The problem on asymptotic of the value
\[ \pi(m, n) = m! \sigma_m(p(1, n), p(2, n), \ldots, p(n, n)) \]

is considered, where \( \sigma_m(x_1, x_2, \ldots, x_n) \) is the \( m \)th elementary symmetric function of \( n \) variables. The result is interpreted in the context of nonequiprobable random mappings theory.

**Key words:** Random Mappings, Chaotic Numerics, Symmetric Functions.

**AMS subject classifications:** 34A50, B58F13.

1 **Statement of the Problem**

Let
\[ p(k, n) = \int_{k-1 \over n}^{k \over n} q(t) \, dt, \quad k = 1, 2, \ldots, n, \]

(1)

with
\[ \int_0^1 q(t) \, dt = 1, \]

(2)

*Permanent address: Institute of Information Transmission Problems, Russian Academy of Science, 19 Bolshoi Karetny Lane, Moscow 101447, Russia.*
where
\[ q(t) = \alpha \beta(t) t^{\gamma-1} \geq 0, \quad \beta(0) = 1, \quad \alpha > 0, \quad 0 < \gamma \leq 1. \] (3)
and the function \( \beta(t) \) is continuous on the interval \([0, 1]\).

The problem on asymptotic of the value
\[ \pi(m, n) = m! \sigma_m(p(1, n), p(2, n), \ldots, p(n, n)) \]
is considered, where \( \sigma_m(x_1, x_2, \ldots, x_n) \) is the \( m \)th elementary symmetric function of \( n \) variables. This problem arises in particular in the analysis of the distribution of transient time and other combinatorial characteristics in random nonequiprobable graphs [7] whose distributions have proved essential to the analysis of discretizations of dynamical systems with quasi-chaotic behavior. See [3, 6] and references therein.

**Theorem 1** The following relations are valid for \( n \to \infty \)
\[
\begin{align*}
\pi(m, n) & \to e^{-\frac{1}{2}(\int_0^1 q^2(t)dt)x^2} \quad \text{as} \quad \frac{m}{\sqrt{n}} \to x, \quad 0 < \gamma \leq 1; \\
\pi(m, n) & \to e^{-\frac{1}{2n^2}x^2} \quad \text{as} \quad \frac{m}{\sqrt{n(\log n)}} \to x, \quad \gamma = \frac{1}{2}; \\
\pi(m, n) & \to L(\gamma, \alpha x) \quad \text{as} \quad \frac{m}{n^{\gamma}} \to x, \quad 0 < \gamma < \frac{1}{2}
\end{align*}
\] (4)

where \( L(\gamma, z) \) is the entire analytic function defined by the infinite product
\[
L(\gamma, z) = \prod_{k=1}^{\infty} \left\{ 1 + \frac{k^{\gamma} - (k-1)^\gamma}{\gamma} z \right\} e^{\frac{k^\gamma - (k-1)^\gamma}{\gamma} x \alpha}. \] (7)

For \( 0 < \gamma < \frac{1}{2} \) and for the values \(|x| < \frac{\alpha}{\gamma}\) the following representation
\[
\pi(m, n) \to e^{-\sum_{r=2}^{\infty} \frac{(-1)^r}{r!} \left\{ \sum_{k=1}^{\infty} \frac{(k^{\gamma} - (k-1)^\gamma)}{\gamma} \right\}(\alpha x)^r} \quad \text{as} \quad \frac{m}{n^{\gamma}} \to x
\]
is also valid.

Note a specification of the theorem above in the spirit of random mappings theory [1]. Denote \( \Xi(n) = \{1, 2, \ldots, n\} \) for a positive integer \( n \). Let also the set \( \Xi(n) \) be endowed with a probability measure \( \mu_{n,q} \) given by equalities \( \mu_{n,q}(k) = p(k, n) \) where the function \( q \) and the numbers \( p(k, n) \) are as in (1). Consider now the random mapping \( F \) defined by
\[
\mathbb{P}_{\mu}(F = f) = \prod_{k=1}^{n} p(f(k), n).
\]

Generally speaking, this mean that the “appeal” of a point \( n \) is proportional to its weight \( p(k, n) \). If \( q \equiv 1 \), then \( F_{q,n} \) is a completely random mapping. We emphasize here that the completely random mappings is essentially a purely combinatorial object. The theory of completely random mappings is quite well developed, using specifically combinatorial methods. See [1] and bibliography therein.
For a mapping $f : \Xi(n) \to \Xi(n)$ and for an element $k \in \Xi(n)$ we denote by $Q(k, f)$ the first recurrence time, that is $Q(k, f) = \min\{i : f^i(k) = f^j(k), \text{ for some } j < i\}$. Designate further by $Q(x, f)$ the scaled distribution function

$$Q_\gamma(x, f) = \frac{1}{n} \# \{k : Q(k, f) < xn^\gamma\}$$

where $\# S$ denotes the cardinality of the finite set $S$. The function $Q$ is a random function if $f$ is constructed as realization of the random mapping $F$. Thus, we can consider the mathematical expectation $Q_{\gamma,n}(x)$. The theorem above implies the following corollary immediately.

**Corollary 1** The following relations are valid for $n \to \infty$

$$Q_{\gamma,n}(x) \to \mathcal{L}(\gamma, ax) \quad \text{as} \quad 0 < \gamma < \frac{1}{2} \quad (8)$$

Random mapping with similar asymptotic of weights of elements arises naturally, for instance, in the analysis of discretizations of random mappings where the box counting dimension of the invariant measure differs from its correlation dimension [3].

To conclude this section we note that the equality (5) can be obtained also as a corollary of Theorem 1 [2].

## 2 Proof

The proof of the theorem is based on the following two lemmas.

**Lemma 1** Let $f(z)$ and $f_n(z)$, $n = 1, 2, \ldots$, be entire analytic functions of $z \in C$ such that

$$f_n(z) \to f(z) \quad \text{as} \quad n \to \infty$$

uniformly with respect to $z$ from any bounded circle $|z| \leq R$. Let $\mu(n)$ be integer-valued function and $\nu(n)$ be real-valued one such that

$$\nu(n) \to \infty, \quad \frac{\mu(n)}{\nu(n)} \to x \quad \text{as} \quad n \to \infty.$$

Then

$$F(n) = \frac{1}{2\pi i} \int_{|z|=\rho} e^{\nu(n)z} f_n(z) \frac{\nu(n)^{\mu(n)}}{\mu(n)!} f(x)(1 + o(1)) \quad \text{as} \quad n \to \infty.$$

**Lemma 2** Let $f(n, z)$ be the polynomial

$$f(n, z) = \prod_{k=1}^{n} (1 + p(k, n)z). \quad (9)$$
Then uniformly with respect to \( z \) from any bounded circle \( |z| \leq R \) the following relations are valid

\[
\begin{align*}
f(n, \sqrt{n}z)e^{-\sqrt{n}z} & \to e^{-\frac{1}{2}(\lambda(t)q^2(t))z^2} \quad \text{as} \quad n \to \infty, \quad \frac{1}{2} < \gamma \leq 1; \\
f(n, \sqrt{n(\log n)^{-1}}z)e^{-\sqrt{n(\log n)^{-1}}z} & \to e^{-\frac{1}{2}a^2z^2} \quad \text{as} \quad n \to \infty, \quad \gamma = \frac{1}{2}; \\
f(n, n^\gamma z)e^{-n^\gamma z} & \to \mathcal{L}(\gamma, \alpha z) \quad \text{as} \quad n \to \infty, \quad 0 < \gamma < \frac{1}{2}
\end{align*}
\]

where \( \mathcal{L}(\gamma, z) \) is the entire analytic function defined by (7).

**Proof of Theorem 1.** Since the proof is identical for the cases \( 0 < \gamma < \frac{1}{2}, \gamma = \frac{1}{2} \) and \( \frac{1}{2} < \gamma \leq 1 \) it will be presented only for the last case.

Remark that the value of \( \frac{1}{m!} \pi (m, n) \) by the Vi`{e}te theorem coincides with the coefficient at the term \( z^m \) in the Taylor expansion of the function \( f(n, z) \) defined by (9). Then by the theorem on residue of an analytic function

\[
\pi (m, n) = m! \frac{1}{2\pi i} \int_{|z|=\rho} f(n, z) \frac{1}{z^{m+1}} \, dz
\]

and, after substitution \( z = \sqrt{n}w \),

\[
\pi (m, n) = \frac{m!}{(\sqrt{n})^m} \frac{1}{2\pi i} \int_{|w|=\tilde{\rho}} e^{\sqrt{n}w} \frac{1}{w^{m+1}} f_n(w) \, dw
\]

where

\[
f_n(w) = f(n, \sqrt{n}w)e^{-\sqrt{n}w}.
\]

From this and from Lemmas 1 and 2 the statement of Theorem for the case \( \frac{1}{2} < \gamma \leq 1 \) immediately follows.

Although Lemma 1 is in line with statements from the theory of integral’s asymptotics proven with the help of the saddle point method (see, e.g. [4, 5]), we failed to find the appropriate reference to the exact formulation. Because of this and for the sake of completeness of presentation, below is given the full proof of Lemma 1.

**Proof of Lemma 1.** By the theorem on residue of an analytic function

\[
\frac{1}{2\pi i} \int_{|z|=\rho} e^{\nu(n)z} \frac{1}{z^{\mu(n)+1}} \, dz = \frac{(\nu(n))^{\mu(n)}}{\mu(n)!}
\]

for any value of \( \rho > 0 \). Hence, choosing \( \rho = \frac{\mu(n)}{\nu(n)} \), the value of \( F(n) \) may be represented as

\[
F(n) = \frac{(\nu(n))^{\mu(n)}}{\mu(n)!} f(x) + \xi(n), \quad (10)
\]
where
\[
\xi(n) = \frac{1}{2\pi i} \int_{|z| = \mu(n)/\nu(n)} e^{\nu(n)z} z^{\mu(n)+1} (f_n(z) - f(x)) \, dz.
\]

Estimate the value of $|\xi(n)|$. Fulfil the substitution $z = \mu(n) e^{i\varphi}$ in the above integral. Then
\[
|\xi(n)| \leq \frac{1}{2\pi} \left| \int_{-\pi}^{\pi} e^{\mu(n)(\cos \varphi + i\sin \varphi)} \left[ f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\varphi} \right) - f(x) \right] \frac{\mu(n)}{\nu(n)} i e^{i\varphi} \, d\varphi \right| \leq \\
\leq \frac{1}{2\pi} \int_{-\pi}^{\pi} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\varphi} \right) - f(x) \right| \, d\varphi = \\
= \frac{1}{2\pi} e^{\mu(n)(\nu(n))\mu(n)} \int_{-\pi}^{\pi} e^{\mu(n)(\cos \varphi - 1)} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\varphi} \right) - f(x) \right| \, d\varphi.
\]

Now, using the Stirling’s formula
\[
\mu(n)! = \frac{1}{\sqrt{2\pi \mu(n)}} \left( \frac{\mu(n)}{e} \right)^{\mu(n)} \left( 1 + O \left( \frac{1}{\mu(n)} \right) \right),
\]
we may write that
\[
|\xi(n)| \leq \frac{(\nu(n))^{\mu(n)}}{\mu(n)!} c_0 \eta(n) (11)
\]
with an appropriate constant $c_0$ where
\[
\eta(n) = \sqrt{\frac{\mu(n)}{2\pi}} \int_{-\pi}^{\pi} e^{\mu(n)(\cos \varphi - 1)} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\varphi} \right) - f(x) \right| \, d\varphi.
\]

In view of (10) and (11) it remains to show that
\[
\eta(n) \to 0 \quad \text{as} \quad n \to \infty. \quad (12)
\]

To do it introduce auxiliary constants
\[
\chi = \min_{-\pi \leq \varphi \leq \pi} 2 \frac{(1 - \cos \varphi)}{\varphi^2}
\]
and
\[
c_1 = \sup_{n \geq 1} \sup_{|z| \leq 2x} |f_n(z) - f(x)|, \quad \varepsilon(n) = \max_{|\varphi| \leq \chi^{-1/2}(\mu(n))^{-1/4}} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\varphi} \right) - f(x) \right|.
\]
Clearly $\chi > 0$, $c_1 < \infty$ and $\varepsilon(n) \to 0$ as $n \to \infty$ in view of uniform convergence of the sequence $\{f_n(z)\}$ to $f(z)$ on any bounded circle. Hence

$$\eta(n) \leq \sqrt{\frac{\mu(n)}{2\pi}} \int_{-\pi}^{\pi} e^{-\frac{\mu(n)}{2} \varphi^2} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\sqrt{\mu(n)}} \right) - f(x) \right| d\varphi$$

and, by substitution $\sqrt{\mu(n)} \chi \varphi = \psi$, we obtain that

$$\eta(n) \leq \frac{1}{\sqrt{2\pi \chi}} \int_{-\sqrt{\mu(n)}}^{\sqrt{\mu(n)}} e^{-\varphi^2/\chi} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\sqrt{\mu(n)}} \right) - f(x) \right| d\psi = I_1(n) + I_2(n) + I_3(n)$$

where

$$I_1(n) = \frac{1}{\sqrt{2\pi \chi}} \int_{-(\mu(n))^{1/4}}^{(\mu(n))^{1/4}} e^{-\varphi^2/\chi} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\sqrt{\mu(n)}} \right) - f(x) \right| d\varphi,$$

$$I_2(n) = \frac{1}{\sqrt{2\pi \chi}} \int_{-\sqrt{\mu(n)}}^{\sqrt{\mu(n)}} e^{-\varphi^2/\chi} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\sqrt{\mu(n)}} \right) - f(x) \right| d\varphi,$$

$$I_3(n) = \frac{1}{\sqrt{2\pi \chi}} \int_{-(\mu(n))^{1/4}}^{\sqrt{\mu(n)}} e^{-\varphi^2/\chi} \left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\sqrt{\mu(n)}} \right) - f(x) \right| d\varphi.$$

By definition of the value $\varepsilon(n)$, we have

$$\left| f_n \left( \frac{\mu(n)}{\nu(n)} e^{i\sqrt{\mu(n)}} \right) - f(x) \right| \leq \varepsilon(n) \quad \text{for} \quad |\psi| \leq (\mu(n))^{1/4}$$

and thus

$$I_1(n) \leq \left( \frac{1}{\sqrt{2\pi \chi}} \int_{-\mu(n)^{1/4}}^{\mu(n)^{1/4}} e^{-\frac{\varphi^2}{\chi}} d\varphi \right) \varepsilon(n) \leq \frac{2\pi}{\chi} \varepsilon(n). \quad (13)$$

At the same time, by definition of the constant $c_1$ we have

$$I_2(n), I_3(n) \leq \left( \frac{1}{\sqrt{2\pi \chi}} \int_{(\mu(n))^{1/4}}^{\sqrt{\mu(n)}} e^{-\frac{\varphi^2}{\chi}} d\varphi \right) c_1 = \zeta(n) \to 0 \quad \text{as} \quad n \to \infty. \quad (14)$$

From (13), (14) it follows (12) which completes the proof of the lemma. \qed
In the proof of Lemma 2 properties of the numbers \( p(k, n) \) play an important role. So, establish these properties prior to pass to the proof of Lemma 2. From the theorem on mean value of integral it follows that
\[
p(k, n) = \alpha \beta(\tau_{k,n}) \frac{k^{\gamma} - (k - 1)^{\gamma}}{\gamma n^{\gamma}}, \quad \frac{k - 1}{n} \leq \tau_{k,n} \leq \frac{k}{n}, \quad k = 1, 2, \ldots, n.
\] (15)
Therefore
\[
p(k, n) = \alpha \left( \beta \left( \frac{k}{n} \right) + \tilde{\beta}(k, n) \right) \frac{k^{\gamma} - (k - 1)^{\gamma}}{\gamma n^{\gamma}}, \quad k = 1, 2, \ldots, n
\] (16)
where
\[
\tilde{\beta}(k, n) \leq \max_{\frac{k-1}{n} \leq t \leq \frac{k}{n}} \left| \beta \left( \frac{k}{n} \right) - \beta(t) \right|
\]
and thus, in view of continuity of the function \( \beta(t) \),
\[
\tilde{\beta}(n) = \max_{1 \leq k \leq n} \tilde{\beta}(k, n) \rightarrow 0 \quad \text{as} \quad n \rightarrow \infty.
\] (17)
From the continuity of the function \( \beta(t) \) it follows that the product of the first two multipliers in (15) is uniformly (with respect to \( n \) and \( k \in [1, n] \)) bounded. At the same time, for a given \( \gamma \in (0, 1] \) the numbers \( k^{1-\gamma}(k^{\gamma} - (k - 1)^{\gamma}) \) are also uniformly bounded. Then by (16) such a constant \( p_{*} = p(\alpha, \gamma) \) can be chosen that
\[
\alpha (k^{\gamma} - (k - 1)^{\gamma}) \leq \gamma p_{*}k^{\gamma-1}
\] (18)
and simultaneously
\[
0 \leq p(k, n) \leq p_{*} \frac{k^{\gamma-1}}{n^{\gamma}} \leq p_{*}n^{-\gamma}.
\] (19)

**Proof of Lemma 2.** Case \( \gamma \leq 1 \). Set \( g(n, z) = f(n, \sqrt{n}z) e^{-\sqrt{n}z} \), then
\[
g(n, z) = e^{-\sqrt{n}z} \prod_{k=1}^{n} (1 + p(k, n)\sqrt{n}z) = \prod_{k=1}^{n} \left\{ (1 + p(k, n)\sqrt{n}z) e^{-p(k,n)\sqrt{n}z} \right\}
\] (20)
(here the latter equality follows from (1) and (2)). By (19), \( 0 \leq p(k, n)\sqrt{n} \leq p_{*}n^{\frac{3}{2} - \gamma} \) and so \( p(k, n)\sqrt{n} \rightarrow 0 \) as \( n \rightarrow \infty \) uniformly with respect to \( k \). Hence for any \( R < \infty \) such a value \( n(R) \) can be chosen that \( |p(k, n)\sqrt{n}z| \leq \frac{1}{2} \) for \( n \geq n(R) \), \( |z| \leq R \) uniformly with respect to \( k \). Then, for such \( n \) and \( z \), the representation
\[
1 + p(k, n)\sqrt{n}z = e^{\ln(1+p(k,n)\sqrt{n}z)} = e^{p(k,n)\sqrt{n}z - \frac{1}{2} (p(k,n)\sqrt{n}z)^{2}} + \theta(k,n,z)(p(k,n)\sqrt{n}z)^{3}
\] (21)
is valid where
\[
|\theta(k, n, z)| \leq \theta_{0} < \infty, \quad n \geq n(R), \quad 1 \leq k \leq n, \quad |z| \leq R.
\] (22)
By substituting (21) in (20) we obtain that
\[
g(n, z) = e^{-\frac{n}{2}(\sum_{k=1}^{n} p^{2}(k,n))z^{2} + \tilde{\theta}(n, z)}
\] (23)
where
\[ \tilde{\theta}(n, z) = n^\frac{3}{2} \left( \sum_{k=1}^{n} \theta(k, n, z) \right) z^3. \] (24)

From (1) it is seen that \( p(k, n) = \frac{1}{n} q(t_{k,n}) \) with an appropriate \( t_{k,n} \in \left[ \frac{k-1}{n} \frac{k}{n} \right] \). Thus, given arbitrary \( \varepsilon > 0 \), we can write
\[ \frac{n}{2} \sum_{k=1}^{n} p^2(k, n) = S_1(\varepsilon, n) + S_2(\varepsilon, n) \]
where
\[ S_1(\varepsilon, n) = \frac{n}{2} \sum_{1 \leq k < \varepsilon n} p^2(k, n), \quad S_2(\varepsilon, n) = \frac{1}{2} \sum_{\varepsilon n \leq k \leq n} \frac{1}{n} q^2(t_{k,n}). \]

From (19) it follows that
\[ S_1(\varepsilon, n) \leq \frac{1}{2} c_0 p_*^2 n^{1-2\gamma} \sum_{1 \leq k < \varepsilon n} k^{2(\gamma-1)} \leq \frac{1}{2} c_0 p_*^2 n^{1-2\gamma} (\varepsilon n)^{2(\gamma-1)+1} \]
with an appropriate constant \( c_0 \), and thus
\[ S_1(\varepsilon, n) \leq \frac{1}{2} c_0 p_*^2 \varepsilon^{2\gamma-1} \rightarrow 0 \quad \text{as} \quad \varepsilon \rightarrow 0. \] (25)

On the other hand, in view of summability of the function \( q^2(t) \) on the interval \( [\varepsilon, 1] \),
\[ S_2(\varepsilon, n) \rightarrow \frac{1}{2} \int_{\varepsilon}^{1} q^2(t) dt \quad \text{as} \quad n \rightarrow \infty. \]

From this and from (25) it follows that
\[ \frac{n}{2} \sum_{k=1}^{n} p^2(k, n) \rightarrow \frac{1}{2} \int_{0}^{1} q^2(t) dt \quad \text{as} \quad n \rightarrow \infty. \] (26)

At the same time from (19), (22) and (24) it follows that
\[ |\tilde{\theta}(n, z)| \leq n^\frac{3}{2} \left( \sum_{k=1}^{n} |\theta(k, n, z)| p^3(k, n) \right) z^3 \leq \theta_0 p_*^3 n^{3(\frac{1}{2}-\gamma)} \left( \sum_{k=1}^{n} k^{3(\gamma-1)} \right) z^3 \leq \theta_0 c_1 p_*^3 n^{3(\frac{1}{2}-\gamma)} n^{3(\gamma-1)+1} z^3 \]
with an appropriate constant \( c_1 \). Thus
\[ |\tilde{\theta}(n, z)| \leq \theta_0 c_1 p_*^3 n^{-\frac{1}{2}}. \] (27)

From (23), (26), (27) and from the definition of the function \( g(n, z) \) the statement of the lemma for the case \( \frac{1}{2} < \gamma \leq 1 \) follows.
Case $\gamma = \frac{1}{2}$. Set $g(n, z) = f(n, \sqrt{n \log n}^{-1}z)e^{-\sqrt{n \log n}^{-1}z}$, then by (1) and (2)

$$
g(n, z) = \prod_{k=1}^{n}\left\{ \left(1 + p(k, n)\sqrt{n \log n}^{-1}z\right)e^{-p(k, n)\sqrt{n \log n}^{-1}z}\right\}. \quad (28)$$

By (19), $0 \leq p(k, n)\sqrt{n \log n}^{-1} \leq p_*(\log n)^{-1/2}$ and so $p(k, n)\sqrt{n \log n}^{-1} \to 0$ as $n \to \infty$ uniformly with respect to $k$. Hence for any $R < \infty$ such a value $n(R)$ can be chosen that $\left|p(k, n)\sqrt{n \log n}^{-1}z\right| \leq \frac{1}{2}$ for $n \geq n(R)$, $|z| \leq R$ uniformly with respect to $k$. Then for such $n$ and $z$ the representation

$$
1 + p(k, n)\sqrt{n \log n}^{-1}z = e^{\ln\left(1+p(k, n)\sqrt{n \log n}^{-1}z\right)} = e^{p(k, n)\sqrt{n \log n}^{-1}z - \frac{1}{2}\left(p(k, n)\sqrt{n \log n}^{-1}z\right)^2 + \theta(k, n, z)\left(p(k, n)\sqrt{n \log n}^{-1}z\right)^3} \quad (29)
$$

is valid where

$$
|\theta(k, n, z)| \leq \theta_0 < \infty, \quad n \geq n(R), \ 1 \leq k \leq n, \ |z| \leq R. \quad (30)
$$

By substituting (29) in (28) we obtain that

$$
g(n, z) = e^{-\sum_{k=1}^{n} \theta_0 p_*(\log n)^{-1/2}\left(p(k, n)\sqrt{n \log n}^{-1}z\right)^{3} + \theta(n, z)} \quad (31)
$$

where

$$
\tilde{\theta}(n, z) = \left(\frac{n}{\log n}\right)^{\frac{3}{2}}\left(\sum_{k=1}^{n} \theta(k, n, z)p_3^2(k, n)\right)z^3.
$$

Estimation of $\tilde{\theta}(n, z)$ is done analogously to the previous case. From (19), (30) and (31) it follows that

$$
|\tilde{\theta}(n, z)| \leq \left(\frac{n}{\log n}\right)^{\frac{3}{2}}\left(\sum_{k=1}^{n} |\theta(k, n, z)|p_3^2(k, n)\right)z^3 \leq
$$

$$
\leq \theta_0 p_3^3 (\log n)^{-\frac{3}{2}}\left(\sum_{k=1}^{n} k^{-\frac{3}{2}}\right)z^3 \leq
$$

$$
\leq \theta_0 c_1 p_3^3 n^{-\frac{3}{2}} (\log n)^{-\frac{3}{2}} z^3 \to 0 \quad \text{as} \quad n \to \infty. \quad (32)
$$

Before estimating the first summand in the power of the number $e$ in (31), we recall Euler’s formula:

$$
\lim_{n \to \infty} \left(\sum_{m=1}^{n} \frac{1}{m} - \log n\right) = C,
$$

from which it immediately follows

$$
\left|\sum_{m=k+1}^{n} \frac{1}{m} - \log \frac{n}{k}\right| \leq C_*, \quad 1 \leq k \leq n, \quad (33)
$$

9
with an appropriate constant $C_*$.

Now, fix an $\varepsilon > 0$ and choose such a real number $\delta > 0$ that

$$
|1 - \beta^2(t)| = |\beta^2(0) - \beta^2(t)| \leq \varepsilon, \quad 0 \leq t \leq \delta
$$

(this can be done by continuity of the function $\beta(t)$). Then we can write

$$
\frac{n}{2 \log n} \sum_{k=1}^{n} p^2(k, n) = S_1(\delta, n) + S_2(\delta, n)
$$

where

$$
S_1(\delta, n) = \frac{n}{2 \log n} \sum_{1 \leq k \leq \delta n} p^2(k, n), \quad S_2(\delta, n) = \frac{n}{2 \log n} \sum_{\delta n < k \leq n} p^2(k, n).
$$

From (19) and (33) it follows that

$$
S_2(\delta, n) \leq \frac{1}{2 \log n} p^2_* \sum_{\delta n < k \leq n} \frac{1}{k} \leq \frac{1}{2 \log n} p^2_* \left( C_* + \log \frac{n}{\delta n} \right) \leq \frac{1}{2 \log n} p^2_* \left( C_* + |\log \delta| \right) \to 0 \quad \text{as} \quad n \to \infty.
$$

At the same time by (15)

$$
S_1(\delta, n) = \frac{\alpha^2}{2 \log n} \sum_{1 \leq k \leq \delta n} 4 \beta^2(\tau_{k,n}) \left( \sqrt{k} - \sqrt{k-1} \right)^2 \quad \text{with} \quad \tau_{k,n} \leq \delta.
$$

Thus

$$
S_1(\delta, n) = \frac{\alpha^2}{2} + S_{11}(\delta, n) + S_{12}(\delta, n) + S_{13}(\delta, n)
$$

where

$$
S_{11}(\delta, n) = \frac{\alpha^2}{2 \log n} \left( \sum_{1 \leq k \leq \delta n} \frac{1}{k} - \log n \right),
$$

$$
S_{12}(\delta, n) = \frac{\alpha^2}{2 \log n} \sum_{1 \leq k \leq \delta n} 4 \left( \beta^2(\tau_{k,n}) - 1 \right) \left( \sqrt{k} - \sqrt{k-1} \right)^2,
$$

$$
S_{13}(\delta, n) = \frac{\alpha^2}{2 \log n} \sum_{1 \leq k \leq \delta n} \left\{ 4 \left( \sqrt{k} - \sqrt{k-1} \right)^2 - \frac{1}{k} \right\}.
$$

From (33) it follows that

$$
|S_{11}(\delta, n)| \leq \frac{\alpha^2(C_* + |\log \delta|)}{2 \log n}.
$$

From (34) it follows that

$$
|S_{12}(\delta, n)| \leq \frac{\alpha^2 \varepsilon}{2 \log n} \sum_{1 \leq k \leq \delta n} 4 \left( \sqrt{k} - \sqrt{k-1} \right)^2 \leq \frac{\alpha^2 \varepsilon}{2 \log n} \sum_{1 \leq k \leq \delta n} \frac{4}{k} \leq \frac{2 \alpha^2 \varepsilon C_* + |\log \delta| + \log n}{\log n}.
$$
At last, since
\[
\frac{1}{k} \leq 4 \left( \sqrt{k} - \sqrt{k-1} \right)^2 = \left( \frac{2}{\sqrt{k} + \sqrt{k-1}} \right)^2 \leq \frac{1}{k-1}
\]
then
\[
|S_{13}(\delta, n)| \leq \frac{\alpha^2}{2\log n} \sum_{1 \leq k \leq \delta n} \left| 4 \left( \sqrt{k} - \sqrt{k-1} \right)^2 - \frac{1}{k} \right| \leq \\
\leq \frac{\alpha^2}{2\log n} \left( 3 + \sum_{k \geq 2} \left( \frac{1}{k-1} - \frac{1}{k} \right) \right) = \frac{2\alpha^2}{\log n}.
\]
(40)

From (37), (38), (39) and (40) it follows that
\[
\limsup_{n \to \infty} \left| S_1(\delta, n) - \frac{\alpha^2}{2} \right| \leq 2\alpha^2 \varepsilon,
\]
and thus in view of (35) and (36)
\[
\limsup_{n \to \infty} \left| \frac{n}{2\log n} \sum_{k=1}^{n} p^2(k, n) - \frac{\alpha^2}{2} \right| \leq 2\alpha^2 \varepsilon.
\]

Since \(\varepsilon\) is arbitrary, then
\[
\lim_{n \to \infty} \frac{n}{2\log n} \sum_{k=1}^{n} p^2(k, n) = \frac{\alpha^2}{2}.
\]

From this and from (31), (32) the statement of the lemma in the case \(\gamma = \frac{1}{2}\) follows.

Case \(0 < \gamma < \frac{1}{2}\). Set \(g(n, z) = f(n, n^\gamma z)e^{-n^\gamma z}\), then
\[
g(n, z) = e^{-n^\gamma z} \prod_{k=1}^{n} \left( 1 + p(k, n)n^\gamma z \right) = \prod_{k=1}^{n} \left\{ (1 + p(k, n)n^\gamma z) e^{-p(k, n)n^\gamma z} \right\}
\]
(41)

(here the latter equality follows from (1) and (2)). Set also
\[
g(m, n, z) = \prod_{k=1}^{m} \left\{ (1 + p(k, n)n^\gamma z) e^{-p(k, n)n^\gamma z} \right\},
\]
(42)
\[
\mathcal{L}(m, \gamma, z) = \prod_{k=1}^{m} \left\{ \left[ 1 + \frac{k^\gamma - (k-1)^\gamma}{\gamma} z \right] e^{-\frac{k^\gamma - (k-1)^\gamma}{\gamma} z} \right\}.
\]
(43)

Now, using the evident inequality
\[
\left| (1 + z)e^{-z} \right| \leq e^{4|z|^2}
\]
and inequalities (18), (19) we can estimate the values \(|g(m, n, z)|\) and \(|\mathcal{L}(m, \gamma, \alpha z)|\) as follows
\[
|g(m, n, z)|, |\mathcal{L}(m, \gamma, \alpha z)| \leq e^{4p^2z^2} (\sum_{k=1}^{m} k^{2(\gamma-1)}) |z|^2 \leq e^{4p^2z^2} (\sum_{k=1}^{\infty} k^{2(\gamma-1)}) |z|^2.
\]
11
Since the power series $\sum_{k=1}^{\infty} k^{2(\gamma-1)}$ is summable for $0 < \gamma < \frac{1}{2}$ then

$$|g(m,n,z)|, \ |L(m,\gamma,\alpha z)| \leq e^{\omega |z|^2} \tag{44}$$

with an appropriate constant $\omega$ uniformly with respect to all possible combinations of $n$ and $m$. Analogously, for the functions

$$\hat{g}(m,n,z) = \prod_{k=m+1}^{n} \left\{ (1 + p(k,n)n^\gamma z) e^{-p(k,n)n^\gamma z} \right\}, \tag{45}$$

$$\hat{L}(m,\gamma,\alpha z) = \prod_{k=m+1}^{\infty} \left\{ 1 + \frac{k^\gamma - (k-1)^\gamma}{\gamma} z \right\} e^{-\frac{k^\gamma - (k-1)^\gamma}{\gamma} z} \tag{46}$$

we can get the following estimates

$$|\hat{g}(m,n,z) - 1|, \ |\hat{L}(m,\gamma,\alpha z)| \leq e^{\omega(m)|z|^2} - 1 \tag{47}$$

where

$$\omega(m) = 4\pi^2 \left( \sum_{k=m+1}^{\infty} k^{2(\gamma-1)} \right) \to 0 \text{ as } m \to \infty.$$ 

Represent the difference $g(n,z) - L(\gamma,\alpha z)$ in the form

$$g(n,z) - L(\gamma,\alpha z) = g(m,n,z)\hat{g}(m,n,z) - L(m,\gamma,\alpha z)\hat{L}(m,\gamma,\alpha z) =$$

$$= (g(m,n,z) - L(m,\gamma,\alpha z)) + g(m,n,z) (\hat{g}(m,n,z) - 1) + L(m,\gamma,\alpha z) (\hat{L}(m,\gamma,\alpha z) - 1)$$

where the integer $m$ will be chosen later. Then by (44) and (47)

$$|g(n,z) - L(\gamma,\alpha z)| \leq |g(m,n,z) - L(m,\gamma,\alpha z)| + 2e^{\omega|z|^2} |e^{\omega(m)|z|^2} - 1|. \tag{48}$$

Now, fix a numbers $R > 0, \ \varepsilon > 0$ and choose such a big integer $m = m(R,\varepsilon)$ that

$$2e^{\omega R^2} \left| e^{\omega(m)R^2} - 1 \right| < \varepsilon.$$ 

Then by (48)

$$|g(n,z) - L(\gamma,\alpha z)| \leq |g(m,n,z) - L(m,\gamma,\alpha z)| + \varepsilon, \quad |z| \leq R, \ n > m(R,\varepsilon). \tag{49}$$

But in view of (16), (17)

$$g(m,n,z) \to L(m,\gamma,\alpha z) \quad \text{as} \quad n \to \infty$$

for any fixed $m$ uniformly with respect to $z$ from any bounded circle. From here and from (49) we get that

$$\limsup_{n \to \infty} |g(n,z) - L(\gamma,\alpha z)| \leq \varepsilon, \quad |z| \leq R$$

and thus, since $\varepsilon$ is arbitrary,

$$g(n,z) \to L(\gamma,\alpha z) \quad \text{as} \quad n \to \infty$$

uniformly with respect to $|z| \leq R$.

The lemma is completely proved and so is the theorem. \qed
