Reporting Checklist

This checklist is used to ensure good reporting standards and to improve the reproducibility of published results. Please respond completely to all questions relevant to your manuscript. For more information, please read the journal’s Guide to Authors.

☐ Check here to confirm that the following information is available in the Material & Methods section:

- the exact sample size \((n)\) for each experimental group/condition, given as a number, not a range;
- a description of the sample collection allowing the reader to understand whether the samples represent technical or biological replicates (including how many animals, litters, culture, etc.);
- a statement of how many times the experiment shown was replicated in the laboratory;
- definitions of statistical methods and measures: (For small sample sizes \((n<5)\) descriptive statistics are not appropriate, instead plot individual data points)
  - very common tests, such as \(t\)-test, simple \(\chi^2\) tests, Wilcoxon and Mann-Whitney tests, can be unambiguously identified by name only, but more complex techniques should be described in the methods section;
  - are tests one-sided or two-sided?
  - are there adjustments for multiple comparisons?
  - statistical test results, e.g., \(P\) values;
  - definition of ‘center values’ as median or mean;
  - definition of error bars as s.d. or s.e.m. or c.i.

Please ensure that the answers to the following questions are reported in the manuscript itself. We encourage you to include a specific subsection in the methods section for statistics, reagents and animal models. Below, provide the page number or section and paragraph number.

### Statistics and general methods

1. How was the sample size chosen to ensure adequate power to detect a pre-specified effect size? (Give section/paragraph or page #)

For animal studies, include a statement about sample size estimate even if no statistical methods were used.

2. Describe inclusion/exclusion criteria if samples or animals were excluded from the analysis. Were the criteria pre-established? (Give section/paragraph or page #)

For animal studies, include a statement about randomization even if no randomization was used.

3. If a method of randomization was used to determine how samples/animals were allocated to experimental groups and processed, describe it. (Give section/paragraph or page #)

For animal studies, include a statement about randomization even if no randomization was used.

| Reported in section/paragraph or page # |
|----------------------------------------|
| Sample sizes were based in standard protocols in the field. Reported in "statistical analysis" section (Line 508). |
| Included in "Methods", in "Animal studies" section (Line 493). |
| No sample or animal was excluded, reported in "Methods", in "Animal studies" section (Line 493). |
| Randomization described in "Methods", in "Animal studies" section (Line 493). |
| Mice were randomly assigned to groups with equal litter contribution. |
### 4. If the investigator was blinded to the group allocation during the experiment and/or when assessing the outcome, state the extent of blinding. (Give section/paragraph or page #)

Experiments with animals were blinded to the researcher assessing markers. Included in "Methods", in "Animal studies" section (Line 493).

For animal studies, include a statement about blinding even if no blinding was done.

Included in "Methods", in "Animal studies" section (Line 493).

### 5. For every figure, are statistical tests justified as appropriate?

Statistical tests, chosen based on the nature of the comparison being made and the standard tests used in the field. Reported in "Methods", in "statistical analysis" sample independence, variance equality, and normality were assumed to be met although not explicitly examined.

Is there an estimate of variation within each group of data?

Variance was assumed equal.

Is the variance similar between the groups that are being statistically compared? (Give section/paragraph or page #)

Variance equality was assumed to be met although not explicitly examined.

### Reagents

6. Report the source of antibodies (vendor and catalog number)

Reported in section/paragraph or page #

Reported in "Methods" section, in "Reagents and antibodies" section (Line 335).

7. Identify the source of cell lines and report if they were recently authenticated (e.g., by STR profiling) and tested for mycoplasma contamination

Reported in section/paragraph or page #

Reported in "Methods" section, in "Cell culture" section (Line 325).

### Animal Models

8. Report species, strain, sex and age of animals

Included in "Methods", in "Animal studies" section (Line 493)

9. For experiments involving live vertebrates, include a statement of compliance with ethical regulations and identify the committee(s) approving the experiments.

Included in "Ethics statement" section (Line 686).

10. We recommend consulting the ARRIVE guidelines (PloS Biol. 8(6), e1000412, 2010) to ensure that other relevant aspects of animal studies are adequately reported.
Human subjects

11. Identify the committee(s) approving the study protocol.

12. Include a statement confirming that informed consent was obtained from all subjects.

13. For publication of patient photos, include a statement confirming that consent to publish was obtained.

14. Report the clinical trial registration number (at ClinicalTrials.gov or equivalent).

15. For phase II and III randomized controlled trials, please refer to the CONSORT statement and submit the CONSORT checklist with your submission.

16. For tumor marker prognostic studies, we recommend that you follow the REMARK reporting guidelines.

Data deposition

17. Provide accession codes for deposited data. Data deposition in a public repository is mandatory for:
   a. Protein, DNA and RNA sequences
   b. Macromolecular structures
   c. Crystallographic data for small molecules
   d. Microarray data

Deposition is strongly recommended for many other datasets for which structured public repositories exist; more details on our data policy are available in the Guide to Authors. We encourage the provision of other source data in supplementary information or in unstructured repositories such as Figshare and Dryad. We encourage publication of Data Descriptors (see Scientific Data) to maximize data reuse.

18. If computer code was used to generate results that are central to the paper’s conclusions, include a statement in the Methods section under “Code availability” to indicate whether and how the code can be accessed. Include version information as necessary and any restrictions on availability.

Reported in section/paragraph or page #

| Reported in "Ethics statement" section (Line 686). |
| Reported in "Ethics statement" section (Line 686). |
| NA |
| NA |

| AmpliSeq RNA-seq data was deposited Gene Expression Omnibus (GEO) databases with number GSE63089, GSE13911, GSE54129, GSE33335 and GSE19826. Reported on "Supplementary Figure Legends", in "Supplementary Fig. S2" and "Supplementary Fig. S3". |
