| Item No | Item | RECOMMENDATION | Reported on Page Number/Line Number | Reported on Section/Paragraph |
|--------|------|----------------|------------------------------------|------------------------------|
|        | Title | Provide as accurate and concise a description of the content of the article as possible. | Page 1 Line 1-2 | Title page |
|        | Abstract | Provide an accurate summary of the background, research objectives, including details of the species or strain of animal used, key methods, principal findings and conclusions of the study. | Page 1,2,3 Line 20-57 | Abstract |
|        |        | **INTRODUCTION** | | |
|        | Background | a. Include sufficient scientific background (including relevant references to previous work) to understand the motivation and context for the study, and explain the experimental approach and rationale.  
 b. Explain how and why the animal species and model being used can address the scientific objectives and, where appropriate, the study's relevance to human biology. | Page 4 Line 61-91, Line 92-94 | Introduction/Paragraph 1-3 |
|        | Objectives | Clearly describe the primary and any secondary objectives of the study, or specific hypotheses being tested. | Page 5 Line 94-97 | Introduction/Paragraph 4 |
|        | **METHODS** | | | |
|        | Ethical statement | Indicate the nature of the ethical review permissions, relevant licences (e.g. Animal [Scientific Procedures] Act 1986), and national or institutional guidelines for the care and use of animals, that cover the research. | Page 6 Line 118-120 | Material and methods/Paragraph 1 |
|        | Study design | For each experiment, give brief details of the study design including:  
a. The number of experimental and control groups.  
b. Any steps taken to minimise the effects of subjective bias when allocating animals to treatment (e.g. randomisation procedure) and when assessing results (e.g. if done, describe who was blinded and when).  
c. The experimental unit (e.g. a single animal, group or cage of animals). A time-line diagram or flow chart can be useful to illustrate how complex study designs were carried out. | Page 5 Line 102-117 | Material and methods/Paragraph 1 |
|        | Experimental procedures | For each experiment and each experimental group, including controls, provide precise details of all procedures carried out. For example:  
a. How (e.g. drug formulation and dose, site and route of administration, anaesthesia and analgesia used [including monitoring], surgical procedure, method of euthanasia). Provide details of any specialist equipment used, including supplier(s).  
b. When (e.g. time of day).  
c. Where (e.g. home cage, laboratory, water maze).  
d. Why (e.g. rationale for choice of specific anaesthetic, route of administration, drug dose used). | Page 6 Line 109-117 | Material and methods/Paragraph 1 |
| Section                                      | Page   | Material and methods/Paragraph |
|----------------------------------------------|--------|--------------------------------|
| Experimental animals                        | 8      | 102-117                        |
| b. Provide further relevant information such as the source of animals, international strain nomenclature, genetic modification status (e.g. knock-out or transgenic), genotype, health/immune status, drug or test naïve, previous procedures, etc. |        |                                |
| Housing and husbandry                        | 9      | 107-108                        |
| a. Housing (type of facility e.g. specific pathogen free [SPF]; type of cage or housing; bedding material; number of cage companions; tank shape and material etc. for fish). |        |                                |
| b. Husbandry conditions (e.g. breeding programme, light/dark cycle, temperature, quality of water etc for fish, type of food, access to food and water, environmental enrichment). |        |                                |
| c. Welfare-related assessments and interventions that were carried out prior to, during, or after the experiment. |        |                                |
| Sample size                                  | 10     | 102                            |
| b. Explain how the number of animals was arrived at. Provide details of any sample size calculation used. |        |                                |
| Allocating animals to experimental groups    | 11     | 102-117                        |
| a. Give full details of how animals were allocated to experimental groups, including randomisation or matching if done. |        |                                |
| Experimental outcomes                       | 12     | 123-174                        |
| a. Clearly define the primary and secondary experimental outcomes assessed (e.g. cell death, molecular markers, behavioural changes). |        |                                |
| Statistical methods                          | 13     | 208-213                        |
| a. Provide details of the statistical methods used for each analysis. |        |                                |
| b. Specify the unit of analysis for each dataset (e.g. single animal, group of animals, single neuron). |        |                                |
| c. Describe any methods used to assess whether the data met the assumptions of the statistical approach. |        |                                |
| RESULTS                                      |        |                                |
| Baseline data                                | 14     | 218-232                        |
| a. For each experimental group, report relevant characteristics and health status of animals (e.g. weight, microbiological status, and drug or test naïve) prior to treatment or testing. (This information can often be tabulated). |        | Result/paragraph 1            |
| Numbers analysed                             | 15     | 218-219                        |
| a. Report the number of animals in each group included in each analysis. Report absolute numbers (e.g. 10/20, not 50%). |        | Result/paragraph 1            |
| b. If any animals or data were not included in the analysis, explain why. |        |                                |
| Outcomes and estimation                      | 16     | 218-219                        |
| a. Report the results for each analysis carried out, with a measure of precision (e.g. standard error or confidence interval). |        | Result/paragraph 1            |
| Adverse events                               | 17     | 218-219                        |
| a. Give details of all important adverse events in each experimental group. |        | Result/paragraph 1            |
| b. Describe any modifications to the experimental protocols made to reduce adverse events. |        |                                |
DISCUSSION

Interpretation/scientific implications 18
a. Interpret the results, taking into account the study objectives and hypotheses, current theory and other relevant studies in the literature.
b. Comment on the study limitations including any potential sources of bias, any limitations of the animal model, and the imprecision associated with the results.
c. Describe any implications of your experimental methods or findings for the replacement, refinement or reduction (the 3Rs) of the use of animals in research.

Page 13 Line 263-272 Discussion/paragraph 1

Generalisability/translation 19
Comment on whether, and how, the findings of this study are likely to translate to other species or systems, including any relevance to human biology.

Page 16 Line 326-331 Discussion/paragraph 5

Funding 20
List all funding sources (including grant number) and the role of the funder(s) in the study.
