^{1/2}q^{-s_3} - u^{-1}q^{-1/2}q^{s_3} \\ (q - q^{-1})S_+ \end{pmatrix}.\]

Recall the R-matrices (3.1) and (3.4). One routinely checks that the relation (4.1) holds. The relations (4.2)-(4.3) follow as a limiting case of (4.1). Note that the overall factor $uq^{1/2}$ in the expression of $L_0(u)$ is kept for further convenience only. Let $k_\pm, \epsilon_\pm \in \mathbb{K}$. Define:

\[(4.10)\quad K_0(u) = \begin{pmatrix} u^{-1}\epsilon_+ & k_+ \\ k_- & u^{-1}\epsilon_- \end{pmatrix} \left( \begin{array}{c} k_+ \\ (q - q^{-1}) \end{array} \right) \left( \begin{array}{c} k_- \\ (q - q^{-1}) \end{array} \right).

It is checked that $K_0(u)$ satisfies (3.9). As a basic example of dressed solution, consider the case $N = 1$ of (4.5). Define the four operators in $U_q(sl_2)$:

\[(4.11)\quad \mathcal{W}_0^{(1)} = k_+ v_1 q^{1/2} S_+ q^{s_3} + \bar{\epsilon}_+ q^{2s_3},\]

\[(4.12)\quad \mathcal{W}_1^{(1)} = k_- v_1 q^{1/2} S_- q^{-s_3} + \bar{\epsilon}_- q^{-2s_3},\]

\[(4.13)\quad \mathcal{G}_0^{(1)} = k_+ k_- v_1^2 \frac{(u_0^{(j)}) - (q + q^{-1})q^{2s_3}}{(q - q^{-1})} + (q^2 - q^{-2})k_- \bar{\epsilon}_+ v_1 q^{-1/2} S_- q^{s_3} + (q - q^{-1})\epsilon_+ \epsilon_-,\]

\[(4.14)\quad \mathcal{G}_1^{(1)} = k_+ k_- v_1^2 \frac{(u_0^{(j)}) - (q + q^{-1})q^{-2s_3}}{(q - q^{-1})} + (q^2 - q^{-2})k_+ \bar{\epsilon}_- v_1 q^{-1/2} S_+ q^{-s_3} + (q - q^{-1})\epsilon_- \epsilon_.\]

Computing explicitly the entries of (4.5) for $N = 1$, one finds that the dressed solution can be written as:

\[(4.15)\quad K^{(1)}(u) = \begin{pmatrix} \mathcal{G}_0^{(1)} & \bar{\epsilon}_+ \mathcal{W}_0^{(1)} + u^{-1}v_1^2 \epsilon_+ \\ k_+(q - q^{-1}) & u^{-1}v_1^2 \epsilon_- \end{pmatrix} + \frac{\mathcal{G}_1^{(1)}}{k_+(q + q^{-1})} + \frac{k_+ q^{-1}u_0^{(j)}}{(q^2 - q^{-2})} - \frac{k_+ q^{-1}u_0^{(j)}}{(q^2 - q^{-2})} - \frac{\epsilon_-(q - q^{-1})}{k_+(q + q^{-1})} u^{-1}v_1^2 \epsilon_.\]
4.2. General dressed solutions. The structure of the above solution (4.15) can be generalized to dressed solutions of arbitrary size as we now show. According to the ordering of the vector spaces $\mathcal{V}(N) = \mathcal{V}_N \otimes \cdots \otimes \mathcal{V}_2 \otimes \mathcal{V}_1$, let us first define recursively the four families of operators $\{W^{(N)}_{-k}, W^{(N)}_{k+1}, G^{(N)}_{k+1}, G^{(N)}_{k}\} | k = 0, 1, \ldots, N\}$, where $N$ is a positive integer:

\begin{equation}
W^{(N)}_{-k} = \frac{(q - q^{-1})}{k_-(q + q^{-1})^2} \left( v_N q^{1/2} S + q^{s_3} \otimes G^{(N)-1}_k \right) + q^{2s_3} \otimes W^{(N)-1}_{-k} - \frac{v^2_N}{(q + q^{-1})} \mathbb{I} \otimes W^{(N)-1}_{-k+1}
\end{equation}

\begin{equation}
W^{(N)}_{k+1} = \frac{(q - q^{-1})}{k_+(q + q^{-1})^2} \left( k_- v_N q^{1/2} S - q^{-s_3} \otimes G^{(N)}_k \right) + q^{-2s_3} \otimes W^{(N)-1}_{k+1} - \frac{v^2_N}{(q + q^{-1})} \mathbb{I} \otimes W^{(N)-1}_k
\end{equation}

\begin{equation}
G^{(N)}_{k+1} = \frac{(q^2 - q^{-2})}{k_- v_N q^{1/2} S - q^{-s_3} \otimes W^{(N)-1}_k} - \frac{v^2_N}{(q + q^{-1})} q^{2s_3} \otimes G^{(N)}_{k+1} + \mathbb{I} \otimes G^{(N)-1}_{k+1}
\end{equation}

\begin{equation}
G^{(N)}_{k} = \frac{(q^2 - q^{-2})}{k_+ v_N q^{1/2} S + q^{s_3} \otimes W^{(N)-1}_{k+1}} - \frac{v^2_N}{(q + q^{-1})} q^{-2s_3} \otimes G^{(N)}_{k} + \mathbb{I} \otimes G^{(N)-1}_{k}
\end{equation}

Here for the special case $k = 0$ we identify\footnote{Although the notation is ambiguous, one must keep in mind that $W^{(N)}_{k}|_{k=0} \neq V^{(N)}_{k}|_{k=0}$, $W^{(N)}_{k+1}|_{k=0} \neq V^{(N)}_{k+1}|_{k=0}$ for any $N$.}:

\begin{equation}
W^{(N)}_{k}|_{k=0} \equiv 0, \quad W^{(N)}_{k+1}|_{k=0} \equiv 0, \quad G^{(N)}_{k}|_{k=0} = G^{(N)}_{k}|_{k=0} \equiv \frac{k_+ k_- (q + q^{-1})^2}{(q - q^{-1})} \mathbb{I}^{(N)}
\end{equation}

together with the ‘initial’ conditions for $k \geq 1$ (the notation $\{(\ref{eq:4.06})\}$ is used)

\begin{equation}
W^{(0)}_{-k} = \left( \frac{\alpha_1}{q + q^{-1}} \right)^{k-1} \left( \frac{\alpha_1}{q + q^{-1}} \right) |_{q_1 = 0} \quad W^{(0)}_{0} = \left( \frac{\alpha_1}{q + q^{-1}} \right)^{k-1} \left( \frac{\alpha_1}{q + q^{-1}} \right) |_{q_1 = 0}
\end{equation}

\begin{equation}
G^{(0)}_{k+1} = G^{(0)}_{k} \equiv \left( \frac{\alpha_1}{q + q^{-1}} \right)^{k} G^{(0)}_{0}
\end{equation}

where

\begin{equation}
W^{(0)}_{0} \equiv \tilde{\epsilon}_+, \quad W^{(0)}_{1} \equiv \tilde{\epsilon}_- \quad \text{and} \quad G^{(0)}_{1} = \tilde{G}^{(0)}_{1} \equiv \tilde{\epsilon}_+ \tilde{\epsilon}_- (q - q^{-1})
\end{equation}

A crucial ingredient in the construction of dressed solutions by induction using (4.16) is the existence of a set of linear relations satisfied by the operators (4.16 - 4.19). We proceed by strict analogy with [BK05a, Appendix B], thus we skip most of the details of the proof. For further convenience, introduce the notation:

\begin{equation}
\tilde{\epsilon}_N^{(N)} = (-1)^N \left( \prod_{k=1}^{N} v^2_k \right) \tilde{\epsilon}_\pm
\end{equation}
Lemma 4.2. The operators (4.16)-(4.19) satisfy the linear relations:

\begin{align}
\sum_{k=0}^{N} c_k^{(N)} W_{k}^{(N)} + \bar{c}_{+}^{(N)} &= 0, \\
\sum_{k=0}^{N} c_k^{(N)} W_{k+1}^{(N)} + \bar{c}_{-}^{(N)} &= 0,
\end{align}

(4.25)

\begin{align}
\sum_{k=0}^{N} c_k^{(N)} g_{k+1}^{(N)} &= 0, \\
\sum_{k=0}^{N} c_k^{(N)} \bar{g}_{k+1}^{(N)} &= 0
\end{align}

(4.26)

with \( c_k^{(N)} = (-1)^{N-k-1}(q + q^{-1})^{k} e_{N-k}(\alpha_1, \alpha_2, \ldots, \alpha_N) \),

\begin{align}
\alpha_1 &= \frac{v_1^2 u_0^{(j_1)}}{(q + q^{-1})}, \\
\alpha_k &= \frac{v_k^2 u_0^{(j_k)}}{(q + q^{-1})} \quad \text{for} \quad k = 2, \ldots, N.
\end{align}

(4.27)

Proof. For \( N = 1, 2 \), the four relations (4.25)-(4.26) are explicitly checked. Then we proceed by induction. \( \square \)

The result below is obtained after some straightforward calculations similar to those performed in [BK05a, BK05b], thus we just sketch the proof. Let \( N \) be a positive integer and \( \{v_i\}_{i=1}^{N} \in K^* \). Introduce the ‘truncated’ generating functions:

\begin{align}
W_{+}^{(N)}(u) &= \sum_{k=0}^{N-1} f_{k+1}^{(N)}(u) W_{-k}^{(N)}, \\
W_{-}^{(N)}(u) &= \sum_{k=0}^{N-1} f_{k+1}^{(N)}(u) W_{k+1}^{(N)},
\end{align}

(4.28)

\begin{align}
G_{+}^{(N)}(u) &= \sum_{k=0}^{N-1} f_{k+1}^{(N)}(u) G_{k+1}^{(N)}, \\
G_{-}^{(N)}(u) &= \sum_{k=0}^{N-1} f_{k+1}^{(N)}(u) \bar{G}_{k+1}^{(N)}
\end{align}

(4.29)

where

\begin{align}
f_{k}^{(N)}(u) &= \sum_{p=k}^{N} (-1)^{N-p}(q + q^{-1})^{p-1} e_{N-p}(\alpha_1, \alpha_2, \ldots, \alpha_N) U^{p-k} \quad \text{with} \quad U = qu^2/(q + q^{-1})
\end{align}

(4.30)

Lemma 4.3. Let \( N \) be a positive integer, \( \{v_i\}_{i=1}^{N} \in K^* \) and \( \{j_i\}_{i=1}^{N} \) integers or half-integers. Define \( L_0(u), L(u) \) by (4.9). Dressed solutions of the form (4.40) can be written as:

\begin{align}
K^{(N)}(u) &= \begin{pmatrix}
\frac{1}{1 - k_+ (q + q^{-1})} \frac{u q W_{+}^{(N)}(u)}{G_{-}^{(N)}(u)} + \frac{k_+ (q + q^{-1})}{(q - q^{-1})} f_0^{(N)}(u) \\
\frac{1}{1 - k_- (q + q^{-1})} \frac{u q W_{-}^{(N)}(u)}{G_{-}^{(N)}(u)} + \frac{k_- (q + q^{-1})}{(q - q^{-1})} f_0^{(N)}(u)
\end{pmatrix}
\end{align}

(4.31)

with (4.28)-(4.29) and (4.40).

Proof. For \( N = 1 \), one checks that (4.31) coincides with (4.15). Then, we proceed by induction. Assume \( K^{(N)}(u) \) is of the form (4.31) for \( N \) fixed. We compute \( (L_0(uv_{N+1})K^{(N)}(u)L(u/v_{N+1}))_{ij} \) for \( i, j = 1, 2 \). For instance, consider the entry (11)\(_{N+1} \). Explicitly, it reads:

\begin{align}
(11)_{N+1} &= u q \left( (q - q^{-1})v_{N+1}q^{1/2}S_+ q^{3s} \otimes \left( \frac{1}{1 - k_+ (q + q^{-1})} G_{+}^{(N)}(u) + \frac{k_+ (q + q^{-1})}{(q - q^{-1})} f_0^{(N)}(u) \right) + q^{2s} \otimes \bar{c}_{+}^{(N)} \\
&\quad + (a^2 q^{2s} - \bar{c}_{N+1}^{(N)}) \otimes W_{+}^{(N)}(u) \right) - u^{-1} v_{N+1} q^{2s} \otimes \bar{c}_{+}^{(N)}.
\end{align}

\(^4\)For the elementary symmetric polynomials in the variables \( \{x_i \mid i = 1, \ldots, n\} \), we use the notation:

\[ e_k(x_1, x_2, \ldots, x_n) = \sum_{1 \leq j_1 < j_2 < \cdots < j_k \leq n} x_{j_1} x_{j_2} \cdots x_{j_k}. \]
Inserting (4.28), (4.29) and using the definitions (4.10)-(4.19), (4.24) for $N \to N + 1$, after some simple operations and reorganizing all terms one gets:

$$
(11)_{N+1} = uq \left( \sum_{k=0}^{N-1} \left( (q + q^{-1}) f_k^{(N)}(u) - \alpha_{N+1} f_{k+1}^{(N)}(u) \right) W_{-k}^{(N+1)} + (q + q^{-1}) f_N^{(N)}(u) W_{-N}^{(N+1)} \right) + u^{-1} \epsilon_+^{(N+1)} + q^{2s} \otimes \left( \sum_{k=0}^{N-1} \left( qu^2 f_{k+1}^{(N)}(u) - (q + q^{-1}) f_k^{(N)}(u) \right) W_{-k}^{(N+1)} - (q + q^{-1}) f_N^{(N)}(u) W_{-N}^{(N+1)} + \epsilon_+^{(N)} \right).
$$

Identifying $(11)_{N+1}$ with $(K^{(N+1)}(u))_{11}$ leads to a set of constraints. They read:

$$
(4.32) \quad (q + q^{-1}) f_k^{(N)}(u) - \alpha_{N+1} f_{k+1}^{(N)}(u) = f_{k+1}^{(N+1)}(u) \quad \text{for} \quad k = 0, \ldots, N - 1,
$$

$$
(4.33) \quad (q + q^{-1}) f_N^{(N)}(u) = f_N^{(N+1)}(u)
$$

and $\Gamma(u) = 0$. The solution of the constraints (4.32)-(4.33) is given by (4.30). Using this expression, one finds that $\Gamma(u)$ coincides with the l.h.s of the first equation in (4.25). By Lemma 4.2, it follows $\Gamma(\cdot) = 0$. For similar arguments, one shows $(ij)_{N+1} = (K^{(N+1)}(u))_{ij}$. By similar arguments, one shows $(ij)_{N+1} = (K^{(N+1)}(u))_{ij}$ using (4.25), (4.26).

4.3. Realizations of $\mathcal{A}_{q}$ in $U_q(sl_2)^{\otimes N}$. According to the previous results, dressed solutions of the form (4.31) automatically generate the finite set of operators (4.10)-(4.19) - recall that $k = 0, 1, \ldots, N - 1$ acting on finite dimensional tensor product representations of $U_q(sl_2)$. In this section, we show (4.10)-(4.19) extends to $k \in \mathbb{N}$ and provide realizations of $\mathcal{A}_q$ in $U_q(sl_2)^{\otimes N}$. To this aim, we need a generalization of Lemma 4.2.

**Lemma 4.4.** For any $p \in \mathbb{N}$, the operators (4.10)-(4.19) satisfy the linear relations:

$$
(4.34) \quad \sum_{k=0}^{N} c_k^{(N)} W_{-k-p} + \delta_{p,0} \epsilon_+^{(N)} = 0,
$$

$$
(4.35) \quad \sum_{k=0}^{N} c_k^{(N)} G_{k+1+p} = 0.
$$

**Proof.** For $p = 0$ the four relations hold by Lemma 4.2. For $N = 1$ and any $p \geq 1$, the four relations are checked using (4.21), (4.22). Then we proceed by induction on $N$.

Define $\mathcal{A}_q^{(N)}$ as the algebra generated by $\{W_{-k}^{(N)}, W_{k+1}^{(N)}, G_{k+1}^{(N)}, G_{k+1}^{(N)} | k \in \mathbb{N} \}$. We are now in position to give the main result of this section.

**Proposition 4.5.** The map $\mathcal{A}_q \to \mathcal{A}_q^{(N)}$ given by:

$$
W_{-k} \mapsto W_{-k}^{(N)}, \quad W_{k+1} \mapsto W_{k+1}^{(N)}, \quad G_{k+1} \mapsto G_{k+1}^{(N)}, \quad G_{k+1} \mapsto G_{k+1}^{(N)}
$$

with (4.10)-(4.19) for $k \in \mathbb{N}$ and (3.7) is a surjective homomorphism.

**Proof.** It is sufficient to show that $K(u)$ given by (3.8) for (4.10)-(4.19) is, up to an overall factor, identical to $K^{(N)}(u)$ given by (4.31). Consider the image of (3.8) such that the generators in (3.5), (3.6) map to (4.10)-(4.19). For instance, one has:

$$
\mathcal{W}_+(u) \mapsto \sum_{k \in \mathbb{N}} W_{-k}^{(N)} U^{-k-1} = \sum_{k=0}^{N-1} W_{-k}^{(N)} U^{-k-1} + \sum_{k=N}^{\infty} W_{-k}^{(N)} U^{-k-1}.
$$
Using (4.34):

\[
\sum_{k=N}^{\infty} \mathcal{W}_k^{(N)} U^{-k-1} = \sum_{p=0}^{\infty} \mathcal{W}_p^{(N)} U^{-p-1} = -\frac{1}{c_N^{(N)}} \sum_{p=0}^{N-1} \sum_{k=0}^{N-1} c_k^{(N)} \mathcal{W}_k^{(N)} U^{-p-1} - \frac{\epsilon_+^{(N)}}{c_N^{(N)}} U^{-1}.
\]

Replacing the last expression into (4.36) and using (4.28), (4.29) and (4.30), one gets:

\begin{equation}
(5.2)
\end{equation}

\[
\mathcal{W}_+(u) + \frac{1}{c_N^{(N)}} \sum_{p=0}^{N-1} \sum_{k=0}^{N-1} c_k^{(N)} \mathcal{W}_k^{(N)} U^{-p-1} = -\frac{\epsilon_+^{(N)}}{c_N^{(N)}} U^{-1}.
\]

(4.36)

\[
f_0^{(N)}(u) \mathcal{W}_+(u) \mapsto \mathcal{W}_+(u) + u^{-2} q^{-1} \epsilon_+^{(N)}.
\]

Similarly, using (4.34), (4.35) one finds:

\[
f_0^{(N)}(u) \mathcal{W}_-(u) \mapsto \mathcal{W}_-(u) + u^{-2} q^{-1} \epsilon_-^{(N)},
\]

\[
f_0^{(N)}(u) \mathcal{G}_\pm(u) \mapsto \mathcal{G}_\pm(u).
\]

It follows \(f_0^{(N)}(u) k(u) \mapsto K^{(N)}(u)\). Thus, the operators (4.16)-(4.19) for \(k \in \mathbb{N}\) generate a quotient of the algebra \(\hat{A}_q\) by the relations (4.34), (4.35).

\[\square\]

**Remark 4.6.** For the specialization \(q \to 1\) in (4.16)-(4.19), realizations of \(\hat{A}\) in \(U(sl_2)^{\otimes N}\) are obtained.

## 5. The algebra \(\hat{A}_q\), alternating subalgebras of \(U_q(\widehat{gl}_2)\) and root vectors

Recall that the quantum affine Kac-Moody algebra \(U_q(\widehat{sl}_2)\) admits a Drinfeld’s second presentation denoted \(U_q^{Dr}\) with generators \(\{x^\pm, h, C^\pm|k \in \mathbb{Z}, \ell \in \mathbb{Z}\} \{0\}\). For \(q \to 1\), this presentation specializes to the universal enveloping algebra of \(\widehat{sl}_2\) with generators \(\{x^\pm, h, c|k \in \mathbb{Z}\}\) - called the Cartan-Weyl presentation - see e.g. Be94 top of page 566. According to (2.17) (similarly (2.61)), a natural question concerns the interpretation of \(\hat{A}_q\) in terms of subalgebras of \(U_q^{Dr}\) (and similarly for \(\hat{A}\) in terms of subalgebras of \(\widehat{sl}_2\)). Although this problem may look complicated at first sight for \(q \neq 1\), it is solved using the framework of Freidel-Maillet algebras combined with the results of Ding-Frenkel [DF93], as shown in this section. In this section, we fix \(\mathbb{K} = \mathbb{C}\).

We start with the simplified situation \(q \to 1\), see Definition 5.3 and Proposition 5.4.

### 5.1. The algebra \(\hat{A}\) and ‘alternating’ subalgebras of \(\widehat{gl}_2\)

The affine general Lie algebra \(\widehat{gl}_2\) admits a presentation of Serre-Chevalley type and Cartan-Weyl type, closely related with the presentations of the affine Lie algebra \(\widehat{sl}_2\) [KS85, GO86]. Consider the presentation of Cartan-Weyl type for \(\widehat{gl}_2\). In the definition below, \([, ,]\) denotes the Lie bracket.

**Definition 5.1.** (Cartan-Weyl presentation \(\widehat{gl}_2^{CW}\)) The affine general Lie algebra \(\widehat{gl}_2\) over \(\mathbb{C}\) is generated by \(\{x^\pm_k, \epsilon_{1,k}, \epsilon_{2,k}, c|k \in \mathbb{Z}\}\) subject to the relations:

\begin{align*}
(5.1) \quad [\epsilon_{i,k}, \epsilon_{j,\ell}] &= k c h_{i,j} \delta_{k+\ell,0}, \\
(5.2) \quad [\epsilon_{1,k}, x^\pm_k] &= \pm x^\pm_{k+\ell}, \\
(5.3) \quad [\epsilon_{2,k}, x^\pm_k] &= \mp x^\pm_{k+\ell}, \\
(5.4) \quad [x^\pm_k, x^\pm_{\ell}] &= \epsilon_{1,k+\ell} - \epsilon_{2,k+\ell} + \delta_{k+\ell,0} k c, \\
(5.5) \quad [x^+_{k}, x^\pm_{k\pm 1}] &= 0
\end{align*}

and \(c\) is central.
THE ALTERNATING PRESENTATION OF $U_q(\hat{gl}_2)$

Note the automorphism $\theta$ such that:

$$\theta : \quad x_k^+ \mapsto x_k^- \ , \ \epsilon_{1,k} \mapsto \epsilon_{2,k} \ , \ \epsilon_{2,k} \mapsto \epsilon_{1,k} \ , \ c \mapsto c \ .$$

Let

$$h_k = \epsilon_{1,k} - \epsilon_{2,k} \ .$$

The subalgebra generated by $\{x_k^+, h_k, c | k \in \mathbb{Z}\}$, denoted $\hat{sl}_2^{CW}$, is isomorphic to the affine Lie algebra $\hat{sl}_2$. The commutation relations are given by (5.4), (5.5) and

$$[h_k, h_\ell] = \delta_{k,\ell} a^{2kc} \ ,$$

$$[h_k, x_\ell^\pm] = \pm 2x_k^\pm \ .$$

Recall the Serre-Chevalley presentation $\hat{sl}_2^{SC}$ in Appendix A.

**Remark 5.2.** An isomorphism $\hat{sl}_2^{SC} \to \hat{sl}_2^{CW}$ is given by:

$$k_0 \mapsto -h_0 - c \ , \ k_1 \mapsto h_0 \ , \ \epsilon_{1,1} \mapsto x_0^+ \ , \ \epsilon_{0,1} \mapsto x_1^- \ , \ f_1 \mapsto x_0^- \ , \ f_0 \mapsto x_1^+ \ , \ c \mapsto -c \ .$$

In view of (2.51), we now study the relation between $\hat{A}$ and $\hat{gl}_2$. Isomorphisms between central extension of certain subalgebras of $gl_2$ and $\hat{A}$ can be identified through a direct comparison of the defining relations (5.1) - (5.5) and (2.38) - (2.41). However, although not necessary for $q = 1$, to prepare the analysis for $q \neq 1$ in the next section it is instructive to exhibit these isomorphisms using the FRT presentation of $U(gl_2)$, which follows from $U(\hat{sl}_2)$'s on.

Introduce the following classical (traceless) $r$-matrix for an indeterminate $z \neq 1$ associated with $\hat{sl}_2$:

$$r(z) = \frac{1}{z - 1} \begin{pmatrix}
-\frac{1}{2} (z + 1) & 0 & 0 & 0 \\
0 & \frac{1}{2} (z + 1) & -2 & 0 \\
0 & -2z & \frac{1}{2} (z + 1) & 0 \\
0 & 0 & 0 & -\frac{1}{2} (z + 1)
\end{pmatrix} \, .$$

Note that $r_{12}(z) = -r_{21}(1/z) = -r_{12}(z)^{1+2}$. It satisfies the classical Yang-Baxter equation

$$[r_{13}(z_1/z_3) \ , \ r_{23}(z_2/z_3)] = [r_{13}(z_1/z_3) + r_{23}(z_2/z_3) \ , \ r_{12}(z_1/z_2)] \, .$$

For simplicity, we keep the same notation for the generators of $U(\hat{sl}_2)$ and $\hat{sl}_2$. Defining:

$$T^+(z) = \left( \begin{array}{cc}
h_0/2 & 2x_0^- \\
0 & -h_0/2 \end{array} \right) + \sum_{k \geq 1} z^k \left( \begin{array}{cc}
h_k & 2x_k^- \\
2x_k^+ & -h_k \end{array} \right) \, ,$$

$$T^-(z) = \left( \begin{array}{cc}
h_0/2 & 0 \\
-2x_0^+ & -h_0/2 \end{array} \right) + \sum_{k \geq 1} z^{-k} \left( \begin{array}{cc}
h_{-k} & -2x_{-k}^- \\
-2x_{-k}^+ & h_{-k} \end{array} \right) \, ,$$

one checks that the relations:

$$[T^\pm(z), c] = 0 \, ,$$

$$[T^+_1(z), T^-_2(w)] = [T^+_1(z) + T^-_2(w), r_{12}(z/w)] \, ,$$

$$[T^+_1(z), T^-_2(w)] = [T^-_1(z) + T^+_2(w), r_{12}(z/w)] - 2cr_{12}(z/w)z/w \, .$$

---

5We expect this presentation appears in the literature, although we could not find a reference. Here it is taken from [BBC17].

6We denote $r'(z) = \frac{d}{dz} r(z) \, .$
Definition 5.3. 
\[ H^\pm(z) = \pm \left( \frac{1}{2}(\epsilon_{1,0} + \epsilon_{2,0}) + \sum_{k \geq 1} z^{\pm k}(\epsilon_{1,\pm k} + \epsilon_{2,\pm k}) \right) \mathbb{I} \] 

The corresponding pair of Lax operators for \( U(\hat{gl}_2) \) is given by \( T^\pm_{\hat{gl}_2}(z) = T^\pm(z) + H^\pm(z) \), and satisfy classical Yang-Baxter relations that follow from (5.14)-(5.16).

We now relate \( \hat{A} \) to certain subalgebras of \( \hat{gl}_2 \) using the FRT presentation. By straightforward computation, it is found that

\[ B(u) \mapsto \hat{B}^-(u) = -T^-_{\hat{gl}_2}(u^2) - t_0 \quad \text{or} \quad B(u) \mapsto \hat{B}^+(u) = T^+_{\hat{gl}_2}(u^{-2}) - t_0 \]

with \( t_0 = diag(\epsilon_{1,0}, \epsilon_{2,0}) \), satisfy the non-standard classical Yang-Baxter equation (3.34) for the identification \( \bar{r}(u,v) = -r(u^2/v^2) - r_0 \), where \( r_0 = diag(1/2, -1/2, -1/2, 1/2) \). In particular, let us consider the first map in (5.17). Applying a similarity transformation:

\[ B^-(u) = -M(u) \hat{B}^-(u)^t M(u)^{-1} \quad \text{with} \quad M(u) = \begin{pmatrix} 0 & -u \\ 1 & 0 \end{pmatrix} \]

one finds for instance that

\[ B^-(u) = \begin{pmatrix} 0 & 2u^{-1}x_0^- \\ 2u^{-1}x_0^+ & 0 \end{pmatrix} + \sum_{k \geq 1} u^{-2k} \begin{pmatrix} 2\epsilon_{1,-k} & 2ux_k^- \\ 2ux_k^+ & 2\epsilon_{2,k} \end{pmatrix} \]

satisfies (3.34) for the symmetric \( r \)-matrix (5.29). Similarly, from the second map in (5.17) one gets a second solution of (3.34) with (5.29):

\[ B^+(u) = \begin{pmatrix} 2u^{-1}x_0^- & 0 \\ 0 & 2u^{-1}x_0^+ \end{pmatrix} + \sum_{k \geq 1} u^{-2k} \begin{pmatrix} 2\epsilon_{1,k} & 2ux_k^- \\ 2ux_k^+ & 2\epsilon_{2,k} \end{pmatrix} \]

According to the structure of the matrices (5.18), (5.19) and the automorphism (5.6), different subalgebras that combine half of the positive/negative root vectors, together with half of the imaginary root vectors are now introduced.

**Definition 5.3.**

\[ \hat{gl}_2^{\pm,\pm} = \{ x_\pm^k, x_\pm^{k+1}, \epsilon_{1,k+1}, \epsilon_{2,k+1} | k \in \mathbb{N} \} \]

\[ \hat{gl}_2^{\pm,\pm} = \{ x_\pm^{-k}, x_\pm^{-k-1}, \epsilon_{1,-k-1}, \epsilon_{2,-k-1} | k \in \mathbb{N} \} \]

We call \( \hat{gl}_2^{\pm,\pm} \) and \( \hat{gl}_2^{\pm,\pm} \) the right and left alternating subalgebras of \( \hat{gl}_2 \). The subalgebra generated by \{\epsilon_{1,0}, \epsilon_{2,0}, c\} is denoted \( \hat{gl}_2^{0} \).

Inserting (5.18) (resp. (5.19)) into (5.34), the relations satisfied by the generators \{\( x_{\pm k}, \epsilon_{1,\pm t}, \epsilon_{2,\pm t} \}\) are extracted. They are identical to the defining relations of the subalgebra \( \hat{gl}_2^{\pm,\pm} \) (resp. \( \hat{gl}_2^{\pm,\pm} \)). Thus, FRT presentations for \( \hat{gl}_2^{\pm,\pm} \) and \( \hat{gl}_2^{\pm,\pm} \) are given respectively by (5.19), (5.18) satisfying (3.34). Applying the automorphism (5.6) to (5.19), (5.18), one gets the FRT presentations of \( \hat{gl}_2^{\pm,\pm} \) and \( \hat{gl}_2^{\pm,\pm} \) respectively.

In particular, combining above results with those of Section 3 it follows:

**Proposition 5.4.** There exists an algebra isomorphism \( \hat{A} \rightarrow U(\hat{gl}_2^{\pm,\pm}) \) (resp. \( \hat{A} \rightarrow U(\hat{gl}_2^{\pm,\pm}) \)) such that:

\[
\begin{align*}
\hat{w}_{-k} &\mapsto 2^{1-k}x_+^{-k+1}, & \hat{w}_{k+1} &\mapsto 2^{1-k}x_+^{-k}, & \hat{g}_{k+1} &\mapsto 2^{3-k}\epsilon_{1,k+1}, & \hat{g}_{k+1} &\mapsto 2^{3-k}\epsilon_{2,k+1} \\
\hat{w}_{-k} &\mapsto 2^{1-k}x_+^{-k}, & \hat{w}_{k+1} &\mapsto 2^{1-k}x_+^{-k-1}, & \hat{g}_{k+1} &\mapsto 2^{3-k}\epsilon_{1,-k-1}, & \hat{g}_{k+1} &\mapsto 2^{3-k}\epsilon_{2,-k-1}.
\end{align*}
\]
Identify where the alternating subalgebras \( \hat{\mathfrak{sl}}^\pm_2 \) isomorphisms of Proposition 5.4. The quantum affine algebra \( \hat{\mathfrak{g}l}_2 \) one has the decompositions \( \mathfrak{g}l_2^\pm = \hat{\mathfrak{sl}}_2^\pm \pm \mathbb{Z} \) and \( \mathfrak{g}l_2^- = \hat{\mathfrak{sl}}_2^- \pm \mathbb{Z} \). So, the images become:

\[
\begin{align*}
\mathfrak{g}_k \mapsto 2^{-k} (h_k + \delta^+_k), & \quad \mathfrak{g}_{k+1} \mapsto 2^{-k} (h_{k+1} + \delta^+_k) \\
\mathfrak{g}_k \mapsto 2^{-k} (h_{k-1} + \delta^-_k), & \quad \mathfrak{g}_{k+1} \mapsto 2^{-k} (h_{k-1} + \delta^-_{k+1}) .
\end{align*}
\]

In the next section, by analogy we use the Freidel-Maillet presentation given in Section 3 to derive \( q \)-anals of the isomorphisms of Proposition 5.4.

5.2. The algebra \( \hat{\mathfrak{A}}_q \) and ‘alternating’ subalgebras of \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \). The Drinfeld’s second presentation (see e.g. [GJ02] and FRT presentation of \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \) [RS90] [DF93], see Definition 5.3 and Theorem 5.7 are first reviewed. Then, alternating subalgebras of \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \) that can be viewed as \( q \)-analogs of (5.20), (5.21) are identified, see [GJ02]. Using the Ding-Frenkel isomorphism [DF93], K-matrices \( K (u) \) (or \( K^\pm (u) \)) that satisfy the Freidel-Maillet equation (3.12) (or (3.25)) are constructed using a dressing procedure, see Lemmas 5.15 5.16 or 5.17. By a direct comparison of the K-matrix (5.8) (resp. (5.24)) to the K-matrix \( K (u) \) (resp. \( K^\pm (u) \)), explicit isomorphisms from \( \hat{\mathfrak{A}}_q \) to ‘alternating’ subalgebras of \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \) are derived, see Propositions 5.18 5.20. For the first generators, Examples 5.19 5.21 are given.

5.2.1. Drinfeld’s second presentation and FRT presentation of \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \). In the subsection, we review some necessary material. For the quantum affine Kac-Moody algebra \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \), there are two standard presentations: the Drinfeld-Jimbo presentation denoted \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \) [RJ], and the Drinfeld’s (second) presentation denoted \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \), see e.g. [CP94] p.392]. [Da14].

For \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \), an analog of Drinfeld’s second presentation is known, see e.g. [GJ02] [FM02].

**Definition 5.5.** The quantum affine algebra \( \mathfrak{u}_q (\hat{\mathfrak{g}l}_2) \) is isomorphic to the associative algebra over \( \mathbb{C} (q) \) with generators \( \{ x_k^\pm \} \), \( \mathcal{E}_1, \mathcal{E}_2, \mathcal{K}^{\pm 1/2} \) and the following relations:

\[
\begin{align*}
\frac{C^{1/2} C^{-1/2}}{q - q^{-1}} & = 1, \quad \mathcal{K}^{-1} = \mathcal{K}^{-1} \\
\left[ \mathcal{E}_{i,k}, \mathcal{E}_{j,\ell} \right] & = \frac{q^k - q^{-k}}{q - q^{-1}} \delta_{i,j} \delta_{k+\ell,0}, \quad \mathcal{K} \mathcal{E}_{i,k} = \mathcal{E}_{i,k} \mathcal{K}, \\
\left[ \mathcal{E}_{1,k}, x^\pm_{\ell} \right] & = \pm \frac{q^k}{q - q^{-1}} C q^{-|k|/2} q^{-|\ell|/2} x^\pm_{k+\ell}, \\
\left[ \mathcal{E}_{2,k}, x^\pm_{\ell} \right] & = \frac{q^k}{q - q^{-1}} C q^{-|k|/2} q^{|\ell|/2} x^\pm_{k+\ell}, \\
\mathcal{K} x^+_{k} \mathcal{K}^{-1} & = q^{2k} x^+_{k}, \\
x^+_{k+1} x^+_{\ell} - q^{\pm 2} x^+_{\ell} x^+_{k+1} = q^{\pm 2} x^+_{k+1} x^+_{\ell} - x^+_{k+1} x^+_{\ell}, \\
\left[ x^+_{k}, x^-_{\ell} \right] & = \frac{(C^{-|\ell|/2} q^{-|\ell|/2} \phi_{k+\ell})}{q - q^{-1}},
\end{align*}
\]

where the \( \psi_k \) and \( \phi_k \) are defined by the following equalities of formal power series in the indeterminate \( z \):

\[
\begin{align*}
\psi(z) & = \sum_{k=0}^{\infty} \psi_k z^{-k} = K \exp \left( (q - q^{-1}) \sum_{k=1}^{\infty} h_k z^{-k} \right), \\
\phi(z) & = \sum_{k=0}^{\infty} \phi_k z = K^{-1} \exp \left( -(q - q^{-1}) \sum_{k=1}^{\infty} h_k z \right)
\end{align*}
\]
where we denote:

\begin{equation}
(5.33) \\
\hat{h}_k = q^{k/2} \mathcal{E}_{1,k} - q^{-k/2} \mathcal{E}_{2,k}.
\end{equation}

Note that there exists a \( q \)-analog of the automorphism \( \theta \): \( \hat{E}_1, \hat{E}_2 \) such that:

\begin{equation}
(5.34) \\
\theta: \quad \hat{E}_1, \hat{E}_2 \mapsto \hat{E}_2, \hat{E}_1 , \quad K \mapsto K , \quad C \mapsto C^{-1} , \quad q \mapsto q^{-1}.
\end{equation}

In addition, there exists an automorphism:

\begin{equation}
(5.35) \\
\nu: \quad \hat{x}^+_k \mapsto K \hat{x}^+_k , \quad \hat{x}^-_k \mapsto K^{-1} \hat{x}^-_k , \quad \hat{E}_1 \mapsto \hat{E}_1 , \quad \hat{E}_2 \mapsto \hat{E}_2 , \quad K \mapsto K , \quad C^{1/2} \mapsto C^{1/2}.
\end{equation}

The associative subalgebra generated by \( \{ \hat{x}^+_k, \hat{x}^-_k, K^\pm, C^{\pm 1/2} | k \in \mathbb{Z}, \ell \in \mathbb{Z} \setminus \{0\} \} \) is isomorphic to the quantum affine algebra \( U_q(\mathfrak{gl}_2) \), known in the literature as the Drinfel’d second presentation \( U_q^{Dr} \). The corresponding defining relations are given by \( (5.24), (5.28)-(5.30) \) and

\begin{equation}
(5.36) \\
[\hat{h}_k, \hat{h}_\ell] = \delta_{k+\ell,0} \frac{1}{k} [2k]_q \frac{C^k - C^{-k}}{q - q^{-1}},
\end{equation}

\begin{equation}
(5.37) \\
[\hat{h}_k, \hat{x}^\pm_k] = \pm \frac{1}{k} [2k]_q C^{\pm |k|/2} \hat{x}^\pm_{k+\ell}.
\end{equation}

**Remark 5.6.** Recall the defining relations of \( U_q^{DJ} \) in Appendix A. An isomorphism \( U_q^{DJ} \rightarrow U_q^{Dr} \) is given by (see e.g. [CP91, p. 393]):

\begin{equation}
(5.38) \\
K_0 \mapsto CK^{-1}, \quad K_1 \mapsto K, \quad E_1 \mapsto \hat{x}^+_0, \quad E_0 \mapsto \hat{x}^-_0 K^{-1}, \quad F_1 \mapsto \hat{x}^-_0, \quad F_0 \mapsto K \hat{x}^+_0.
\end{equation}

Note that it is still an open problem to find the complete Hopf algebra isomorphism between \( U_q^{DJ} \) and \( U_q^{Dr} \). Only partial information is known, see e.g. [CP91 Section 4 4].

Extending previous works [FRT89, RS90], for the quantum affine Lie algebra of type \( A \) such as \( U_q(\mathfrak{gl}_n) \) a FRT presentation has been obtained in [DF93]. For type \( B, C, D \) see [JLM19, LLM20]. The explicit isomorphism between Drinfel’d second presentation of \( U_q(\mathfrak{gl}_2) \) and the FRT presentation given in [DF93] is now recalled. Define:

\begin{equation}
(5.39) \\
\tilde{R}(z) = \begin{pmatrix}
1 & 0 & 0 & 0 \\
0 & \frac{z-1}{z-q^{-1}} & \frac{z^{-1}}{z-q} & 0 \\
0 & \frac{z^{-1}}{z-q} & \frac{z-1}{z-q^{-1}} & 0 \\
0 & 0 & 0 & 1
\end{pmatrix}
\end{equation}

which satisfies the Yang-Baxter equation \( (3.33) \). Note that \( \tilde{R}_{12}(z) = \tilde{R}_{21}^{12}(z) \). The above \( R \)-matrix is related to the symmetric \( R \)-matrix \( (3.31) \) through the similarity transformations:

\begin{equation}
(5.40) \\
\left( \frac{u}{v} - \frac{q^{-1}}{q} \right)^{-1} R_{12}(u/v) = \mathcal{M}(u)_1 \mathcal{M}(v)_2 \tilde{R}_{12}(u^2/v^2) \mathcal{M}(v)_1^{-1} \mathcal{M}(u)_1^{-1},
\end{equation}

\begin{equation}
= \mathcal{M}(u)_1^{-1} \mathcal{M}(v)_2^{-1} \tilde{R}_{21}(u^2/v^2) \mathcal{M}(v)_2 \mathcal{M}(u)_1 \quad \text{with} \quad \mathcal{M}(u) = \begin{pmatrix} u^{-1/2} & 0 \\ 0 & u^{1/2} \end{pmatrix}.
\end{equation}

**Theorem 5.7.** (see [RS90, DF93]) \( U_q(\mathfrak{gl}_2) \) admits a FRT presentation given by a unital associative algebra with generators \( \{ \hat{x}^+_k, \hat{x}^-_k, k^+_j, k^-_j, q^{\pm c/2} | k \in \mathbb{Z}, \ell \in \mathbb{N}, j = 1, 2 \} \). The generators \( q^{\pm c/2} \) are central and mutually inverse. Define:

\begin{equation}
(5.41) \\
L^\pm(z) = \begin{pmatrix}
k^+_1(z) & k^-_1(z) & k^+_1(z) R^+(z) \\
e^\pm(z) k^+_1(z) & k^-_2(z) + e^\mp(z) k^-_1(z) R^+(z)
\end{pmatrix}
\end{equation}
in terms of the generating functions in the indeterminant $z$:

\begin{align}
\text{e}^+(z) & = (q - q^{-1}) \sum_{k=0}^{\infty} q^{k(c/2-1)} x_k^+ z^k, \quad \text{e}^-(z) = -(q - q^{-1}) \sum_{k=1}^{\infty} q^{k(c+1)} \bar{x}_k^- z^{-k}, \\
\text{f}^+(z) & = (q - q^{-1}) \sum_{k=1}^{\infty} q^{-k(c+1)} \bar{x}_k^- z^k, \quad \text{f}^-(z) = -(q - q^{-1}) \sum_{k=0}^{\infty} q^{-k(c-1)} x_k^+ z^{-k}, \\
\end{align}

\begin{align}
k_j^+(z) & = \sum_{k=0}^{\infty} k_{j,k}^+ z^k, \\
k_j^-(z) & = \sum_{k=0}^{\infty} k_{j,k}^- z^{-k}, \quad j = 1, 2.
\end{align}

The defining relations are the following:

\begin{align}
k_{i,0}^+ k_{i,0}^- & = k_{i,0}^+ k_{i,0}^- = 1, \\
\hat{R}(z/w) (L^+(z) \otimes 1) (1 \otimes L^+(w)) & = (1 \otimes L^+(w)) (L^+(z) \otimes 1) \hat{R}(z/w), \\
\hat{R}(q^c z/w) (L^+(z) \otimes 1) (1 \otimes L^-(w)) & = (1 \otimes L^-(w)) (L^+(z) \otimes 1) \hat{R}(q^{-c} z/w).
\end{align}

For \(5.46\), the expansion direction of \(\hat{R}(z/w)\) can be chosen in \(z/w\) or \(w/z\), but for \(5.46\) the expansion direction is only in \(z/w\). \(U_q(gl_2)\) is a Hopf algebra. The coproduct \(\Delta\) is defined by

\begin{align}
\Delta(L^+(z)) & = L^+(zq^{\pm(1\otimes c/2)}) \otimes L^+(zq^{\mp(c/2\otimes 1)}) \\
\end{align}

and its antipode is \(S(L^+(z)) = L^+(z)^{-1}\).

**Remark 5.8.** The inverse of the quantum Lax operators \(5.41\) are such that \(DF93\) eq. (4.9):

\begin{align}
(L^+(z))^{-1} & = \left( (k_1^+(z))^{-1} + \text{f}^+(z)(k_2^+(z))^{-1} \text{e}^+(z) - \text{f}^+(z)(k_2^+(z))^{-1} \text{e}^-(z) \\
& \quad - (k_2^+(z))^{-1} \text{e}^+(z) \right).
\end{align}

The explicit isomorphism between the FRT presentation of Theorem 5.7 and Drinfel’d second presentation of \(U_q(gl_2)\) of Definition 5.6 is given in \(JJ02\) Section 4. Introduce the generating functions \(DF93\):

\begin{align}
x^+(z) & = \sum_{k \in \mathbb{Z}} x_k^+ z^{-k}.
\end{align}

In terms of \(5.42, 5.43\), one has:

\begin{align}
x^+(z) & = (q - q^{-1}) \left( \text{f}^+(q^{c/2+1} z) - \text{f}^-(q^{-c/2+1} z) \right), \\
x^{-}(z) & = (q - q^{-1}) \left( \text{e}^+(q^{-c/2+1} z) - \text{e}^-(q^{c/2+1} z) \right)
\end{align}

and

\(C^{1/2} = q^{c/2}\).

The generating functions \(\{k_i^+(z)\}_{i=1,2}\) are related with the generators \(\{E_{i,k}\}_{i=1,2}\) as follows \(JJ02\) Section 4 (see also \(FM02\)):

\begin{align}
k_i^+(z) & = k_{i,0}^+ \exp \left( \pm (q - q^{-1}) \sum_{n=1}^{\infty} a_{i,\mp n} z^{\pm n} \right)
\end{align}

where the new generators

\begin{align}
a_{1,m} & = q^m \left( q^{m/2} E_{1,m} - q^{-m/2} E_{2,m} \right) + a_{2,m}, \\
a_{2,m} & = q^{2m+|m|/2} \left( \frac{|m|}{m} \frac{E_{1,m} + q^{|m|/2} E_{2,m}}{1 + q^{|m|/2}} + E_{2,m} \right)
\end{align}
are introduced. The generators $k_{i,0}^\pm$ are such that $[k_{i,0}^+, a_{j,m}] = [k_{j,0}^+, k_{i,0}^-] = 0$ for any $i, j$ and

$$k_{i,0}^-(k_{i,0}^-)^{-1} = K, \quad k_{i,0}^+(k_{i,0}^+)^{-1} = K^{-1}. \tag{5.54}$$

The commutation relations of $U_q(\widehat{gl}_2)$ presented in terms of the generators $\{a_{i,m}|i = 1, 2\}$ are given in [GJ02, Section 4]. Although not reported here, for further analysis some of those are displayed in Appendix B.

In the context of the FRT presentation of $U_q(\widehat{gl}_2)$ [DF93], the explicit exchange relations between the generating functions (5.42)-(5.44) are extracted from (5.40), (5.41) inserting (5.41). We refer the reader to [DF93, p. 288-292] for details. In particular, for the following analysis, we will need the asymptotics of some of the exchange relations displayed in [DF93]. Considering the limits $k_j^+(0)$ and $k_j^-(\infty)$ of (5.41), from [DF93] eqs. (4.24), (4.25), (4.40), (4.41) one gets for instance:

$$k_{i,0}^+(w)(k_{i,0}^-)^{-1} = q^\pm_1 e^\pm_1(w), \quad k_{i,0}^-(w)(k_{i,0}^+)^{-1} = q^\pm_1 f^\pm_1(w), \tag{5.55}$$

and from [DF93] eqs. (4.13), (4.14), (4.17) one gets:

$$k_{i,0}^\pm(k_{j,0}^\pm) = k_j^\pm(k_i^\mp), \quad k_{i,0}^\pm(k_{j,0}^\mp) = k_j^\mp(k_i^\pm), \quad i \neq j = 1, 2. \tag{5.57}$$

To prepare the discussion in further sections, the description of the known embedding $U_q(\widehat{sl}_2) \hookrightarrow U_q(\widehat{gl}_2)$ is now recalled. First, central elements of $U_q(\widehat{gl}_2)$ are constructed using the FRT presentation. Following [FMu02, Section 2.6], define the generating functions:

$$y^\pm(z) = k^\pm_1(q^{-1}z)k^\mp_2(qz). \tag{5.58}$$

By [DF93, eq. (4.17)], note that the ordering of the factors in (5.58) is irrelevant. Using the other exchange relations in [DF93], one finds $[y^\pm(z), e^\epsilon(w)] = [y^\pm(z), f^\epsilon(w)] = [y^\pm(z), k_i^\pm(w)] = [y^\pm(z), k_i^\mp(w)] = 0$ for $\epsilon = \pm$ and any $z, w$.

**Proposition 5.9.** (see [FMu02]) The coefficients of the generating function $y^\pm(z)$ are central elements of $U_q(\widehat{gl}_2)$.

**Corollary 5.10.** The elements

$$k_{i,0}^\pm k_{j,0}^\mp \quad \text{and} \quad \gamma_m = q^m a_{1,m} + q^{-m} a_{2,m} \quad \text{for} \quad m \in \mathbb{Z}$$

are central in $U_q(\widehat{gl}_2)$.

**Proof.** Insert (5.51) into (5.58). Identify the coefficients of the resulting power series $y^\pm(z)$. \qed

Note that $[U_q(\widehat{gl}_2), y] = 0$ for $y = k_{i,0}^\pm k_{j,0}^\mp, \gamma_m$ can be independently checked using (5.52), (5.53) and the commutation relations (B.1)-(B.4).

**Remark 5.11.** In terms of the generators $h_m$ (5.35) and central elements $\gamma_m$ (5.55), the new generators $a_{1,m}, a_{2,m}$ entering in (5.31) decompose as:

$$a_{1,m} = q^m \frac{1}{1+q^{2m}}(h_m + \gamma_m), \quad a_{2,m} = q^m \frac{1}{1+q^{-2m}}(-h_m + q^{-2m}\gamma_m). \tag{5.60}$$

It is known that these elements generate the center $\mathcal{C}$ of $U_q(\widehat{gl}_2)$. The following arguments are described in [FMu02] (see also [JLM19]). One has the embedding $U_q^{Dr} \otimes \mathcal{C} \hookrightarrow U_q(\widehat{gl}_2).$ Furthermore, define $U^{Dr}_q$ as the extension of $U_q^{Dr}$ by $q^\pm_{1/2}, K^\pm_{1/2},$ and define $\mathcal{C}'$ as the extension of $\mathcal{C}$ by $(k_{i,0}^\pm k_{j,0}^\mp)^{1/2}$. Then, one has the inverse embedding $U_q(\widehat{gl}_2) \hookrightarrow U_q^{Dr} \otimes \mathcal{C}'$. It follows that $U_q(\widehat{gl}_2)$ and $U_q^{Dr} \otimes \mathcal{C}$ are “almost” isomorphic. So, one has the tensor product decomposition:

$$U_q(\widehat{gl}_2) \cong U_q^{Dr} \otimes \mathcal{C}. \tag{5.61}$$

I thank N. Jing for communications on this point. Note that the analogs of $y^\pm(z)$ are known for higher rank affine Lie algebras of type $A, B, C, D$ [FMu02, JLM19, JLM20].
For more details, see e.g. [JLM10] Proposition 2.3, Corollary 2.4. The explicit isomorphism $\varphi_D : U_q(\widehat{gl}_2) \rightarrow U_q^{Dr} \otimes \mathcal{C}$ is constructed along these lines. In view of these comments, $U_q^{Dr}$ can be considered as the quotient of the Drinfel’d type presentation of $U_q(\widehat{gl}_2)$ by the relations
\begin{equation}
y^\pm(z) = 1 \iff k^\pm_{1,0} k^\pm_{2,0} = 1 \quad \text{and} \quad \gamma_m = 0 \quad \forall m \in \mathbb{Z} .
\end{equation}

Below, we will use the surjective homomorphism $\gamma_D : U_q(\widehat{gl}_2) \rightarrow U_q^{Dr}$ using the presentation of Theorem 5.2.2. Recall (5.60) and (5.61). Using (5.60) and setting (5.62), for instance one has:
\begin{align}
\gamma_D(q^{c/2}) & \mapsto C^{1/2} , \quad \gamma_D(x^\pm(z)) \mapsto x^\pm(z) , \\
\gamma_D(a_{1,m}) & \mapsto \frac{1}{q^m + q^{-m}} h_m , \quad \gamma_D(a_{2,m}) \mapsto -\frac{q^{2m}}{q^m + q^{-m}} h_m , \\
\gamma_D(k^\pm_{2,0}(k^\mp_{1,0})^{-1}) & \mapsto K^\pm^1 .
\end{align}

Thus, the FRT presentation of $U_q(\widehat{sl}_2)$ is obtained as a corollary of [DF93, Main Theorem]. It is given by the image of (5.46), (5.47) with (5.48) via $\gamma_D$.

5.2.2. Alternating subalgebras $U_q(\widehat{gl}_2)^{\circ, \pm}$ and $U_q(\widehat{gl}_2)^{\delta, \pm}$ and $K$-matrices. By analogy with the analysis of previous section, we need to identify $q$-deformed analogs of the “classical” alternating subalgebras [5.20], [5.21]. For instance, consider the elements:
\begin{equation}
C^{-k/2}K^{-1}x^+_k , \quad C^{(k+1)/2}x^{-}_{k+1} , \quad E_{1,k+1} , \quad E_{2,k+1} \quad \text{for} \quad k \in \mathbb{N} .
\end{equation}

Using the defining relations of $U_q(\widehat{gl}_2)$, for $k, \ell \in \mathbb{N}$ one finds:
\begin{align*}
[E_{i,k}, E_{j,\ell}] &= 0 , \\
[E_{1,k}, C^{-\ell/2}K^{-1}x^+_k] &= \frac{[k]}{k} q^{k/2} C^{-(k+\ell)/2}K^{-1}x^+_k , \\
[E_{2,k}, C^{-\ell/2}K^{-1}x^+_k] &= -\frac{[k]}{k} q^{k/2} C^{-(k+\ell)/2}K^{-1}x^+_k , \\
[E_{1,k}, C^{(\ell+1)/2}x^{-}_{k+1}] &= -\frac{[k]}{k} q^{k/2} C^{(k+\ell+1)/2}x^{-}_{k+\ell+1} , \\
[E_{2,k}, C^{(\ell+1)/2}x^{-}_{k+1}] &= \frac{[k]}{k} q^{-k/2} C^{(k+\ell+1)/2}x^{-}_{k+\ell+1} .
\end{align*}

Furthermore, the relations (5.29) are left invariant by the action of $C^{-(k+\ell+1)/2}K^{-2}$ for $\pm$ or the action of $C^{(k+\ell+1)/2}$ for $\mp$. Also, using (5.28), (5.30) one finds:
\begin{equation}
[C^{-k/2}K^{-1}x^+_k , C^{(\ell+1)/2}x^{-}_{k+1}] = \frac{1}{q - q^{-1}} K^{-1}x^+_{k+\ell+1} + (q^2 - 1) \left( C^{-k/2}K^{-1}x^+_k \right) \left( C^{(\ell+1)/2}x^{-}_{k+1} \right) .
\end{equation}

According to (5.31), $K^{-1}x^+_{k}$ only depends on $h_k$ so it is a combination of $E_{1,k}, E_{2,k}$. Thus, we conclude that the elements (5.66) form a subalgebra of $U_q(\widehat{gl}_2)$. Other subsets of elements are similarly considered, which form different subalgebras. It follows:

**Definition 5.12.**
\begin{align*}
U_q(\widehat{gl}_2)^{\circ, \pm} &= \{ C^{\pm k/2}K^{-1}x^+_k , C^{\pm (k+1)/2}x^{-}_{k+1} , E_{1,k+1} , E_{2,k+1} | k \in \mathbb{N} \} , \\
U_q(\widehat{gl}_2)^{\delta, \pm} &= \{ C^{\mp k/2}x^+_{k} , C^{\pm (k+1)/2}x^{-}_{k+1} , K, E_{1,k+1} , E_{2,k+1} | k \in \mathbb{N} \} .
\end{align*}

We call $U_q(\widehat{gl}_2)^{\circ, \pm}$ and $U_q(\widehat{gl}_2)^{\delta, \pm}$ the right and left alternating subalgebras of $U_q(\widehat{gl}_2)$. The subalgebra generated by $\{K^\pm, C^{\pm 1/2}\}$ is denoted $U_q(\widehat{gl}_2)^{\circ}$.

In each alternating subalgebra introduced above, the center is characterized as follows. Consider for instance $U_q(\widehat{gl}_2)^{\circ, \pm}$. Its center is the subalgebra of $\mathcal{C}$ generated by the coefficients of the generating function $y^+(z)$ as defined in (5.58).
Remark 5.13. The center $C^\circ$ (resp. $C^\circ$) of $U_q(\hat{gl}_2)^{\pm,\pm}$ (resp. $U_q(\hat{gl}_2)^{\pm,-}$) is generated by $k_{-1,0}^\pm k_{1,0}^\pm$, $\gamma_m$ (resp. $k_{2,0}^\pm k_{1,0}^\pm$, $\gamma_{-m}$) with $m \in \mathbb{N}$.

For $U_q(\hat{s}l_2)$, it is known that given a certain ordering the elements $\{x^\pm_k, \hbar, K^\pm, C^{\pm,1/2}\mid k \in \mathbb{Z}, \ell \in \mathbb{Z}\setminus\{0\}\}$ generate a PBW basis, see [Be94, Proposition 6.1] with [BCP98, Lemma 1.5]. According to (5.33), with a minor modification in the Cartan sector associated with the decomposition of $h_k$ into $\mathcal{E}_{1,k}, \mathcal{E}_{2,k}$, a PBW basis for $U_q(\hat{gl}_2)$ is obtained. If one considers the subalgebra $U_q(\hat{gl}_2)^{\pm,+}$, let us choose the ordering:

$$C^{1/2}x_1^- < Cx_2^- < \cdots < \mathcal{E}_{1,1} < \mathcal{E}_{1,2} < \cdots < \mathcal{E}_{2,1} < \mathcal{E}_{2,2} < \cdots < C^{-1/2}K^{-1}x_1^+ < K^{-1}x_0^+,$$

whereas for the subalgebra $U_q(\hat{gl}_2)^{\pm,-}$ we choose the ordering:

$$x_0^- < C^{1/2}x_1^- < \cdots < \mathcal{E}_{1,1} < \mathcal{E}_{1,2} < \cdots < \mathcal{E}_{2,1} < \mathcal{E}_{2,2} < \cdots < C^{-1/2}x_2^+ K < C^{-1/2}x_1^+ K.$$

It follows:

Proposition 5.14. The vector space $U_q(\hat{gl}_2)^{\pm,+}$ (resp. $U_q(\hat{gl}_2)^{\pm,-}$) has a linear basis consisting of the products $x_1 x_2 \cdots x_n$ ($n \in \mathbb{N}$) with $x_i \in U_q(\hat{gl}_2)^{\pm,+}$ (resp. $x_i \in U_q(\hat{gl}_2)^{\pm,-}$) such that $x_1 \leq x_2 \leq \cdots \leq x_n$.

Using the automorphism (5.34), PBW bases for $U_q(\hat{gl}_2)^{\pm,-}$ and $U_q(\hat{gl}_2)^{\pm,+}$ are similarly obtained.

We now turn to the construction of $K$-matrices satisfying the Freidel-Maillet equations (3.9) or (3.25), whose entries are formal power series in the elements of alternating subalgebras. Assume there exists a matrix $\tilde{K}$ with scalar entries and two quantum Lax operators $L(z), L^0$ such that the following relations hold (recall that $\tilde{R}_{21}(z) = P \tilde{R}_{12}(z) P$):

$$(5.67) \quad \tilde{R}_{12}(z/w) \tilde{K}_1^0 R(\bar{0}) \tilde{K}_2^0 \tilde{R}(z/w) = \tilde{K}_2^0 R(\bar{0}) \tilde{K}_1^0 \tilde{R}_{21}(z/w),$$
$$(5.68) \quad \tilde{R}_{12}(z/w) L(z) L^0(w) = L^0_2 L^0_1 \tilde{R}_{12}(z/w),$$
$$(5.69) \quad \tilde{R}_{21}(z/w)(L^0_1^0 L^0_2^0) \tilde{R}_{21}(z/w) = (L^0_2 L^0_1 \tilde{R}_{21}(z/w),$$
$$(5.70) \quad (L^0_1 R(\bar{0}) L^0_2) = L^0_2 R(\bar{0}) L^0_1,$$
$$(5.71) \quad L(z) R(\bar{0}) L^0 = L^0_2 R(\bar{0}) L^0_1.$$

Adapting [Sk88] Proposition 2], using the above relations one finds that:

$$(5.72) \quad \tilde{K}(z) \mapsto L(z) \tilde{K}^0 L^0$$

satisfies the following Freidel-Maillet equation (for a non-symmetric $R$-matrix)

$$(5.73) \quad \tilde{R}_{12}(z/w) (\tilde{K}(z) \otimes \mathbb{I}) R(\bar{0}) (\mathbb{I} \otimes \tilde{K}(w)) = (\mathbb{I} \otimes \tilde{K}(w)) R(\bar{0}) (\tilde{K}(z) \otimes \mathbb{I}) \tilde{R}_{21}(z/w).$$

An example built from the FRT presentation of $U_q(\hat{gl}_2)$ of Definition 5.7 is obtained as follows. For the choices $L(z) \mapsto L^-(z)$ and $L^0 \mapsto L^{-,0} = diag((k_{2,0}^-)^{-1}, (k_{1,0}^1)^{-1})$, eq. (5.68) holds and using the exchange relations (5.55)-(5.57) it is checked that eqs. (5.69)-(5.71) hold. Also, for the choice

$$(5.75) \quad \tilde{K}^0 = \begin{pmatrix} 0 & k_+ (q^{0+1}) \\ k_+ (q^{0+1}) & 0 \end{pmatrix}$$

it is checked that eq. (5.71) holds. It follows

$$(5.76) \quad \tilde{K}(z) \mapsto \tilde{K}^-(z) = L^-(z) \tilde{K}^0 L^{-,0}$$

satisfies (5.73). Note that eq. (5.73) is left invariant under the transformation $(z, w) \mapsto (\lambda z, \lambda w)$ for any $\lambda \in \mathbb{C}^\ast$.

A solution of the Freidel-Maillet equation (3.9) associated with the symmetric $R$-matrix (3.1) is readily obtained using the similarity transformation (5.40).
Lemma 5.15. The dressed $K$-matrix

$$K^-(u) = \left( \begin{array}{ccc} u^{-1} \left( \frac{k_{2}(q+q^{-1})}{q-q^{-1}} k_{1} (qu)^2 f (qu^2) (k_{2,0})^{-1} \right) & & k_{2}(q+q^{-1}) k_{1} (qu)^2 (k_{1,0})^{-1} \\ \left( \frac{k_{2}(q+q^{-1})}{q-q^{-1}} (k_{2} (qu^2) + e^- (qu^2) k_{1} (qu^2) f (qu^2)) (k_{2,0})^{-1} \right) & u \left( \frac{k_{2}(q+q^{-1})}{q-q^{-1}} e^- (qu^2) k_{1} (qu^2) (k_{1,0})^{-1} \right) & \end{array} \right)$$

satisfies the Freidel-Maillet equation \[(3.9)\].

Proof. The $K$-matrix $\tilde{K}^-(z)$ defined by \[(5.70)\] satisfies \[(5.75)\]. Applying the transformation \[(5.40)\] to \[(5.73)\] and defining

$$K^-(u) = \mathcal{M}(u) \tilde{K}^-(qu^2) \mathcal{M}(u) ,$$

the claim follows. \qed

Another solution of \[(5.9)\] is obtained as follows. Assume there exists two quantum Lax operators $L(z), L^0$ such that the relations \[(5.70), (5.71)\] and

$$\tilde{R}_{21}(z/w)L_1(z)L_2(w) = L_2(w)L_1(z)\tilde{R}_{21}(z/w) ,$$
$$\tilde{R}_{12}(z/w)(L^0)_1(L^0)_2 = (L^0)_2(L^0)_1\tilde{R}_{12}(z/w)$$

are satisfied. Then

$$\tilde{K}(z) \rightarrow L^0 \tilde{K}^0 L(z) \tag{5.77}$$

satisfies the Freidel-Maillet equation \[(5.73)\]. It is straightforward to check that

$$L(z) \rightarrow (L^+(z)^{-1})^{-1} \quad \text{and} \quad L^0 \rightarrow L^{+0} = \text{diag}(k_{2,0}^+, k_{1,0}^+)$$

obey the above set of relations. Then

$$\tilde{K}(z) \rightarrow \tilde{K}^+(z) = L^{+0} \tilde{K}^0 (L^+(z)^{-1})^{-1} \tag{5.78}$$

satisfies \[(5.73)\]. Using this result combined with the similarity transformation \[(5.40)\], it follows:

Lemma 5.16. The dressed $K$-matrix

$$K^+(u) = \left( \begin{array}{ccc} u^{-1} \left( \frac{k_{2}(q+q^{-1})}{q-q^{-1}} k_{2,0}^+ k_{2}^+ (1/qq^2)^{-1} e^+ (1/qq^2) \right) & & k_{2}(q+q^{-1}) k_{2,0}^+ k_{2}^+ (1/qq^2)^{-1} \\ \left( \frac{k_{2}(q+q^{-1})}{q-q^{-1}} k_{1,0}^+ (1/qq^2)^{-1} + f^+ (1/qq^2) k_{2}^+ (1/qq^2)^{-1} e^+ (1/qq^2) \right) & u \left( \frac{k_{2}(q+q^{-1})}{q-q^{-1}} k_{1,0}^+ f^+ (1/qq^2) k_{2}^+ (1/qq^2)^{-1} \right) & \end{array} \right)$$

satisfies the Freidel-Maillet equation \[(3.25)\].

For completeness, a $K$-matrix satisfying the Freidel-Maillet equation \[(3.25)\] is now constructed along the same lines. To this aim, we consider the set of relations \[(5.67), (5.71)\] with the substitution:

$$R^{(0)} \rightarrow (R^{(0)})^{-1} \tag{5.79}$$

For the choices

$$L(z) \rightarrow L^+(z) \quad \text{and} \quad L^0 \rightarrow L^{+0} = \text{diag}(k_{2,0}^+)^{-1}, (k_{1,0}^+)^{-1} , \tag{5.80}$$

one finds that

$$\tilde{K}(z) \rightarrow \tilde{K}^+(z) = L^+(z)\tilde{K}^0 L^{+0}$$

satisfies the Freidel-Maillet equation (for a non-symmetric $R$-matrix)

$$\tilde{R}_{12}(z/w) (\tilde{K}(z) \otimes \mathbb{I}) (R^{(0)})^{-1} (\mathbb{I} \otimes \tilde{K}(w)) = (\mathbb{I} \otimes \tilde{K}(w)) (R^{(0)})^{-1} (\tilde{K}(z) \otimes \mathbb{I}) \tilde{R}_{21}(z/w) . \tag{5.82}$$

Using \[(5.40)\], it follows:
Lemma 5.17. The dressed $K$-matrix

\[
K^+(u) = \begin{pmatrix}
    u^{-1} \left( \frac{k_+(q+q^{-1})}{q-q^{-1}} k_1^+(qu^2) f^+(qu^2)(k_2^+)^{-1} \right) \\
    \frac{k_-(q+q^{-1})}{q-q^{-1}} (k_1^+(qu^2) + e^+(qu^2) k_1^+(qu^2) f^+(qu^2)) (k_2^+)^{-1}
\end{pmatrix}
\]

satisfies the Freidel-Maillet equation (5.22).

The entries of the $K$-matrices are formal power series in the elements of the alternating subalgebras. Consider for instance the entry $(K^-(u))_{11}$. One has:

\[
(K^-(u))_{11} = u^{-1} q \left( \frac{k_-(q+q^{-1})}{q-q^{-1}} k_1^+(qu^2) f^-(qu^2)(k_2^-)^{-1} \right) \quad \text{by } (5.50)
\]

\[
= u^{-1} q \left( \frac{k_-(q+q^{-1})}{q-q^{-1}} k_1^+(qu^2)(k_2^-)^{-1} f^-(qu^2) \right) \quad \text{by } (5.51)
\]

Inserting (5.43), one gets:

\[
(K^-(u))_{11} = \exp \left( -\left( q-q^{-1} \right) \sum_{n=1}^{\infty} a_{1,n}(qu^2)^{-n} \right) \sum_{k=0}^{\infty} q^k C^{-k/2} K^{-1} x_k^+(qu^2)^{-k-1}
\]

According to Definition 5.12 and (5.52), (5.53), we conclude $(K^-(u))_{11} \in U_q(gl_2)^{b,+}[u^2]$. Studying similarly the other entries and repeating the same analysis for $K^+(u)$ and $K^+(u)$, one finds:

(5.83) \( (K^+(u))_{ij} \in U_q(gl_2)^{b,+}[u^2] \), \( (K^+(u))_{ij} \in U_q(gl_2)^{a,-}[u^2] \) and \( (K^+(u))_{ij} \in U_q(gl_2)^{a,+}[u^2] \).

5.2.3. Isomorphisms relating $\tilde{A}_q$ and the alternating subalgebras $U_q(gl_2)^{b,\pm}$ and $U_q(gl_2)^{a,\pm}$. From Section 5.2, recall the Freidel-Maillet presentation for $\tilde{A}_q$, see Theorem 3.1. A direct comparison between the $K$-matrix (3.8) and the $K$-matrices $K^\pm(u)$ previously derived provides explicit maps from $\tilde{A}_q$ to the alternating subalgebras of $U_q(gl_2)$. Recall the generating functions (3.53), (3.54) of the algebra $\tilde{A}_q$.

Proposition 5.18. There exists an isomorphism from $\tilde{A}_q$ to $U_q(gl_2)^{b,+}$ such that:

(5.84) \( \mathcal{W}(u) \mapsto -k-(q^2+1) \exp \left( -\left( q-q^{-1} \right) \sum_{n=1}^{\infty} a_{1,n}(qu^2)^{-n} \right) \sum_{k=0}^{\infty} q^k C^{-k/2} K^{-1} x_k^+(qu^2)^{-k-1} \),

(5.85) \( \mathcal{W}_-(u) \mapsto -k+(q^2+1) \left( \sum_{k=0}^{\infty} q^{k+1} C^{(k+1)/2} x_{k+1}^- (qu^2)^{-k-1} \right) \exp \left( -\left( q-q^{-1} \right) \sum_{n=1}^{\infty} a_{1,n}(qu^2)^{-n} \right) \),

(5.86) \( \mathcal{G}_+(u) \mapsto \frac{\tilde{p}}{q-q^{-1}} \left( \exp \left( -\left( q-q^{-1} \right) \sum_{n=1}^{\infty} a_{1,n}(qu^2)^{-n} \right) - 1 \right) 
\]

(5.87) \( \mathcal{G}_-(u) \mapsto \frac{\tilde{p}}{q-q^{-1}} \left( \exp \left( -\left( q-q^{-1} \right) \sum_{n=1}^{\infty} a_{2,n}(qu^2)^{-n} \right) - 1 \right)
\]

\[ + \tilde{p}(q-q^{-1}) \sum_{k,\ell=0}^{\infty} q^{k+\ell+2} C^{(k-\ell+1)/2} x_{k+1}^- K^{-1} \exp \left( -\left( q-q^{-1} \right) \sum_{n=1}^{\infty} a_{1,n}(qu^2)^{-n} \right) x_{\ell+1}^+(qu^2)^{-\ell-1} \].
Proof. As previously discussed, using (5.42), (5.43) and (5.51), one finds that the entries of $K^-(u)$ are power series in $qu^2$ such that (5.83) holds. Identifying (5.8) with the solution $K^-(u)$, one gets the above homomorphism $\bar{A}_q \to U_q(\hat{gl}_2)^{\circ,-}$ through identifying the generating functions. It remains to show that it is an isomorphism. Firstly, by analogy with $U_q(\hat{gl}_2)$ [CP91, page 289] $U_q(\hat{gl}_2)$ with defining relations (5.1)-(5.5) is known as the specialization $q \to 1$ of $U_q(\hat{gl}_2)$. So, the subalgebra $U_q(\hat{gl}_2)^{\circ,-}$ specializes to $U(\hat{gl}_2)^{\circ,-}$ with (5.20). Secondly, by Proposition (5.4), $\bar{A}_q \cong U(\hat{gl}_2)^{\circ,-}$. Thirdly, by Proposition (2.18), $\bar{A}_q$ is the specialization of $\bar{A}_q$ at $q \to 1, \bar{\rho} \to 16$. All together, we conclude that the map above is an isomorphism. □

Identifying the leading terms of the power series, one finds for instance:

**Example 5.19.** The image in $U_q(\hat{gl}_2)^{\circ,-}$ of the first generators of $\bar{A}_q$ is such that:

\[
\begin{align*}
W_0 & \mapsto -k_-qK^{-1}x_k^+, \\
W_1 & \mapsto -k_+C^{1/2}x_k^-, \\
G_1 & \mapsto -\frac{\bar{\rho}}{q + q^{-1}}a_{1,1}, \\
\tilde{G}_1 & \mapsto -\frac{\bar{\rho}}{q + q^{-1}}a_{2,1} + \frac{\bar{\rho}(q - q^{-1})}{(q + q^{-1})}q^2C^{1/2}x_k^-K^{-1}x_k^+.
\end{align*}
\]

As a second example, recall the Freidel-Maillet presentation (3.23) for $\bar{A}_q$ with (3.24). In this case, the K-matrix (5.21) is compared with the K-matrix $K^{\circ,-}(u)$ of Lemma 5.11. It follows

**Proposition 5.20.** There exists an isomorphism from $\bar{A}_q$ to $U_q(\hat{gl}_2)^{\circ,-}$ such that:

\[
\begin{align*}
W_+ (u^{-1}q^{-1}) & \mapsto k_+(q + q^{-1}) \sum_{k=0}^{\infty} q^{-k} C^{k/2} x_{-k}^- (q u^2)^{k+1} \exp \left( q - q^{-1} \sum_{n=1}^{\infty} a_{1,-n} (q u^2)^n \right), \\
W_- (u^{-1}q^{-1}) & \mapsto k_- (q + q^{-1}) \exp \left( q - q^{-1} \sum_{n=1}^{\infty} a_{1,-n} (q u^2)^n \right) \sum_{k=0}^{\infty} q^{-k+1} C^{-(k+1)/2} x_{-k-1}^- (q u^2)^{k+1}, \\
G_+ (u^{-1}q^{-1}) & \mapsto \frac{\bar{\rho}}{q - q^{-1}} \left( \exp \left( q - q^{-1} \sum_{n=1}^{\infty} a_{1,-n} (q u^2)^n \right) - 1 \right), \\
G_- (u^{-1}q^{-1}) & \mapsto \frac{\bar{\rho}}{q - q^{-1}} \left( \exp \left( q - q^{-1} \sum_{n=1}^{\infty} a_{2,-n} (q u^2)^n \right) - 1 \right) + \frac{\bar{\rho}(q - q^{-1})}{(q + q^{-1})} \sum_{k,\ell=0}^{\infty} q^{-k-\ell} C^{-(k+\ell)/2} x_{-k-\ell}^- \exp \left( q - q^{-1} \sum_{n=1}^{\infty} a_{1,-n} (q u^2)^n \right) x_{-k-\ell-1}^- (q u^2)^{k+\ell+1}.
\end{align*}
\]

**Example 5.21.** The image in $U_q(\hat{gl}_2)^{\circ,-}$ of the first generators of $\bar{A}_q$ is such that:

\[
\begin{align*}
W_0 & \mapsto k_+x_k^+, \\
W_1 & \mapsto -k_-C^{1/2}x_k^-K, \\
G_1 & \mapsto \frac{\bar{\rho}}{q + q^{-1}}a_{1,-1}, \\
\tilde{G}_1 & \mapsto \frac{\bar{\rho}}{q + q^{-1}}a_{2,-1} + \frac{\bar{\rho}(q - q^{-1})}{(q + q^{-1})}C^{-1/2}x_0^+x_1^- K.
\end{align*}
\]

So, the alternating subalgebra $U_q(\hat{gl}_2)^{\circ,-}$ (resp. $U_q(\hat{gl}_2)^{\circ,+}$) admits a Freidel-Maillet type presentation given by the K-matrix $K^-(u)$ (resp. $K^{\circ,+}(u)$) satisfying eq. (3.3) (resp. eq. (5.23)). Using the automorphism (5.34), a presentation for $U_q(\hat{gl}_2)^{\circ,-}$ (resp. $U_q(\hat{gl}_2)^{\circ,+}$) can be obtained as well.

Finally, let us introduce the alternating subalgebras of $U_q^{Dr}$.

**Definition 5.22.**

\[
\begin{align*}
U_q^{Dr,\circ,-} & = \{ C^{\mp k/2} x_k^\pm, C^{\pm(k+1)/2} x_{k+1}^\mp, h_k | k \in \mathbb{N} \}, \\
U_q^{Dr,\circ,+} & = \{ C^{\mp k/2} x_k^\pm, C^{\pm(k+1)/2} x_{k-1}^\mp, K, h_k | k \in \mathbb{N} \}.
\end{align*}
\]
We call $U_{q}^{Dr,\oplus,\pm}$ and $U_{q}^{Dr,\ominus,\pm}$ the right and left alternating subalgebras of $U_{q}^{Dr}$. The subalgebra generated by $\{K^{\pm 1}, C^{\pm 1/2}\}$ is denoted $U_{q}^{Dr,\diamond}$. As a corollary of (5.61) and Remark 6.13 one has the tensor product decompositions:

\[ U_{q}(gl_{2})^{\oplus,\pm} \cong U_{q}^{Dr,\oplus,\pm} \otimes C^{\ominus}, \quad U_{q}(gl_{2})^{\ominus,\pm} \cong U_{q}^{Dr,\ominus,\pm} \otimes C^{\oplus}. \]

Recall (5.59).

**Remark 5.23.** The alternating subalgebra $U_{q}^{Dr,\oplus,\pm}$ (resp. $U_{q}^{Dr,\ominus,\pm}$) is the quotient of $U_{q}(gl_{2})^{\oplus,\pm}$ (resp. $U_{q}(gl_{2})^{\ominus,\pm}$) by the ideal generated from the relations $\{\gamma_{m+1} = 0 \mid \forall m \in \mathbb{N}\}$.

We conclude this section with some comments. Using the isomorphism of Propositions 5.18 the image of the generating function $\Delta(u) \in Z[[u^{2}]]$ defined by (5.28) gives a generating function in $C^{\oplus}$ that looks more complicated than (5.58). In the context of FRT/Sklyanin/Freidel-Maillet presentations, this is not surprising as $\Delta(u)$ and $y^{\pm}(qu^{2})$ are built from different quantum determinants (see e.g. Sk88 for details). However, as a consistency check one can compare the leading orders of both power series. For instance, let us compute the image in $\mathbb{C}$ of $\Delta_{1}$ given by (2.27) using the expressions of Example 5.13. After simplifications using (5.28), (5.30), it reduces to:

\[ \Delta_{1} = \frac{2}{(q + q^{-1})^{2}}(qg_{1,1} + q^{-1}a_{2,1}), \]

which produces $\gamma_{1}$ (see (5.59) for $m = 1$).

### 5.3. The comodule algebra homomorphism $\delta: \hat{A}_{q} \to U_{q}(gl_{2})^{\oplus,0} \otimes \hat{A}_{q}$

At the end of Section 2, a coaction map $\langle W_{0}, W_{1} \rangle \to U_{q}^{D_{1},\oplus,0} \otimes \langle W_{0}, W_{1} \rangle$ has been given. In this subsection, we study further the comodule algebra structure of $\hat{A}_{q}$ using the FRT presentation of Theorem 5.7. A coaction formula for all the generators of $\hat{A}_{q}$ is derived as follows. Recall the coproduct formulae for the quantum Lax operators (5.18). Take the K-matrix (5.70) and define the new K-matrix:

\[ \Delta(L^{-}(z)) = L^{-}(z)^{-1} \otimes L^{-}(z). \]

Here $\Delta(L^{-}(z)) = L^{-}(z)^{-1} \otimes L^{-}(z)$ because (5.43):

\[ \Delta(k_{i,0}^{-}) = k_{i,0}^{-} \otimes k_{i,0}^{-}. \]

By construction, it satisfies the Freidel-Maillet equation (5.73) for the non-symmetric R-matrix (5.39). Using the invariance of (5.73) under shifts in the ratio $z/w$, it follows that

\[ \delta(\hat{K}^{-}(z)) = L^{-}(z) \hat{K}^{-}(z) \otimes L^{-}(z) \]

solves (5.73) with (5.39). More generally, starting from any K-matrix satisfying (5.73) and following standard arguments [Sk88], different types of coactions can be constructed from the FRT presentation. Using (5.40), for a symmetric R-matrix for instance it yields to:

**Proposition 5.24.** The Freidel-Maillet presentation (5.7) of $\hat{A}_{q}$ associated with R-matrix (5.7) and K-matrix (5.8) admits a comodule algebra structure. The left coaction is given by:

\[ \delta(K^{-}(u)) = (M(u)L^{-}(qu^{2})M(u)^{-1}) \otimes K^{-}(u) \otimes L^{-}(z). \]

A right coaction map is similarly obtained by analogy with (5.78). Now, recall the generating functions (5.5), (5.6). Also, define $U_{q}(gl_{2})^{\oplus,0}$ as the alternating subalgebra $U_{q}(gl_{2})^{\oplus,0}$ extended by $K, K^{-1}$. 

\[ \{\gamma_{m+1} = 0 \mid \forall m \in \mathbb{N}\}. \]
Lemma 5.25. There exists a left comodule algebra homomorphism $\delta : \tilde{A}_q \rightarrow U_q(\tilde{g}_2)^{\psi,+}\ot A_q$ such that:

$$\delta(W_+(u)) \mapsto (qu^2)^{-1}qk_1^{-1}(qu_2^2)(k_2^0)^{-1}f^-(qu^2) \otimes \left(\frac{1}{k_+(q + q^{-1})}G_+(u) + \frac{k_-(q + q^{-1})}{(q - q^{-1})}I\right)$$

$$+ k_1^{-1}(qu_2^2)(k_2^0)^{-1} \otimes W_+(u),$$

$$\delta(W_-(u)) \mapsto q^{-1}e^-(qu^2)_k^{-1}(qu_2^2)(k_2^0)^{-1} \otimes \left(\frac{1}{k_-(q + q^{-1})}G_+(u) + \frac{k_+(q + q^{-1})}{(q - q^{-1})}I\right)$$

$$+ k_2^{-1}(qu_2^2)(k_2^0)^{-1} + q^{-1}e^-(qu_2^2)_k^{-1}(qu_2^2)(k_2^0)^{-1}f^-(qu^2) \otimes W_-(u),$$

$$\delta(G_+(u)) \mapsto (q - q^{-1})k_1^{-1}(qu_2^2)(k_2^0)^{-1} \otimes G_+(u) + \frac{\bar{\rho}}{q - q^{-1}}(k_1^{-1}(qu_2^2)(k_2^0)^{-1} - 1)I \otimes I$$

$$+ k_-(q + q^{-1})(k_1^{-1}(qu_2^2)(k_2^0)^{-1}f^-(qu_2^2) \otimes W_-(u),$$

$$\delta(G_-(u)) \mapsto (q - q^{-1})(k_2^{-1}(qu_2^2)(k_2^0)^{-1} + qe^-(qu_2^2)_k^{-1}(qu_2^2)(k_2^0)^{-1}f^-(qu^2)) \otimes G_-(u)$$

$$+ \frac{\bar{\rho}}{q - q^{-1}}(k_2^{-1}(qu_2^2)(k_2^0)^{-1} + qe^-(qu_2^2)_k^{-1}(qu_2^2)(k_2^0)^{-1}f^-(qu_2^2) - 1)I \otimes I$$

$$+ k_+(qu_2^2)(q + q^{-1})e^-(qu_2^2)_k^{-1}(qu_2^2)(k_2^0)^{-1} \otimes W_+(u).$$

Proof. Compute (5.89) using (5.41), (5.40) and (3.8). Compare the entries of the resulting matrix to $\delta(K(u))$ with (3.8).

Expanding the power series on both sides of the above equations using (3.5), (3.4), (5.42)-(5.44) with (5.51), (5.54), one gets the image by $\delta$ of the generators of $\tilde{A}_q$. This generalizes example (2.48).

Example 5.26.

$$\delta(W_0) = -k_-qK^{-1}x^+_0 \otimes I + K^{-1} \otimes W_0,$$

$$\delta(W_1) = -k_+C^{1/2}x^-_0 \otimes I + K \otimes W_1.$$

If we define similarly $U_q(\tilde{g}_2)^{\alpha,-,0}$, note that a right coaction map $\tilde{A}_q \rightarrow A_q \otimes U_q(\tilde{g}_2)^{\alpha,-,0}$ can be derived along the same lines.

5.4. Relation between the generators of $\tilde{A}_q$ and the root vectors of $U_q(\tilde{g}_2)$. Let $\alpha_0, \alpha_1$ denote the simple roots of $\tilde{s}_2$ and $\delta = \alpha_0 + \alpha_1$ be the minimal positive imaginary root. Let $R = \{n\delta + \alpha_0, n\delta + \alpha_1, m\delta | n \in \mathbb{Z}, m \in \mathbb{Z} \setminus \{0\}\}$ be the root system of $\tilde{s}_2$ and $R^+ = \{n\delta + \alpha_0, n\delta + \alpha_1, m\delta | n \in \mathbb{N}, m \in \mathbb{N} \setminus \{0\}\}$ denote the positive root system. Recall $U_q^{D, r,+}$ denote the subalgebra generated by

$$E_{\alpha_1} = E_1, \quad E_{\alpha_0} = E_0.$$ 

Using Lusztig's braid group action with generators $T_0, T_1$ such that $T_1 : U_q(\tilde{s}_2) \rightarrow U_q(\tilde{s}_2)$, root vectors $E_{\beta} \in U_q^{D, r,+}$ for every $\beta \in R^+$ are defined [Da93, Be94]. Namely, for real root vectors $n\delta + \alpha_0, n\delta + \alpha_1$ with $n \in \mathbb{N}$ one chooses

$$E_{n\delta + \alpha_0} = (T_0\Phi)^n(E_0) \quad \text{and} \quad E_{n\delta + \alpha_1} = (T_0\Phi)^{-n}(E_1).$$

Here $\Phi : U_q(\tilde{s}_2) \rightarrow U_q(\tilde{s}_2)$ denotes the automorphism defined by:

$$\Phi(X_0) = X_1, \quad \Phi(X_1) = X_0 \quad \text{for} \quad X = E, F, K \pm 1.$$

For the imaginary root vectors, following [Be94, BCP98] they are defined through the functional equation (note that $E_{n\delta}, E_{m\delta} = 0$ for any $n, m$):

$$\exp \left( (q - q^{-1}) \sum_{k=1}^{\infty} E_{k\delta} z^k \right) = 1 + (q - q^{-1}) \sum_{k=0}^{\infty} \tilde{v}_k z^k \quad \text{with} \quad \tilde{v}_k = E_{k\delta - \alpha_1}E_{\alpha_1} - q^{-2}E_{\alpha_1}E_{k\delta - \alpha_1}.$$
For the negative root system denoted $\mathcal{R}^-$, similarly one defines the root vectors $F_\beta \in U_q^{DJ,\neg}$ for every $\beta \in \mathcal{R}^-$. The root vectors of $U_q^{DJ,+}$ and $U_q^{DJ,-}$ are related as follows (see [Da93] Theorem 2):

\begin{equation}
F_\beta = \Omega(E_\beta) \quad \forall \beta \in \mathcal{R}^+,
\end{equation}

where $\Omega$ is an antiautomorphism of $U_q(\widehat{\mathfrak{sl}_2})$ such that

$$
\Omega(E_i) = F_i, \quad \Omega(F_i) = E_i, \quad \Omega(K_i) = K_i^{-1} \quad \text{for } i = 1, 2, \quad \Omega(C) = C^{-1} \quad \text{and} \quad \Omega(q) = q^{-1}.
$$

The explicit relation between Drinfel’d generators and root vectors has been given in [Be94, Section 4] (see also [BCP98, Lemma 1.5]). For $U_q(\widehat{\mathfrak{sl}_2})$, according to above definitions one has the correspondence:

\begin{align}
(\text{5.91}) & \quad x_k^+ = E_{k\delta + \alpha_1}, \quad x_k^- = -C^{-k-1}K E_{k\delta + \alpha_0}, \quad h_{k+1} = C^{-(k+1)/2}E_{(k+1)\delta}, \\
(\text{5.92}) & \quad x_{-k}^- = F_{k\delta + \alpha_1}, \quad x_{-k-1}^+ = -F_{k\delta + \alpha_0}K^{-1}C^{k+1}, \quad h_{-k-1} = C^{(k+1)/2}F_{(k+1)\delta}
\end{align}

for $k \in \mathbb{N}$. From (5.37), one gets the following relations in terms of the root vectors [Da93, Section 3]:

\begin{equation}
[E_\delta, E_{k\delta + \alpha_1}] = (q + q^{-1})E_{(k+1)\delta + \alpha_1}, \quad [E_{k\delta + \alpha_0}, E_\delta] = (q + q^{-1})E_{(k+1)\delta + \alpha_0}.
\end{equation}

By induction, root vectors can be written as polynomials in $E_1, E_0$. For instance:

$$
E_\delta = E_0E_1 - q^{-2}E_1E_0,
E_{\delta + \alpha_0} = \frac{1}{q + q^{-1}} \left( \frac{E_0^2E_1 - (1 + q^{-2})E_0E_1E_0 + q^{-2}E_1E_0^2}{(q + q^{-1})^2} \right),
E_{\delta + \alpha_1} = \frac{1}{q + q^{-1}} \left( \frac{E_0E_1^2 - (1 + q^{-2})E_1E_0E_1 + q^{-2}E_1^2E_0}{(q + q^{-1})^2} \right).
$$

We now relate the root vectors to the generators of alternating subalgebras. For convenience, compute the image of $U_q^{Dr,\neg,+}$ (see Definition 5.22) by the automorphism $\nu$ (5.33) using (5.33). This alternating subalgebra is denoted $(U_q^{Dr,\neg,+})^\nu$. Combining (5.35) and (5.91), in terms of root vectors the generators of $(U_q^{Dr,\neg,+})^\nu$ read:

\begin{align}
(\text{5.94}) & \quad C^{-k/2}K^{-1}x_k^+ \xrightarrow{\nu} C^{-k/2}x_k^+ = C^{-k/2}E_{k\delta + \alpha_1}, \\
(\text{5.95}) & \quad C^{(k+1)/2}x_{k+1} \xrightarrow{\nu} C^{(k+1)/2}x_{k+1}K^{-1} = -q^{-2}C^{-(k+1)/2}E_{k\delta + \alpha_0}, \\
(\text{5.96}) & \quad h_{k+1} \xrightarrow{\nu} h_{k+1} = C^{-(k+1)/2}E_{(k+1)\delta}.
\end{align}

As an application of Proposition 5.18 a set of functional relations relating the generators of $\widehat{A}_q$ to the root vectors of $U_q^{DJ,+}$ (or similarly for $U_q^{DJ,-}$) is easily derived. Recall the surjective homomorphism $\gamma : \widehat{A}_q \rightarrow A_q \cong U_q^{DJ,+}$, see (2.37). Consider the image of the generating functions (3.5), (3.9) via $\gamma$. 
The isomorphism $\iota: \tilde{A}_q \rightarrow U^D_{q \mathfrak{l}^2}$ is such that:

\[
\gamma(W_+(u)) \mapsto -k_- q (q + q^{-1}) \exp \left(- (q - q^{-1}) \sum_{n=1}^{\infty} \frac{1}{(q^n + q^{-n}) E_n \delta(q^2)^{-n}} \right) \sum_{k=0}^{\infty} q^k E_{k \delta + \alpha_1} (q^2)^{-k-1},
\]

\[
\gamma(W_-(u)) \mapsto k_+ q^{-1} (q + q^{-1}) \left( \sum_{k=0}^{\infty} q^{k-1} E_{k \delta + \alpha_0} (q^2)^{-k-1} \right) \exp \left(- (q - q^{-1}) \sum_{n=1}^{\infty} \frac{1}{(q^n + q^{-n}) E_n \delta(q^2)^{-n}} \right) ,
\]

\[
\gamma(G_+(u)) \mapsto \frac{\bar{\rho}}{(q - q^{-1})} \left( \exp \left(- (q - q^{-1}) \sum_{n=1}^{\infty} \frac{1}{(q^n + q^{-n}) E_n \delta(q^2)^{-n}} \right) - 1 \right),
\]

\[
\gamma(G_-(u)) \mapsto \frac{\bar{\rho}}{(q - q^{-1})} \left( \exp \left(- (q - q^{-1}) \sum_{n=1}^{\infty} \frac{q^{2n}}{(q^n + q^{-n}) E_n \delta(q^2)^{-n}} \right) \right) - 1
\]

\[
+ \bar{\rho} (q - q^{-1}) \sum_{k,\ell=0}^{\infty} q^{k+\ell} E_{k \delta + \alpha_0} \exp \left(- (q - q^{-1}) \sum_{n=1}^{\infty} \frac{1}{(q^n + q^{-n}) E_n \delta(q^2)^{-n}} \right) E_{\ell \delta + \alpha_1} (q^2)^{-\ell-1}.
\]

**Proof.** Recall the surjective homomorphism $\gamma_D$ which acts as $\gamma_D^{\mathfrak{l}^2}$. Consider its restriction to $U_q^{(\mathfrak{l}^2)_{\rho,\nu}^+}$, applied to the r.h.s. of Eqs. (5.84)-(5.87). The resulting expressions are now in $U_q^{D_{\mathfrak{r},\nu}^+[[u^2]]}$. Then, studying the relations satisfied by $C_{-k/2}K^{-1}x_1^\pm, C^{(k+1)/2}x_{k+1}^\pm$ one finds that they are equivalent to the defining relations of the quotient of $U_q^{D_{\mathfrak{r},\nu}^+}$ by $C = 1$. Apply $\nu$ and use the identification given in the r.h.s of Eqs. (5.94)-(5.96) for $C = 1$. □

Expanding the above power series, for instance set $k_+ \rightarrow q^2$, $k_- \rightarrow -q^{-1}$ (which gives $\bar{\rho} = -q(q + q^{-1})^2$) in these expressions. It follows:

\[
W_0 \mapsto E_1, \quad W_1 \mapsto E_0, \quad G_1 \mapsto q E_\delta, \quad \text{(note that $\bar{G}_1 \mapsto -q^3 E_\delta + (q^3 - q^{-1}) E_0 E_1$)},
\]

\[
W_1 \mapsto \frac{1}{(q + q^{-1})^2} \left(- (q - q^{-1}) E_\delta E_1 + (q^2 + 1) E_{\delta + \alpha_1} \right),
\]

\[
W_2 \mapsto \frac{1}{(q + q^{-1})^2} \left(- (q - q^{-1}) E_\delta E_0 + (q^2 + 1) E_{\delta + \alpha_0} \right).
\]

By construction, $(U_q^{D_{\mathfrak{r},\nu}^+})^{\nu}/c_1 = U_q^{D_{\mathfrak{r},\nu}^+}$. Using (5.90), an isomorphism $\tilde{A}_q \rightarrow U_q^{D_{\mathfrak{r},\nu}^{+}/c_1} \cong U_q^{D_{\mathfrak{r},\nu}^+}$ is obtained from the above expressions.

The inverse of the map $\iota$ is now considered. We want to solve the positive root vectors $E_{\delta + \alpha_1}, E_{\delta + \alpha_0}, E_{\delta}$ in terms of the generators $W_-, W_{k+1}, G_{k+1}$. Although we do not have the explicit inverse map between generating functions, the images of the root vectors in $\tilde{A}_q$ can be obtained recursively from Proposition 5.27. For instance,

\[
E_1 \mapsto W_0, \quad E_0 \mapsto W_1, \quad E_\delta \mapsto q^{-1} G_1 W_0,
\]

\[
E_{\delta + \alpha_1} \mapsto \frac{(q - q^{-1})}{(q + q^{-1})} q^{-2} G_1 W_0 + (1 + q^{-2}) W_{-1},
\]

\[
E_{\delta + \alpha_0} \mapsto \frac{(q - q^{-1})}{(q + q^{-1})} q^{-2} W_1 G_1 + (1 + q^{-2}) W_2.
\]

Of course, these expressions could be given in a different ordering (see Theorem 2.15) using (2.23) for $k = 0$.

Finally, let us point that several relations mixing both sets of generators can be readily obtained using (3.9) combined with Proposition 5.27. Namely, define the image of the K-matrix (5.8) by $\iota$ as:

\[
K^\nu(u) = \iota(K(u)).
\]

Consider the pair of K-matrices $\{K(u), K^\nu(u)\}$. They satisfy:

\[
R(u/v) (K(u) \otimes \mathbb{I}) R(0) (\mathbb{I} \otimes K^\nu(u)) = (\mathbb{I} \otimes K^\nu(u)) R(0) (K(u) \otimes \mathbb{I}) R(u/v)
\]
with (5.1). If we define the generating functions \( W_{\pm}(v)^{\gamma} = \ell \circ \gamma(W_{\pm}(v)) \), \( G_{\pm}(v)^{\gamma} = \ell \circ \gamma(G_{\pm}(v)) \), from (5.10)–(6.18) one extracts the set of functional relations associated with (5.10).

**Remark 5.28.** In [T19a, Section 11], the relation between Damiani’s PBW basis and the alternating PBW basis for \( \hat{A}_q \) has been studied in details within the framework of the q-shuffle algebra. In particular, various relations mixing both sets of generators have been obtained.

6. The alternating presentation of \( U_q(\widehat{s\ell_2}) \) from \( U_q^{DJ} \)

Define the alternating subalgebra \( \tilde{A}_q^a \cong (U_q^{DJ,+,+})^\ast /_{C=1} \) (resp. \( \tilde{A}_q^a \cong U_q^{DJ,+,−} /_{C=1} \)) as the image of \( \tilde{A}_q \) by \( \ell \) (resp. \( \Omega \circ \ell \)) (see Proposition 5.27) for \( k_+ \rightarrow q^2 \), \( k_- \rightarrow q^{-1} \). For convenience, let us denote the generators of \( \tilde{A}_q^a \) (resp. \( \tilde{A}_q^a \)) by \( \{ W^{\pm}_k, W^{\pm}_{k+1}, G^{\pm}_k, G^{\pm}_{k+1} | k \in \mathbb{N} \} \) (resp. \( \{ W^{a}_k, W^{a}_{k+1}, G^{a}_k, G^{a}_{k+1} | k \in \mathbb{N} \} \)). According to (5.97):

\[
W^{a}_0 = E_1, \quad W^{a}_1 = E_0, \quad W^{a}_2 = F_1, \quad W^{a}_3 = F_0.
\]

Recall Proposition 2.14 and \( U_q^{DJ,0} = \{ K_0, K_1 \} \). By construction, one gets the tensor product decomposition:

\[
U_q(\widehat{s\ell_2}) \cong \tilde{A}_q^a \otimes U_q^{DJ,0} \otimes \tilde{A}_q^a.
\]

Moreover, by Theorem 2.13 an ‘alternating’ PBW basis for \( U_q(\widehat{s\ell_2}) \) readily follows from the results of [T19a, T19b].

**Theorem 6.1.** A PBW basis for \( U_q(\widehat{s\ell_2}) \) is obtained by its alternating right and left generators

\[
\{ W^{\pm}_k \}_{k \in \mathbb{N}}, \quad \{ G^{\pm}_{k+1} \}_{k \in \mathbb{N}}, \quad \{ W^{a}_n \}_{n \in \mathbb{N}}, \quad \{ W^{a}_{r+1} \}_{r \in \mathbb{N}}, \quad \{ G^{a}_{s+1} \}_{s \in \mathbb{N}}, \quad \{ W^{a}_{t+1} \}_{t \in \mathbb{N}}
\]

and \( K_0, K_1 \) in any linear order \( < \) that satisfies

\[
W^{a}_{k} < G^{a}_{k+1} < W^{a}_{k+1} < K_0 < K_1 < W^{a}_{k+1} < G^{a}_{k+1} < W^{a}_{k}, \quad k, \ell, n, r, s, t \in \mathbb{N}.
\]

The transition matrix from the alternating PBW basis of Theorem 6.1 to Damiani’s PBW basis for \( U_q(\widehat{s\ell_2}) \) [Da93, Theorem 2] is determined by Proposition 5.27 and using the anti-automorphism \( \Omega \) (5.90).

**Acknowledgments:** I am very grateful to Naihuan Jing, Stefan Kolb and Paul Terwilliger for discussions. In particular, some results were obtained motivated by questions from Paul Terwilliger. I also thank Nicolas Crampé for gratefully sharing a MAPLE code and discussions. P.B. is supported by C.N.R.S.

**Appendix A. Drinfel’d-Jimbo presentation of \( U_q(\widehat{s\ell_2}) \)**

A.1. **Drinfel’d-Jimbo presentation** \( U_q^{DJ} \). Define the extended Cartan matrix \( \{ a_{ij} \} \) (\( a_{ii} = 2, a_{ij} = -2 \) for \( i \neq j \)).

The quantum affine algebra \( U_q(\widehat{s\ell_2}) \) over \( \mathbb{C}(q) \) is generated by the elements \( \{ E_j, F_j, K_j^{\pm1} \}, j \in \{0, 1\} \) which satisfy the defining relations

\[
K_i K_j = K_j K_i, \quad K_i K_i^{-1} = K_i^{-1} K_i = 1, \quad K_i E_j K_i^{-1} = q^{a_{ij}} E_j, \quad K_i F_j K_i^{-1} = q^{-a_{ij}} F_j, \quad [E_i, F_j] = \delta_{ij} K_i - K_i^{-1} q^{-1}/q \]

together with the \( q \)-Serre relations \( (i \neq j) \)

\[
(E_i, [E_i, [E_i, E_j]_{q^{-1}}]_{q^{-1}}) = 0, \tag{A.1}
\]
\[
(F_i, [F_i, [F_i, F_j]_{q^{-1}}]_{q^{-1}}) = 0. \tag{A.2}
\]

The product \( C = K_0 K_1 \) is the central element of the algebra. The Hopf algebra structure is ensured by the existence of a comultiplication \( \Delta \), antipode \( S \) and a counit \( \varepsilon \) with

\[
\Delta(E_i) = 1 \otimes E_i + E_i \otimes K_i, \quad \Delta(F_i) = F_i \otimes 1 + K_i^{-1} \otimes F_i, \quad \Delta(K_i) = K_i \otimes K_i. \tag{A.3}
\]
\[ S(E_i) = -E_iK_i^{-1}, \quad S(F_i) = -K_iF_i, \quad S(K_i) = K_i^{-1} \quad S(1) = 1 \]

and

\[ \mathcal{E}(E_i) = \mathcal{E}(F_i) = 0, \quad \mathcal{E}(K_i) = 1, \quad \mathcal{E}(1) = 1. \]

More generally, one defines the \( N \)-coproduct \( \Delta^{(N)} : U_q(\hat{sl}_2) \to U_q(\hat{sl}_2) \otimes \cdots \otimes U_q(\hat{sl}_2) \) as

\[ \Delta^{(N)} \equiv (id \times \cdots \times id \times \Delta) \circ \Delta^{(N-1)} \]

for \( N \geq 3 \) with \( \Delta^{(2)} \equiv \Delta, \Delta^{(1)} \equiv id \). Note that the opposite coproduct \( \Delta' \) can be similarly defined with \( \Delta' \equiv \sigma \circ \Delta \) where the permutation map \( \sigma(x \otimes y) = y \otimes x \) for all \( x, y \in U_q(\hat{sl}_2) \) is used.

A.2. Serre-Chevalley presentation \( \hat{sl}_{2}^{SC} \). In the definition below, \([.,.]\) denotes the Lie bracket. The affine algebra \( \hat{sl}_2 \) over \( \mathbb{C} \) is generated by the elements \( \{e_j, f_j, k_j\}, j \in \{0, 1\} \) which satisfy the defining relations

\[ [k_i, k_j] = 0, \quad [k_i, e_j] = a_{ij}e_j, \quad [k_i, f_j] = -a_{ij}f_j, \quad [e_i, f_j] = \delta_{ij}k_i \]

together with the Serre relations \((i \neq j)\)

\[ [e_i, [e_i, [e_i, e_j]]] = 0, \]
\[ [f_i, [f_i, [f_i, f_j]]] = 0. \]

The sum \( c = k_0 + k_1 \) is the central element of the algebra.

For \( U(\hat{sl}_{2}^{SC}) \), as usual \( [x, y] \to xy - yx \).

Appendix B. Some defining relations of Gao-Jing presentation of \( U_q(\hat{g}_2) \)

We refer the reader to [GJ02] Theorem 4.16. From Definition 5.5 and [5.52], [5.53], the following commutation relations are derived:

\[ [a_{i,m}, a_{i,n}] = 0, i = 1, 2, \]
\[ [a_{2,m}, a_{1,n}] = \frac{[m]}{m} [mc]q^{-m} \delta_{m+n,0}, \]
\[ [a_{1,m}, x^\pm_n] = \pm \frac{[m]}{m} q^{\mp m|c|/2 x^\pm_{m+n}}, \]
\[ [a_{2,m}, x^\pm_n] = \mp \frac{[m]}{m} q^{2m|c|/2 x^\pm_{m+n}}. \]
