Upper semicontinuity of pullback attractors for a nonautonomous damped wave equation

Yonghai Wang1,2*, Minhui Hu1 and Yuming Qin1,2

Abstract
In this paper, we study the local uniformly upper semicontinuity of pullback attractors for a strongly damped wave equation. In particular, under some proper assumptions, we prove that the pullback attractor \( \{A_\varepsilon(t)\}_{t \in \mathbb{R}} \) of Eq. (1.1) with \( \varepsilon \in [0, 1] \) satisfies

\[
\lim_{\varepsilon \to \varepsilon_0} \sup_{t \in [a, b]} \text{dist}_{X \times \mathbb{L}_2} (A_\varepsilon(t), A_{\varepsilon_0}(t)) = 0 \quad \text{for any} \ [a, b] \subset \mathbb{R} \text{ and } \varepsilon_0 \in [0, 1].
\]

Keywords: Pullback attractor; Upper semicontinuity; Wave equation

1 Introduction
The theory of pullback (or random) attractors is a useful tool to study the long-time behavior of nonautonomous (or random) dynamical systems (see [1, 3, 7] and references therein), in which the trajectory can be unbounded as “time” goes to infinity, and thus classical theory of global (or uniform) attractors is not applicable. A pullback attractor is a parameterized family \( \{A_\varepsilon(t)\}_{t \in \mathbb{R}} \) of nonempty compact sets of the state space, which attracts bounded deterministic sets starting from earlier time. In recent years the upper semicontinuity of pullback attractors for dynamical systems with different kind of perturbations has also been widely studied (see, e.g., [2, 6, 10, 13, 14, 19, 21, 23, 24]). Simply speaking, if \( \{A_\varepsilon(t)\}_{t \in \mathbb{R}} \) is the pullback attractor generated by the perturbed dynamical systems and \( \{A_0(t)\}_{t \in \mathbb{R}} \) is the pullback attractor for the unperturbed one, then we say that \( \{A_\varepsilon(t)\}_{t \in \mathbb{R}} \) and \( \{A_0(t)\}_{t \in \mathbb{R}} \) are upper semicontinuous in a metric space \( (X, d) \) if

\[
\lim_{\varepsilon \to 0} \text{dist}_X (A_\varepsilon(t), A_0(t)) = 0, \quad \forall t \in \mathbb{R},
\]

where, \( \text{dist}_X (\cdot, \cdot) \) denotes the Hausdorff semidistance \( \text{dist}_X (A, B) = \sup_{a \in A} \inf_{b \in B} d(a, b) \).
In this paper, we consider the upper semicontinuity of pullback attractors for the following strongly damped wave equation:

\[
\begin{align*}
\partial_t^2 u + \partial_t u - \varepsilon \Delta \partial_t u - \Delta u + f(u) &= g(x, t) \quad \text{in } \Omega \times [r, \infty), \\
(u(r), \partial_t u(r)) &= (u_r, u'_r), \\
|u(x, t)|_{\partial \Omega \times [r, \infty)} &= 0,
\end{align*}
\] (1.1)

where \( \Omega \subset \mathbb{R}^3 \) is a bounded smooth domain, and \( \varepsilon \in [0, 1] \). For the nonlinearity \( f \in C^2(\mathbb{R}) \) with \( f(0) = 0 \), we assume that it satisfies:

\[
\begin{align*}
|f''(u)| &\leq C(|u| + 1), \\
\lim_{|u| \to \infty} |f'(u)| &> -\lambda_1,
\end{align*}
\] (1.2) (1.3)

where \( \lambda_1 > 0 \) is the first eigenvalue of \(-\Delta\).

The external force \( g(x, t) \) is assumed to satisfy: \( g(x, t), \partial_t g(x, t) \in L^2_{\text{loc}}(\mathbb{R}; L^2(\Omega)) \), and

\[
\int_{-\infty}^{t} e^{\sigma s} \left\| g(x, s) \right\|^2 ds < \infty \quad \text{for all } t \in \mathbb{R},
\] (1.4)

where the positive constant \( \sigma \) will be settled in the proof of Lemma 3.1.

The dynamic behavior of analogous equations have been analyzed in the literature under different hypotheses. In the autonomous case (i.e., the forcing term \( g(x, t) = g(x) \)), the well-posedness, existence, and regularity of global attractors have been studied extensively for more general damped wave equations \([4, 5, 8, 9, 12, 15, 16]\), and the exponential attractors and dimension estimates for global attractors are considered in \([11, 15, 17]\). In the nonautonomous case, we refer the readers to \([20–22, 25]\) and references therein.

When \( \varepsilon = 0 \), Eq. (1.1) reduces to the usual wave equation without strong damping term \(-\Delta \partial_t u\). Our main purpose in this paper is to study the limiting behavior of Eq. (1.1) as \( \varepsilon \) goes to 0. More precisely, we will prove the upper semicontinuity of pullback attractors in \( H^1_0(\Omega) \times L^2(\Omega) \) for Eq. (1.1), that is, that the pullback attractor \( \{A_{\varepsilon}(t)\}_{t \in \mathbb{R}} \) (\( \varepsilon \in [0, 1] \)) for Eq. (1.1) satisfies

\[
\lim_{\varepsilon \to \varepsilon_0} \sup_{t \in [a, b]} \text{dist}_{H^1_0 \times L^2} (A_{\varepsilon_0}(t), A_{\varepsilon}(t)) = 0 \quad \text{for all } \varepsilon_0 \in [0, 1] \text{ and } [a, b] \subset \mathbb{R}.
\]

For Eq. (1.1), if the initial data belong to \( H^1_0(\Omega) \times L^2(\Omega) \), then its solution is always in \( H^1_0(\Omega) \times L^2(\Omega) \) and has no higher regularity, and we cannot obtain the compactness property by showing the boundedness of solutions in higher regular phase spaces. In this paper, we apply the techniques of Zelik [25] to overcome this difficulty and establish the asymptotic compactness of solution operators with perturbations (see Lemmas 3.3–3.5).

The structure of the paper is as follows. In the next section, we first recall some basic concepts and conclusions of the theory of pullback attractors and then prove an abstract result for verifying the upper semicontinuity of pullback attractors (Theorem 2.2), by applying which we prove the upper semicontinuity of pullback attractors for Eq. (1.1) in Sect. 3.

We introduce some notation that will be used in the paper. We denote by \( \langle \cdot, \cdot \rangle \) and \( \| \cdot \| \) the inner product and norm in \( L^2(\Omega) \), respectively. Let \( \mathcal{H}^\alpha = D((-\Delta)^{\alpha/2}) \ (\alpha \in \mathbb{R}) \) be the
scale of Hilbert spaces generated by the Laplacian with Dirichlet boundary conditions on $L^2(\Omega)$ (see [18] for more detail) and endowed with standard inner products and norms, respectively,

$$\langle \cdot, \cdot \rangle_{H^s} = \langle (-\Delta)^s \cdot, (-\Delta)^s \cdot \rangle$$

and $\parallel \cdot \parallel_{H^s} = \parallel (-\Delta)^{\frac{s}{2}} \cdot \parallel$.

In particular,

$$\mathcal{H}^{-1} = H^{-1}(\Omega), \quad \mathcal{H}^0 = L^2(\Omega), \quad \mathcal{H}^1 = H^1(\Omega).$$

Then we have the continuous embeddings $\mathcal{H}^s \hookrightarrow \mathcal{H}^r$ for any $s > r$,

$$\mathcal{H}^s \hookrightarrow L^\frac{2}{2-s} (\Omega), \quad \forall s \in \left[0, \frac{3}{2}\right],$$

and the following inequalities.

**Interpolation inequalities:** if $r = \theta s + (1 - \theta)q$, where $r, s, q \in \mathbb{R}, s \geq q$, and $\theta \in [0,1]$, then there exists a constant $C > 0$ such that

$$\parallel u \parallel_{\mathcal{H}^r} \leq C \parallel u \parallel_{\mathcal{H}^s}^{\theta} \parallel u \parallel_{\mathcal{H}^q}^{1-\theta}, \quad \forall u \in \mathcal{H}^s.$$

**Generalized Poincaré inequality:**

$$\lambda_1 \parallel u \parallel_{\mathcal{H}^{2s}}^2 \leq \parallel u \parallel_{\mathcal{H}^{2s+1}}^2, \quad \forall u \in \mathcal{H}^{s+1}.$$

We define the product Hilbert spaces as follows:

$$\mathcal{E}^{-1} = L^2(\Omega) \times H^{-1}(\Omega), \quad \mathcal{E} = H^1_0(\Omega) \times L^2(\Omega),$$

and

$$\mathcal{E}^\alpha = \mathcal{H}^{\alpha+1} \times \mathcal{H}^\alpha (\alpha \in \mathbb{R}).$$

For any given function $u(t)$, we shortly write

$$\xi_u(t) = (u(t), \partial_t u(t)) \quad \text{and} \quad \parallel \xi_u(t) \parallel_{\mathcal{E}}^2 = \parallel \nabla u \parallel^2 + \parallel \partial_t u \parallel^2.$$

Throughout the paper, the symbols $C$ and $Q$ stand for a generic positive constant and a generic positive increasing function, respectively.

### 2 Preliminaries

In this section, we collect some basic facts from general theory of pullback attractors (see, e.g., [1, 3]) and then state an abstract result for verifying the upper semicontinuity of pullback attractors.

Let us define a nonautonomous dynamical system by a process on a Banach space $X$ with norm $\parallel \cdot \parallel_X$, that is, a family of continuous mappings $U(t, \tau) : X \rightarrow X, t \geq \tau$, such that $U(\tau, \tau) = \text{Id}$ and $U(t, s)U(s, \tau) = U(t, \tau)$ for all $t \geq s \geq \tau$. 
Definition 2.1 A family of compact sets $\mathcal{A} = \{A(t)\}_{t \in \mathbb{R}}$ is called a pullback attractor for process $U(\cdot, \cdot)$ if

(i) $\mathcal{A}$ is pullback attracting, that is, $\lim_{t \to \infty} \text{dist}_X(U(t, t - \tau), A(t)) = 0$ for all bounded $D \subset X$;

(ii) $\mathcal{A}$ is invariant, that is, $U(t, \tau)A(\tau) = A(t)$ for all $t \geq \tau$.

Definition 2.2 A family of sets $\mathcal{D} = \{D(t)\}_{t \in \mathbb{R}}$ is said to be pullback absorbing with respect to $U(\cdot, \cdot)$ if for every $t \in \mathbb{R}$ and any bounded $D \subset X$, there exists $T > 0$ (which depends on $t$ and $D$) such that

$$U(t, t - \tau)D \subset D(t) \quad \text{for all } \tau \geq T.$$ 

Definition 2.3 A process $U(\cdot, \cdot)$ is said to be pullback $\mathcal{D}$-asymptotically compact in $X$ if for any $t \in \mathbb{R}$ and any sequences $\tau_n \xrightarrow{n \to \infty} \infty$ and $x_n \in D(t - \tau_n)$, the sequence $\{U(t, t - \tau_n)x_n\}_{n \in \mathbb{N}}$ is relatively compact in $X$.

Theorem 2.1 (see [3]) Let a family $\mathcal{D} = \{D(t)\}_{t \in \mathbb{R}}$ be pullback absorbing, and let $U(\cdot, \cdot)$ be pullback $\mathcal{D}$-asymptotically compact in $X$. Then the family $\mathcal{A} = \{A(t)\}_{t \in \mathbb{R}}$ defined by $A(t) := \Lambda(\mathcal{D}, t)$, where

$$\Lambda(\mathcal{D}, t) = \bigcap_{s \geq 0} \bigcup_{\tau \geq s} U(t, t - \tau)D(t - \tau)$$

for $t \in \mathbb{R}$, \quad (2.1)

is a pullback attractor for $U(\cdot, \cdot)$. Moreover, if for any $t \in \mathbb{R}$, there exists $T > 0$ (which depends on $t$) such that

$$U(t, t - \tau)D(t - \tau) \subset D(t) \quad \text{for all } \tau \geq T,$$ \quad (2.2)

then

$$\lim_{\tau \to \infty} \text{dist}_X(U(t, t - \tau)D(t - \tau), A(t)) = 0 \quad \text{for each } t \in \mathbb{R}.$$ \quad (2.3)

Lemma 2.1 Assume that for every $\varepsilon \in [0, \mu]$, a process $U_{\varepsilon}(\cdot, \cdot)$ has a pullback absorbing family $\mathcal{D}_\varepsilon = \{D_\varepsilon(t)\}_{t \in \mathbb{R}}$ satisfying (2.2). Assume that for any sequences $\{\varepsilon_n\}_{n \in \mathbb{N}} \subset [0, \mu]$, $\{\tau_n\}_{n \in \mathbb{N}} \subset [a, b] \subset \mathbb{R}$, $\{\tau_n\}_{n \in \mathbb{N}} \subset \mathbb{R}^+$ with $\tau_n \xrightarrow{n \to \infty} \infty$, and $x_n \in D_{\varepsilon_n}(a - \tau_n)$, the sequence $\{U_{\varepsilon_n}(t_n, a - \tau_n)x_n\}_{n \in \mathbb{N}}$ is precompact in $X$. Then

(i) for every $\varepsilon \in [0, \mu]$, $U_{\varepsilon}(\cdot, \cdot)$ has a pullback attractor $\mathcal{A}_{\varepsilon} = \{A_{\varepsilon}(t)\}_{t \in \mathbb{R}}$;

(ii) $\bigcup_{\varepsilon \in [0, \mu]} \bigcup_{t \in [0, \mu]} A_{\varepsilon}(t)$ is precompact in $X$.

Proof From Theorem 2.1 we immediately get (i). Taking any sequence $x_n \in \bigcup_{\varepsilon \in [0, \mu]} \bigcup_{t \in [0, \mu]} A_{\varepsilon}(t)$, without loss of generality, we let $x_n \in A_{\varepsilon_n}(t_n)$. Then we can find sequences $\tau_n \to \infty$ and $\xi_n \in D_{\varepsilon_n}(a - \tau_n)$ such that

$$\|U_{\varepsilon_n}(t_n, a - \tau_n)\xi_n - x_n\| \leq \frac{1}{n}, \quad \forall n \in \mathbb{N}.$$ 

Then from the assumptions we easily obtain the precompactness of $\{x_n\}_{n \in \mathbb{N}}$. \qed
The theory for verifying the upper semicontinuity of pullback attractors has been considered by many authors; see [7, 13] and references therein. By applying the ideas of [13, Theorem 4.1] we get the following result.

**Theorem 2.2** Let $X, Y$ be two Banach spaces with norms $\| \cdot \|_X$ and $\| \cdot \|_Y$, respectively, and let $X$ be continuously embedded into $Y$. Assume that for every $\varepsilon \in [0, \mu]$, a process $U_{\varepsilon}(\cdot, \cdot)$ has a pullback absorbing family $D_{\varepsilon} = \{ D_{\varepsilon}(t) \}_{t \in \mathbb{R}}$ satisfying (2.2), and a pullback attractor $A_{\varepsilon} = \{ A_{\varepsilon}(t) \}_{t \in \mathbb{R}}$ is given by Theorem 2.1. Suppose the following assumptions hold:

(i) $D_{\varepsilon} = \{ D_{\varepsilon}(t) \}_{t \in \mathbb{R}}$ is independent of $\varepsilon$, and $D_{\varepsilon}(t)$ is closed in $X$ for each $t \in \mathbb{R}$;

(ii) for any $\tau > 0$, any sequences $\{ t_n \}_{n \in \mathbb{N}} \subset [a, b]$ such that $t_n \xrightarrow{n \to \infty} t_0$, $\{ \varepsilon_n \}_{n \in \mathbb{N}} \subset [0, \mu]$ such that $\varepsilon_n \xrightarrow{n \to \infty} \varepsilon_0$, and $\{ x_n \}_{n \in \mathbb{N}} \subset X$ such that $x_n \xrightarrow{n \to \infty} x_0$ in $X$,

$$U_{\varepsilon_n}(t_n, a - \tau)x_n \xrightarrow{n \to \infty} U_{\varepsilon_0}(t_0, a - \tau)x_0 \quad \text{in } Y;$$  

(2.4)

(iii) for any $[a, b] \subset \mathbb{R}$,

$$\bigcup_{t \in [a, b]} \bigcup_{\varepsilon \in [0, \mu]} A_{\varepsilon}(t) \quad \text{is precompact in } X.$$  

(2.5)

Then

$$\lim_{\varepsilon \to \varepsilon_0} \sup_{t \in [a, b]} \text{dist}_X(A_{\varepsilon}(t), A_{\varepsilon_0}(t)) = 0 \quad \text{for all } \varepsilon_0 \in [0, \mu].$$  

(2.6)

**Proof** Step 1. We prove that under our assumptions, for any $t \in \mathbb{R}$, any sequences $\{ \varepsilon_n \}_{n \in \mathbb{N}} \subset [0, \mu]$ such that $\varepsilon_n \xrightarrow{n \to \infty} \varepsilon_0$, and $y_n \in A_{\varepsilon_n}(t)$, there exist $y_0 \in A_{\varepsilon_0}(t)$ and a subsequence $\{ y_{n_k} \}_{k \in \mathbb{N}} \subset \{ y_n \}_{n \in \mathbb{N}}$ such that

$$y_{n_k} \xrightarrow{k \to \infty} y_0 \quad \text{in } X.$$  

(2.7)

Let $t_m \xrightarrow{m \to \infty} \infty$. For all $m, n \in \mathbb{N}$, there exist $z^{(m)}_n \in A_{\varepsilon_n}(a - \tau_m)$ such that

$$y_n = U_{\varepsilon_n}(t, a - \tau_m)z^{(m)}_n.$$  

(2.8)

By assumption (i) we let

$$D_{\varepsilon}(t) = D(t) \quad \text{for all } t \in \mathbb{R} \text{ and } \varepsilon \in [0, \mu],$$

and by assumption (iii), without loss of generality, for each $m$, we let

$$z^{(m)}_n \xrightarrow{n \to \infty} z_m \in D(a - \tau_m).$$

Let $y_{0,m} = U_{\varepsilon_0}(t, a - \tau_m)z_m$, and, without loss of generality, let

$$y_{0,m} \xrightarrow{m \to \infty} y_0 \in A_{\varepsilon_0}(t).$$  

(2.9)
By assumption (ii) we find
\[ \lim_{n \to \infty} \| y_n - y_{0,m} \|_Y = \lim_{n \to \infty} \left\| U_{\tau_n}(t,a - \tau_m)z_{\tau_m}^{(m)} - U_{\tau_0}(t,a - \tau_m)z_{\tau_m} \right\|_Y = 0. \tag{2.10} \]

Then, combining (2.9) and (2.10), for any \( \delta > 0 \), we can find \( m_\delta, N_\delta \in \mathbb{N} \) such that
\[ \| y_n - y_0 \|_Y \leq \| y_n - y_{0,m_\delta} \|_Y + \| y_{0,m_\delta} - y_0 \|_Y \leq \delta \quad \text{for all} \quad n \geq N_\delta. \tag{2.11} \]

From assumption (iii) we also know that \( \{ y_n \}_{n \in \mathbb{N}} \) is precompact in \( X \). Thus by (2.11), noting that \( X \hookrightarrow \rightarrow Y \), we immediately get (2.7).

Step 2. We claim that for any sequences \( \{ t_n \}_{n \in \mathbb{N}} \subseteq [a, b] \) such that \( t_n \to t_0 \), \( \{ \varepsilon_n \}_{n \in \mathbb{N}} \subseteq [0, \mu] \) such that \( \varepsilon_n \to \varepsilon_0 \), and \( x_n \in A_{\varepsilon_n}(t_n) \), there exist a subsequence \( \{ x_{n_k} \}_{k \in \mathbb{N}} \subseteq \{ x_n \}_{n \in \mathbb{N}} \) and \( x_k^* \in A_{\varepsilon_0}(t_{n_k}) \) such that for any \( \delta > 0 \), we can find \( N \in \mathbb{N} \) large enough such that
\[ \| x_{n_k} - x_k^* \|_X \leq \delta \quad \text{for all} \quad k \geq N. \tag{2.12} \]

Let \( \tau > 0 \). We can find \( y_n \in A_{\varepsilon_n}(a - \tau) \) such that
\[ x_n = U_{\varepsilon_n}(t_n, a - \tau)y_n \quad \text{for all} \quad n \in \mathbb{N}. \tag{2.13} \]

By (2.7), without loss of generality, we let
\[ y_n \overset{n \to \infty}{\longrightarrow} y_0 (\in A_{\varepsilon_0}(a - \tau)) \]

Setting
\[ x_n^* = U_{\varepsilon_0}(t_n, a - \tau)y_0 (\in A_{\varepsilon_0}(t_n)) \]
and using assumption (ii), we readily check that
\[ \lim_{n \to \infty} \| x_n - x_n^* \|_Y = 0. \tag{2.14} \]

On the other hand, assumption (iii) implies that sequences \( \{ x_n \}_{n \in \mathbb{N}} \) and \( \{ x_n^* \}_{n \in \mathbb{N}} \) are precompact in \( X \), from which, together with (2.14), noting that \( X \hookrightarrow \rightarrow Y \), we immediately obtain (2.12).

Now we are ready to prove (2.6). If not true, then we can find \( \delta > 0 \), sequences \( \{ \varepsilon_n \}_{n \in \mathbb{N}} \subseteq [0, \mu] \) such that \( \varepsilon_n \to \varepsilon_0 \), \( \{ t_n \}_{n \in \mathbb{N}} \subseteq [a, b] \) such that \( t_n \to t_0 \), and \( x_n \in A_{\varepsilon_n}(t_n) \) such that
\[ \text{dist}_X \left( x_n, A_{\varepsilon_0}(t_n) \right) \geq \delta \quad \text{for all} \quad n \in \mathbb{N}. \tag{2.15} \]

It follows from (2.12) that we can extract a subsequence \( \{ x_{n_k} \}_{k \in \mathbb{N}} \) from \( \{ x_n \}_{n \in \mathbb{N}} \) and \( x_k^* \in A_{\varepsilon_0}(t_{n_k}) \) such that
\[ \| x_{n_k} - x_k^* \|_X \overset{k \to \infty}{\longrightarrow} 0, \]
which contradicts (2.15). The proof is completed. \( \square \)
3 Upper semicontinuity of pullback attractors for Eq. (1.1)

The existence and uniqueness of (weak) solutions $u$ to Eq. (1.1) is classical (see, e.g., [4, 5]) and can be obtained by the standard Faedo–Galerkin method. Such solutions satisfy: for any $\varepsilon \geq 0$ and $[r, T] \subset \mathbb{R}$,

$$u \in C([r, T], H^1_0(\Omega)), \quad \partial_t u \in C([r, T], L^2(\Omega)).$$

As a consequence, for any $\varepsilon \geq 0$, we can construct the process $U(\varepsilon)(t, r)$ associated with Eq. (1.1) as follows:

$$U(\varepsilon)(t, r) \xi = (u(t), \partial_t u(t)) \quad \text{with} \quad \xi \in \mathcal{E},$$

and the mapping $U(\varepsilon)(t, r) : \mathcal{E} \to \mathcal{E}$ is continuous.

The main result of this section can be stated as follows.

**Theorem 3.1** Let assumptions (1.2)–(1.4) be satisfied. For any $\varepsilon \in [0, 1]$, there exists a pullback attractor $\mathcal{A}_\varepsilon = \{A_\varepsilon(t)\}_{t \in \mathbb{R}}$ for Eq. (1.1) such that

$$\lim_{\varepsilon \to 0} \sup_{t \in [a, b]} \text{dist}_\mathcal{E}(A_\varepsilon(t), A_0(t)) = 0 \quad \text{for all} \quad \varepsilon_0 \in [0, 1] \quad \text{and} \quad [a, b] \subset \mathbb{R} \quad (3.1)$$

and

$$\bigcup_{t \in [a, b]} \bigcup_{\varepsilon \in [0, 1]} A_\varepsilon(t) \quad \text{is precompact in} \quad \mathcal{E}. \quad (3.2)$$

**Lemma 3.1** Under assumptions (1.2)–(1.4), we have the estimate

$$\|\xi_\varepsilon(t)\|_\mathcal{E}^2 + e^{-\sigma t} \int_r^t e^{\sigma s} \left(\|\nabla u(s)\|^2 + \|\partial_t u(s)\|^2\right) ds \leq Ce^{-\sigma(t-r)}\left(\|\xi_\varepsilon(r)\|_\mathcal{E}^4 + 1\right) + Ce^{-\sigma t} \int_r^t e^{\sigma s} \|g(x, s)\|^2 ds + C \quad (3.3)$$

for all $\varepsilon \in [0, 1]$, $t \geq r$, and any $\xi_\varepsilon(r) = (u(r), \partial_t u(r)) \in \mathcal{E}$, where $\sigma > 0$ satisfies (3.16), and $C > 0$ is independent of $r, t, and \varepsilon$.

**Proof** Let $F(u) = \int_0^u f(s) ds$. From (1.3) we obtain that

$$\langle f(u), u \rangle \geq -\rho \|u\|^2 - C_\rho, \quad (3.4)$$

$$\langle F(u), 1 \rangle \geq -\frac{1}{2} \rho \|u\|^2 - C_\rho, \quad (3.5)$$

$$\langle f(u), u \rangle - \langle F(u), 1 \rangle \geq -\frac{1}{2} \rho \|u\|^2 - C_\rho \quad (3.6)$$

for positive constants $\rho < \lambda_1$ and $C_\rho$ (see [17] for more detail).

Multiplying Eq. (1.1) by $2(\partial_t u + \delta u)$ and integrating over $\Omega$, we have

$$\frac{d}{dt} \Lambda(t) + \delta \Lambda(t) + 2\varepsilon \|\nabla \partial_t u\|^2 + \Gamma(t) = 2[g(x, t), \partial_t u + \delta u], \quad (3.7)$$
where

\[ \Lambda(t) = (1 + \varepsilon \delta) \| \nabla u \|^2 + \delta \| u \|^2 + \| \partial_t u \|^2 + 2 \delta \langle \partial_t u, u \rangle + 2 \langle F(u), 1 \rangle + 2C_\rho \]

and

\[ \Gamma(t) = 2 \delta \| \nabla u \|^2 + (2 - 2 \delta) \| \partial_t u \|^2 + 2 \delta \langle f(u), u \rangle - \delta \Lambda(t). \]

Let

\[ 0 < \delta < \min \left\{ \frac{1}{2} \frac{\lambda_1 - \rho}{\lambda_1 + 2} \right\}. \quad (3.8) \]

By (1.2) and the Sobolev embeddings \( H^1_0(\Omega) \hookrightarrow L^6(\Omega) \hookrightarrow L^4(\Omega) \) we have

\[ \| f(u), u \| \leq C \int_\Omega (1 + |u|^4) \ dx \leq C (1 + \| u \|^4_{L^4}) \leq C (1 + \| \nabla u \|^4). \quad (3.9) \]

From (3.4)–(3.9), applying Cauchy’s inequality and Poincaré’s inequality \( \lambda_1 \| u \|^2 \leq \| \nabla u \|^2 \), we deduce that

\[ \Lambda(t) \geq (1 + \varepsilon \delta) \| \nabla u \|^2 + \delta \| u \|^2 + \| \partial_t u \|^2 - \delta \partial_t u \| \| u \|^2 - \rho \| u \|^2 \]
\[ \geq (1 - \rho \lambda_1^{-1}) \| \nabla u \|^2 + (1 - \delta) \| \partial_t u \|^2 \]
\[ \geq C_1 \| \xi_u(t) \|^2, \quad (3.10) \]

\[ \Lambda(t) \leq (1 + \varepsilon \delta) \| \nabla u \|^2 + (2 \delta + \rho) \| u \|^2 + (1 + \delta) \| \partial_t u \|^2 \]
\[ + 2C (1 + \| \nabla u \|^4) + 4C_\rho \]
\[ \leq (1 + 2C) \| \nabla u \|^4 + \frac{1}{2} \| \partial_t u \|^4 + \frac{1}{2} (1 + \varepsilon \delta)^2 + \frac{1}{2} (2 \delta + \rho) \lambda_1^{-1} \]
\[ + \frac{1}{2} (1 + \delta)^2 + 2C + 4C_\rho \]
\[ \leq C_2 (\| \xi_u(t) \|^4 + 1) \quad (3.11) \]

and

\[ \Gamma(t) \geq 2 \delta \| \nabla u \|^2 + (2 - 2 \delta) \| \partial_t u \|^2 - \delta (1 + \varepsilon \delta) \| \nabla u \|^2 \]
\[ - \delta^2 \| u \|^2 - \delta \| \partial_t u \|^2 - 2 \delta^2 \langle \partial_t u, u \rangle \]
\[ + 2 \delta \langle f(u), u \rangle - \langle F(u), 1 \rangle - 2 \delta C_\rho \]
\[ \geq (2 \lambda_1^{-1} - \delta (1 + \varepsilon \delta) - 2 \lambda_1^{-1} - \delta \lambda_1^{-1} \| \nabla u \|^2 \]
\[ + (2 - 2 \delta - \delta^2) \| \partial_t u \|^2 - 4 \delta C_\rho \]
\[ \geq \lambda_1^{-1} \delta (\lambda_1 - \rho - \delta (\lambda_1 + 2)) \| \nabla u \|^2 \]
\[ + (2 - 4 \delta) \| \partial_t u \|^2 - 4 \delta C_\rho \]
\[ \geq C_3 \| \xi_u(t) \|_E^2 - C_4, \] (3.12)

where \( C_1 = \min(1 - \rho \lambda_1^{-1}, 1 - \delta) \), \( C_2 = 4 + (2 \lambda_1^{-1} + 1)^2 + 2C + 4C_\rho \), \( C_3 = \min(\lambda_1^{-1} \delta((\lambda_1 - \rho) - \delta(\lambda_1 + 2)), 2 - 4\delta) \), and \( C_4 = 4\delta C_\rho \).

By (3.8) and Cauchy’s inequality we observe that

\[
2\langle g(x, t), \partial_t u + \delta u \rangle \\
\leq 2\langle g(x, t), \partial_t u \rangle + 2\langle g(x, t), \delta u \rangle \\
\leq 4C_3^{-1} \| g(x, t) \|^2 + \frac{C_3}{2} (\delta^2 \| u \|^2 + \| \partial_t u \|^2) \\
\leq 4C_3^{-1} \| g(x, t) \|^2 + \frac{C_3}{2} \| \xi_u(t) \|_E^2. \tag{3.13}
\]

Combining (3.10)–(3.13), we estimate (3.7) as follows:

\[
\frac{d}{dt} \Lambda(t) + \delta \Lambda(t) + \epsilon \| \nabla \partial_t u \|^2 \leq 4C_3^{-1} \| g(x, t) \|^2 + C_4. \tag{3.14}
\]

Multiplying this inequality by \( e^{\sigma t} \), we have

\[
\frac{d}{dt} (e^{\sigma t} \Lambda(t)) + (\delta - \sigma) e^{\sigma t} \Lambda(t) \leq 4C_3^{-1} e^{\sigma t} \| g(x, t) \|^2 + C_4 e^{\sigma t}, \tag{3.15}
\]

where

\[ 0 < 2\sigma < \delta. \tag{3.16} \]

Integrating (3.15) from \( r \) to \( t \) and considering (3.10)–(3.11), we have

\[
C_1 e^{\sigma t} \| \xi_u(t) \|_E^2 + C_1 (\delta - \sigma) \int_r^t e^{\sigma s} \| \xi_u(s) \|_E^2 ds \\
\leq C_2 e^{\sigma t} (\| \xi_u(r) \|_E^4 + 1) + 4C_3^{-1} \int_r^t e^{\sigma s} \| g(x, s) \|^2 ds + C_4 \sigma^{-1} e^{\sigma t}. \]

After a simple computation, we arrive at

\[
\| \xi_u(t) \|_E^2 + e^{-\sigma t} \int_r^t e^{\sigma s} \| \xi_u(s) \|_E^2 ds \\
\leq C_5 \left( e^{-\sigma (t-r)} (\| \xi_u(r) \|_E^4 + 1) + e^{-\sigma t} \int_r^t e^{\sigma s} \| g(x, s) \|^2 ds + 1 \right), \tag{3.17}
\]

where \( C_5 = (C_1 (\delta - \sigma))^{-1} (C_2 + 4C_3^{-1} + C_3 \sigma^{-1}) \). The proof is completed. \( \square \)

**Corollary 3.1** Assume (1.2)–(1.4). Then, for every \( \epsilon \in [0, 1] \), the process \( U(\cdot, \cdot) \) has a pullback absorbing family \( \mathcal{D} = \{ D(t) \}_{t \in \mathbb{R}} \) in \( E \), which is independent of \( \epsilon \in [0, 1] \) and satisfies (2.2).
Proof. Set
\[
R(t) = \left(2Ce^{-\gamma t}\int_{-\infty}^{t} e^{\sigma s} \|g(x,s)\|^2 \, ds + 2C\right)^{1/2},
\]
(3.18)
\[
D(t) = \{\xi \in E \mid \|\xi\|_E \leq R(t)\},
\]
(3.19)
where \(C\) given by (3.3). By Lemma 3.1 the family \(D(t)\) is pullback absorbing for every \(U_t\).

Choose \(\gamma > 0\) satisfying
\[
2\sigma < \gamma < \delta,
\]
(3.20)
where \(\delta > 0\) is given by (3.8).

From the proof of Lemma 3.1 we easily check that inequality (3.3) still holds if \(\sigma\) is replaced by \(\gamma\), that is,
\[
\|\xi(t)\|^2_E \leq Ce^{-\gamma t} \left(\left((R(t - \tau))^4 + 1\right) + Ce^{-\gamma t} \int_{t-\tau}^{t} e^{\gamma s} |g(x,s)|^2 \, ds + C\right)
\]
\[
\leq Ce^{-\gamma t} \left(\left((R(t - \tau))^4 + 1\right) + Ce^{-\gamma t} \int_{-\infty}^{t} e^{\gamma s} |g(x,s)|^2 \, ds + C\right)
\]
(3.21)
for all \(u_{t-\tau} \in D(t - \tau)\).

By (3.18) and (3.20) we observe that
\[
e^{-\gamma t} \left((R(t - \tau))^4 \right)^{1/4} \to 0,
\]
(3.22)
which, together with (3.19), implies that the family \(\{D(t)\}\) satisfies (2.2).

Lemma 3.2. Under assumptions (1.2)–(1.4), for any \(\{t_n\}_{n \in \mathbb{N}} \subset [a,b]\) such that \(t_n \to t_0\), \(\{\varepsilon_n\}_{n \in \mathbb{N}} \subset [0,1]\) such that \(\varepsilon_n \to \varepsilon_0\), and \(\{x_n\}_{n \in \mathbb{N}} \subset \mathcal{E}\) such that \(x_n \to x_0\), we have
\[
\left\|U_{t_n}(t_n,a-\tau)x_n - U_{t_0}(t_0,a-\tau)x_0\right\|_{E^{-1}} \to 0, \quad \forall \tau \geq 0.
\]
(3.23)

Proof. Set \(\xi_{u_n}(t) = (u_n(t), \partial_t u_n(t)) = U_{t_n}(t,a-\tau)x_n\) and \(\xi_{u_0}(t) = (u_0(t), \partial_t u_0(t)) = U_{t_0}(t,a-\tau)x_0\) be solutions of Eq. (1.1) with initial data \(\xi_{u_n}(a-\tau) = x_n\) and \(\xi_{u_0}(a-\tau) = x_0\), respectively.

Set \(z_n = u_n - u_0\), which solves the equation
\[
\partial_t^2 z_n + \partial_t z_n - \Delta z_n - \varepsilon_n \Delta \partial_t z_n = -(f(u_n) - f(u_0)) + (\varepsilon_n - \varepsilon_0) \Delta \partial_t u_n
\]
(3.24)
with initial condition \(\xi_{z_n}(a-\tau) = x_n - x_0\).

Let us introduce the functional
\[
\Pi(t) = (1 + \varepsilon_0 \delta) \|z_n\|^2 + \delta \|z_n\|^2_{H^{-1}} + \|\partial_t z_n\|^2_{H^{-1}} + 2\delta \|(-\Delta)^{-1/2} \partial_t z_n\|_{(-\Delta)^{-1/2}}^2.
\]
Taking \(0 < \delta < 1\), we observe that
\[
(1 - \delta)\left\|\xi_{z_n}(t)\right\|_{E^{-1}}^2 \leq \Pi(t) \leq 2\left(1 + \lambda_1^{-1}\right)\left\|\xi_{z_n}(t)\right\|_{E^{-1}}^2.
\]
(3.25)
Multiplying (3.24) by \((-\Delta)^{-1}(\partial_t z_n + \delta z_n)\) and integrating over \(\Omega\), we have

\[
\frac{d}{dt} \Pi(t) + 2\delta \|z_n\|^2 + (2 - 2\delta)\|\partial_t z_n\|^2_{H^{-1}} + 2\varepsilon_0 \|\partial_t z_n\|^2
\]

\[
= -2[f(u_n) - f(u_0), (-\Delta)^{-1}(\partial_t z_n + \delta z_n)]
\]

\[
- 2(\varepsilon_n - \varepsilon_0)(-\Delta \partial_t u_n, (-\Delta)^{-1}(\partial_t z_n + \delta z_n)).
\]

By (1.2), (3.25), and the embeddings \(H^1 \hookrightarrow L^6(\Omega), H^0 \hookrightarrow H^{-1}\), applying Cauchy’s and Hölder’s inequalities, the right-hand side of the above equality can be estimated as follows:

\[
2\|f(u_n) - f(u_0), (-\Delta)^{-1}(\partial_t z_n + \delta z_n)\| \leq C \int_\Omega (|u_n|^6 + |u_0|^6 + 1)|z_n|\|(-\Delta)^{-1}(\partial_t z_n + \delta z_n)\| dx
\]

\[
\leq C\left(\int_\Omega (|u_n|^6 + |u_0|^6 + 1) dx\right)^{1/2} \left(\int_\Omega |z_n|^2 dx\right)^{1/2} \left(\int_\Omega \|(-\Delta)^{-1}(\partial_t z_n + \delta z_n)\|^6 dx\right)^{1/2}
\]

\[
\leq C\left(\|u_n\|^2_{H^1} + \|u_0\|^2_{H^1} + 1\right)\|z_n\| \left(\|(-\Delta)^{-1}(\partial_t z_n)\|_{H^1} + \|(-\Delta)^{-1}z_n\|_{H^1}\right)
\]

\[
= C\left(\|u_n\|^2_{H^1} + \|u_0\|^2_{H^1} + 1\right)\|z_n\| \left(\|\partial_t z_n\|_{H^{-1}} + \|z_n\|_{H^{-1}}\right)
\]

\[
\leq C\left(\|u_n\|^2_{H^1} + \|u_0\|^2_{H^1} + 1\right)\|z_n\| \|\partial_t u_n\|^2_{H^1} + \|\partial_t z_n\|^2_{H^{-1}} + \delta^2\|z_n\|^2_{H^{-1}}.
\]

Hence

\[
\frac{d}{dt} \Pi(t) \leq C\left(\|u_n\|^2_{H^1} + \|u_0\|^2_{H^1} + 1\right)\Pi(t) + 2\varepsilon_n^{-1}(\varepsilon_n - \varepsilon_0)^2 \cdot \varepsilon_n \|\partial_t u_n\|^2_{H^1}.
\]

Integrating (3.14) from \(a - \tau\) to \(b\), we get

\[
\int_{a-\tau}^{b} \left(\|u(t)\|^2_{H^1} + \varepsilon \|\partial_t u(t)\|^2_{H^1}\right) dt \leq Q \quad \text{for all} \ \varepsilon \in [0, 1],
\]

where \(Q > 0\) depends on \(a - \tau\), \(b\), and \(\|\xi_n(a - \tau)\|_{L^6}\) but is independent of \(\varepsilon\).

By (3.25) and (3.27) an application of Gronwall’s inequality to (3.26) entails

\[
\sup_{t \in [a, b]} \|\xi_n(t)\|^2_{H^{-1}} \leq Q\|\xi_n(a - \tau)\|^2_{H^{-1}} + Q\varepsilon^{-1}(\varepsilon_n - \varepsilon_0)^2,
\]

where \(Q > 0\) depends on \(a - \tau\), \(b\), and \(D(a - \tau)\) but is independent of \(\varepsilon\).

Taking the limits as \(n \to \infty\) yields

\[
\sup_{t \in [a, b]} \|U_n(t, a - \tau)x_0 - U_0(t, a - \tau)x_0\|_{H^{-1}} \xrightarrow{n \to \infty} 0.
\]
Since $U(t, a - \tau) x \in C([a - \tau, b], C)$, we have
\[
\left\| U_{t_n}(t_n, a - \tau) x_n - U_{t_0}(t_0, a - \tau) x_0 \right\|_{\mathcal{L}^{-1}} \\
\leq \left\| U_{t_n}(t_n, a - \tau) x_n - U_{t_0}(t_0, a - \tau) x_0 \right\|_{\mathcal{L}^{-1}} \\
+ \left\| U_{t_0}(t_0, a - \tau) x_0 - U_{t_0}(t_0, a - \tau) x_0 \right\|_{\mathcal{L}^{-1}} \xrightarrow{n \to \infty} 0.
\]

(3.29)

This finishes the proof. \qed

To obtain the regularity estimates, we will apply the ideas of Zelik [25].

Split the solution $U(t, r) \xi_n(r) = u(t)$ of Eq. (1.1) as follows:
\[
U(t, r) \xi_n(r) = V(t, r) \xi_n(r) + W(t, r) \xi_n(r),
\]
where $V(t, r) \xi_n(r) = \xi_n(t)$ and $W(t, r) \xi_n(r) = \xi_n(t)$ solve the following equations, respectively:
\[
\begin{align*}
\begin{cases}
\partial_t^2 \nu + \partial_t \nu - \varepsilon \Delta \partial_t \nu - \Delta \nu + f(\nu) + L \nu = 0, \\
\xi_n(t) = \xi_n(r), \\
\nu(x, t) \mid_{\partial \Omega \times [r, \infty)} = 0,
\end{cases}
\end{align*}
\]

(3.31)

and
\[
\begin{align*}
\begin{cases}
\partial_t^2 \omega + \partial_t \omega - \varepsilon \Delta \partial_t \omega - \Delta \omega + f(\omega) - f(\nu) = L(\nu(t) + g(x, t), \\
\xi_n(t) = \xi_n(r), \\
\omega(x, t) \mid_{\partial \Omega \times [r, \infty)} = 0,
\end{cases}
\end{align*}
\]

(3.32)

where $L > 0$ will be settled in the proof of Lemma 3.3.

**Lemma 3.3**  Assume (1.2)–(1.4). Then for any $[a, b] \subset \mathbb{R}$ and $\mu > 0$, there exists $T_{\mu} > 0$ such that the following estimate holds:
\[
\sup_{\xi_n(a - \tau) \in D(a - \tau)} \left\| V(t, a - \tau) \xi_n(a - \tau) \right\|^2_{\mathcal{E}} \leq \mu \quad \text{for all } \tau \geq T_{\mu},
\]

(3.33)

where $[D(t)]_{t \in \mathbb{R}}$ is defined by (3.19).

**Proof** Let $\gamma > 0$ satisfy (3.20). Using the same argument as in the proof of Lemma 3.1, we have
\[
\sup_{\xi_n(a - \tau) \in D(a - \tau)} \left\| \xi_n(\tau) \right\|^2_{\mathcal{E}} \leq C e^{-\gamma (a - \tau)} \left( (R(a - \tau))^4 + 1 \right) + C.
\]

Then we can find $T > 0$ large enough such that
\[
\sup_{\xi_n(a - \tau) \in D(a - \tau)} \left\| \xi_n(\tau) \right\|^2_{\mathcal{E}} \leq C \quad \text{for all } \tau \geq T.
\]

(3.34)
From (1.3), noting that \( f(0) = 0 \), we have
\[
[f(v), v] \geq -K\|v\|^2 \quad \text{and} \quad \langle F(u), 1 \rangle \geq -\frac{K}{2}\|v\|^2
\] (3.35)
for some positive \( K \).

Let \( 0 < \delta < 1 \) and \( L > K \). Multiplying (3.31) by \( \partial_t v + \delta v \) and integrating over \( \Omega \), we have
\[
\frac{d}{dt} \Phi_\epsilon(t) + \beta \|\xi_\epsilon(t)\|^2 \leq 0 \quad \text{for all } \epsilon \in [0, 1],
\] (3.36)
where \( \beta = \min\{2(1 - \delta), 2\delta\} \), and
\[
\Phi_\epsilon(t) := \Phi_\epsilon(V(t, a - \tau)\xi_\epsilon(a - \tau)) \\
:= \|\partial_t v\|^2 + \|\nabla v\|^2 + \delta \|v\|^2 + \epsilon \delta \|\nabla v\|^2 + 2\delta\langle \partial_t v, v \rangle + 2\langle F(v), 1 \rangle + L\|v\|^2.
\] (3.37)

In light of (1.2) and (3.35), noting that \( L > K \), we easily realize that \( \Phi_\epsilon(t) \) fulfills the inequalities
\[
C_1 \|\xi_\epsilon(t)\|^2 \leq \Phi_\epsilon(t) \leq C_2 \|\xi_\epsilon(t)\|^4 + 1
\] (3.38)
for some suitable positive constants \( C_1, C_2 \), which are independent of \( \epsilon \).

By (3.34) and (3.38) there exists \( T > 0 \) such that
\[
\sup_{\xi_\epsilon(a - \tau) \in D(a - \tau) \atop \epsilon \in [0,1]} \Phi_\epsilon(V(t, a - \tau)\xi_\epsilon(a - \tau)) < \tilde{C} \text{ for all } \tau \geq T,
\] (3.39)
where \( \tilde{C} > 0 \) is independent of \( a - \tau, t, \) and \( \epsilon \).

Next, we claim that for any \( \eta > 0 \), there exist \( \tau_\eta > a \) and \( t_\eta \in [a - \tau_\eta, a] \) such that
\[
\frac{d}{dt} \Phi_\epsilon(V(t, a - \tau_\eta)\xi_\epsilon(a - \tau_\eta)) \big|_{t = t_\eta} \geq -\eta
\] (4.40)
for all \( \epsilon \in [0, 1] \) and \( \xi_\epsilon(a - \tau_\eta) \in D(a - \tau_\eta) \). If not, then for \( \tau_n \rightarrow \infty \), there exist \( \epsilon_n \in [0, 1] \) and \( \xi_\epsilon(a - \tau_\eta) \in D(a - \tau_\eta) \) such that
\[
\frac{d}{dt} \Phi_{\epsilon_n}(V(t, a - \tau_\eta)\xi_\epsilon(a - \tau_\eta)) < -\eta \quad \text{for all } t \in [a - \tau_\eta, a] \text{ and } n \in \mathbb{N}.
\] (4.41)

Hence, integrating the above inequality over \( [a - \tilde{\tau}_n, a] \) and considering (3.39), we get that there exists \( N \in \mathbb{N} \) large enough such that
\[
\Phi_{\epsilon_n}(V(a, a - \tau_\eta)\xi_\epsilon(a - \tau_\eta)) \\
< -\tilde{C} + \Phi_{\epsilon_n}(V\left(a - \frac{\tilde{C}}{\eta}, a - \tau_\eta\right)\xi_\epsilon(a - \tau_\eta)) \times 0 \quad \text{for all } n \geq N,
\] (4.42)
which contradicts the positivity of \( \Phi_\epsilon(t) \) (see (3.38)). Thus (4.40) is correct.
Exploiting (3.36) and (3.40), we have

$$
\sup_{\xi_{\nu}(a-\tau_{\eta}) \in D(a-\tau_{\eta})} \Phi_{\epsilon}(V(t_{\eta}, a - \tau_{\eta})\xi_{\nu}(a - \tau_{\eta}))
\leq \sup_{\xi_{\nu}(a-\tau_{\eta}) \in D(a-\tau_{\eta})} \{ \Phi_{\epsilon}(V(t_{\eta}, a - \tau_{\eta})\xi_{\nu}(a - \tau_{\eta})) | \beta \| \xi_{\nu}(a - \tau_{\eta}) \|_{E}^{2} \leq \eta \}.
$$

Inequality (3.36) implies that $\Phi_{\epsilon}(t)$ is a nonincreasing function. Note that $t_{\eta} \in [a-\tau_{\eta}, a]$ and hence

$$
\Phi_{\epsilon}(V(t, a - \tau_{\eta})\xi_{\nu}(a - \tau_{\eta})) \leq \Phi_{\epsilon}(V(t_{\eta}, a - \tau_{\eta})\xi_{\nu}(a - \tau_{\eta})) \quad \text{for all } t \geq a,
$$

which, together with (3.44), yields

$$
\Phi_{\epsilon}(V(t, a - \tau_{\eta})\xi_{\nu}(a - \tau_{\eta}))
\leq \sup_{\xi_{\nu}(a-\tau_{\eta}) \in D(a-\tau_{\eta})} \{ \Phi_{\epsilon}(V(t_{\eta}, a - \tau_{\eta})\xi_{\nu}(a - \tau_{\eta})) | \beta \| \xi_{\nu}(a - \tau_{\eta}) \|_{E}^{2} \leq \eta \}.
$$

Since $V(\cdot, \cdot)$ forms a process on $E$, by (3.34) we can find $T_{\eta} > 0$ large enough, which depends on $\tau_{\eta}$, such that

$$V(a - \tau_{\eta}, a - \tau)D(a - \tau) \subset D(a - \tau_{\eta}) \quad \text{for all } \tau \geq T_{\eta} \text{ and all } \epsilon \in [0,1].$$

Thus, in view of (3.46), we arrive at

$$
\Phi_{\epsilon}(V(t, a - \tau)\xi_{\nu}(a - \tau))
\leq \sup_{\xi_{\nu}(a-\tau) \in D(a-\tau)} \{ \Phi_{\epsilon}(V(t_{\eta}, a - \tau)\xi_{\nu}(a - \tau)) | \beta \| \xi_{\nu}(a - \tau) \|_{E}^{2} \leq \eta \}
\text{for all } \tau \geq T_{\eta}.
$$

From the definition of $\Phi_{\epsilon}(t)$ we easily check that $\Phi_{\epsilon}((v_{1}, v_{2})) \rightarrow 0$ as $\| (v_{1}, v_{2}) \|_{E}^{2} \rightarrow 0$ uniformly with respect to $\epsilon \in [0,1]$. Then from the above analysis, fixing $\mu > 0$ small enough, we can choose $\eta > 0$, $\tau_{\eta} > 0$, and $t_{\eta} \in [a-\tau_{\eta}, a]$ such that

$$
\sup_{\xi_{\nu}(a-\tau) \in D(a-\tau)} \beta \| \xi_{\nu}(t_{\eta}) \|_{E}^{2} \leq \eta
$$
\[
\Rightarrow \sup_{\xi_\varepsilon(a - \tau) \in D(a - \tau)} \Phi_\varepsilon \left( V(t, a - \tau) \xi_\varepsilon(a - \tau) \right) \leq C_1 \mu,
\]

which, together with (3.38) and (3.47), implies

\[
\sup_{\xi_\varepsilon(a - \tau) \in D(a - \tau)} \left\| \xi_\varepsilon(t) \right\|^2 \leq \mu \quad \text{for all } \tau \geq T,
\]

(3.48)

where \( T > 0 \) large enough. This completes the proof. \( \square \)

To obtain the regularity of \( w \), we need the following result in [25].

**Lemma 3.4** Let \( \alpha \in [0, \frac{1}{2}) \). Then

\[
\| u_1 \cdot (-\Delta)^{\alpha-1} u_2 \|_{L^2} \leq C \| u_1 \|_{H^{2\alpha}} \| u_2 \|_{H^{2\alpha-1}},
\]

(3.49)

\[
\| u_3 \cdot (-\Delta)^{\alpha-1} u_2 \|_{L^2} \leq C \| u_3 \|_{H^{\alpha}} \| u_2 \|_{H^{2\alpha-1}}
\]

(3.50)

for all \( u_1 \in H^{\alpha+1}, u_2 \in H^{\alpha-1}, \) and \( u_3 \in H^\alpha \), where the positive constant \( C \) depends on \( \alpha \) but is independent of \( u_1 \) and \( u_2 \).

**Lemma 3.5** Under the same assumptions of Lemma 3.3, for any \( \alpha \in [0, \frac{1}{2}) \), \([a, b] \subset \mathbb{R} \), and \( M > 0 \), we have

\[
\sup_{\xi_\varepsilon(a - \tau) \in D(a - \tau)} \left\| W(t, a - \tau) \xi_\varepsilon(a - \tau) \right\|_{E^\varepsilon} \leq Q,
\]

(3.51)

where \( Q > 0 \) depends on \( \alpha, a - \tau, b, \) and \( M \) but is independent of \( \varepsilon \).

**Proof** Multiplying Eq. (3.32) by \((-\Delta)^\alpha \partial_\tau w\) and integrating over \( \Omega \), we have

\[
\frac{d}{dt} \left( \| \partial_\tau w \|_{H^\alpha}^2 + \| w \|_{H^{2\alpha+1}}^2 \right) + 2 \| \partial_\tau w \|_{H^\alpha}^2 + 2 \varepsilon \| \partial_\tau w \|_{H^{2\alpha+1}}^2 \\
\leq 2 \left| \langle f(v + w) - f(v), (-\Delta)^\alpha \partial_\tau w \rangle \right| + 2 \left| \langle L v + g(x, t), (-\Delta)^\alpha \partial_\tau w \rangle \right|. 
\]

(3.52)

Applying (1.2) and the embeddings \( H^1 \hookrightarrow L^6(\Omega), H^{\alpha+1} \hookrightarrow H^{2\alpha} \), we deduce that

\[
2 \left| \langle f(v + w) - f(v), (-\Delta)^\alpha \partial_\tau w \rangle \right| \\
\leq C \int_{\Omega} \left( 1 + \| u \|_{H^1}^2 + \| v \|_{H^1}^2 \right) \left( \| u \|_{H^1} + \| v \|_{H^1} \right) \left| (-\Delta)^\alpha \partial_\tau w \right| \, dx \\
\leq C \left( \int_{\Omega} (1 + \| u \|_{H^1}^2 + \| v \|_{H^1}^2) \, dx \right) \left( \int_{\Omega} (\| u \|_{H^1}^2 + \| v \|_{H^1}^2) \, dx \right) \left( \int_{\Omega} \left| (-\Delta)^\alpha \partial_\tau w \right|^2 \, dx \right)^{\frac{1}{2}} \\
\leq C \left( \int_{\Omega} (1 + \| u \|_{H^1}^2 + \| v \|_{H^1}^2) \left( \| u \|_{H^1} + \| v \|_{H^1} \right) \| \partial_\tau w \|_{H^{2\alpha}} \, dx \right) \\
\leq \frac{C}{\varepsilon} \left( 1 + \| u \|_{H^1}^6 + \| v \|_{H^1}^6 \right) + \frac{\varepsilon}{2} \| \partial_\tau w \|_{H^{2\alpha+1}}^2
\]

(3.53)
2) \(|Lv + g(x, t), (-\Delta)^\alpha \partial_tw| \leq \frac{C}{\varepsilon} (\|v\|^2 + \|g(x, t)\|^2) + \frac{\varepsilon}{2}\|\partial_tw\|^2_{L^{2+\alpha}}.

As a consequence, inequality (3.52) improves to
\[
\frac{d}{dt}(\|\partial_tw\|^2_{L^{2+\alpha}} + \|w\|^2_{L^{2+\alpha}} + \varepsilon \|\partial_tw\|^2_{L^{2+\alpha}}) \leq \frac{C}{\varepsilon} (1 + \|u\|^6_{H^1} + \|v\|^6_{H^1} + \|g(x, t)\|^2).
\]

Integrating this inequality from \(a - \tau\) to \(t\) and considering Lemmas 3.1 and 3.3, we deduce
\[
\int_{a - \tau}^{t} \varepsilon^2 \|\partial_tw(s)\|^2_{L^{2+\alpha}} ds \leq Q \quad \text{for all} \quad t \in [a, b],
\]
where the positive constant \(Q\) depends on \(a - \tau, b,\) and \(M\) but is independent of \(\varepsilon\).

Differentiating Eq. (3.32) with respect to \(t\) and setting \(\theta(t) = \partial_tw\), we have
\[
\partial_t^2\theta + \partial_t\theta - \varepsilon \Delta \partial_t\theta - \Delta \theta = -(f'(u) - f'(v))\partial_tu - f'(v)\theta + L\partial_tv(t) + \partial_tg(x, t)
\]
with initial condition
\[
\theta(r) = 0, \quad \partial_t\theta(r) = Lu(r) + g(x, r).
\]

Taking the scalar product of (3.54) with \((-\Delta)^{\alpha-1}(\partial_t\theta + \delta\theta)\) (where \(\delta > 0\) is small enough), we find that
\[
\frac{d}{dt}\Psi(t) + \delta\Psi(t)
\leq -(f'(v + w) - f'(w))\partial_tu, (-\Delta)^{\alpha-1}(\partial_t\theta + \delta\theta))
- (f'(v) - f'(0))\theta, (-\Delta)^{\alpha-1}(\partial_t\theta + \delta\theta))
+ [L\partial_tv(t) + \partial_tg(x, t) - f'(0)\theta, (-\Delta)^{\alpha-1}(\partial_t\theta + \delta\theta)]
:= I_1 + I_2 + I_3,
\]
where
\[
\Psi(t) = \|\xi_0\|^2_{L^{2+\alpha}} + \delta \|\theta\|^2_{L^{2+\alpha}} + \varepsilon \delta \|\theta\|^2_{L^{2+\alpha}} + 2\delta \|\partial_t\theta, (-\Delta)^{\alpha-1}\theta),
\]
and we easily check that
\[
C_1 \|\xi_0\|^2_{L^{2+\alpha}} \leq \Psi(t) \leq C_2 \|\xi_0\|^2_{L^{2+\alpha}}
\]
for some positive constants \(C_1\) and \(C_2\).

Next, we estimate \(I_1, I_2,\) and \(I_3\) one by one.

From (1.2) we have
\[
\left|f'(v + w) - f'(w)\right| \leq C(1 + |v + w| + |v||w|),
\]
where \(C > 0\) is independent of \(v, w,\) and \(\varepsilon\).
Applying the Gronwall inequality to (3.64) and using of (3.53), it follows that

\[
\|e_{\theta}(t)\|_{2^{\alpha-1}} \leq \int_{\tau}^{t} \|e_{\theta}(s)\|_{2^{\alpha-1}} e^{-t-s} ds + \int_{\tau}^{t} \left( e^{-s} \right)^{2} (3.65)
\]

where \( Q > 0 \) depends on \( a - \tau, b, \) and \( M \) but is independent of \( \varepsilon \).

Due to Lemma 3.4 and (3.59) and (3.60), we estimate \( I_{3} \) as follows:

\[
I_{3} \leq C(1 + \|u\|_{L^6} + \|v\|_{L^6}) \|x_{a} w\|_{2^{\alpha-1}} \|w\|_{2^{\alpha-1}} \|\theta\|_{2^{\alpha-1}} + Q
\]

Combining (3.58) and (3.61)–(3.63), we simplify (3.56) as follows:

\[
\frac{d}{dt} \Psi(t) \leq Q\Psi(t) + \varepsilon^{2} \|e_{\theta}(t)\|_{2^{\alpha-1}}^{2} + Q
\]

Applying the Gronwall inequality to (3.64) and using of (3.53), it follows that

\[
\|e_{\theta}(t)\|_{2^{\alpha-1}} \leq \int_{\tau}^{t} \|e_{\theta}(s)\|_{2^{\alpha-1}} e^{-t-s} ds + \int_{\tau}^{t} \left( e^{-s} \right)^{2} (3.65)
\]

provided that \( \|\xi_{u}(\tau)\| \leq M \).

Now we rewrite Eq. (3.32) as

\[
\varepsilon \partial_{t}w(t) + w(t) = (-\Delta)^{-1}H(t),
\]

where \( H(t) = -\partial_{t}^{2}w - \partial_{t}w - (f(u) - f(v)) + Lv + g(x, t) \) and \((-\Delta)^{-1}H(t) \in C_{b}([-\tau, b], L^{2}(\Omega))\).

Applying the variation of constants method and considering the fact that \( \xi_{w}(a - \tau) = 0 \), we obtain

\[
w(t) = \frac{1}{\varepsilon} e^{-\frac{1}{\varepsilon} t} \int_{a - \tau}^{t} e^{\frac{1}{\varepsilon} s}(-\Delta)^{-1}H(s) ds.
\]

From Lemmas 3.1 and 3.3 and (3.65) we find

\[
\|H(t)\|_{2^{\alpha-1}} \leq Q \quad \text{for all } t \in [a - \tau, b] \text{ and } \varepsilon \in [0, 1],
\]

where \( Q > 0 \) depends on \( a, a - \tau, b, \) and \( M \) but is independent of \( \varepsilon \).
Finally, combining (3.65) and (3.68) and taking the $H^{a+1}$-norm of both sides of (3.67), we get the desired conclusion. The proof is finished.

The proof of Theorem 3.1 The existence of pullback attractors follows directly from Theorem 2.1, Corollary 3.1, and Lemmas 3.3 and 3.5. Then by Lemmas 2.1, 3.2, 3.3, and 3.5 we readily check that all assumptions of Theorem 2.2 (with $X = \mathcal{E}$ and $Y = \mathcal{E}^{-1}$) are satisfied.

Acknowledgements
We would like to thank the referee for invaluable comments and insightful suggestions.
