Safety and efficacy of a feed additive consisting of an essential oil from the leaves of *Citrus ×aurantium* L. (petitgrain bigarade oil) for use in all animal species (FEFANA asbl)

EFSA Panel on Additives and Products or Substances used in Animal Feed (FEEDAP), Vasileios Bampidis, Giovanna Azimonti, Maria de Lourdes Bastos, Henrik Christensen, Mojca Fašmon Durjava, Maryline Kouba, Marta López-Alonso, Secundino López Puente, Francesca Marcon, Baltasar Mayo, Alena Pečová, Mariana Petkova, Fernando Ramos, Yolanda Sanz, Roberto Edoardo Villa, Ruud Woutersen, Paul Brantom, Andrew Chesson, Johannes Westendorf, Paola Manini, Fabiola Pizzo and Birgit Dusemund

Abstract

Following a request from the European Commission, the EFSA Panel on Additives and Products or Substances used in Animal Feed (FEEDAP) was asked to deliver a scientific opinion on the safety and efficacy of an essential oil from the leaves of *Citrus ×aurantium* L. (petitgrain bigarade oil), when used as a sensory additive (flavouring) in feed and water for drinking for all animal species. The FEEDAP Panel concluded that the essential oil under assessment is safe up to the maximum proposed use level of 125 mg/kg complete feed for ornamental fish. For the other species, the calculated safe concentrations in complete feed are 10 mg/kg for chicken for fattening, 14 mg/kg for laying hen, 13 mg/kg for turkey for fattening, 17 mg/kg for piglet, 20 mg/kg for pig for fattening, 25 mg/kg for lactating sow, 43 mg/kg for veal calf (milk replacer), 38 mg/kg for cattle for fattening, sheep, goat and horse, 24 mg/kg for dairy cow, 15 mg/kg for rabbit, 42 mg/kg for salmon, 44 mg/kg for dog and 8 mg/kg for cat. The FEEDAP Panel considered that the use level in water for drinking is safe provided that the total daily intake of the additive does not exceed the daily amount that is considered safe when consumed via feed. Simultaneous use in feed and water for drinking may lead to the maximum safe dose being exceeded. No concerns for consumer safety were identified following the use of the additive up to the highest safe level in feed. The essential oil under assessment should be considered as irritant to skin, eyes and the respiratory tract, and as a skin sensitiser. The use of the additive in animal feed under the proposed conditions was not expected to pose a risk for the environment. Petitgrain bigarade oil was recognised to flavour food. Since its function in feed would be essentially the same as that in food, no further demonstration of efficacy was considered necessary.

Annex A – Executive Summary of the Evaluation Report of the European Union Reference Laboratory for Feed Additives on the Method(s) of Analysis for buchu leaves oil, olibanum extract (wb), lime oil, petitgrain bigarade oil, bitter orange extract of the whole fruit, lemon oil expressed, lemon oil distilled (residual fraction), lemon oil distilled (volatile fraction), orange oil cold pressed, orange terpenless (concentrated 4 times), orange terpenless (concentrated 10 times), orange terpenless (folded), orange terpenes, mandarin oil and quebracho extract (wb) from botanically defined flavourings Group (BDG 08) – Sapindales ....................... 20
1. Introduction

1.1. Background and Terms of Reference

Regulation (EC) No 1831/20031 establishes the rules governing the Community authorisation of additives for use in animal nutrition. In particular, Article 4(1) of that Regulation lays down that any person seeking authorisation for a feed additive or for a new use of a feed additive shall submit an application in accordance with Article 7. In addition, Article 10(2) of that Regulation specifies that for existing products within the meaning of Article 10(1), an application shall be submitted in accordance with Article 7, within a maximum of seven years after the entry into force of this Regulation.

The European Commission received a request from Feed Flavourings Authorisation Consortium European Economic Interest Grouping (FFAC EEIG)2 for authorisation/re-evaluation of 20 preparations (buchu leaves oil, amyrin oil, olibanum extract (water based, wb), olibanum tincture, lime oil, neroli bigarade oil, petitgrain bigarade oil, petitgrain bigarade absolute, bitter orange extract of the whole fruit, lemon oil expressed, lemon oil distilled, orange oil, orange terpenes, mandarin oil, mandarin terpenes, grapefruit oil expressed, grapefruit extract (sb), grapefruit extract, quebracho extract (wb), cashew oil), belonging to botanically defined group (BDG) 8 - Sapindales, when used as feed additives for all animal species (category: sensory additives; functional group: flavourings). During the assessment, the applicant withdrew the application for ten preparations.3,4 These preparations are excluded from the present assessment. In addition, during the course of the assessment, the application was split and the present opinion covers only one out of the 20 initial preparations under application: an essential oil from the leaves of Citrus × aurantium L.5 (petitgrain bigarade oil) for all animal species.

According to Article 7(1) of Regulation (EC) No 1831/2003, the Commission forwarded the application to the European Food Safety Authority (EFSA) as an application under Article 4(1) (authorisation of a feed additive or new use of a feed additive) and under Article 10(2) (re-evaluation of an authorised feed additive). EFSA received directly from the applicant the technical dossier in support of this application. The particulars and documents in support of the application were considered valid by EFSA as of 19 March 2018.

According to Article 8 of Regulation (EC) No 1831/2003, EFSA, after verifying the particulars and documents submitted by the applicant, shall undertake an assessment in order to determine whether the feed additive complies with the conditions laid down in Article 5. EFSA shall deliver an opinion on the safety for the target animals, consumer, user and the environment and on the efficacy of an essential oil from the leaves of Citrus × aurantium L. (petitgrain bigarade oil), when used under the proposed conditions of use (see Section 3.2.4).

The remaining 10 preparations belonging to botanically defined group (BDG) 8 - Sapindales under application are assessed in separate opinions.

1.2. Additional information

Petitgrain bigarade oil from Citrus aurantium L. is currently authorised as a feed additive according to the entry in the European Union Register of Feed Additives pursuant to Regulation (EC) No 1831/2003 (2b natural products – botanically defined). It has not been assessed as a feed additive in the EU.

Many of the individual components of petitgrain bigarade oil have been already assessed as chemically defined flavourings for use in feed and food by the FEEDAP Panel, the EFSA Panel on Food Contact Materials, Enzymes, Flavourings and Processing Aids (CEF) and the EFSA Panel on Food Additives and Flavourings (FAF). The list of flavouring compounds together with the EU Flavour Information System (FLAVIS) number, the chemical group (CG) as defined in Commission Regulation (EC) No 1565/20005 and the corresponding EFSA opinion is given in Table 1.

1 Regulation (EC) No 1831/2003 of the European Parliament and of the Council of 22 September 2003 on additives for use in animal nutrition. OJ L 268, 18.10.2003, p. 29.
2 On 13/3/2013, EFSA was informed by the applicant that the applicant company changed to FEFANA asbl, Avenue Louise 130 A, Box 1, 1050 Brussels, Belgium.
3 On 27 February 2019, EFSA was informed about the withdrawal of the application on amyrin oil, cashew oil, olibanum tincture, neroli bigarade oil, petitgrain bigarade absolute, mandarin terpenes, grapefruit oil expressed, grapefruit extract (sb), grapefruit extract.
4 On 2 April 2021, EFSA was informed by the applicant about the withdrawal of the application on olibanum extract (wb).
5 Accepted name: Citrus × aurantium, synonym Citrus aurantium L. subspecies amara L.
6 Commission Regulation (EC) No 1565/2000 of 18 July 2000 laying down the measures necessary for the adoption of an evaluation programme in application of Regulation (EC) No 2232/96 of the European Parliament and of the Council. OJ L 180, 19.7.2000, p. 8.
### Table 1: Flavouring compounds already assessed by EFSA as chemically defined flavourings, grouped according to the chemical group (CG) as defined in Commission Regulation (EC) No 1565/2000, with indication of the EU Flavour Information System (FLAVIS) number and the corresponding EFSA opinion. They are currently authorised for food and feed uses unless otherwise indicated.

2. Data and methodologies

2.1. Data

The present assessment is based on data submitted by the applicant in the form of a technical dossier in support of the authorisation request for the use of petitgrain bigarade oil from *Citrus aurantium* as a feed additive.

The FEEDAP Panel on Additives and Products or Substances used in Animal Feed (FEEDAP) used the data provided by the applicant together with data from other sources, such as previous risk assessments by EFSA or other expert bodies, peer-reviewed scientific papers, other scientific reports, and experts’ knowledge, to deliver the present output.

Many of the components of the essential oil under assessment have been already evaluated by the FEEDAP Panel as chemically defined flavourings. The applicant submitted a written agreement to refer to the data submitted for the assessment of chemically defined flavourings (dossiers, publications and unpublished reports) for the risk assessment of preparations belonging to BDG 8.

*: FEEDAP opinion unless otherwise indicated.

(a): Evaluated for use in food. According to Regulation (EC) 1565/2000, flavourings evaluated by JECFA before 2000 are not required to be re-evaluated by EFSA.

(b): Linalool oxide [13.140]: A mixture of cis- and trans-linalool oxide (5-ring) was evaluated.

(c): β-Ocimene [01.018], as a mixture of (E)- and (Z)-isomers, containing 50-70% (E)-isomer and 17-17% (Z)-isomer was evaluated.

(d): Evaluated applying the ‘Procedure’ described in the Guidance on the data required for the risk assessment of flavourings to be used in or on food (EFSA CEF Panel, 2010).

---

9 FEED dossier reference: FAD-2010-0322.
10 Technical dossier/Supplementary information/Letter dated 29/4/2021.
EFSA has verified the European Union Reference Laboratory (EURL) report as it relates to the methods used for the control of the phytochemical markers in the additives. The Executive Summary of the EURL report can be found in Annex A.11

2.2. Methodologies

The approach followed by the FEEDAP Panel to assess the safety and the efficacy of petitgrain bigarade oil from *Citrus × aurantium* L. is in line with the principles laid down in Regulation (EC) No 429/200812 and the relevant guidance documents: Guidance on safety assessment of botanicals and botanical preparations intended for use as ingredients in food supplements (EFSA Scientific Committee, 2009), Compendium of botanicals that have been reported to contain toxic, addictive, psychotropic or other substances of concern (EFSA, 2012), Guidance for the preparation of dossiers for sensory additives (EFSA FEEDAP Panel, 2012d), Guidance on studies concerning the safety of use of the additive for users/workers (EFSA FEEDAP Panel, 2012e). Guidance on the identity, characterisation and conditions of use of feed additives (EFSA FEEDAP Panel, 2017a), Guidance on the safety of feed additives for the target species (EFSA FEEDAP Panel, 2017b), Guidance on the assessment of the safety of feed additives for the consumer (EFSA FEEDAP Panel, 2017c), Guidance on the assessment of the safety of feed additives for the environment (EFSA FEEDAP Panel, 2019), Guidance document on harmonised methodologies for human health, animal health and ecological risk assessment of combined exposure to multiple chemicals (EFSA Scientific Committee, 2019a), Statement on the genotoxicity assessment of chemical mixtures (EFSA Scientific Committee, 2019b) and Guidance on the use of the Threshold of Toxico logical Concern approach in food safety assessment (EFSA Scientific Committee, 2019c).

3. Assessment

The additive under assessment, petitgrain bigarade oil, is an essential oil obtained by steam distillation from the leaves of *Citrus × aurantium* L. It is intended for use as a sensory additive (functional group: flavouring compounds) in feed and water for drinking for all animal species.

3.1. Origin and extraction

The taxonomy and systematics of the *Citrus* genus, belonging to the Rutaceae family, are complex and the exact number of natural species is unclear. Almost all the common commercially important citrus fruits found today are hybrids derived from three ancestral species now represented by the cultivars described as the mandarin orange, pomelo, and citron. *Citrus × aurantium* is considered to have arisen from a cross between the pomelo (*Citrus maxima*) and the mandarin (*Citrus reticulata*). The group *Citrus × aurantium* now includes numerous varieties and cultivars as a result of natural and deliberate back-crossing to other parents. These include the orange, bitter orange, grapefruit and clementine. Many varietal names and sub-species have been used to distinguish between members of this hybrid complex but none have current taxonomic standing. Instead, the applicant uses the traditional description ‘petitgrain bigarade oil’, in which petitgrain refers to the small green fruit from which the oil was originally extracted and bigarade an anglicised version of the French for the bitter orange.

The additive is extracted from the leaves by steam distillation. The volatile constituents are condensed and then separated from the aqueous phase by decantation. Residual traces of water may be removed with sodium sulfate if necessary.

3.2. Characterisation

3.2.1. Characterisation of petitgrain bigarade oil

The essential oil under assessment is a pale yellow clear mobile liquid with a characteristic aroma. In four batches of the additive (all originating from Egypt), the refractive index was 1.46. Petitgrain bigarade oil is identified with the single Chemical Abstracts Service (CAS) number 8014-17-3, the

11 The full report is available on the EURL website: https://ec.europa.eu/jrc/sites/jrcsh/files/finrep-fad-2010-0322-bdg08.pdf
12 Commission Regulation (EC) No 429/2008 of 25 April 2008 on detailed rules for the implementation of Regulation (EC) No 1831/2003 of the European Parliament and of the Council as regards the preparation and the presentation of applications and the assessment and the authorisation of feed additives. OJ L 133, 22.5.2008, p. 1.
European Inventory of Existing Chemical Substances (EINECS) number 283-881-6, the Flavor Extract Manufacturers Association (FEMA) number 2855, and the Council of Europe (CoE) number 136.

The product specifications are based on the standards developed by the International Organisation for Standardization (ISO) 8901:2003 for ‘oil of bitter orange petitgrain, cultivated (Citrus aurantium L.),’13 which were adapted to reflect the concentrations of the main volatile components, analysed by gas chromatography with flame ionisation detection (GC-FID) and expressed as % of gas chromatographic peak area (% GC area). These components are linalyl acetate (40–72%, selected as the phytochemical marker), linalool (10–32%, selected as the phytochemical marker), α-terpineol (1–7%), d-limonene (1–6%), geranyl acetate (1.5–5.5%) and geraniol (1–4%). Analysis of four batches of the additive by GC-FID showed compliance with these specifications14 for all compounds, except geraniol.15 When analysed by gas chromatography-mass spectrometry (GC-MS) these six compounds account for about 88.7% on average (range 88.4–89.2%) of the % GC area (Table 2).

Table 2: Major constituents of the essential oil from the leaves of Citrus × aurantium L. as defined by the ISO standard (8901:2003): specifications and batch to batch variation based on the analysis of four batches. The content of each constituent is expressed as the area per cent of the corresponding chromatographic peak (% GC area), assuming the sum of chromatographic areas of all detected peaks as 100%

| Constituent | CAS no | FLAVIS no | % GC area | Specification | Mean(a) | Range |
|-------------|--------|-----------|-----------|---------------|---------|-------|
| Linalyl acetate | 115-95-7 | 09.013 | 40–72 | 53.25 | 52.3–54.1 |
| Linalool | 78-70-6 | 02.013 | 10–32 | 24.55 | 23.9–25.4 |
| Geranyl acetate | 105-87-3 | 09.011 | 1.5–5.5 | 4.65 | 4.39–4.83 |
| α-Terpineol | 10482-56-1 | 02.014 | 1–7 | 4.14 | 3.90–4.38 |
| d-Limonene | 5989-27-5 | 01.045 | 1–6 | 1.98 | 1.63–2.37 |
| Geraniol | 106-24-1 | 02.012 | 1–4 | 0.19 | 0.18–0.19 |
| Total | | | | 88.7 | 88.4–89.2 |

CAS no: Chemical Abstracts Service number; FLAVIS number: EU Flavour Information System numbers.
(a): Mean calculated on four batches.

The applicant provided the full characterisation of the four batches obtained by GC-MS.16 In total, up to 100–130 peaks were detected in the chromatogram, 56 of which were identified and accounted on average for 99.1% (99.0–99.4%) of the % GC area. Besides the six compounds indicated in the product specifications, 22 other compounds were detected at individual levels > 0.1% and are listed in Table 3. These 28 compounds together account on average for 98.1% (98.0–98.3%) of % GC area. The remaining 28 compounds (ranging between 0.002% and 0.1%) and accounting for 1.02% are listed in the footnote.17

---

13 Technical dossier/Supplementary information March 2020/Annex_IV_SIn_Reply_petitgran bigarade oil_ISO_8901_2003.
14 Technical dossier/Supplementary information March 2020/SIn reply_petigrain bigarade oil/GC-FID analysis: linalyl acetate (53.2–54.2%), linalool (26.0–26.8%), geranyl acetate (3.41–3.56%), α-terpineol (3.41–3.56%), d-limonene (1.57–2.28%) and geraniol (0.11–0.22%).
15 According to the applicant, the use of an apolar column during GC-FID analysis probably resulted in an underestimation of geraniol which peak might have been partly included in the linalyl acetate peak.
16 Technical dossier/Supplementary information March 2020/Annex_III_SIn_Reply_petigrain bigarade oil_chromatograms.
17 Additional constituents: constituents (n = 11) between < 0.1 and ≥ 0.05%: α-terpinyl acetate, cis-8-hydroxylinalool, 4(10)-thujene (sabinene), 6-methylhept-5-en-2-one, methyl geranate, δ-cadinene, 2-(4-methylphenyl)propan-2-ol (p-cimen-8-ol), terpinolene, linalyl propionate, nerolidol, 3,7,10-humulatriene; constituents (n = 6) between < 0.05 and ≥ 0.01%: spathulenol, cis-linalool oxide (pyranoid), trans-linalool oxide (pyranoid), δ-elemene, α-thujene, 8-hydroxyxycarvanacetone; constituents (n = 11) ≤ 0.01%: α-terpinene, bicyclogermacrene, γ-phellandrene, γ-terpinene, cis-sabinene hydrate, rose furan, carvone, camphene, 1,8-cineole, octanal and heptan-1-ol.
The applicant performed a literature search regarding substances of concern and chemical composition of the plant species *Citrus × aurantium* L. and its preparations. The occurrence of furocoumarins such as 5-methoxypsoralen (5-MOP, synonym: bergapten) in the aerial parts of the plant has been reported in the EFSA Compendium (EFSA, 2012). Analysis of the four batches tested showed that 5-MOP was below the limit of detection of the high performance liquid chromatography (HPLC) method in all samples. Psoralen and coumarin were reported to be not present in leaves (Lim, 2012).

### 3.2.2. Impurities

The applicant makes reference to the ‘periodic testing’ of some representative flavourings premixtures for heavy metals (mercury, cadmium and lead), arsenic, fluoride, dioxins and polychlorinated biphenyls (PCBs), organochloride pesticides, organophosphorous pesticides, aflatoxin B1, B2, G1, G2 and ochratoxin A. However, no data have been provided. Since petitgrain bigarade oil is produced by steam distillation, the likelihood of any measurable carry-over of heavy metals is low except for mercury.

Table 3: Constituents of the essential oil from the leaves of *Citrus × aurantium* L. accounting for > 0.1% of the composition (based on the analysis of four batches) not included in the specification. The content of each constituent is expressed as the area per cent of the corresponding chromatographic peak (% GC area), assuming the sum of chromatographic areas of all detected peaks as 100%.

18 Technical dossier/Supplementary information March 2020/Literature search_petitgrain_bigarade_oil.
19 Technical dossier/Supplementary information March 2020/Annex VI_Sin petitgrain_bigarade_oil_SOC_COA, limit of detection (LOD) 5 mg/kg.
3.2.3. Shelf-life

The typical shelf-life of the additive is stated to be at least 12 months, when stored in tightly closed containers under standard conditions (in a cool, dry place protected from light).\textsuperscript{20}

3.2.4. Conditions of use

Petitgrain bigarade oil is intended to be added to feed and water for drinking for all animal species without a withdrawal time. The maximum proposed use levels in complete feed for the different target species are reported in Table 4. No use level has been proposed by the applicant for the use in water for drinking.

\textbf{Table 4:} Conditions of use for the essential oil from the leaves of \textit{Citrus x aurantium} L.: maximum proposed use levels in complete feed for the different target species

| Animal category | Maximum use level (mg/kg complete feed) |
|-----------------|----------------------------------------|
| Chicken for fattening | 10.5 |
| Laying hen | 16 |
| Turkey for fattening | 14.5 |
| Piglet | 19 |
| Pig for fattening | 23 |
| Sow lactating | 28 |
| Veal calf (milk replacer) | 45 |
| Cattle for fattening | 42.5 |
| Dairy cow | 27.5 |
| Sheep/goat | 42.5 |
| Horse | 42.5 |
| Rabbit | 17 |
| Salmon | 48.5 |
| Dog | 51 |
| Cat | 42.5 |
| Ornamental fish | 125 |

3.3. Safety

The assessment of safety is based on the maximum use levels proposed by the applicant. Many of the major components of petitgrain bigarade oil, accounting for about 99% of the % GC peak areas, have been previously assessed and considered safe for use as flavourings, and are currently authorised for food\textsuperscript{7} and feed\textsuperscript{8} uses. The list of the compounds already evaluated by the EFSA Panels is given in Table 1 (see Section 1.2).

Two compounds, \(\delta\)-cadinene [01.021] and 3,7,10-humulatriene [01.043], have been evaluated in FGE25.Rev2 (EFSA CEF Panel, 2011b) by applying the procedure described in the Guidance on the data required for the risk assessment of flavourings to be used in or on food (EFSA CEF Panel, 2010). For these compounds, for which there is no concern for genotoxicity, EFSA requested additional subchronic toxicity data (EFSA CEF Panel, 2011b). In the absence of such toxicological data, the EFSA CEF Panel was unable to complete its assessment. As a result, these compounds are not authorised for use as flavours in food. In the absence of toxicity data, the FEEDAP Panel applies the threshold of toxicological concern (TTC) approach or read-across from structurally related substances.

For 3-methyl-2(3-methylbut-2-enyl)furan (rose furan) [13.148], the EFSA CEF Panel had requested additional genotoxicity data to complete the assessment (EFSA CEF Panel, 2015a). Based on the data submitted on 2-pentylfuran [13.059] and 2-acetyl furan [13.054], the EFSA Panel on Food Additives and Flavourings (EFSA FAF Panel) ruled out the genotoxicity concern and concluded that there is no safety concern at the estimated levels of intake as flavouring substances based on the maximised survey-derived intake (MSDI) approach (EFSA FAF Panel, 2021a,b).

\textsuperscript{20} Technical dossier/Section II.
Several volatile components accounting for < 0.5% of the % GC area (8-hydroxylinalyl acetate, trans-8-hydroxyinalool, cis-8-hydroxyinalool, cis-sabinene hydrate, cis- and trans-linalool oxide (pyranoid structures), spathulenol, 8-hydroxycarvotanacetone, β-elemene, α-thujene and bicyclogermacrene) have not been previously assessed for use as flavourings. The FEEDAP Panel notes that they are aliphatic mono- or sesquiterpenes structurally related to flavourings already assessed in CGs 6, 31 and 8 and a similar metabolic and toxicological profile is expected. These lipophilic compounds are expected to be rapidly absorbed from the gastrointestinal tract, oxidised to polar oxygenated metabolites, conjugated and excreted (EFSA FEEDAP Panel, 2012a, 2016c,d). These compounds were screened with the Organisation for Economic Co-operation and Development (OECD) Quantitative Structure-Activity Relationship (QSAR) Toolbox and no alerts were identified for in vitro mutagenicity, for genotoxic and non-genotoxic carcinogenicity and for other endpoints.21

### 3.3.1. Safety for the target species

Tolerance studies and/or toxicological studies made with the essential oil under application were not submitted.

In the absence of these data, the approach to the safety assessment of a mixture whose individual components are known is based on the safety assessment of each individual component (component-based approach). This approach requires that the mixture is sufficiently characterised. The individual components can be grouped into assessment groups, based on structural and metabolic similarity. The combined toxicity can be predicted using the dose addition assumption within an assessment group, taking into account the relative toxic potency of each component.

As the additive under assessment is sufficiently characterised (> 99%), the FEEDAP Panel applied a component-based approach to assess the safety for target species of the essential oil.

Based on considerations related to structural and metabolic similarities, the components were allocated to 12 assessment groups, corresponding to the CGs 1, 3, 4, 5, 6, 8, 13, 14, 16, 27, 31 and 32, as defined in Annex I of Regulation (EC) No 1565/2000. For CG 31 (‘aliphatic and aromatic hydrocarbons’), sub-assessment groups as defined in Flavouring Group Evaluation 25 (FGE.25) and FGE.78 are applied (EFSA CEF Panel, 2015b,c). The allocation of the components to the (sub-)assessment groups is shown in Table 5.

For each component in the assessment group, exposure of target animals was estimated considering the use levels in feed, the percentage of the component in the oil and the default values for feed intake according to the guidance on the safety of feed additives for target species (EFSA FEEDAP Panel, 2017a–c). Default values on body weight are used to express exposure in terms of mg/kg body weight (bw) per day. The intake levels of the individual components calculated for chicken for fattening, the species with the highest ratio of feed intake/body weight per day, are shown in Table 5.

For hazard characterisation, each component of an assessment group was first assigned to the structural class according to Cramer classification. For some components in the assessment group toxicological data were available to derive no observed adverse effect level (NOAEL) values. Structural and metabolic similarity among the components in the assessment groups were evaluated to explore the application of read-across allowing extrapolation from a known NOAEL of a component of an assessment group to the other components of the group with no available NOAEL or, if sufficient evidence were available for members of a (sub-)assessment group, to derive a (sub-)assessment group NOAEL.

Toxicological data for subchronic studies, from which NOAEL values could be derived, were available for octyl acetate [09.007] in CG 1 (EFSA FEEDAP Panel, 2013), citral [05.020] in CG 3 (EFSA FEEDAP Panel, 2016a), citronellol [02.011] in CG 4 (EFSA FEEDAP Panel, 2016b), terpineol [02.230] and linalool [02.013] in CG 6 (EFSA FEEDAP Panel, 2012a), carvone [07.147] in CG 8 (EFSA SC, 2014; EFSA FEEDAP Panel, 2016d), 1,8-cineole in CG 16 (EFSA SC, 2014; EFSA CEF Panel, 2011), 8-methyl anthranilate [09.781] in CG 27 (EFSA FEEDAP Panel, 2011), myrcene [01.008], d-limonene [01.045], p-cymene [01.002] and β-caryophyllene [01.007] in CG 31 (EFSA FEEDAP Panel, 2015b, 2016c), and β-caryophyllene epoxide in CG 32 (EFSA CEF Panel, 2014).

---

21 Technical dossier/Supplementary information March 2020/Annex IX_SIn_reply_petitgrain_bigarade_oil_QSAR. ‘For 8-hydroxycarvotanacetone, predictions of Ames mutagenicity was made by “read-across” analyses of data available for similar substances to the target compounds (i.e. analogues obtained by categorisation). Categories were defined using general mechanistic and endpoint profilers as well as empirical profilers. Subcategorisation was performed in order to exclude analogues less similar to 8-hydroxycarvotanacetone. Ames test (with and without S9) read across predictions for 8-hydroxycarvotanacetone were found negative.’
The NOAEL of 120 mg/kg for octyl acetate [09.007] was selected as reference point for CG 1 compounds. Similarly, read-across was also applied using the NOAEL of 345 mg/kg bw per day for citral [05.020] to extrapolate to geraniol [02.012], geranial [05.188], geranyl acetate [09.011], geranyl formate [09.076], nerol [02.058], neral [05.170], neryl acetate [09.213] and neryl formate [09.212] in CG 3.

Considering the structural and metabolic similarities, the NOAEL of 117 mg/kg bw per day for linalool was extrapolated to linalyl acetate [09.013], linalyl propionate [09.130], 8-hydroxylinalylacetate and trans-8-hydroxylinalool in CG 6. For the subgroup of terpinyl derivatives in CG 6, i.e. α-terpineol [02.072] and terpinen-4-ol [02.072], the reference point was selected based on the NOAEL of 250 mg/kg bw per day available for terpineol [02.230] and d-limonene [01.045].

Similarly, the NOAELs for the representative compounds of CG 31, myrcene [01.008], d-limonene [01.045], and β-caryophyllene [01.007] were applied, respectively, using read-across to the compounds within sub-assessment group II (cis-β-ocimene [01.064] and trans-β-ocimene), group III (terpinolene [01.005], α-elemene, α-terpinene [01.019], phellandrene [01.006] and γ-terpinene [01.020]) and group V (β-pinene [01.003], δ-3-carene [01.029] and α-pinene [01.004]) (EFSA CEF Panel, 2015b,c). The FEEDAP Panel applied the same NOAEL to trans-sabinene hydrate [02.085] in CG 8, as it is structurally related to sabinene in group V. The NOAEL for p-cymene [01.002] in group IVe was applied to 2-(4-methylphenyl)propan-2-ol (p-cimen-8-ol) in CG 8.

For the remaining compounds, 6-methylhept-5-en-2-one [07.015] in CG 5, spathulenol in CG 6, 8-hydroxycarvotanacetone in CG 8, cis-linalool oxide and trans-linalool oxide in CG 13, rosefuran [13.148] in CG 14, bicyclogermacrene and 3,7,10-humulatriene [01.043] and in CG 31, toxicity studies and NOAEL values performed with the compounds under assessment were not available and read-across was not possible. Therefore, the TTC approach was applied (EFSA FEEDAP Panel, 2017b).

As the result of the hazard characterisation, a reference point was identified for each component in the assessment group based on the toxicity data available (NOAEL from in vivo toxicity study or read across) or from the 5th percentile of the distribution of NOAELs of the corresponding Cramer Class (i.e. 3, 0.91 and 0.15 mg/kg bw per day, respectively, for Cramer Class I, II and III compounds). Reference points selected for each compound are shown in Table 5.

For risk characterisation, the margin of exposure (MOE) was calculated for each component as the ratio between the reference point and the exposure. For each assessment group, the combined (total) margin of exposure (MOET) was calculated as the reciprocal of the sum of the reciprocals of the MOE of the individual substances (EFSA Scientific Committee, 2019a). A MOET > 100 allowed for interspecies- and intra-individual variability (as in the default 10 × 10 uncertainty factor). The compounds resulting individually in a MOE > 50,000 were not further considered in the assessment group as their contribution to the MOE(T) is negligible. They are listed in the footnote.

The approach to the safety assessment of petitgrain bigarade oil expressed for the target species is summarised in Table 5. The calculations were done for chicken for fattening, the species with the highest ratio of feed intake/body weight and represent the worst-case scenario at the use level of 10.5 mg/kg.

Table 5: Compositional data, intake values, reference points and margin of exposure (MOE) for the individual components of petitgrain bigarade oil classified according to assessment groups

| Essential oil composition | Exposure | Hazard characterisation | Risk characterisation |
|---------------------------|----------|------------------------|----------------------|

FLAVIS: EU Flavour Information System; bw: body weight; NOAEL: no observed adverse effect level; MOE: margin of exposure; MOET: (total) margin of exposure.

(a): Intake calculations for the individual components are based on the use level of 10.5 mg/kg in feed for chicken for fattening, the species with the highest ratio of feed intake/body weight. The MOE for each component is calculated as the ratio of the...
reference point (NOAEL) to the intake. The combined margin of exposure (MOET) is calculated for each assessment group as the reciprocal of the sum of the reciprocals of the MOE of the individual substances.

(b): Values in bold refer to those components for which the NOAEL value was available, values in italics are the 5th percentile of the distribution of NOAELs of the corresponding Cramer Class, other values (plain text) are NOAELs extrapolated by using read-across.

As shown in Table 5, for all the assessment groups, the MOET was ≥ 91. From the lowest MOET of 91 for chicken for fattening, the MOET was calculated for the other target species considering the respective daily feed intake and conditions of use. The results are summarised in Table 6.

**Table 6:** Combined margin of exposure (MOET) for the assessment group 'Linalool oxides' (CG 13) calculated for the different target animal categories at the proposed use level and maximum safe use levels in feed calculated to ensure a MOET ≥ 100 (500 for cats)

| Animal category          | Body weight (kg) | Feed intake (g DM/day) | Proposed use level (mg/kg feed) | Lowest MOET | Maximum safe use level (mg/kg feed)(a) |

CG: chemical group; MOET: (total) margin of exposure; DM: dry matter.
(a): Complete feed containing 88% DM, milk replacer 94.5% DM.
(b): The MOET for cats is increased to 500 because of the reduced capacity of glucuronidation.

At the proposed use levels, the MOET was below the value of 100 for all species except ornamental fish. The maximum safe use levels in feed were calculated in order to ensure a MOET ≥ 100 for the different target species and > 500 for cats, considering their unusually low capacity for glucuronidation (Court and Greenblatt, 1997; Lautz et al., 2021). The calculated maximum safe levels in feed are shown in Table 6.

No specific proposals have been made by the applicant for the use level in water for drinking. The Panel considers that the use in water for drinking is safe provided that the total daily intake of the additive does not exceed the daily amount that is considered safe when consumed via feed (EFSA FEEDAP Panel, 2010). Simultaneous use in feed and water for drinking may lead to the maximum safe dose being exceeded.

### 3.3.1.1. Conclusions on safety for the target species

The FEEDAP Panel concludes that petitgrain bigarade oil from the leaves of *Citrus × aurantium* L. is safe up to the maximum proposed use level of 125 mg/kg complete feed for ornamental fish. For the other species, the calculated safe concentrations in complete feed are 10 mg/kg for chicken for fattening, 14 mg/kg for laying hen, 13 mg/kg for turkey for fattening, 17 mg/kg for piglet, 20 mg/kg for pig for fattening, 25 mg/kg for lactating sow, 43 mg/kg for veal calf (milk replacer), 38 mg/kg for cattle for fattening, sheep, goat and horse, 24 mg/kg for dairy cow, 15 mg/kg for rabbit, 42 mg/kg for salmon, 44 mg/kg for dog and 8 mg/kg for cat.

The Panel considers that the use in water for drinking is safe provided that the total daily intake of the additive does not exceed the daily amount that is considered safe when consumed via feed.

Simultaneous use in feed and water for drinking may lead to the safe maximum dose being exceeded.
3.3.2. Safety for the consumer

Petitgrain bigarade oil obtained by steam distillation of the leaves and twigs of the bitter orange tree is added to a wide range of food categories for flavouring purposes. Although individual consumption figures for the EU are not available, the Fenaroli’s handbook of flavour ingredients (Burdock, 2009) cites values of 0.76 μg/kg bw per day for petitgrain bigarade oil.

The majority of the individual constituents of the essential oil under assessment are currently authorised as food flavourings without limitations and have been already assessed for consumer safety when used as feed additives in animal production (see Table 1).

No data on residues in products of animal origin were made available for any of the constituents of the essential oil. However, the Panel recognises that the constituents of petitgrain bigarade oil are expected to be extensively metabolised and excreted in the target species. Therefore, a relevant increase of the uptake of the individual constituents by humans consuming products of animal origin is not expected.

Considering the reported human exposure due to direct use of petitgrain bigarade oil in food (Burdock, 2009), it is unlikely that consumption of products from animals given petitgrain bigarade oil at the proposed maximum use level would significantly increase human background exposure.

Consequently, no safety concern would be expected for the consumer from the use of petitgrain bigarade essential oil up to highest safe level in feed for the target animals.

3.3.3. Safety for user

No specific data were provided by the applicant regarding the safety of the additive for users.

The applicant produced a safety data sheet23 for petitgrain bigarade oil where skin and eye irritancy and sensitisation hazards for users have been identified.

3.3.4. Safety for the environment

Citrus × aurantium L. is a native species to Europe where it is widely grown both for commercial and decorative purposes. The use of the additive in animal feed under the proposed conditions is not expected to pose a risk for the environment.

3.4. Efficacy

Petitgrain bigarade oil from the leaves of Citrus × aurantium L. (petitgrain) is listed in Fenaroli’s Handbook of Flavour Ingredients (Burdock, 2009) and by FEMA with the reference number 2855.

Since petitgrain bigarade oil is recognised to flavour food and its function in feed would be essentially the same as that in food, no further demonstration of efficacy is considered necessary.

4. Conclusions

The essential oil from the leaves of Citrus × aurantium L. (petitgrain bigarade oil) is safe up to the maximum proposed use levels of 125 mg/kg for ornamental fish. For the other species, the calculated safe concentrations in complete feed are 10 mg/kg for chicken for fattening, 14 mg/kg for laying hen, 13 mg/kg for turkey for fattening, 17 mg/kg for piglet, 20 mg/kg for pig for fattening, 25 mg/kg for lactating sow, 43 mg/kg for veal calf (milk replacer), 38 mg/kg for cattle for fattening, sheep, goat and horse, 24 mg/kg for dairy cow, 15 mg/kg for rabbit, 42 mg/kg for salmon, 44 mg/kg for dog and 8 mg/kg for cat. The FEEDAP Panel considers that the use level in water for drinking is safe provided that the total daily intake of the additive does not exceed the daily amount that is considered safe when consumed via feed. Simultaneous use in feed and water for drinking may lead to the safe maximum dose being exceeded.

No concerns for consumer safety were identified following the use of the additive up to highest safe level in feed for the target animals.

The essential oil under assessment should be considered as irritant to skin, eyes and the respiratory tract, and as a skin sensitiser.

The use of the additive in animal feed under the proposed conditions is not expected to pose a risk for the environment.

---

23 Technical dossier/Supplementary Information March 2020/Annex_X_SIn reply_petitgrain_bigarade_oil_MSDS. Hazards for skin irritation (H315), skin sensitisation (H317b, category 1B), eye damage (H318).
Since petitgrain bigarade oil from Citrus × aurantium L. is recognised to flavour food, and its function in feed would be essentially the same as that in food, no further demonstration of efficacy is considered necessary.

5. Documentation as provided to EFSA/Chronology

| Date       | Event                                                                 |
|------------|------------------------------------------------------------------------|
| 05/11/2010 | Dossier received by EFSA. Botanically defined flavourings from Botanical Group 08 – Sapindales for all animal species and categories. Submitted by Feed Flavourings Authorisation Consortium European Economic Interest Grouping (FFAC EEIG) and registered with the Question number EFSA-Q-2010-01517 |
| 14/12/2010 | Reception mandate from the European Commission                           |
| 26/02/2013 | EFSA informed the applicant (EFSA ref. 7150727) that, in view of the workload, the evaluation of applications on feed flavourings would be re-organised by giving priority to the assessment of the chemically defined feed flavourings, as agreed with the European Commission |
| 24/06/2015 | Technical hearing during risk assessment with the applicant according to the “EFSA’s Catalogue of support initiatives during the life-cycle of applications for regulated products”: data requirement for the risk assessment of botanicals |
| 17/06/2016 | Technical hearing during risk assessment with the applicant according to the “EFSA’s Catalogue of support initiatives during the life-cycle of applications for regulated products”. Discussion on the ongoing work regarding the pilot dossiers BDG08 and BDG 09 |
| 27/04/2017 | Trilateral meeting organised by the European Commission with EFSA and the applicant FEFANA on the assessment of botanical flavourings: characterisation, substances of toxicological concern present in the botanical extracts, feedback on the pilot dossiers |
| 19/03/2018 | Application validated by EFSA – Start of the scientific assessment |
| 03/05/2018 | Request of supplementary information to the applicant in line with Article 8(1)(2) of Regulation (EC) No 1831/2003 – Scientific assessment suspended. Issues: characterization, safety for the target species, safety for the consumer, safety for the user, safety for the environment |
| 20/06/2018 | Comments received from Member States                                   |
| 27/02/2019 | Partial withdrawal by applicant (EC was informed) for the following additives: amyris oil, cashew oil, olibanum tincture, neroli bigarade oil, petitgrain bigarade absolute, mandarin terpenes, grapefruit oil expressed, grapefruit extract (sb), grapefruit extract |
| 26/03/2020 | Reception of supplementary information from the applicant (partial submission) |
| 12/03/2021 | The application was split and a new EFSA-Q-2021-00134 was assigned to the preparation included in the present assessment |
| 17/03/2021 | Reception of the Evaluation report of the European Union Reference Laboratory for Feed Additives - Scientific assessment re-started for the preparation included in the present assessment |
| 02/04/2021 | Partial withdrawal by applicant (EC was informed) for the following additive: olibanum extract (wb) |
| 05/05/2021 | Opinion adopted by the FEEDAP Panel. End of the Scientific assessment for the preparation included in the present assessment |

Annex A – Executive Summary of the Evaluation Report of the European Union Reference Laboratory for Feed Additives on the Method(s) of Analysis for buchu leaves oil, olibanum extract (wb), lime oil, petigrain bigarade oil, bitter orange extract of the whole fruit, lemon oil expressed, lemon oil distilled (residual fraction), lemon oil distilled (volatile fraction), orange oil cold pressed, orange terpenless (concentrated 4 times), orange terpenless (concentrated 10 times), orange terpenless (folded), orange terpenes, mandarin oil and quebracho extract (wb) from botanically defined flavourings Group (BDG 08) – Sapindales

In the current grouped application an authorisation is sought under Articles 4(1) and 10(2) for buchu leaves oil, olibanum extract (wb), lime oil, petigrain bigarade oil, bitter orange extract of the whole fruit, lemon oil expressed, lemon oil distilled (residual fraction), lemon oil distilled (volatile fraction), orange oil cold pressed, orange terpenless (concentrated 4 times), orange terpenless (concentrated 10 times), orange terpenless (folded), orange terpenes, mandarin oil and quebracho extract (wb) from botanically defined flavourings group 08 (BDG 08)1, under the category/functional group 2(b) ‘sensory additives’/flavouring compounds’, according to Annex I of Regulation (EC) No 1831/2003. The authorisation is sought for all animal species. For each preparation the Applicant indicated the corresponding phytochemical marker(s) and the corresponding range of content. The feed additives are intended to be incorporated into feedingstuffs or drinking water directly or through flavouring premixtures with no proposed minimum or maximum levels. However, the Applicant suggested the typical maximum inclusion level of the feed additives of 25 mg/kg feedingstuffs.

For the quantification of the phytochemical markers d-limonene and d,l-isomenthone in buchu leaves oil and d-limonene in orange terpenless (concentrated 10 times) oil, the Applicant submitted a method using gas chromatography coupled with flame ionisation detection (GC-FID) based on the generic standard ISO 11024. The quantification is performed by using the normalisation approach for the estimation of the area percentage of individual components. The Applicant tested the method, following an experimental design proposed by the EURL, and obtained satisfactory performance characteristics.

For the quantification of the phytochemical markers 11-keto-β-boswellic acid and 3-O-acetyl-11-keto-β-boswellic acid in olibanum extract (wb), the Applicant submitted a method using high performance liquid chromatography (HPLC) with spectrophotometric (UV) detection at 250 nm described in the European Pharmacopeia monograph for Indian Frankincense (Olibanum indicum). The quantification of 11-keto-β-boswellic acid and 3-O-acetyl-11-keto-β-boswellic acid is performed by means of specific expressions and is indicated as percentage content (absolute value). The Applicant, using the HPLC-UV method, analysed 5 batches of the feed additive obtaining results within the proposed specifications.

For the quantification of the phytochemical marker d-limonene in lime oil the Applicant submitted a GC-FID method based on the corresponding standard ISO 3519:2005 for the characterisation of the “oil of lime distilled, Mexican type (Citrus aurantiifolia [Christm.] Swingle)”. The quantification is performed using the normalisation approach for the estimation of the area percentage of individual components. The Applicant presented a chromatogram and the specific analytical procedure for the analysis of d-limonene in lime oil.

For the quantification of the phytochemical markers linalyl acetate and linalool in petigrain bigarade oil the Applicant submitted a GC-FID method based on the corresponding standard ISO 8901:2003 for “Oil of bitter orange petitgrain, cultivated (Citrus aurantium L.)”. The quantification is performed using the normalisation approach for the estimation of the area percentage of individual components. The Applicant presented a chromatogram and the specific analytical procedure for the analysis of linalyl acetate and linalool in petigrain bigarade oil.

For the quantification of the phytochemical marker naringin in bitter orange extract of the whole fruit the Applicant submitted a single-laboratory validated and further verified method based on HPLC-UV (284 nm). The method has been developed for the determination of total flavonoids (including naringin alone) in a mixture of citrus flavonoids. The quantification of naringin is performed using the normalisation approach for the estimation of the area percentage of individual components. The Applicant provided validation and verification studies demonstrating the applicability of the method for
the analysis of pure naringin. Furthermore, naringin has been satisfactorily quantified in the feed additive by the proposed method in 5 different lots of bitter orange extract of the whole fruit.

For the quantification of the phytochemical marker d-limonene in lemon oil expressed, lemon oil distilled (residual fraction) and lemon oil distilled (volatile fraction) the Applicant submitted a GC-FID method based on the corresponding standard ISO 855:2003 for “Oil of lemon (Citrus limon (L.) Burm. f.), obtained by expression”. The quantification is performed using the normalisation approach for the estimation of the area percentage of individual components. The Applicant presented a chromatogram and the specific analytical procedure for the analysis of d-limonene in lemon oil expressed, lemon oil distilled (residual fraction) and lemon oil distilled (volatile fraction).

For the quantification of the phytochemical marker d-limonene in orange oil cold pressed, orange terpenless (concentrated 4 times) oil, orange terpenless (folded) oil and orange terpenes oil the Applicant submitted a GC-FID method based on the corresponding standard ISO 3140:2019 for “Essential oil of sweet orange expressed (Citrus sinensis (L.))”. The quantification is performed using the normalisation approach for the estimation of the area percentage of individual components. The Applicant presented a chromatogram and the specific analytical procedure for the analysis of d-limonene in orange oil cold pressed, orange terpenless (concentrated 4 times) oil, orange terpenless (folded) oil and orange terpenes oil.

For the quantification of the phytochemical marker d-limonene in mandarin oil the Applicant submitted a GC-FID method based on the corresponding standard ISO 3528:2012 for “Essential oil of mandarin, Italian type (Citrus reticulate Blanco)”. The quantification is performed using the normalisation approach for the estimation of the area percentage of individual components. For mandarin oil, the Applicant presented a chromatogram and the specific analytical procedure for the analysis of the d-limonene in mandarin oil.

For the quantification of the phytochemical marker tannins in quebracho extract (wb) the Applicant submitted the method ISO 14088:2020 “Leather - Chemical tests - Quantitative analysis of tanning agents by filter method”. The method proposed is suitable for the determination of tanning agents in all vegetable tanning products and it is based on indirect gravimetric analysis of tanning agents with fixing of the absorbent compounds in low chromed hide powder. The quantification of tannins in quebracho extract (wb) is performed by means of specific expressions and is indicated as percentage content (absolute value). Furthermore, the Applicant provided satisfactory results for the analysis of tannins in 3 batches of quebracho extract (wb).

The accurate quantification of the feed additives in premixtures and feedingstuffs is not achievable experimentally and the Applicant did not provide experimental data to determine the feed additives in water. Therefore, the EURL cannot evaluate nor recommend any method for official control to quantify the feed additives in premixtures, feedingstuffs and water.

Based on the information above, the EURL recommends for official control: (i) the GC-FID method based on the generic standard ISO 11024 for the quantification of d-limonene and d-l-isomenthone in buchu leaves oil and d-limonene in orange terpenless (concentrated 10 times) oil; (ii) the HPLC-UV method described in the European Pharmacopoeia monograph “Indian Frankincense (Olibanum indicum)” for the quantification of 11-keto-β-boswellic acid and 3-O-acetyl-11-keto-β-boswellic acid in olibanum extract (wb); (iii) the GC-FID method based on the standard ISO 3519:2005 for the quantification of d-limonene in lime oil; (iv) the GC-FID method based on the standard ISO 8901:2003 for the quantification of linalyl acetate and linalool in petitgrain bigarade oil; (v) the HPLC-UV single-laboratory validated and further verified method for the quantification of naringin in bitter orange extract of the whole fruit; (vi) the GC-FID method based on the standard ISO 855:2003 for the quantification of d-limonene in lemon oil expressed, lemon oil distilled (residual fraction) and lemon oil distilled (volatile fraction); (vii) the GC-FID method based on the standard ISO 3140:2019 for the quantification of d-limonene in orange oil cold pressed, orange terpenless (concentrated 4 times) oil, orange terpenless (folded) oil and orange terpenes oil; (viii) the GC-FID method based on the standard ISO 3528:2012 for the quantification of d-limonene in mandarin oil; and (ix) the indirect gravimetric analysis of tanning agents with fixing of the absorbent compounds in low chromed hide powder described in ISO 14088:2020 for the quantification of tannins in quebracho extract (wb).

Further testing or validation of the methods to be performed through the consortium of National Reference Laboratories as specified by Article 10 (Commission Regulation (EC) No 378/2005, as last amended by Regulation (EU) 2015/1761) is not considered necessary.
