Abstract

The purpose of this paper is to analyze the leadership styles and approaches that are linked to Afghan and Thai professionals by exploring their task and relationship orientations to glean best practices for application in the war-torn nation of Afghanistan. To continue gathering more data, we have consistently been using Northouse’s Style Questionnaire to collect responses from different cultures over the past two decades. More specifically, for this latest study, we compared the leadership orientations of working adult respondents from Thailand and Afghanistan based on their nationality and socialization in each culture on the task and relationship-orientation continuum of leadership. To gain practical insights across these two Asian cultures, we reflect and explore the Afghan orientation and compare it with the cultural practices of people in Thailand, where politicians have managed their political affairs more peacefully with their neighbors. Both Afghanistan and Thailand’s cultures are rooted in thousands of years of Asian philosophies, and both are high-context and collective; therefore, people are presumed to be more relationship-oriented, and this study found statistically significant support for this presumption. While respondents from both countries do have a stronger focus on their relationships, data shows that their task orientation is significantly lower. Analysis, recommendations for inclusion training, dealing with societal / workplace mobbing, and the study’s limitations are presented toward the end of the paper. The findings are useful for training purposes with managers, political leaders, and expatriates working in these two South and East Asian countries. For example, currently the political leaders in Afghanistan are working with the international community to unite all Afghans so they can become less dependent on foreign forces to keep the country peaceful. As such, they can capitalize on their task and relationship orientation skills to work on this gigantic task. Similarly, as of May 2021, Thailand has been experiencing another wave of the Covid-19 coronavirus, with about 10,000 infection cases on some days; as such, Thai leaders have to build strong relationships with everyone in the country to effectively manage this task of limiting the spread of this deadly infection through strict quarantine rules and quick vaccination of their large population.

Keywords: Afghan Leadership Orientation, Thai Cultural Orientations, Relationship-Orientation, Task-Orientation, Inclusion, Training, Societal Mobbing.

Introduction

The leadership styles and practices of people worldwide, especially Asians, have been discussed for thousands of years through rituals and stories being passed on from one generation to the next (Mujtaba, 2019b). Modern researchers and academicians write about the specific leadership styles of managers from across the globe, and some focus on better understanding their task and relationship orientations. The focus of task and relationship orientations can be observed in how different countries have responded to the Covid-19 coronavirus pandemic as some countries have been more task-oriented to reduce the number of deaths (such as New Zealand, Canada,
China, Singapore, South Korea, and Thailand). Others have suffered more due to cultural socialization of maintaining relationship rituals (such as Italy, Iran, Afghanistan, India, Brazil, and the United States) (Korman and Mujtaba, 2020). To explore the behavioral tendencies of working adults in the Afghan and Thai workplaces, we review the socialized norms of Afghan and Thai cultural practices while scientifically assessing their similarities and differences to gain insights for application in the modern workplace.

Afghans and Thais are likely to be relationship-oriented because their cultures are in Asia, collectivist, and influenced by Buddhism (2019a). While Afghans are majority Muslim today and Thais are majority Buddhists, the people of both countries have a good understanding of different spiritual views due to their centuries of being influenced by Islamic and Buddhist practices. Similarly, the people of both cultures are family-oriented and somewhat paternalistic. Perhaps because of this relationship-oriented society, people in Thailand seem to be more tolerant, internationally diverse, and inclusive of the world’s cultures, enabling their politicians and entrepreneurs to benefit from globalization trends and foreign direct investment opportunities. On the other side, despite their collective and relationship-oriented culture, the people of Afghanistan have had political upheavals, widespread corruption, and several regressive political regimes over the past four decades, which has hurt their economy (Mujtaba, 2013). Afghans can learn from the Thais best practices to improve their work environment and political economy since there are links and connections between cultural leadership practices and a nation’s economic performance (Misumi and Seki, 1971; Misumi, 1986; Mujtaba, Tajaddini, and Chen, 2011; Hughes, Ginnett, and Curphy, 2019). As such, we review the literature on traditional leadership and the general management styles of managers in Afghanistan and Thailand, along with their cultural norms. Then, we explain our methodology, research hypotheses, and the results. Finally, we discuss general implications, limitations, training opportunities, and conclusions of the study.

**Culture and Behavior.** Modern workers living in a globalized work environment have been exposed to many diverse cultures as people travel abroad for global education or work (Karadjova-Stoev and Mujtaba, 2009) and through the use of modern technology. As such, there might be a convergence, divergence, and crossvergence of cultural practices and leadership styles present in their behaviors (Nieves, Mujtaba, Pellet, and Cavico, 2006). *Convergence* describes the merging of different cultures due to globalization and other factors that bring them into close contact with one another. *Divergence* is the extent to which a specific culture exhibits distinctiveness despite interaction with other cultures. Finally, *crossvergence* is the development of a new culture with its characteristics that result from cultures interacting with each other over time (Dastoor, Roote, and Mujtaba, 2005). Most importantly, modern Afghans and Thais living in rapidly growing cities of Kabul and Bangkok tend to exhibit individualistic values associated with western economies. Westerners have adopted many high-context cultural practices since employers encourage employees to work collectively in achieving organizational goals and understand that in “highly competitive, rapidly changing environments, caring and appreciative leaders bet on for long-term success” (Kouzes & Posner, 2003: 78). The call for participative management and continuous improvement practices through concurrent engineering and teamwork has been advocated in Western industries for many decades (Kreitner, 2007). In essence, the forces of globalization are inducing changes in all cultures (Adler, 1986), mainly democratic nations like Thailand, which has welcomed scholars, entrepreneurs, and investors from all over the globe.

Culture is a prominent factor in the differences people share. Such differences can be critical in effectively managing workplace diversity and inclusion, which is why so many researchers have studied such relationship-building opportunities across the globe (Al-Kwif, Khoo, Ongsakul, & Ahmed, 2020; Ali, & Al-Aali, 2016; Arslan & Dikova, 2015; Lee and Suwimol, 2018; Ng & Tung, 2018). Additionally, culture is essential because shared values tend to regularize human behavior and make individuals more predictable. Knowing how others perceive and value their environment provides a guide for managers to anticipate behavior and respond effectively. This point is becoming increasingly more important as globalization brings distant peoples into closer contact while they face cultural, economic, and legal challenges (Scarborough, 1998). The growth in international trade has dramatically increased people’s understanding of the similarities and differences between diverse cultures (Gardenswartz, Rowe, Digh, & Bennett, 2003).

Afghanistan is a country trying desperately to recover from decades of ethnic conflicts. The lack of progression in Afghanistan and the presence of widespread corruption are partly due to cultural disintegration. Sims and Mujtaba (2005) warn that corruption can significantly damage and slow the growth process of an economy. These are not the people of Afghanistan that are corrupt; instead, the realities of low-paying jobs and a terrible economy have conditioned some people to accept inappropriate actions such as drug trafficking, theft, and bribery as an essential element of day-to-day survival. Sims and Mujtaba’s research conclude that ongoing corruptive practices within the public sector have enormous implications on the security of the Afghan government. Citizens unhappy with the unfair, inequitable, and untimely distribution of public services can
resort to revolts and other negative behaviors; such behaviors play a significant part in the regression of a nation and its demographics. As such, an awareness of the people’s leadership orientation toward tasks and relationships may help understand such long-lasting conflicts and corrupt practices in Afghanistan. Strong leaders should be “guided by a commitment to work for justice and equality, among those who are disenfranchised and underserved” (Lawrence-Lightfoot, 2000: 83).

The studies on cultural differences (Munene, Schwartz, and Smith, 2000) conclude that Asian cultures like Thailand and Afghanistan emphasize hierarchy, paternalism, and mastery in contrast to egalitarianism, autonomy, and harmony (Huang, Mujtaba, Cavico, and Sims, 2006). Moreover, Asian managers often stress reliance on formal rules and superiors in reaching decisions compared with the cultural profile of people in Canada, the United States, and most European countries. In today’s competitive world, understanding and responding to culturally driven behaviors are paramount to succeeding (Habil, Aboramadan, and Zaqout, 2019), especially in cross-cultural management because “the people in an organization are crucial to its performance and the quality of work-life within it” (Rainey, 2003: 219). Afghanistan and Thailand are high-context cultures where people tend to socialize as part of their cultural mores. However, due to cultural convergences, more and more people are also demonstrating individualistic values as they attempt to secure long-term independence from undue foreign aid and political influences. Navigating between individualistic and collectivistic cultures and recognizing the shifts in diverse cultures can directly impact how international firms and their people perform. People of an individualistic culture tend to value the needs, concerns, and identity of oneself above the community’s needs, which contribute to the traditional Asian norms. We know that a collective culture’s citizens and inhabitants are generally socialized to focus more on world peace, being helpful to others and group interests instead of an individual’s needs. This study seeks to expand our knowledge of Afghanistan’s leadership culture by directly comparing Afghans and Thais’ task and relationship orientation. While the scope of this study is limited, the goal is to expand our knowledge of leadership across cultures through the systematic collection of data and empirical analysis. This knowledge can then be used to improve the international community’s understanding of these Asian cultures and facilitate their continued stability and economic prosperity in the coming years and decades (Oyserman, 2002; Schwartz, 1994, 1999).

Today’s environment of global competition and fears of Covid-19 has changed many aspects of work in dramatic ways (Mujtaba, Cavico, and Senathip, 2020; Ibrahim, Imtiaz, Mujtaba, Vo, & Ahmed, 2020; Ahmed, Khan, Khan, & Mujtaba, 2020; Ahmad, Hussain, Saleem & Qureshi, 2015). However, peoples’ thinking regarding violence, indulgence, and greed still tends to drive their behaviors about the accumulation of wealth through moral, immoral, and amoral means in society. It has been said that ineffective or insufficient management theories and concepts widespread both in the private and public sectors of Afghanistan and Thailand tend to lead to bad practices and often do more damage than what is apparent to the naked eye (Ghoshal, 2005). According to some experts, the twenty-first century world has achieved modernity and brilliance without developing a higher level of conscience since this world has many “nuclear giants and ethical infants” (Drumm, 2002: 17). Reischl, Cavico, Mujtaba, and Pellet mention that “Although the natural sciences paved the way for advancement in the quantity of life, little has changed in the way of advancement in the quality of life” (2010: 7). Afghan officials should emphasize that effective leadership means doing the right tasks at the rights times while building long-term relationships with all relevant stakeholders in organizations, communities, region, and society (Mujtaba, 2007a).

**Afghan and Thailand’s Culture.** Cultures are necessary as they help us to learn best practices and behave within certain norms that can keep us safe and functional in society. These cultural practices are traditionally passed on from one generation to the next in Asian cultures like Afghanistan and Thailand through their familial connections and storytelling. These cultural norms regularize behavior and make one’s actions consistent and thereby predictable. Academically, we know that culture is “The collective programming of the mind that distinguishes one human group members from another. Culture, in this sense, includes systems of values; and values are among the building blocks of culture” (Hofstede, 1980: 21). The behavior of Thais and Afghans reflects their years of socialization and native roots based on their various beliefs, norms, and mores passed on from one generation to the next for thousands of years. We know that cultures regularize human behavior, thereby making decisions more predictable and most Asians find comfort in knowing how everyone is expected to behave. Culture plays an important role in acting as moral leaders and being perceived as ethical managers locally, nationally, and globally (Sanyal, 2005).

However, we also know that the Thai culture differs from the Afghan culture in some ways. Afghan managers often use more directive leadership styles, while Thais tend to be more democratic and participative in their management and decision-making approaches. While Afghanistan has a growing population of about 40
million inhabitants as of 2021, Thailand’s population is about 75 million. Furthermore, while there are millions of Muslims in Thailand, most people are Buddhists. In Afghanistan, 99% of the population is Muslim today, but Buddhism used to be popular in Afghanistan over one thousand years ago prior to the introduction of Islam. Thais enjoy much more freedom and pragmatism, as people are economically in a better position, flexible and more open-minded toward new ideas compared to the average person in Afghanistan. As can be witnessed, Thais have adopted many western practices, perhaps due to the constant evolution of culture and widespread availability of technology and information. Similarly, in search of a better economy and a peaceful country, Afghans have adopted many diverse Western and Asian practices to encourage employees to work more collectively to achieve the organization’s goals in a very competitive and globally open society. In essence, modern practices and focus on competitiveness and high expectations from the international communities have induced favorable changes in both Afghan and Thai cultures. In Thai culture, where collectivism is high and individualism is low (Figure 1), the group is the primary unit of the social organization due to people living in extended families, which explains why it is easier for them to work cohesively as teams and groups. Similarly, power distance and uncertainty avoidance are high, while achievement and long-term orientation are on the lower side as people have become more indulgence-oriented.

While there is no published empirical research data available based on Hofstede’s cultural dimensions as of yet for the culture of Afghanistan, there are some practical explanations from researchers (Entezar, 2008). In general, based on two decades of socialization and personal observations of the first author along with the results of qualitative interviews with educators and leaders in Afghanistan, power distance between workers and managers is high for Afghans since formal position title and rank tend to have a high level of importance both on the job and in the community. Both masculinity and uncertainty avoidance are relatively high in Afghanistan as the concept of “guzara” conditions people to “play it safe” and not take too much risk. Since Afghans do put their faith in God, some authors believe that many individuals have low uncertainty avoidance tendencies (Entezar, 2008). However, as a country, Afghanistan is a culture of cautious optimists and calculated risk-takers; consequently, most people avoid unnecessary uncertainty and risk. On the other side of the continuum, individualism and long-term orientation are in the medium range. Finally, Afghan’s indulgence score is likely to be in the low range since people are conditioned by the local norms of uncertainty avoidance and other cultural traditions to avoid extravagant expenditures and save for a “rainy” day. Due to the collective nature of people in Afghanistan and the history of tribalism, most individuals learn to socialize and respect members of the community, especially their elders. While Afghans do restrain themselves from acting upon their impulsive indulgences, some of their decisions are short-term oriented as the years of political instability, widespread corruption, and ethnic conflicts have conditioned many toward a survival mode of making it through the day or even the current political regime.

Hall (1976) divides culture into two extreme types: high context and low context cultures. In high context cultures, people share their way of thinking, feeling, and acting; therefore, they often use non-verbal communication. On the contrary, in low-context cultures, people utilize verbal communication. Thailand, like Afghanistan, is a high-context society. It partly explains why the Thai and Afghan people tend to avoid uncertainty. Afghans and Thais try to build strong and stable relationships with others. Due to their high-context and homogenous cultures, people can more effectively communicate with each other. Thais and Afghans have thousands of years of Asian culture and history, which still drives people's behavior in achieving their goals while maintaining strong work relationships. The cultures of these countries are somewhat
Leadership is about effectively influencing to achieve organizational objectives (Habil, Aboramadan, and Zaqout, 2019). In the behavioral perspective of leadership, two clusters of behaviors focus on the people and tasks. First, people-oriented behaviors include showing mutual concern, trust, and respect for others. People-oriented leadership tends to result in higher job satisfaction among subordinates and lower absenteeism, grievances, and turnover compared to using a task-oriented style. However, Mujtaba (2019) mentions that job performance tends to be lower than for employees with task-oriented leaders. Second, task-oriented leadership styles generally include behaviors that define and structure work roles to ensure that everyone follows the established rules to reach performance capacity and meet the standards. An unintended consequence or side effect of task-oriented leadership is that it can result in lower job satisfaction and higher absenteeism and turnover among subordinates (Hersey, Blanchard, and Johnson, 2001). Behavioral leadership scholars conclude that most individuals are somewhere in between in the continuum (Hersey, 1984).

Buckner (Buckner, 2019: 315) mentions that “Higher education institutions (HEIs) are increasingly being called upon to educate youth for global labor markets and societies.” Buckner states that many HEIs “have integrated international and intercultural ways of knowing into their work. This phenomenon is internationalization” (Buckner, 2019: 315). Afghanistan has a young population that should be trained, developed, and socialized toward critical thinking leadership skills and economic development through the global education of best practices from around the world. Baha (Baha, 2019: 5) believes that “it is predicted that the number of students will increase by approximately 12% annually for the next four years” in the higher education section of Afghanistan, which was initiated in the 1930s. The fact is that while about 50,000 students were annually entering higher education in 2008, today, nearly 400,000 students are expected to be enrolled during 2020 in the higher education institutions of Afghanistan (Baha, 2019: 5). Research shows that university graduates now need various intercultural competencies to participate in the global labor markets (Buckner, 2019: 317). Consequently, the training and development of modern students, educators, political leaders, and entrepreneurs for effective leadership become important as future leaders begin their higher education journey.

Afghan leaders must keep in mind that certain aspects of the Afghan culture, such as strong bonds among friends and reciprocal expectations of loyalty, tend to lead to favoritism among all public and private sector professionals. This cultural foundation associated with loyalty to one’s friends and colleagues or even cronymism in Afghanistan has evolved over the years out of socialization and necessity. One can trust his or her closest friends in times of turmoil and political conflicts. While some elements of favoritism and cronymism are prevalent in most cultures, including Thailand, it is especially true in Afghanistan since there is a diverse range of ethnic groups and tribes divided through political animosity by foreign influences in a land-locked country. As such, this study seeks to identify the extent to which the leadership orientations of Afghans are similar or different by examining their task and relationship orientation scores while also learning best practices from other nations, such as Thailand, for benchmarking purposes.

Leadership Orientations. Leadership is a science as it can be studied over time by understanding the leaders, the followers, and the situational conditions along with the interactions taking place between the leaders and situational or cultural conditions (Habil, Aboramadan, and Zaqout, 2019; Barnard, 1948; Bass, 1990). In the leadership literature, the behaviors of leaders are discussed in terms of initiating structure (task-orientation) and consideration (relationship-orientation) components (Halpin and Winer, 1957; Fleishman, 1967). Bass (1990) found that relationship-oriented functions are associated with subordinate satisfaction, and task-oriented functions are linked with performance. Similarly, the relationship functions are positively associated with a group performance, which explains why Afghans and Thais work well in teams. Overall, situational leadership theory states that the best leadership style depends on the variables surrounding each decision, person, and strategy. One dimension of each person’s leadership style is the extent to which he or she is people-oriented or task-oriented. Since cultures influence people through years of socialization, this study aids in determining and confirming whether people of high-context culture are more relationship-oriented or more task-oriented.
Maintaining healthy relationships in a group is a top priority in Thailand and Afghanistan; consequently, leaders tend to avoid stressful disagreements and effectively manage dysfunctional conflicts in their organizations as quickly as possible (Nakane, 1970). The leader and followers in most Asian cultures exchange their opinions informally until a common understanding occurs to avoid conflicts in department and group meetings (Xu, 1987). After negotiating and reaching a consensus, which can be time-consuming, formal decisions are made. Generally, the Thai manager will not unilaterally decide until followers who will be affected, have had sufficient time to offer their views, feel they have been fairly heard, and are willing to support the agreed-upon decision even though they may feel that it is not the best one (Ouchi, 1976: 308). However, this is not always the case for managers in Afghanistan, as they tend to be more directive and authoritarian. To sum up Afghan and Thai leadership behaviors, the role of leaders in these Asian cultures is to maintain relationships, using autocratic, directive, authoritarian, democratic, and participative leadership approaches.

**Methodology**

Literature demonstrated that leaders and managers worldwide tend to use various amounts of task and relationship behaviors to motivate their followers and achieve organizational objectives. To get a better understanding of a leader or manager’s style, Northouse (2007) provides the Style Questionnaire. This survey can be used to obtain a general profile of a person’s leadership behaviors regarding task and relationship orientations. Like previous studies by the authors, this instrument was selected because it has short statements that make it easy for the respondents to fill them out. In a cross-cultural environment, it leaves little room for misunderstandings and misinterpretations. The statistical output for the reliability data has shown that the Cronbach’s alpha is 0.887, which means that the questions are good for tests, and they are acceptable in social science research (Nguyen, Mujtaba, Tran, and Ruijis, 2013; Nguyen, Mujtaba, & Pham, 2013). Overall, in the Style Questionnaire, each respondent must circle one of the options that best describe him or her regarding each statement that relates to getting the job done or keeping the relationship strong. In other words, for each statement, the respondent indicates the degree to which he or she (or the person being evaluated) engages in the stated behavior. In the Style Questionnaire, a rating of 1 means “never,” and a rating of 5 means “always,” with the person demonstrating the specific behavior. To determine one’s scores for the leadership styles questionnaire, researchers add the responses for the odd-numbered items to determine the score for task-orientation behaviors and add the responses for the even-numbered items to determine the score for relationship-orientation behaviors. Northouse’s (Northouse, 2007: 87) scoring interpretation ranges from “Very high” to “Very low,” as shown in Table 1.

| Score range | Description         |
|-------------|---------------------|
| 45-50       | Very high range     |
| 40-44       | High range          |
| 35-39       | Moderately high range |
| 30-34       | Moderately low range |
| 25-29       | Low range           |
| 10-24       | Very low range      |

Table 1. Task and Relationship Score Interpretations

Source: Northouse, 2007, p. 87

**Sampling Procedures.** This study targeted Afghan and Thai citizens, workers, and managers. The original questionnaire was translated into the Thai and Persian languages to increase both accuracy and response rate so that those who were not fluent in English could quickly respond to each question. The Thai and Persian versions of the survey were back-translated into English by two other individuals to confirm their accuracy with the original instrument. The printed surveys were offered in Thailand and Afghanistan to individuals who volunteered to complete them. The online version of the survey was only available in English. The surveys were distributed and collected physically and sent electronically to working adults, graduate students, colleagues, and friends who live worldwide. The self-administered questionnaire offers anonymity (Nguyen, Mujtaba, & Pham, 2013), which is essential when conducting research related to the leadership and management characteristics of respondents or their superiors. For purpose of this study, 400 candidates’ responses were selected for analysis from each nation, with a response rate of 30% in Afghanistan and 65% in Thailand. The convenience sample was obtained through educational organizations, businesses, entrepreneurs, and private and public sector institutions. A paragraph explaining the purpose of this research and guaranteeing confidentiality were included with the survey. The respondents were asked to complete the questionnaire, using print or online format voluntarily.
Research Hypotheses

The research question for this study was to determine whether Afghan and Thai respondents have similar or different scores on the relationship orientation and task orientation dimensions of leadership. The specific hypotheses for this study are as follows:

**Hypothesis 1:** Thai respondents will have similar scores for relationship and task orientations.

**Hypothesis 2:** Afghan and Thai respondents will have similar scores on task and relationship orientation.

Task and Relationship Orientation Results

Like our previous studies, the current data analysis demonstrates that Afghans are highly task-oriented and relationship-oriented. Yes, Afghan respondents have been shown to have statistically significant differences in their task and relationship orientations. Afghan respondents have dissimilar scores for relationship and task orientations as they are more highly focused on their relationships. Let us see how different the task and relationship orientations of Afghans from their Thai colleagues are. Thai respondents also appear to have high scores in both their task and relationship orientations. While the average score of Thai respondents for task and relationship orientations falls in “high range,” there are statistically significant differences among them.

| Level of Significance | Task Orientation | 0.05 |
|-----------------------|------------------|------|
| Sample Size           | 400              |      |
| Sample Mean           | 41.51            |      |
| Sample Standard Deviation | 2.86         |      |

| Relationship Orientation | Sample Size | 400 |
|--------------------------|-------------|-----|
| Sample Mean              | 43.36       |     |
| Sample Standard Deviation | 2.324      |     |

Intermediate Calculations

| Total Degrees of Freedom | 798 |
|--------------------------|-----|
| Pooled Variance          | 6.790288 |
| Difference in Sample Means | -1.85 |
| t-Test Statistic         | -10.04 |

| Two-Tailed Test           |      |
|--------------------------|------|
| Lower Critical Value      | -1.963 |
| Upper Critical Value      | 1.963 |
| p-Value                   | 0.00  |

Source: Compiled by the authors

As can be seen from Table 2 and using the t-test for differences in two means, at a 0.05 level of significance, the first hypothesis is rejected because the calculated t value (-10.04) does not fall within the critical value of t for statistical significance; thus, the alternative hypothesis is supported. Furthermore, since the p-value of 0.00 is smaller than alpha (α)=0.05, there is sufficient evidence to reject the hypothesis. Therefore, Thai respondents have dissimilar scores for relationship and task orientations as they are more highly focused on their relationships. Let us see how different the task and relationship orientations of Afghans from their Thai colleagues are. Thai respondents also appear to have high scores in both their task and relationship orientations. While the average score of Thai respondents for task and relationship orientations falls in “high range,” there are statistically significant differences among them.

As can be seen from Tables 3 and 4, the second hypothesis cannot be rejected because the calculated t value (1.08) for task orientation of Afghans and Thais does fall within the critical values of t (-1.963 – 1.963) for statistical significance. Also, since the p-value of 0.279 is larger than alpha (α)=0.05, there is sufficient evidence to support the hypothesis. Furthermore, as can be seen in Table 4, analysis on the relationship orientation of Afghan and Thai respondents demonstrated that the calculated t value (-1.47) falls within the critical value of t for statistical significance; in other words, the hypothesis is supported. Furthermore, since the p-value of 0.141 is greater than alpha (α)=0.05, there is sufficient evidence to support the hypothesis. Therefore, Afghan and Thai respondents have similar scores for task and relationship orientations.

Discussion

Due to people’s collective cultures with the country’s economic success, one could assume that Thai respondents would have similar scores for relationship and task orientations. However, our research did not support this hypothesis because Thais are more focused on their leadership element; this shows the same trend for Afghan respondents. This study’s result supports previous literature on the Thai and Afghan cultures, organizations, and management practices that they lead and manage by maintaining harmony in their relationships as “face-saving” is so essential for harmony in these Asian cultures. Thais and Afghans are more relationship-oriented than task-oriented; however, their task orientation falls in the high range as well. Global managers should pay attention to the reality that Afghan and Thai management practices are based on their relationship orientation and getting along with all relevant stakeholders through effective teamwork, participative decision-making, and cooperation.

Overall, the findings of this research are consistent with previous studies conducted with Thai working adults (Sungkhawan, Mujtaba, Swaidan, and Kaweevisultrakul, 2012; Murphy Jr., Mujtaba, Manyak, Sungkhawan, and Greenwood, 2010; Mujtaba, Luk, Murphy, and Saowakul, 2009), and Afghan respondents. Learning and benchmarking leadership best practices can take place in any country or culture. The hope for every leader is that we make a positive difference in the lives of those around us between birth and death. Afghans should learn from their own positive and negative trends in the past and the positive and negative patterns of other cultures and countries. As the proverb goes, those who do not know history are likely to repeat it. As such, we should learn from the past to positively influence our lives in the present and future.

The political leaders of Thailand have been able to use their high relationship orientation positively with the international community by keeping a strong bond with their neighbors and other nations both in the west and
east. Consequently, the people of Thailand have enjoyed a better quality of life through a sustaining peaceful work environment, inclusion, democracy, and a stronger and progressively developing economy (Senathip, Muitaba, and Cavico, 2017). In today’s Covid-19 world, where the coronavirus and pandemic has dramatically increased unemployment rates and decreased economic activities, political leaders in Thailand seem have done a fairly good job of managing the task of reducing the spread of the virus and its resulting deaths by promptly implementing relevant actions and policies. Sadly, it has not been the case in efficiently dealing with the task of stopping the spread of the coronavirus in Afghanistan due to the political conflicts among different groups and the poor state of the Afghan economy, which has been largely dependent on the international community. We know that effective leadership is even more important during crisis events and pandemics. For example, even though the United States’ economy was powerful before the Covid-19 pandemic, due to a lack of an effective national strategy and timely response, the country has had about 600,000 deaths as of July 2021. The United States was expected to be able to not only effectively manage this pandemic crisis well for their people as this rich nation has some of the best laboratories and diverse medical experts from around the world, but they were also expected to help other nations. Yet, due to a lack of adequate and trustworthy political leadership, nearly 35 million Americans lost their jobs in 2020, with diverse minorities and women suffering the most, and the U.S. economy experienced its worst depression for almost a century now. Even though Americans are expected to be high in their task orientation due to their individualist culture and socialization, influential and trustworthy leadership was needed during 2020 to focus diverse people groups toward a clear vision and mission. Of course, the new administration during early 2021 brought about much-needed political leadership and stability in effectively managing the vaccination process for the Covid-19 coronavirus in the United States of America. While Thailand has people of diverse ethnic backgrounds, they seem to be more inclusive and effective at synergizing because of their differences.

Thais have less blatant forms of ethnic animosity, conflict, gender discrimination, and workplace mobbing of those who are different from everyone else. Perhaps Afghan leaders should take advantage of their relationship orientation element of leadership to build strong bonds and connections within the country’s diverse tribal groups, as well as with their neighbors and other influential nations around the globe. Author Jordan Raynor (2020) states that most individuals spend their days, weeks, and years making little progress in a million different directions; thus, they become competent at many things but exceptional at none of them. Raynor (2020) recommends that modern leaders explore, choose, eliminate, and master the “one thing” that will make a long-lasting, impactful, and sustainable positive difference in their lives. It is exactly what the father of scientific management, Frederick Taylor, emphasized at the beginning of the 20th century when he said managers and leaders should find employees who are “First-Class” at doing each specific task. Taylor believed that everyone is a “first-class” worker, and managers should match employees with the right jobs. Afghan leaders should focus on their strong points while also studying the Thai culture of politics and business practices to implement the relevant ones in Afghanistan. One critical area for immediate improvements in Afghanistan is to offer more opportunities for females to get quality education at all levels while also battling the devious societal mobbing (group bullying of those who are different) practices based on ethnic, religious, and/or political differences. In any culture, influential leaders are ultimately responsible for establishing ethical strategies that the country should implement in the present to create a better and ideal future. It is imperative in Afghanistan that leaders become ethical role models and deliver what they promise to others in the community, country, region, and society by reducing and eradicating mismanagement. It is the responsibility of all public officials and private sector leaders to be culturally competent, ethical role models. It is a fact that specific training and educational programs can significantly enhance human development and critical thinking. Educated critical thinkers should be trained to be open-minded and self-directed as they discipline and monitor their views before implementing a significant decision.

Critical thinkers purposely and explicitly go beyond their intuition or gut feelings to analyze and assess all the facts in a given situation to be consistently fair to all stakeholders in a decision. Critical thinkers live fairmindedly while internalizing and promoting universal values. Like all studies, there are some limitations to this study. First, the small number of responses from a convenient population is one of them. Future studies should compare specific populations in different parts of each country with similar working backgrounds and demographic variables. Afghan and Thai populations seem to have a significantly higher focus on relationship orientation. It might be true simply because they understand the importance of maintaining good relations with others due to the economic necessities and not necessarily years of cultural socialization. Researchers should also note that the quality of education might also be an important variable or factor in respondents' scores. Therefore, future studies should test “sub-cultures,” “gender,” and “education” to see if these are significant variables in the task and relationship orientation scores of respondents in each culture.
Implications for Practice

Afghanistan’s population will soon be going beyond 40 million people, and their current literacy rate is still about 30 percent. Since their population is growing rapidly, leaders must focus on the education of all diverse Afghans, especially the young and upcoming leaders, to help them become globally competent. Sadly, about 70 percent of Afghans have no formal schooling experience due to the poor economy, lack of proper security, and several decades of war. The starting point for progress can be strengthening the government branches in Afghanistan so all managers and representatives can be effective role models of cultural inclusion, continuous learning, and education to enforce high ethical standards (Cavico and Mujtaba, 2018; De Maria, 2008). For centuries, an overlooked and under-represented group in Afghanistan has been the female population. The agony for Afghanistan's women must come to an end if the country benefits from the talent of its entire population from all minority groups (Haidari, 2010). Luckily, according to Haidari (2010), the Afghan Parliament continues to convene with a higher percentage of female representatives (27.3%) than the legislative bodies of most established democracies, including the U.S. Congress (15.2%) and British Parliament (19.7%). Despite some progressive advances, sadly, one woman dies every 29 minutes in childbirth in Afghanistan.

Furthermore, only 12% of females 15 years and older can read and write at the basic levels, compared to 39% of men in Afghanistan. The overall literacy rate for women between the ages of 15 and 24 stands at 24%, compared to 53% for men in Afghanistan. Haidari emphasizes that this troubling situation is a legacy of decades of war and state collapse. Unfortunately, with a weak government and lack of appropriate infrastructure developments in the country, such statistics will continue to be realities in Afghanistan for the next few decades to come. Afghans have a long way to go before providing a fair, just, and secure environment for everyone in Afghanistan. The Afghan government officials must continue to create, lead, and implement culturally inclusive and sustainable policies (Wolf and Mujtaba, 2011), simultaneously functioning as agents of social change to ameliorate the traditional views that prevent the female and other minority populations in Afghanistan from becoming full contributors in the development process. For women and all diverse Afghans to be fully empowered to make a significant contribution to Afghanistan's long-term development, the international community must continue to help the Afghan government become stronger and more focused on cultural inclusion, as well as the leadership training and equal treatment of all individuals in the country (Cavico and Mujtaba, 2018).

Societal Mobbing and Inclusion Training. Training and development of everyone in the Afghan society should be strategic to socialize them to become more inclusive, like the Thai culture where diverse groups work together toward common goals. For example, in most places in Thailand, men and women of various backgrounds can cohesively live and work together without anyone being blatantly discriminated based on their different genders, ethnicities, religious beliefs, or appearances. Afghans need to be educated, trained and developed to adopt similar inclusive mindsets in the context of their own culture and religious beliefs. Sadly, stereotypical views and prejudices based on gender and ethnicity have been widespread in Afghanistan for decades. However, some politicians, warlords, and gangs seem to have used existing prejudices for sinister purposes all the way to terrorizing people simply because they are different from the majority. We call this concept “societal mobbing,” where an innocent victim is regularly bullied by members of the community, by gangs, and through like-minded colleagues in the workplace. Such negative practices can lead to high employee turnover and layoffs as the best employees would leave, thereby hurting the organization’s profitability and sustainability (Mujtaba and Senathip, 2020a).

For example, Afghan minorities of all ethnic backgrounds (Hazaras, Hindus, Uzbeks, etc.) have been physically hurt, ostracized, abused, and often consistently harassed with stereotypical jokes in the workplace. Similarly, qualified females are not afforded opportunities and privileges that are available to most men. The popular book and movie entitled “The Kite Runner” by Khalid Hosseini provide some examples of how prejudices, biases, and stereotypical norms in the Afghan culture can lead to societal mobbing. While development focuses on the audience's educational needs, training is the process of teaching everyone the basic skills they need to immediately function as productive members of the department, community, and society at large. Training has an impressive record of influencing organizational effectiveness and its effect on productivity tends to be higher than performance appraisal and feedback and just below goal setting (Noe, Hollenbeck, Gerhart, and Wright, 2019). As such, it should have similar outcomes when it is targeted toward the needs of communities and society as well. One area where Afghans need training is diversity and inclusion so people can avoid stereotypes and bullying (mobbing) of women and minority members in the community and workplace. While diversity is about having members of all ethnic backgrounds from the community being...
represented in the workplace, inclusion relates to making sure that they are all equally engaged in the significant decisions of the organization and society. Diversity is about being invited to an event or party, while inclusion is having an active part in it as per one’s area of responsibility and competence without being isolated, bullied, or harassed due to one’s gender, ethnicity, religion, disability, or appearance.

Societal mobbing can involve two or more like-minded individuals, friends, colleagues, and/or employees ganging up to target or consistently bully a person through isolation, humiliation, and aggression (Mujtaba and Senathip, 2020b). The victim is often selected because he or she has a unique view or is somewhat different from everyone else based on his/her gender, ethnicity, religion, body size, appearance, age, leadership style, rank, sexual orientation, etc. Compared to individually bullying another person, societal mobbing involves a group of individuals against a specific target who is different from everyone else regarding his/her views, thoughts, and/or some dimension of diversity. If there is no effective intervention for the workplace or societal mobbing, it can lead to continued conflicts, suicides and/or the voluntary or involuntary turnover and brain drain of qualified employees into foreign nations.

Extreme forms of peer pressure, bullying, mobbing, and systematic soldiering can cause much unnecessary conflict in the workplace, especially in diverse departments and organizations (Baillien, Camps, Van den Broeck, Stouten, Godderis, Sercu & De Witte, 2016; De Cieri, Sheehan, Donohue, Shea, & Cooper, 2019; Wall, Smith, & Nodoushani, 2018). While workplace mobbing can be very stressful for the victim and other professionals, managers, and observers alike, some best practices and procedures must be followed to make the workplace fair and just for all parties involved. It is mainly in the worker’s mind that believes he/she is a victim of workplace mobbing. Managers and all professionals must always behave rationally and professionally by objectively following relevant policies and guidelines to ensure the workplace is a good environment for everyone. Managers and politicians must create appropriate training programs and policies to effectively deal with such challenges to create an inclusive workplace and society for all diverse Afghans. Training and development practices are essential for a healthy society, department, and organizational culture (Quinn, Spreitzer & Lam, 2012; Ray, 1986; Ouchi, 1979). It should be noted that the cultural control and the leadership role of change agents, as connectors or transitional agents, play a critical role in investigating, communicating, and regularly assessing managers and employees so they can internalize the organization’s desired values and expected norms (Merchant and Van der Stede, 2007; Malmi and Brown, 2008). Afghan managers and politicians need to become transitional connectors and change agents who can help people move toward peace and progress in the economy by demonstrating patience and cultural inclusion at all levels of the society.

Conclusion

This research provided a cursory overview of the culture and people of Afghanistan and Thailand. The paper also discussed the Afghan culture’s norm of getting along, which influences their relationship orientation. Most Afghans have an attitude of cooperating, getting along, showing restraint, win-win thinking, avoiding unnecessary risks, being sustainable, and doing whatever is necessary to preserve meaningful relationships and “save face.” While the Thais may live far from Afghanistan and speak a different language, their culture and daily behaviors seem mostly aligned with this concept of “getting along” since it implies that one’s actions should always cooperate, team-oriented, “saving face”, and being sustainable. Today’s global and competitive work environment, especially in developing economies such as Afghanistan, needs educated and strong leaders and change agents who think critically about their decisions based on current facts and developmental needs. Since both countries have similar cultural orientations, Afghan leaders and managers can better educate themselves by learning many of the relevant best practices, such as the inclusion of all diversities, making Thailand successful and applying them to their own country in Afghanistan. Overall, this study explored the basics of Afghan and Thai leadership orientations based on quantitative research and provided information for local and global managers about the mechanism of their behavior by more closely exploring the culture of Afghanistan. Recommendations for discussion, reflection, and training related to inclusion and workplace mobbing are presented.
