**Abstract.** We use elliptic Taylor series expansions and interpolation to deduce a number of summations for elliptic hypergeometric series. We extend to the well-poised elliptic case results that in the \(q\)-case have previously been obtained by Cooper and by Ismail and Stanton. We also provide identities involving Bhargava’s cubic theta functions.

1. Introduction

Previously, one of us [21] established an elliptic Taylor expansion theorem which extends Ismail’s [11] expansion for functions symmetric in \(z\) and \(1/z\) in terms of the Askey–Wilson monomial basis. The expansion theorem in [21] involves a special case of Rains’ [17] elliptic extension of the Askey–Wilson divided difference operator. As applications, new simple proofs were given for Frenkel and Turaev’s [6] elliptic extensions of Jackson’s \(8\varphi_7\) summation and of Bailey’s \(10\varphi_9\) transformation. A further application concerned the computation of the connection coefficients of Spiridonov’s [23] elliptic extension of Rahman’s biorthogonal rational functions.

Here we take a closer look at elliptic Taylor expansions. In particular, we describe the action of the \(n\)-th elliptic divided difference on a function, expressed in terms of the function. In the ordinary case, if \(\delta_h\) denotes the central difference operator, defined by \(\delta_h f(x) = f(x + \frac{h}{2}) - f(x - \frac{h}{2})\), the \(n\)-th difference is given by

\[
\delta^n_h f(x) = \sum_{k=0}^{n} (-1)^k \binom{n}{k} f\left(x + \left(\frac{n}{2} - k\right)h\right).
\]

For the \(q\)-case, where \(\delta_h\) is replaced by the Askey–Wilson operator \(D_q\), acting on functions \(f(z)\) symmetric in \(z\) and \(1/z\), an explicit formula for \(D^n_q f(z)\) was established by Cooper [7]. One of the results of our paper concerns an extension of Cooper’s formula to the elliptic setting. Independently, Ismail, Rains and Stanton [12] have also proved an elliptic extension of Cooper’s formula which however appears to be different from ours. In [14], Ismail and Stanton have used Cooper’s explicit formula to work out an explicit interpolation formula for polynomials symmetric in \(z\) and \(1/z\). Likewise, we use our elliptic extension of Cooper’s formula to find an elliptic interpolation formula. Application of this formula yields single and multivariable identities of Karlsson–Minton type.

Ismail and Stanton [13] not only considered Taylor expansions in terms of the Askey–Wilson monomial basis \(\{(az,a/z;q)_n, n \geq 0\}\) (see the subsequent subsection for the \(q\)-shifted factorial notation), but also in terms of the basis \(\{(q^2z,q^2/z;q^2)_n, n \geq 0\}\), for which they deduced quadratic summations as applications. We are able to extend Ismail and Stanton’s analysis and provide, in particular, a Taylor expansion for an elliptic extension of this other basis.

Finally, we consider series partially involving products of Bhargava’s [3] cubic theta functions. We consider two different cubic theta extensions of shifted factorials. Applications of Taylor expansion yield

book [9]. Elliptic hypergeometric series are treated there in Chapter 11.

1.1. Elliptic hypergeometric series.

For basic hypergeometric series, see Gasper and Rahman’s textbook [9]. Elliptic hypergeometric series are treated there in Chapter 11.

By definition, a function is elliptic if it is meromorphic and doubly periodic. It is well known (cf. e.g. [25]) that elliptic functions can be built from quotients of theta functions.

As building blocks we will use the modified Jacobi theta function with argument \(x\) and nome \(p\), defined (in multiplicative notation) by

\[
\theta(x; p) = \prod_{j=0}^{\infty} ((1 - p^j x)(1 - p^{j+1}/x)), \quad \theta(x_1, \ldots, x_m; p) = \prod_{k=1}^{m} \theta(x_k; p),
\]

where \(x, x_1, \ldots, x_m \neq 0, |p| < 1\).

The modified Jacobi theta functions satisfy the following basic properties which are essential in the theory of elliptic hypergeometric series:

\[
\begin{align*}
\theta(x; p) &= -x \theta(1/x; p), \quad (1.1a) \\
\theta(px; p) &= -\frac{1}{x} \theta(x; p), \quad (1.1b)
\end{align*}
\]

and the addition formula

\[
\theta(xy, x/y, uv, u/v; p) - \theta(xv, x/v, uy, u/y; p) = \frac{u}{y} \theta(yv, y/v, xu, x/u; p) \quad (1.1c)
\]

(cf. [26, p. 451, Example 5]).

Note that in the theta function \(\theta(x; p)\) we cannot let \(x \to 0\) (unless we first let \(p \to 0\)) for \(x\) is a pole of infinite order.

Further, we define the theta shifted factorial (or \(q, p\)-shifted factorial) by

\[
(a; q, p)_n = \begin{cases} 
\prod_{k=0}^{n-1} \theta(aq^k; p), & n = 1, 2, \ldots, \\
1, & n = 0, \\
1/\prod_{k=0}^{-n-1} \theta(aq^{n+k}; p), & n = -1, -2, \ldots,
\end{cases}
\]

together with

\[
(a_1, a_2, \ldots, a_m; q, p)_n = \prod_{k=1}^{m} (a_k; q, p)_n,
\]

for compact notation. For \(p = 0\) we have \(\theta(x; 0) = 1 - x\) and, hence, \((a; q, 0)_n = (a; q)_n\) is a \(q\)-shifted factorial in base \(q\). The parameters \(q\) and \(p\) in \((a; q, p)_n\) are called the base and nome, respectively. Observe that

\[
(pa; q, p)_n = (-1)^n a^{-n} q^{-\binom{n}{2}} (a; q, p)_n, \quad (1.2)
\]

which follows from (1.1b). A list of other useful identities for manipulating the \(q, p\)-shifted factorials is given in [9, Sec. 11.2]. A list of other useful identities for manipulating the \(q, p\)-shifted factorials is given in [9, Sec. 11.2].

A series \(\sum c_n\) is called an elliptic hypergeometric series if \(g(n) = c_{n+1}/c_n\) is an elliptic function of \(n\) with \(n\) considered as a complex variable; i.e., the function \(g(x)\) is a doubly periodic meromorphic function of the complex variable \(x\). Without loss of generality, by the theory of theta functions, one may assume that

\[
g(x) = \frac{\theta(a_1 q^n, a_2 q^n, \ldots, a_{s+1} q^n; p)}{\theta(q^{1+x}, b_1 q^n, \ldots, b_s q^n; p)} z,
\]

where the elliptic balancing condition, namely

\[
a_1 a_2 \cdots a_{s+1} = q b_1 b_2 \cdots b_s,
\]
where \( \iota \) considered as a function in \( a \) where \( \text{D} \) holds. If we write \( q = e^{2\pi i \sigma} \), \( p = e^{2\pi i \tau} \), with complex \( \sigma \), \( \tau \), then \( g(x) \) is indeed periodic in \( x \) with periods \( \sigma^{-1} \) and \( \tau^{-1} \).

For convergence reasons, one usually requires \( a_{s+1} = q^{-n} \) \( (n \text{ being a nonnegative integer} \) \), so that the sum of an elliptic hypergeometric series is in fact finite.

Very-well-poised elliptic hypergeometric series are defined as

\[
s+1V_s(a_1; a_6, \ldots, a_{s+1}; q, p) := \sum_{k=0}^{\infty} \frac{\theta(a_1 q^{2k}; p)}{\theta(a_1; p)} \frac{(a_1, a_6, \ldots, a_{s+1}; q, p)_k}{(q, a_1 q/a_6, \ldots, a_1 q/a_{s+1}; q, p)_k} (qz)^k, \tag{1.3}
\]

where

\[q^2a_2^2q^3 \cdots a_{s+1}^2 = (a_1 q)^{s-5}.
\]

Note that in the elliptic case the number of pairs of numerator and denominator parameters involved in the construction of the very-well-poised term \( \theta(a_1 q^{2k}; p)/\theta(a_1; p) \) is four \( (\text{whereas in the basic case this number is two, in the ordinary case only one}) \). See Spiridonov [23] or Gasper and Rahman [9, Ch. 11].

In their study of elliptic 6j symbols (which are elliptic solutions of the Yang–Baxter equation found by Baxter [2] and Date et al. [5]), Frenkel and Turaev [6] discovered the following \( 10V_9 \) summation formula \( (\text{as a result of a more general 12}V_{11} \text{transformation, being a consequence of the tetrahedral symmetry of the elliptic 6j symbols}) \):

\[10V_9(a; b, c, d, e, q^{-n}; q, p) = \frac{(aq, aq/bc, aq/bd, aq/cd; q, p)_n}{(aq/b, aq/c, aq/d, aq/bcd; q, p)_n}, \tag{1.4}
\]

where \( a^2q^{n+1} = bcde \). The \( 10V_9 \) summation is an elliptic analogue of Jackson’s \( \phi \) summation formula \( (\text{cf. [9, Eq. (2.6.2)])}) \)

\[
\frac{\sum_{k=0}^{n} (1 - aq^{2k})(a, b, c, d, e, q^{-n}; q)_k}{(1-a)(q, aq/b, aq/c, aq/d, aq/q, aq^{n+1}; q)_k} q^k = \frac{(aq, aq/bc, aq/bd, aq/cd; q)_n}{(aq/b, aq/c, aq/d, aq/bcd; q)_n}, \tag{1.5}
\]

where \( a^2q^{n+1} = bcde \), which in turn is a \( q \)-analogue of Dougall’s \( \tau F_6 \) summation formula.

1.2. The Askey–Wilson operator. The Askey–Wilson operator \( \text{D}_q \) was first defined in [1]. We consider meromorphic functions \( f(z) \) symmetric in \( z \) and \( 1/z \). Writing \( z = e^{i\theta} \) (\( \text{note that } \theta \text{ need not to be real}) \), we may consider \( f \) to be a function in \( x = \cos \theta = (z + 1/z)/2 \) and write \( f[x] := f(z) \). \( (\text{I.e., } f \text{ can be considered as a function in } z \text{, or equivalently, as a function in } x \text{, where the two different notations specify the dependency to be considered.}) \)

The Askey–Wilson operator acts on functions of \( x = \cos \theta \). It is defined as follows:

\[
\text{D}_q f[x] = \frac{f(q^{\frac{1}{4}}z) - f(q^{-\frac{1}{4}}z)}{i(q^{\frac{1}{4}}z) - i(q^{-\frac{1}{4}}z)}, \tag{1.6}
\]

where \( i[x] = x \) \( (\text{i.e., } i(z) = (z + 1/z)/2) \). Equation (1.6) can also be written as

\[
\text{D}_q f[x] = \frac{f(q^{\frac{1}{4}}z) - f(q^{-\frac{1}{4}}z)}{i(q^{\frac{1}{4}} - q^{-\frac{1}{4}}) \sin \theta}. \tag{1.7}
\]

The operator \( \text{D}_q \) is a \( q \)-analogue of the differentiation operator \( (\text{which is different to Jackson’s } q \text{-difference operator}) \). In particular, since

\[
\text{D}_q T_n[x] = q^{\frac{n}{2}} - q^{-\frac{n}{2}} \frac{q^{\frac{n}{2}} - q^{-\frac{n}{2}}}{q^{\frac{1}{2}} - q^{-\frac{1}{2}}} U_{n-1}[x], \tag{1.8}
\]

where \( T_n[\cos \theta] = \cos n\theta \) and \( U_n[\cos \theta] = \sin (n+1)\theta/\sin \theta \) are the Chebyshev polynomials of the first and second kind, one easily sees that \( \text{D}_q \) maps polynomials to polynomials, lowering the degree by one.

In the calculus of the Askey–Wilson operator the so-called “Askey–Wilson monomials” \( \omega_n(x; a) = (az, a/z; q)_n \) form a natural basis for polynomials or power series in \( x \). One readily computes

\[
\text{D}_q(az, a/z; q)_n = -\frac{2a(1 - q^n)}{(1 - q)} (aq^{\frac{1}{2}}z, aq^{\frac{1}{2}}/z; q)_{n-1}. \tag{1.9}
\]
Ismail [11] proved the following Taylor theorem for polynomials $f[x]$:  

**Theorem 1.1.** If $f[x]$ is a polynomial in $x$ of degree $n$, then  

$$f[x] = \sum_{k=0}^{n} f_k \phi_k(x; a),$$

where  

$$f_k = \frac{(q - 1)^k}{(2a)^k(q; q)_k} q^{-k(k-1)/4} \left[ D_q^k f[x]\right]_{x=x_k}, \quad x_k := \frac{1}{2} (aq^{\frac{k}{2}} + q^{-\frac{k}{2}}/a).$$

As it was shown in [11], the application of Theorem 1.1 to $f(z) = (bz, b/z; q)_n$ immediately gives the $q$-Pfaff–Saalschütz summation (cf. [9, Eq. (1.7.2)]), in the form  

$$ \frac{(bz, b/z; q)_n}{(ba, b/a; q)_n} = 3\phi_2\left[ \frac{az, a/z, q^{-n}}{ab, q^{-n}a/b}, q, q \right],$$

while its application to the Askey–Wilson polynomials,  

$$\omega_n(x; a, b, c, d; q) := q^\frac{n}{2} \left[ \frac{az, a/z, abcq^{n-1}}{ab, ac, ad} : q, q \right],$$

gives a connection coefficient identity which, by specialization, can be reduced to the Sears transformation (cf. [9, Eq. (3.2.1)]), in the form  

$$\omega_n(x; a, b, c, d; q) = a^n(bc, bd; q)_n \frac{1}{b^n(ac, ad; q)_n} \omega_n(x; b, a, c, d; q).$$

Ismail and Stanton [13] extended the above polynomial Taylor theorem to hold for entire functions of exponential growth, resulting in infinite Taylor expansions with explicit remainder term. Among other results they were able to recover the nonterminating $q$-Pfaff–Saalschütz summation (cf. [9, Appendix (II.24)]).

### 1.3. The well-poised and elliptic Askey–Wilson operator

Since  

$$D_q^{(az, a/z; q)_n} = \frac{2}{(q^{\frac{1}{2}} - q^{-\frac{1}{2}})(z - 1/z)} \left[ \frac{(aq^{\frac{1}{2}}z, aq^{-\frac{1}{2}}/z; q)_n}{(cq^{\frac{1}{2}}z, cq^{-\frac{1}{2}}/z; q)_n} - \frac{(aq^{-\frac{1}{2}}z, aq^{\frac{1}{2}}/z; q)_n}{(cq^{-\frac{1}{2}}z, cq^{\frac{1}{2}}/z; q)_n} \right]$$

$$= \frac{2}{(q^{\frac{1}{2}} - q^{-\frac{1}{2}})(z - 1/z)} \left[ \frac{(1 - azq^{\frac{1}{2}})(1 - aq^{-\frac{1}{2}}/z)}{(1 - czq^{\frac{1}{2}}z)(1 - cq^{-\frac{1}{2}}/z)} - \frac{(1 - aq^{-\frac{1}{2}}/z)}{(1 - czq^{\frac{1}{2}}z)(1 - cq^{-\frac{1}{2}}/z)} \right]$$

we were led in [21] to define a $c$-generalized well-poised Askey–Wilson operator acting on $x$ (or $z$) by  

$$D_{c,q} = (1 - czq^{\frac{1}{2}}z)(1 - cq^{-\frac{1}{2}}/z)(1 - czq^{\frac{1}{2}}z)(1 - cq^{-\frac{1}{2}}/z) \frac{1}{(1 - q) \frac{(az, a/z; q)_n}{(cz, c/z; q)_n}},$$

which acts “degree-lowering” on the “rational monomials” (or “well-poised monomials”)  

$$\frac{(az, a/z; q)_n}{(cz, c/z; q)_n}$$

in the form  

$$D_{c,q} \left[ \frac{(az, a/z; q)_n}{(cz, c/z; q)_n} \right] = \frac{(-1)^2a(1 - c/a)(1 - acq^{n-1})(1 - q^n)}{(1 - q) \frac{(aq^{\frac{1}{2}}z, aq^{-\frac{1}{2}}/z; q)_n}{(cq^{\frac{1}{2}}z, cq^{-\frac{1}{2}}/z; q)_n}}.$$
extends Theorem 1.1 of Ismail.

More generally, for parameters $c, q, p$ with $|q|, |p| < 1$, we defined an elliptic extension of the Askey–Wilson operator, acting on functions symmetric in $z^{\pm 1}$, by

$$D_{c,q,p} f(z) = 2q^{\frac{1}{2}} z \frac{\theta(czq^{-\frac{1}{2}}, czq^{\frac{1}{2}}, cq^{-\frac{1}{2}}/z; q^2; z/p)}{\theta(q, z^2; p)} \left( f(q^{\frac{1}{2}} z) - f(q^{-\frac{1}{2}} z) \right). \tag{1.10}$$

Note that

$$D_{c,q,0} = D_{c,q}.$$  

In particular, using (1.1c), we have

$$D_{c,q,p} (az, a/z; q, p)_{n} = (-1)^{2a} \frac{\theta(c/a, acq^{-1}; q^{n-1}; q) (aq^{\frac{1}{2}} z, aq^{\frac{1}{2}}/z; q, p)_{n-1}}{\theta(q; p)} (cq^{\frac{1}{2}} z, cq^{\frac{1}{2}}/z; q, p)_{n-1}. \tag{1.11}$$

Remark 1.2. The operator $D_{c,q,p}$ happens to be a special case of a multivariable difference operator introduced by Rains in [16]. Already in the single variable case Rains’ operator involves two more parameters than $D_{c,q,p}$. (Rains’ difference operators generate a representation of the Sklyanin algebra, as observed in [16] and made explicit in [18] and [19, Sec. 6].) Rains’ operator can be specialized to act as degree-lowering (as the above $D_{c,q,p}$ does), degree-preserving or degree-raising on abelian functions. Rains used his multivariable difference operators in [16] to construct $BC_n$-symmetric biorthogonal abelian functions that generalize Koornwinder’s orthogonal polynomials. He further used his operator in [17] to derive $BC_n$-symmetric extensions of Frenkel and Turaev’s $10V_9$ summation and $12V_{11}$ transformation.

2. Elliptic Taylor expansions and interpolation

We work in the following space of abelian functions.

For a complex number $c$, let

$$W^n_c := \text{span}_c \left\{ \frac{g_k(z)}{(cz, c/z; q, p)_k}, \ 0 \leq k \leq n \right\}, \tag{2.1}$$

where $g_k(z)$ runs over all functions being holomorphic for $z \neq 0$ with $g_k(z) = g_k(1/z)$ and

$$g_k(pz) = \frac{1}{p^k z^{2k}} g_k(z).$$

In classical terminology, $g_k(z)$ is an even theta function of order $2k$ and zero characteristic. Rains [17] refers to such functions as $BC_1$ theta functions of degree $k$, whereas in Rosengren and Schlosser [20] they are referred to as $D_k$ theta functions. It is well-known that the space $V^k$ of even theta functions of order $2k$ and zero characteristic has dimension $k + 1$ (see e.g. Weber [25, p. 49]).

Note that $W^n_c$ consists of certain abelian functions. (For $p \to 0$ these degenerate to certain rational functions which we may call “well-poised”.)

Lemma 2.1. [21, Lemma 4.1] For any arbitrary but fixed complex number $a$ (satisfying $a \neq cq^j p^k$, for $j = 0, \ldots, n - 1$, and $k \in \mathbb{Z}$, and $a \neq q^j p^k/c$, for $j = 2 - 2n, \ldots, 1 - n$, and $k \in \mathbb{Z}$), the set

$$\left\{ \frac{(az, a/z; q, p)_k}{(cz, c/z; q, p)_k}, \ 0 \leq k \leq n \right\}$$

forms a basis for $W^n_c$.

Note that, in view of (1.11), the elliptic Askey–Wilson operator maps functions in $W^n_c$ to functions in $W^{n-1}_{cq^2}$. We now define

$$D_{c,q,p}^{(k)} = D_{cq^2,q,p}^{(k-1)} D_{c,q,p}, \tag{2.2}$$

with $D_{c,q,p}^{(0)} = \varepsilon$, the identity operator. We have the following elliptic Taylor expansion theorem which extends Theorem 1.1 of Ismail.
Theorem 2.2. [21, Theorem 4.2] If \( f \) is in \( W^n_c \), then
\[
f(z) = \sum_{k=0}^{n} f_k \frac{(az, a/z; q, p)_k}{(cz, c/z; q, p)_k},
\tag{2.3a}
\]
where
\[
f_k = \frac{(-1)^k q^{-k(k-1)/4} \theta(q; p)^k}{(2a)^k(q, c/a, acq^{k-1}; q, p)_k} \left[ D_{c,q,p}(f(z)) \right]_{z = aq^k}.
\tag{2.3b}
\]

Example 2.3. Let
\[
f(z) = \frac{(bz, b/z; q, p)_n}{(cz, c/z; q, p)_n}.
\]

Application of Theorem 2.2 in conjunction with (1.11) gives

\[
f_k = \frac{(-1)^k q^{-k(k-1)/4} \theta(q; p)^k}{(2a)^k(q, c/a, acq^{k-1}; q, p)_k} \times \frac{(-1)^k (2b)^k q^{-k(k-1)/4} (q; q, p)_n (c/b, bcq^{n-1}; q, p)_k}{(q; q, p)_n-k \theta(q; p)^k} \frac{(ac, c/a, acq^{k-1}; q, p)_n}{(ac, c/a; q, p)_n} \theta(acq^{k-1}; p) \frac{(aq^{k-1}; q, p)_k q^k}{(q, q, q)_k}
\]

thus yielding Frenkel and Turaev’s 10V9 summation (1.4), in the form

\[
\frac{(ac, c/a, bz, b/z; q, p)_n}{(ab, b/a, c, c/z; q, p)_n} = 10V9(acq^{-1}; a, a/z, c/b, bcq^{n-1}, q^{-n}; q, p).
\]

We now prove an elliptic extension of a theorem of S. Cooper [7]. Interestingly, another elliptic extension of Cooper’s result was independently given by Ismail, Rains and Stanton [12, Proposition 8.1], which however appears to be different from Theorem 2.4 below. The difference is that while in the present paper an elliptic Askey-Wilson operator is considered which shifts the denominator parameter \( c \) by \( q^2 \) in each step, the elliptic Askey-Wilson operator in [12] acts on a different space (namely on theta functions, instead of quotients of theta functions of the same degree) which does not involve \( c \) and its iterated action is defined using certain multipliers with an extra parameter \( v \).

Theorem 2.4. The action of \( D_{c,q,p}^{(n)} \) on a function \( f \in W^n_c \) is given by
\[
D_{c,q,p}^{(n)} f(z) = (-2)^n q^{n(n-1)/2} \frac{(cq^{2-1}z, cq^{2-1}; q, p)_n}{(\theta(q; p))^n} \times \sum_{k=0}^{n} q^{k(k-1)/2} \left[ \frac{n}{k}_{p,q} \frac{z^{2(k-n)}(cq^{2-k-1}z, cq^{2-k-1}; q, p)_n}{(q^{n-2k+1}z^2; q, p)_k(q^{2k-n+1}z^{-2}; q, p)_{n-k}} \right] f(q^{2-k}z),
\tag{2.4}
\]

where
\[
\left[ \frac{n}{k}_{p,q} \right] = \frac{(q^{k+1}; q, p)_n}{(q, q, p)_{n-k}}.
\]

Proof: We prove this by induction. If \( n = 1 \), then (2.4) just reduces to the definition of \( D_{c,q,p}(f(z)) \) in (1.10) . Now say (2.4) holds up to some \( n \). Then if we let \( f^{(n)}(z) := D_{c,q,p}^{(n)}(f(z)), \)
\[
D_{c,q,p}^{(n+1)} f(z) = D_{c,q,p} \frac{f^{(n)}(z)}{\theta(q, z^2; p)}
\]
\[
= 2q^{\frac{1}{2}} \frac{(cq^{2n-1}z, cq^{2n-1}; q, p)_2}{\theta(q, z^2; p)} \left( f^{(n)}(q^{\frac{1}{2}}z) - f^{(n)}(q^{-\frac{1}{2}}z) \right)
\]
\[
= 2q^{\frac{1}{2}} \frac{(cq^{2n-1}z, cq^{2n-1}; q, p)_2}{\theta(q, z^2; p)} \times (-2)^n q^{n(n-1)/2} \frac{(q^{n-1}; q, p)_n}{(\theta(q; p))^n}
\]
\[
\times \left( q^{\frac{1}{2}} (cq^{2n-1}z, cq^{2n-1}; q, p)_{n+1} \right)
\]
By combining Theorem 2.2 and Theorem 2.4, we find that

\[
\begin{align*}
&\sum_{k=0}^{n} q^{(k-1)(n-k)} \left[ \sum_{k=0}^{n} q^{(k-1)(n-k)} \frac{z^{2(k-n)}}{(q^{2k-n+2}; q, p)_{n-1}} f(q^{\frac{n-k}{2}} z) \
&- q^{-n} \theta(q^{\frac{n-k}{2}} z, q^{\frac{n-k}{2}} z; q, p) \sum_{k=0}^{n} q^{(k+1)(n-k)} \frac{z^{2(k-n)}}{(q^{2k-n+2}; q, p)_{n-1}} f(q^{\frac{n-k}{2}} z) \
&\times \left( q^{-n} \theta(q^{\frac{n-k}{2}} z, q^{\frac{n-k}{2}} z; q, p) \sum_{k=0}^{n} q^{(k+1)(n-k)} \frac{z^{2(k-n)}}{(q^{2k-n+2}; q, p)_{n-1}} f(q^{\frac{n-k}{2}} z) \right) \right] \\
&= (2z)^{n+1} q^{\frac{n(n+1)}{2}} \frac{z^{2(n-1)}}{(q^{2n-2}; q, p)_{n+1}} f(q^{\frac{n-1}{2}} z) \\
&\times \left( q^{-n} \theta(q^{\frac{n-k}{2}} z, q^{\frac{n-k}{2}} z; q, p) \sum_{k=0}^{n} q^{(k+1)(n-k)} \frac{z^{2(k-n)}}{(q^{2k-n+2}; q, p)_{n-1}} f(q^{\frac{n-k}{2}} z) \right) \\
&= (2z)^{n+1} q^{\frac{n(n+1)}{4}} \frac{z^{2(n-1)}}{(q^{2n-2}; q, p)_{n+1}} f(q^{\frac{n-1}{2}} z).
\end{align*}
\]

Hence the theorem is proved. Notice that in the last step, we used the addition formula (1.1c) with the substitutions \((x, y, u, v) \mapsto (q^{n-1}, q^{n+1}, q^{n+1}, q^{n+1})\) to simplify the summand.

We are now able to obtain an elliptic extension of Ismail and Stanton’s [14, Theorem 3.4] interpolation formula.

**Theorem 2.5.** If \(f\) is in \(W_n^e\), then

\[
\frac{(a^2 q, q, cz, c/z; q, p)_n}{(ac, c/a, aqz, aqz/z; q, p)_n} f(z) = \sum_{k=0}^{n} q^k \frac{\theta(a^2 q^{2k}; p)}{\theta(a^2; p)} \frac{q^{n-k} a^2, aq/c, ac^{n}, az, a/z; q, p)_k}{(q, a^2q^{n+1}, ac, aq^{n+1}/c, aqz, aqz/z; q, p)_k} f(aq^k). \tag{2.5}
\]

**Proof.** By combining Theorem 2.2 and Theorem 2.4, we find that

\[
f(z) = \sum_{k=0}^{n} q^k \frac{\theta(a^2q^{-k}; p)}{\theta(a^2; p)} \frac{a^2, az, a/z; q, p)_k}{(aq^{-k}, aq^{-k}/c, aq^{-k}/z; q, p)_k} f(aq^{-k}).
\]
Proof. We take
\[ f(z) = \sum_{j=0}^{k} \sum_{j=0}^{n-k} q^{k+j} \theta(cq^{-1}/a, acq^{2k+2j-1}; p) (a z/a; q, p)_{k+j} \]
\[ \times q^{-k} a^{-2k} (aq^{k}, cq^{-k}/a; q, p)_{k+j-1} f(aq^{k}) \]
\[ = \sum_{k=0}^{n} q^{(k-1)k} \theta(acq^{k}, cq^{-k}/a, a z/a; q, p)_{k} f(aq^{k}) \]
\[ \times \prod_{j=0}^{n-k} q^{j} \theta(acq^{2k+2j-1}; p) (aca^{2k+2j-1}/a, acq^{2k+2j-1}; q, p)_{k} f(aq^{k}) \]
\[ = \sum_{k=0}^{n} q^{k(k+1)} \theta(acq^{k}, cq^{-k}/a, a z/a; q, p)_{k} f(aq^{k}) \]
\[ \sum_{j=0}^{n-k} q^{j} \theta(acq^{k}, cq^{-k}/a, a z/a; q, p)_{k} f(aq^{k}) \]
\[ \times f(z) = \frac{(b z/a; q, p)_{n-s}}{(a z/a; q, p)_{n-s}}. \]

More generally, we have the following result.

Corollary 2.7. We have the elliptic Karlsson–Minton type identity
\[ \frac{(a^{2} q; q, p)_{n}}{(aq z, a q/z; q, p)_{n}} \prod_{j=1}^{n} \theta(b z, b z/a; p) \]
\[ = \sum_{k=0}^{n} q^{k(n+1)} \theta(a^{2} q^{2k}; p) (q^{-n}, a^{2}, a z/a; q, p)_{k} \prod_{j=1}^{n} \theta(abq^{k}, b j/a; p) f(z). \]

Proof. We take
\[ f(z) = \frac{\prod_{j=1}^{n} \theta(b z, b z/a; p)}{(a z, c z/a; q, p)_{n}} \]
and apply Theorem 2.5.

Remark 2.8. It should be noted that if in the proof of Corollary 2.7 we instead would have taken
\[ f(z) = \frac{\prod_{j=1}^{t} \theta(b z, b z/a; p)}{(a z, c z/a; q, p)_{t}} \]
for 0 ≤ t ≤ n, we would have just obtained the special case of Corollary 2.7 with b_{j} → cq^{j-1} for t + 1 ≤ n, which is clear carrying out those specializations in (2.9).
We now consider a multivariate version of Theorem 2.5. Let us consider the space of functions
\[ W_{c_1,\ldots,c_m}^{n_1,\ldots,n_m} := \text{Span} \left\{ \frac{g_{k_1,\ldots,k_m}(z_1,\ldots,z_m)}{\prod_{i=1}^m (c_i z_i, c_i/z_i; q, p)_{k_i}} : 0 \leq k_i \leq n_i, \ i = 1,\ldots,m \right\}, \]
where \( g_{k_1,\ldots,k_m}(z_1,\ldots,z_m) \) runs over all functions being holomorphic in \( z_1, z_2, \ldots, z_m \neq 0 \) and symmetric in \( z_i \) and \( 1/z_i \), and
\[ g_{k_1,\ldots,k_m}(z_1,\ldots,p z_i,\ldots,z_m) = \frac{1}{p^{k_i} z_i^{2k_i}} g_{k_1,\ldots,k_m}(z_1,\ldots,z_i,\ldots,z_m), \]
for all \( i = 1,\ldots,m \).

We define a multivariate extension of the elliptic Askey–Wilson operator as follows.
\[ D_{c_1,\ldots,c_m}^{(k+1)} f(z_1,\ldots,z_m) = D_{c_1,\ldots,c_m}^{(k)} f(z_1,\ldots,z_m), \]
and for \( c = (c_1,\ldots,c_m) \), \( k = (k_1,\ldots,k_m) \), and \( z = (z_1,\ldots,z_m) \),
\[ D_{c,\ldots,c}^{(k)} f(z_1,\ldots,z_m) = D_{c_1,\ldots,c_m}^{(k_1)} \cdots D_{c_m,\ldots,c_m}^{(k_m)} f(z_1,\ldots,z_m). \]

**Theorem 2.9.** If \( f(z_1,\ldots,z_m) \) is in \( W_c^{n_1,\ldots,n_m} \), then
\[ f(z_1,\ldots,z_m) = \sum_{k_1,\ldots,k_m = 0}^{n_1,\ldots,n_m} f_{k_1,\ldots,k_m} \prod_{i=1}^m \frac{(a_i z_i/a_i/z_i; q, p)_{k_i}}{(c_i z_i, c_i/z_i; q, p)_{k_i}}, \]
where
\[ f_{k_1,\ldots,k_m} = \prod_{i=1}^m (-1)^{k_i} q^{-\frac{k_i(k_i+1)}{2}} (\theta(q;p))_{k_i} \cdot \left[D_{c,\ldots,c}^{(k)} f(z_1,\ldots,z_m)\right]_{z_i = a_i q_i^{k_i}/2}, \]
where \( k = (k_1,\ldots,k_m) \).

**Proof.** Note that, for each \( j = 1,\ldots,m \),
\[ D_{c_j,\ldots,c_j}^{(k)} \prod_{i=1}^m \frac{(a_i z_i/a_i/z_i; q, p)_{n_i}}{(c_i z_i, c_i/z_i; q, p)_{n_i}} = \frac{(-1)^{2a_j} \theta(c_j/a_j, a_j c_j q^{n_i-1}; q, p)}{\theta(q;p)} \frac{\theta(c_j z_j, c_j z_j; q, p)_{n_j-1}}{\theta(c_j q^2 z_j, c_j q^2 z_j; q, p)_{n_j-1}} \prod_{i \neq j}^{m} \frac{(a_i z_i/a_i/z_i; q, p)_{n_i}}{(c_i z_i, c_i/z_i; q, p)_{n_i}}. \]

Iterating (2.12) gives
\[ \left[D_{c,\ldots,c}^{(k)} f(z_1,\ldots,z_m)\right]_{z_i = a_i q_i^{k_i}/2} = \prod_{i=1}^m (-1)^{k_i} (2a_i)^{k_i} q^{-\frac{k_i(k_i+1)}{2}} (q, q^{-1})_{n_i}(c_i/a_i, a_i c_i q^{n_i-1}; q, p)_{k_i} (q, q)_{n_i-k_i} \theta(q;p)_{k_i} \times \frac{(a_i q^{k_i}/z_i, a_i q^{k_i}/z_i; q, p)_{n_i-k_i}}{(c_i q^{k_i}/z_i, c_i q^{k_i}/z_i; q, p)_{n_i-k_i}} \xi_{n_i, k_i} \times \prod_{i=1}^m (-1)^{k_i} (2a_i)^{k_i} q^{-\frac{k_i(k_i+1)}{2}} (q, c_i/a_i, a_i c_i q^{k_i-1}; q, p)_{k_i} \theta(q;p)_{k_i}. \]

Then the theorem follows by applying \( D_{c,\ldots,c}^{(j)} f \) to both sides of (2.11) and then setting \( z_i = a_i q_i^{j_i}/2 \), for \( i = 1,\ldots,m \) and \( j = (j_1,\ldots,j_m) \).

Now we provide a multivariate extension of Theorem 2.4.
Theorem 2.10. For \( n = (n_1, \ldots, n_m), c = (c_1, \ldots, c_m), \)
\[
D_{c,q,p}^{(m)} f(z_1, \ldots, z_m) = \prod_{i=1}^{m} \left[ (-2z_i)^{n_i} q^{\frac{m(n_i+1)}{2}} \frac{(c_i q^{\frac{n_i}{2}} - 1 z_i, c_i q^{\frac{n_i}{2}} - 1 z_i; q, p)_{n_i+1}}{(\theta(q; p))^{n_i}} \right] 
\times \sum_{k_m=0}^{n_m} \cdots \sum_{k_1=0}^{n_1} \prod_{i=1}^{m} \left( q^{k_i(n_i-k_i)} \left[ \prod_{p,q} \frac{z_i^{2(k_i-n_i)}(c_i q^{\frac{n_i}{2}} - k_i z_i, c_i q^{\frac{n_i}{2}} + k_i z_i; q, p)_{n_i-1}}{(q^{n_i-2k_i+1} z_i^{2}, q, p)_{k_i}(q^{2k_i-n_i+1} z_i^{2} z_i; q, p)_{n_i-k_i}} \times f(q^{\frac{n_i}{2}} - k_i z_i, \ldots, q^{\frac{n_i}{2}} - k_m z_m) \right] \right). 
\tag{2.13}
\]

Proof. The theorem follows by applying Theorem 2.4 successively for each \( i = 1, \ldots, m. \) \qed

We combine Theorems 2.9 and 2.10 to obtain the following multivariable elliptic interpolation formula.

Theorem 2.11. For \( f(z_1, \ldots, z_m) \) in \( W^n_{c,q,p}, \) we have
\[
\prod_{i=1}^{m} \frac{(a_i^2 q, q, c_i z_i, c_i z_i; q, p)_{n_i}}{(a_i q z_i, a_i q z_i; q, p)_{n_i}} f(z_1, \ldots, z_m) = \sum_{k_1, \ldots, k_m=0}^{n_1, \ldots, n_m} \prod_{i=1}^{m} q^{k_i} \frac{\theta(a_i^2 q^{2k_i}; p)}{\theta(a_i^2; p)} \frac{(q^{-n_i}, a_i^2, a_i q/c_i, a_i q^{n_i}, a_i z_i, a_i z_i; q, p)_{k_i}}{(a_i q^{k_i}, a_i q^{k_i+1}, a_i q^{a_i q^{n_i-1}/c_i}, a_i q^{z_i}, a_i q^{z_i}; q, p)_{k_i}} 
\times f(a_i q^{k_i}, \ldots, a_m q^{k_m}). \tag{2.14}
\]

This theorem extends a result given by Ismail and Stanton [14, Theorem 3.10], which can be obtained by taking \( m = 2, p \to 0, c_1 = c_2 = 0 \) and \( n_1 = n_2 = n. \)

Corollary 2.12. We have the following multivariable elliptic Karlsson–Minton type identity
\[
\prod_{i=1}^{m} \left( \frac{(a_i^2 q, q, c_i z_i, c_i z_i; q, p)_{n_i}}{(a_i q z_i, a_i q z_i; q, p)_{n_i}} \prod_{j=1}^{n_i} (b_{ij} z_i, b_{ij} z_i; q, p)_{v_{ij}} \right) 
\times \prod_{1 \leq i < j \leq m} q^{w_{ij}} \prod_{i=1}^{n_i} q^{-w_{ij} + w_{ij}} \theta(z_i z_j, z_i z_j; p)_{w_{ij}} \frac{\sum_{r=1}^{r_{ij}} \prod_{j=1}^{r_{ij}} (a_{ij} q^{r_{ij} w_{ij}}, a_i q/b_{ij}; q, p)_{k_{ij}}}{\prod_{j=1}^{r_{ij}} (a_{ij} q^{r_{ij} w_{ij}}, a_j q/b_{ij}; q, p)_{k_{ij}}} 
\times \prod_{1 \leq i < j \leq m} q^{w_{ij} + k} \theta(a_i q^{k}, a_i q^{k-1} a_j; q, p)_{w_{ij}}, \tag{2.15}
\]
where
\[
n_i = \sum_{j=1}^{s_i} v_{ij} + \sum_{j=1}^{i-1} w_{ij} + \sum_{j=i+1}^{m} w_{ij} + 2 \sum_{i=1}^{r_{ij}} \left( \sum_{j=1}^{i-1} u_{ij} + \sum_{j=i+1}^{m} u_{ij} \right),
\]
for \( i = 1, \ldots, m. \)

Proof. We apply Theorem 2.11 to
\[
f(z_1, \ldots, z_m) = \prod_{i=1}^{m} \prod_{j=1}^{n_i} (b_{ij} z_i, b_{ij} z_i; q, p)_{v_{ij}} \prod_{1 \leq i < j \leq m} \frac{z_i^{w_{ij}} \theta(z_i z_j, z_i z_j; p)_{w_{ij}}}{(c_i z_i, c_i z_i; q, p)_{n_i}}.
\]
We have the following multivariable elliptic Karlsson–Minton type identity.

\[
\prod_{1 \leq i < j \leq m} \prod_{l_{ij}=1}^{r_{ij}} \left( \alpha_{l_{ij}} z_i z_j, \alpha_{l_{ij}} z_i/z_j, \alpha_{l_{ij}} z_j/z_i, \alpha_{l_{ij}} / z_i z_j; q, p \right) u_{ij},
\]

where

\[
n_i = s_i + \sum_{j=1}^{i-1} w_{ij} + \sum_{j=i+1}^{m} w_{ij} + 2 \sum_{j=1}^{i-1} \sum_{l_{ij}=1}^{r_{ij}} u_{ij} + 2 \sum_{j=i+1}^{m} \sum_{l_{ij}=1}^{r_{ij}} u_{ij},
\]

for \( i = 1, \ldots, m \).

Corollary 2.12 extends a result by Ismail and Stanton (see [14, Corollary 3.11]), corresponding to a special case of its \( m = 2 \) instance.

More generally, \( f(z) \) could involve symmetrized products of \( 2^k \) factors of the form \((\lambda_{z_{i_1}^\pm z_{i_2}^\pm \cdots z_{i_k}^\pm}; q, p)_y \) (the notation \( z_{i_1}^\pm \) means that the respective variable could appear as \( z_i \) or \( z_i^{-1} \), where all possible combinations appear), where \( \{i_1, \ldots, i_k\} \) is any subset of \( \{1, \ldots, n\} \). (In the corollary, we only considered factors for \( k = 1, 2 \).)

Corollary 2.12 can be easily seen to be equivalent to its \( u_{ij} = 1 \) and \( v_{ij} = 1 \) case, for all \( i, j \), in which case the respective factorials reduce to simple theta functions. To recover the general case from this special case one can suitably increase \( r_{ij} \) and \( s_1 \), \ldots, \( s_m \), and choose the parameters partially in geometric progression to obtain shifted factorials. In particular, we can replace \( r_{ij} \) by \( u_1 + \cdots + u_{r_{ij}} \) and relabel \( \alpha_{u_1+\cdots+u_{r_{ij}}-1+h} \rightarrow \alpha_{u_1} q^{h-1} \), for all \( 1 \leq l_{ij} \leq r_{ij}, 1 \leq h \leq u_{ij}, \) etc. (One could even add extra bases, in addition to \( q \). This feature is typical for series of Karlsson–Minton type.)

For convenience, we restate the corollary in this equivalent form.

**Corollary 2.13.** We have the following multivariable elliptic Karlsson–Minton type identity.

\[
\prod_{i=1}^{m} \left( \frac{(a_i^2 q, q; q, p)_{s_i}}{(a_i q z_i, a_i q/z_i; q, p)_{s_i}} \prod_{j=1}^{\sum_{i=1}^{m} r_{ij}} \theta(b_{ij} z_i, b_{ij}/z_i; p) \right) \\
\times \prod_{1 \leq i < j \leq m} \theta\left( z_i z_j, z_i/z_j; q, p \right) \prod_{l_{ij}=1}^{r_{ij}} \theta\left( \alpha_{l_{ij}} z_i z_j, \alpha_{l_{ij}} z_i/z_j, \alpha_{l_{ij}} z_j/z_i, \alpha_{l_{ij}} / z_i z_j; q, p \right) \\
= \sum_{k_1, \ldots, k_m=0}^{s_1, \ldots, s_m} \prod_{i=1}^{m} \left( q^{k_i} \frac{\theta(a_i^2 q^{2k_i}; p)}{\theta(a_i^2; p)} \left( \frac{(q^{-s_i} a_i^2 q^{s_i+1}; q, p)_{k_i}}{(q a_i^2 q^{s_i+1}; q, p)_{k_i}} \prod_{j=1}^{s_i} \theta(a_i b_{ij} q^{k_i}, a_i q^{k_i}; b_{ij}; p) \right) \right) \\
\times \prod_{1 \leq i < j \leq m} \left( q^{-w_{ij} k_i} \theta(a_i b_{ij} q^{k_i}, a_i q^{k_i}; b_{ij}; p) \right)^{w_{ij}}, \tag{2.16}
\]

where

\[
n_i = s_i + \sum_{j=1}^{i-1} w_{ij} + \sum_{j=i+1}^{m} w_{ij} + 2 \sum_{j=1}^{i-1} r_{ij} + 2 \sum_{j=i+1}^{m} r_{ij},
\]

for \( i = 1, \ldots, m \).

**2.1. A quadratic elliptic Taylor expansion theorem.** In [13] Ismail and Stanton also considered the basis \( \{\phi_k(z), 0 \leq k \leq n\} \) where \( \phi_k(z) = (q^{1/4} z, q^{1/4} z; q^{1/2}; p)_k \). The set

\[
\left\{ (\frac{(q^{1/4} z, q^{1/4} z; q^{1/2}; p)_k}{(q^2 z, q z; q)_k}, 0 \leq k \leq n \right\}
\]

apparently forms a basis for \( W^\alpha_n \). We now provide a Taylor expansion theorem with respect to this basis.
Theorem 2.14. If \( f \) is in \( W_c^\infty \), then
\[
f(z) = \sum_{k=0}^{n} f_k \frac{(q^{1/4}z, q^{1/4}/z; q^{1/2}, p)_k}{(cz, c/z; q, p)_k},
\]
(2.17a)
where
\[
f_k = \frac{(-1)^k q^{-k/4} \theta(q; p)^k}{2^k (q; q, p)_k (cq^{\frac{k}{2}}; q^{1/2}, p)_k} \left[ \mathcal{D}^{(k)}_{c, q, p} f(z) \right]_{z=q^{1/4}}.
\]
(2.17b)

Proof. Note that
\[
\mathcal{D}^{(k)}_{c, q, p} \left( \frac{(q^{1/4}z, q^{1/4}/z; q^{1/2}, p)_n}{(cz, c/z; q, p)_n} \right)
= \frac{(-2)^k q^{k/4} (cq^{\frac{k}{2}-\frac{3}{2}}; q^{1/2}, p)_k (q; q, p)_n (q^{1/4}z, q^{1/4}/z; q^{1/2}, p)_{n-k}}{(q; q, p)_{n-k} \theta(q; p)^k (cq^{\frac{k}{2}}z, cq^{\frac{k}{2}}/z; q, p)_{n-k}},
\]
(2.18)
which can be proved by induction. The theorem then follows by applying \( \mathcal{D}^{(j)}_{c, q, p} \) to both sides of (2.17a) and then setting \( z = q^{1/4} \).
\[\square\]

In the following, we recover an elliptic quadratic summation by Warnaar [24, Corollary 4.4; \( b = a \)], which was originally proved by using inverse relations. Its \( p = 0 \) case has been given earlier by Gessel and Stanton [10, Equation (1.4)].

Corollary 2.15. We have the following summation
\[
\left( \frac{az, a/z; q, p)_n (cq^{-1/4}, q^{1/2}, p)_2n}{(cz, c/z; q, p)_n (aq^{-1/4}, q^{1/2}, p)_2n} \right)
= \sum_{k=0}^{n} q^\frac{k}{2} \frac{\theta(cq^{\frac{k}{2}-\frac{3}{2}}; p) (c/a, acq^{n-1}, q^{-n}; q, p)_k}{\theta(cq^{-\frac{3}{4}}, p) (cz, c/z, q; q, p)_{k} (aq^{-\frac{1}{4}}, cq^{n-\frac{1}{4}}, q^{n-1}/a; q^{1/2}, p)_{k}},
\]
(2.19)

Proof. We apply Theorem 2.14 to
\[
f(z) = \frac{(az, a/z; q, p)_n}{(cz, c/z; q, p)_n}.
\]
\[\square\]

Remark 2.16. If we expand
\[
\frac{(q^{\frac{1}{4}}z, q^{\frac{1}{4}}/z; q^{\frac{1}{4}}, p)_n}{(cz, c/z; q, p)_n}
\]
in terms of
\[
\frac{(az, a/z; q, p)_n}{(cz, c/z; q, p)_n}
\]
using Theorem 2.2, we obtain
\[
\left( \frac{az, a/z; q^{1/4}, p)_n (ac, c/a; q, p)_n}{(aq^{\frac{1}{4}}, q^{\frac{1}{4}}/a; q^{\frac{1}{4}}, p)_n (cz, c/z; q, p)_n} \right)
= \sum_{k=0}^{n} q^k \frac{\theta(acq^{2k-1}, p) (q^{-n}, acq^{-1}, a, a/z, cq^{\frac{n}{2}-\frac{1}{2}}, cq^{\frac{n}{2}-\frac{1}{2}}; q, p)_n}{\theta(acq^{-1}; p) (q, acq^n, cz, c/z, aq^{\frac{n}{2}-\frac{1}{2}}, aq^{\frac{n}{2}-\frac{1}{2}}; q, p)_n}.
\]
(2.20)

At first glance this appears to be a true quadratic summation formula. However, the right-hand side of (2.20) is
\[
10 V_0(acq^{-1}; a, a/z, cq^{\frac{n}{2}-\frac{1}{2}}, cq^{\frac{n}{2}-\frac{1}{2}}, q^{-n}; q, p),
\]
which, by Frenkel and Turaev’s summation formula (1.4), can be reduced to
\[
\frac{(ac, c/a, q^{\frac{n}{2}-\frac{1}{2}}, z, q^{\frac{n}{2}-\frac{1}{2}}/z; q, p)_n}{(cz, c/z, aq^{\frac{n}{2}-\frac{1}{2}}, q^{\frac{n}{2}-\frac{1}{2}}/a; q, p)_n}.
\]
Elementary manipulations can now be applied to transform this expression to the left-hand side of (2.20).
3. Expansions involving cubic theta functions

The cubic theta function $\gamma(z, a; p)$ with two independent variables $z$ and $a$ in addition to the nome $p$ was considered by S. Bhargava [3]. (For a thorough treatment of the theory of cubic theta functions in analogy to the theory of the classical Jacobi theta functions, see [22].) It is defined by

$$\gamma(z, a; p) = \sum_{k=-\infty}^{\infty} \sum_{l=-\infty}^{\infty} p^{k^2 + kl + l^2} a^{k+l} z^{k-l}. \quad (3.1)$$

This function, up to a normalization factor $(p^2; p^2)_\infty^2$ (independent from $a$ and $z$), is almost equal to the following product of two modified Jacobi theta functions

$$(p^2; p^2)_\infty^2 \theta(-pa z; p^2) \theta(-pa/z; p^2) = \sum_{k=-\infty}^{\infty} \sum_{l=-\infty}^{\infty} p^{k^2 + l^2} a^{k+l} z^{k-l}, \quad (3.2)$$

which differs by the factor $p^{kl}$ to the summand of the double series in (3.1). Because of this additional factor $p^{kl}$, the cubic theta function does not factorize into a product of two modified Jacobi theta functions of such a simple form. In principle though, the cubic theta function could be factorized into two modified Jacobi theta functions, but their arguments would have nontrivial expansions in $a$, $z$, and $p$.

From (3.1), by replacing $(k, l)$ by $(l, k)$, or $(k, l)$ by $(-l, -k)$, respectively, we immediately deduce the symmetries [3]

$$\gamma(1/z, a; p) = \gamma(z, a; p), \quad (3.3a)$$

and

$$\gamma(z, 1/a; p) = \gamma(z, a; p). \quad (3.3b)$$

Further, from (3.1), by replacing $(k, l)$ by $(k + \lambda + \mu, l + \lambda)$, it is easy to verify that for all integers $\lambda$ and $\mu$ the following functional equation holds [3]:

$$\gamma(z, a; p) = p^{3\lambda^2 + 3\lambda \mu + \mu^2} a^{2\lambda + \mu} z^{\mu} \gamma(p^{\mu/2} z, p^{3(2\lambda + \mu)/2} a; p). \quad (3.4)$$

In particular, we have the quasi periodicities

$$\gamma(pz, a; p) = \frac{1}{pz^2} \gamma(z, a; p), \quad (3.5a)$$

and

$$\gamma(z, p^3 a; p) = \frac{1}{p^3 a^2} \gamma(z, a; p). \quad (3.5b)$$

Further, by separating the terms in the expansion of $p$ according to whether the exponents of $p$ are divisible by $3$ or not, one can show [3]

$$\gamma(z, a; p) = \gamma(\sqrt{a} z^3, \sqrt{a}^3/z^3; p^3) + pa z^{-1} \gamma(\sqrt{a} z^3, p^3 \sqrt{a^3/z^3}; p^3), \quad (3.6)$$

while separating the terms in the expansion of $z$ according to whether the exponents of $z$ are even or odd, one has [4]

$$\gamma(z, a; p) = (p^6; p^6)_\infty (p^2; p^2)_\infty [\theta(-p^3 a; p^6) \theta(-p z^2; p^3) + pa z \theta(-p^6 a^2; p^6) \theta(-p^2 z^2; p^3)]. \quad (3.7)$$

Cooper and Toh [8] proved the following addition formulae which will be useful in our computations.

**Lemma 3.1.** [8, Corollary 4.5] The following identities connecting modified Jacobi theta functions and cubic theta functions hold:

$$\gamma(z_1, \alpha; p) \theta(z_3/z_2, z_2 z_3; p) - \gamma(z_2, \alpha; p) \theta(z_3/z_1, z_1 z_3; p) = \frac{z_3}{z_1} \gamma(z_3, \alpha; p) \theta(z_1/z_2, z_1 z_2; p), \quad (3.8a)$$

and

$$\gamma(z, \alpha_1; p^\frac{1}{2}) \theta(\alpha_1 z_2, \alpha_2 \alpha_3; p) - \gamma(z, \alpha_2; p^\frac{1}{2}) \theta(\alpha_3/\alpha_1, \alpha_1 \alpha_3; p) = \frac{\alpha_3}{\alpha_1} \gamma(z, \alpha_3; p^\frac{1}{2}) \theta(\alpha_1/\alpha_2, \alpha_1 \alpha_2; p). \quad (3.8b)$$
These two identities were proved in [8] by specializing a \((3 \times 3)\) determinant evaluation involving cubic theta functions. They can also be proved directly, expanding the cubic theta functions and modified Jacobi theta functions as infinite series, together with clever series rearrangement.

Now we introduce the first cubic theta analogue of the \(q\)-shifted factorial by

\[
(az, a/z; q, p)_n := \prod_{j=0}^{n-1} \gamma(zq^{\frac{j}{n}}; aq^{\frac{n-1}{n}}; p). \tag{3.9}
\]

From (3.5a) it is easy to see that the cubic shifted factorial satisfies

\[
(az, a/z; q, p)_n = \frac{1}{p^{n/2}}(az, a/z; q, p)_n. \tag{3.10}
\]

Together with (3.3a), this implies that the quotient

\[
\frac{(az, a/z; q, p)_n}{(cz, c/z; q, p)_n}
\]

is in the space \(W^n\). Hence we can apply Theorem 2.2 to it, by which we obtain the first cubic theta extension of Jackson’s \(\phi_7\) summation (1.5).

**Corollary 3.2.** We have the following summation.

\[
(bc, c/b; q, p)_n \frac{(az, a/z; q, p)_n}{(cz, c/z; q, p)_n} = \sum_{k=0}^{n} q^{nk} \left( \frac{a}{b} \right)^k \frac{\theta(bcq^{2k-1}; p)}{\theta(bcq^{-1}; p)} \frac{(q^{-n}, bcq^{-1}, bz, b/z; q, p)_k}{(q, bcq^n, cz, c/z; q, p)_k} \times \langle acq^{n-1}, aq^{-k}/c; q, p \rangle_k \frac{\langle abq^k, aq^{-k}/b; q, p \rangle_k}{\langle abq^n, aq^{-k}/b; q, p \rangle_k}. \tag{3.12}
\]

**Proof.** By using (3.8a) in Lemma 3.1, we can prove by induction that

\[
D^{(k)}_{c/q,p} \left( \frac{(az, a/z; q, p)_n}{(cz, c/z; q, p)_n} \right)
= (2c)^k q^{\frac{k}{2}(k-1)} \frac{\theta(bcq^{k-1}; p)}{\theta(bcq^{-1}; p)} \prod_{j=0}^{k-1} \gamma(qzq^{\frac{j}{n}}; aq^{\frac{n-1}{n}}; p) \frac{(aq^{\frac{k}{2}} z, aq^{\frac{k}{2}} z; q, p)_n}{(cq^{\frac{k}{2}} z, cq^{\frac{k}{2}} z; q, p)_n} \frac{\langle acq^{n-1}, aq^{-k}/c; q, p \rangle_k}{\langle cz, c/z; q, p \rangle_n}.
\]

Then the corollary follows from Theorem 2.2 while expanding in the basis

\[
f(z) = \frac{(bz, b/z; q, p)_n}{(cz, c/z; q, p)_n}. \tag*{□}
\]

To recover Jackson’s \(\phi_7\) summation from Corollary 3.2, substitute

\[
a \mapsto -\frac{a}{p(1 + a^2q^{n-1})}
\]

in (3.12), multiply both sides of the identity by \((1 + a^2q^{n-1})^n\) and let \(p \to 0\). When \(p \to 0\), the usual theta shifted factorials clearly reduce to the \(q\)-shifted factorials. That is, the quotient on the left-hand side reduces to

\[
\lim_{p \to 0} \frac{(bc, c/b; q, p)_n}{(cz, c/z; q, p)_n} = \frac{(bc, c/b; q)_n}{(cz, c/z; q)_n}.
\]

What happens with the cubic theta shifted factorial? We have

\[
\lim_{p \to 0} (1 + a^2q^{n-1})^n \frac{-az}{p(1 + a^2q^{n-1})} \frac{-a}{p(1 + a^2q^{n-1})z} ; p \bigg) \bigg|_n
\]
We have the following Karlsson–Minton type identity involving cubic theta functions.

We take similar limits on the right-hand side of (3.12).

We apply Theorem 2.5 to

Now it is easy to see that for three terms correspond to the cases \((k,l) = (0,0), (1,0), (0,1)\). The last expression thus reduces to

\[
(1 + a^2 q^{-n})^n \prod_{j=0}^{n-1} \left( 1 - \frac{a q^{\frac{j}{n}} - 1}{1 + a^2 q^{\frac{j}{n}} - 1} \right) (z q^{\frac{j}{n}} + z^{-1} q^{\frac{n-1-j}{n}})
\]

We take similar limits on the right-hand side of (3.12).

Our next result involves elliptic interpolation of cubic theta shifted factorials.

**Corollary 3.3.** We have the following Karlsson–Minton type identity involving cubic theta functions.

\[
\frac{(a^2 q, q; q)_{n}}{(aq, aq/z; q)_{n}} \frac{(bz, b/z; q, p)_{n}}{(b z, b/z; q, p)_{n}} = \sum_{k=0}^{n} q^{k(n+1)} \frac{\theta(a^2 q^k; p)}{\theta(a^2; p)} \frac{(q^{-n}, a^2, a z; q, p)_{k}}{(q, a^2 q^{n+1}, a z, a q/z; q, p)_{k}} (a b q^k, b q^{-k}/a; q, p)_{n}.
\]  

**Proof.** We apply Theorem 2.5 to

\[ f(z) = \frac{(b z, b/z; q, p)_{n}}{(cz, c/z; q, p)_{n}}. \]

More generally, we have the following Karlsson–Minton type identity involving cubic theta functions.

**Corollary 3.4.** We have

\[
\frac{(a^2 q, q; q)_{n}}{(aq, aq/z; q)_{n}} \prod_{i=1}^{s} \theta(b_i z, b_i/z; p) \prod_{j=1}^{n-s} \gamma(z, d_j; p) = \sum_{k=0}^{n} q^{k(n+1)} \frac{\theta(a^2 q^k; p)}{\theta(a^2; p)} \frac{(q^{-n}, a^2, a z; q, p)_{k}}{(q, a^2 q^{n+1}, a z, a q/z; q, p)_{k}} \prod_{i=1}^{s} \theta(a b q^k, b q^{-k}/a; p) \prod_{j=1}^{n-s} \gamma(a q^k, d_j; p).
\]  

**Proof.** We apply Theorem 2.5 to

\[ f(z) = \prod_{i=1}^{s} \theta(b_i z, b_i/z; p) \prod_{j=1}^{n-s} \gamma(z, d_j; p). \]

Our next result concerns a cubic theta extension of Gessel and Stanton’s quadratic summation [10, Equation (1.4)].

**Corollary 3.5.** We have the following summation

\[
\frac{(a z, a/z; q, p)_{n}}{(cz, c/z; q, p)_{n}} (c q^{-\frac{1}{2}}, c q^{\frac{1}{2}}; q, p)_{n} = \sum_{k=0}^{n} c_k q^{k(k-2)+nk} \frac{\theta(c q^{k-\frac{1}{2}}; p)}{\theta(q^{\frac{1}{2}}; p)} \frac{(q^{-n}, q, p)_{k}}{(q, q, p)_{k}} \frac{(c q^{\frac{1}{2}} z, q^{\frac{1}{2}}/z; q^{\frac{1}{2}}, p)_{k}}{(c q^{\frac{1}{2}} z, q^{\frac{1}{2}}; q^{\frac{1}{2}}, p)_{k}} \frac{(c z, c/z; q, p)_{n}}{(c z, c/z; q, p)_{n}}
\]
\[ \times (aq^{n-1}, aq^{1-k}/c; q, p)_k (aq^k, aq^{k-1}; q, p)_{n-k}. \]  

(3.15)

**Proof.** We apply Theorem 2.14 to

\[
 f(z) = \frac{(az, a/z; q, p)_n}{(cz, c/z; q, p)_n}. 
\]

Similarly to the way we recovered Jackson’s \( s_{07} \) summation from Corollary 3.2, Gessel and Stanton’s quadratic summation can be readily obtained by substituting \( a \mapsto -p^{-1}a/(1 + a^2q^{n-1}) \) in (3.15), multiplying both sides by \((1 + a^2q^{n-1})^n \) and taking the limit \( p \to 0 \).

Next, we define the second cubic theta shifted factorial, with base \( p^{1/3} \):

\[
 (\langle az, a/z; q, p^{1/3} \rangle)_n := \prod_{j=0}^{n-1} \gamma(aq^{n-1+j}, zq^{3n}+j; p^{1/3}).
\]

(3.16)

Recalling Equations (3.5a) and (3.5b) (which we reformulate after interchanging \( a \) and \( z \)),

\[
 \gamma(a, z; p) = \gamma(a, 1/z; p),
\]

\[
 \gamma(a, z; p) = p^{3z^2}\gamma(a, p^3z; p),
\]

we see that

\[
 (\langle apz, a/pz; q, p^{1/3} \rangle)_n = \frac{1}{p^{n^2/2}}(\langle az, a/z; q, p^{1/3} \rangle)_n.
\]

This implies that the quotient

\[
 \frac{\langle \langle az, a/z; q, p^{1/3} \rangle \rangle_n}{(cz, c/z; q, p)_n}
\]

is also in the space \( W^\theta_\gamma \). Thus, Theorem 2.2 can be applied to it, by which we obtain the second cubic theta extension of Jackson’s \( s_{07} \) summation (1.5).

**Corollary 3.6.** We have the following summation:

\[
 \frac{\langle \langle bz, b/z; q, p^{1/3} \rangle \rangle_n (ac, c/a; q, p)_n}{(cz, c/z; q, p)_n} = \sum_{k=0}^{n} q^{nk} \left( \frac{c}{a} \right)^k \frac{\theta(acq^{k-1}; p)}{\theta(acq^{k-1}; p)} \frac{(q, acq^{n}; c, c/a; q, p)_k}{(q, aq^n, c, c/a; q, p)_k}
\]

\[
 \times \langle \langle bq^{n-1}, bq^{1-k}/c; q, p^{1/3} \rangle \rangle_k \langle \langle abq^{k}, b/a; q, p^{1/3} \rangle \rangle_{n-k}.
\]

(3.17)

**Proof.** Note that by using (3.8b) in Lemma 3.1, we can show by induction that

\[
 D_{c, q, p}^{(k)} \left( \frac{\langle \langle bz, b/z; q, p^{1/3} \rangle \rangle_n}{(cz, c/z; q, p)_n} \right)
\]

\[
 = (2c)^k q^{\frac{k}{4}(k-1)} \frac{(q^n; q^{-1}; p)_k}{\theta(q; p)^k} \prod_{j=0}^{k-1} \gamma(bq^{n-1-j}, cq^{n+1+j}; p^{1/3}) \frac{\langle \langle bq^{\frac{k}{2}}z, bq^{\frac{k}{2}}/z; q, p^{1/3} \rangle \rangle_n-k}{(cq^{2k}z, cq^{2k}/z; q, p)_{n-k}}
\]

\[
 = (2c)^k q^{\frac{k}{4}(k-1)} \frac{(q^n; q^{-1}; p)_k}{\theta(q; p)^k} \frac{\langle \langle bq^{n-1}, bq^{1-k}/c; q, p^{1/3} \rangle \rangle_k}{(cq^{2k}z, cq^{2k}/z; q, p)_{n-k}} \frac{\langle \langle bq^{\frac{k}{2}}z, bq^{\frac{k}{2}}/z; q, p^{1/3} \rangle \rangle_{n-k}}{(cq^{2k}z, cq^{2k}/z; q, p)_{n-k}}.
\]

Using this, we apply Theorem 2.2 to

\[
 f(z) = \frac{\langle \langle bz, b/z; q, p^{1/3} \rangle \rangle_n}{(cz, c/z; q, p)_n}.
\]

To recover Jackson’s \( s_{07} \) summation from Corollary 3.6, substitute

\[
b \mapsto \frac{-b}{p^{1/3}(1 + b^2q^{n-1})}
\]
in (3.17), multiply both sides of the identity by \((1 + b^2 q^{n-1})^n\) and let \(p \to 0\). When \(p \to 0\), the usual theta shifted factorials reduce to the \(q\)-shifted factorials and the cubic theta shifted factorial on the left-hand side of (3.17) becomes

\[
\lim_{p \to 0} \left(1 + b^2 q^{n-1}\right)^n \left\langle -\frac{b}{p^2 (1 + b^2 q^{n-1})}, -\frac{b}{p^2 (1 + b^2 q^{n-1})} z^{-\frac{1}{2}} : p^\frac{1}{2} \right\rangle_n
\]

\[
= \left(1 + b^2 q^{n-1}\right)^n \lim_{p \to 0} \prod_{j=0}^{n-1} \gamma \left( -\frac{b q^n}{p^2 (1 + b^2 q^{n-1})}, z q^{\frac{n}{2} + j} : p^\frac{1}{2} \right)
\]

\[
= \left(1 + b^2 q^{n-1}\right)^n \prod_{j=0}^{n-1} \sum_{k=-\infty}^{\infty} \sum_{l=-\infty}^{\infty} (-1)^{k-l} p^\frac{1}{2} (k^2 + kl + l^2 + k + l) \left( z q^{\frac{n}{2} + j} \right)^{k+l} \left( \frac{b q^n}{1 + b^2 q^{n-1}} \right)^{k-l}
\]

Now it is easy to see that for \(p \to 0\) only three terms in the various double infinite series survive. These correspond to the cases \((k, l) = (0, 0), (1, 0), (0, -1)\). The last expression thus reduces to

\[
\left(1 + b^2 q^{n-1}\right)^n \prod_{j=0}^{n-1} \left(1 - \frac{b q^n}{1 + b^2 q^{n-1}} \left( z q^{\frac{n}{2} + j} + z^{-1} q^{\frac{n}{2} - j} \right) \right)
\]

\[
= \prod_{j=0}^{n-1} \left(1 + b^2 q^{n-1} - b q^n \left( z q^{\frac{n}{2} + j} + z^{-1} q^{\frac{n}{2} - j} \right) \right)
\]

\[
= \prod_{j=0}^{n-1} (1 - b z q^j) (1 - b q^{n-1-j} / z) = (b z, b / z, q)_n.
\]

We take similar limits on the right-hand side of Equation (3.17).

Our final result concerns another cubic theta extension of Gessel and Stanton’s quadratic summation [10, Equation (1.4)].

**Corollary 3.7.** We have the following summation

\[
\frac{\langle\langle az, a/z; q, p^\frac{1}{2} \rangle\rangle_n}{(cz, c/z; q, p)_n} (cq^{-\frac{1}{2}}, cq^\frac{1}{2}; q, p)_n
\]

\[
= \sum_{k=0}^{n} c z q^{\frac{k(k-2)}{2} + nk} \theta(cq^{\frac{2k-2}{2}} : p) (q^{-n}; q, p)_k (cq^{-\frac{1}{2}}, cq^\frac{1}{2}; q, p)_k (q^{\frac{1}{2}} z, q^\frac{1}{2} / z; q^\frac{1}{2}, p)_k
\]

\[
\times \langle\langle ac q^{n-1-1/k}/c; q, p^\frac{1}{2} \rangle\rangle_k \langle\langle a q^{n-1-1/k}, a q^{1-1/k}; q, p^\frac{1}{2} \rangle\rangle_n \langle\langle a q^{1-1/k}, a q^{1-1/k}; q, p^\frac{1}{2} \rangle\rangle_n^{-k}.
\]

**Proof.** We apply Theorem 2.14 to

\[
f(z) = \frac{\langle\langle az, a/z; q, p^\frac{1}{2} \rangle\rangle_n}{(cz, c/z; q, p)_n}.
\]
