\textbf{\textit{L}^p \textit{ ESTIMATES FOR WAVE EQUATIONS WITH SPECIFIC \textit{C}^{0,1}} \textit{ COEFFICIENTS}}

DOROTHEE FREY AND PIERRE PORTAL

Abstract. Peral/Miyachi’s celebrated theorem on fixed time \textit{L}^p estimates with loss of derivatives for the wave equation states that the operator \((I - \Delta)^{-\frac{\alpha}{2}} \exp(i\sqrt{-\Delta})\) is bounded on \(L^p(\mathbb{R}^d)\) if and only if \(\alpha \geq s_p := (d - 1) \left| \frac{1}{p} - \frac{1}{2} \right| \). We extend this result to operators of the form \(L = -\sum_{j=1}^{d} a_{j+1} \partial_j a_j \partial_j\), such that, for \(j = 1, \ldots, d\), the functions \(a_j\) and \(a_{j+1}\) only depend on \(x_j\), are bounded above and below, but are merely Lipschitz continuous. This is below the \(C^{1,1}\) regularity that is known to be necessary in general for Strichartz estimates in dimension \(d \geq 2\). Our proof is based on an approach to the boundedness of Fourier integral operators recently developed by Hassell, Rozendaal, and the second author. We construct a scale of adapted Hardy spaces on which \(\exp(i\sqrt{L})\) is bounded by lifting \(L^p\) functions to the tent space \(T^{p,2}(\mathbb{R}^d)\), using a wave packet transform adapted to the Lipschitz metric induced by the coefficients \(a_j\). The result then follows from Sobolev embedding properties of these spaces.

Mathematics Subject Classification (2020): Primary 42B35. Secondary 35L05, 42B30, 42B37, 35S30.

1. Introduction

In 1980, Peral \cite{Peral80} and Miyachi \cite{Miyachi80} proved that the operator \((I - \Delta)^{-\frac{\alpha}{2}} \exp(i\sqrt{-\Delta})\) is bounded on \(L^p(\mathbb{R}^d)\) if and only if \(\alpha \geq s_p := (d - 1) \left| \frac{1}{p} - \frac{1}{2} \right| \). Their result was then extended to general Fourier integral operators (FIOs) in a celebrated theorem of Seeger, Sogge, and Stein \cite{Seeger84}, leading, in particular, to \(L^p(\mathbb{R}^d)\) well-posedness results for wave equations with smooth variable coefficients on \(\mathbb{R}^d\) or driven by the Laplace-Beltrami operator on a compact manifold. To establish well-posedness of wave equations in more complex geometric settings, many results have been obtained in the past 30 years, using extensions of Peral/Miyachi’s fixed time estimates with loss of derivatives, Strichartz estimates, and/or local smoothing properties. This includes Smith’s parametrix construction \cite{Smith94}, Tataru’s Strichartz estimates \cite{Tataru95} for wave equations on \(\mathbb{R}^d\) with \(C^{1,1}\) coefficients, and Müller-Seeger’s extension of Peral-Miyachi’s result to the sublaplacian on Heisenberg type groups \cite{MullerSeeger97}, as well as many other important results for specific operators, such as Laplace-Beltrami operators on symmetric spaces.

In this paper, we consider operators of the form $L = - \sum_{j=1}^{d} a_{j+d} \partial_j a_j \partial_j$, such that, for $j = 1, \ldots, d$, the functions $a_j$ and $a_{j+d}$ only depend on $x_j$, are bounded above and below, and are Lipschitz continuous. For these operators, we extend Peral/Miyachi’s result by proving that $(I + L)^{-\frac{\alpha}{2}} \exp(i \sqrt{L})$ is bounded on $L^p(\mathbb{R}^d)$ for $\alpha \geq s_p := (d - 1) \left| \frac{1}{p} - \frac{1}{2} \right|$. When $s_p \leq 2$, we show well-posedness for data in $W^{s_p,p}(\mathbb{R}^d)$, even when $L$ is perturbed by first order drift terms depending on all the variables (see Theorem 9.6 and Section 10). While the algebraic structure of the coefficient matrix is a serious limitation, the roughness of the coefficients is a satisfying and somewhat surprising feature of our result. Indeed, Strichartz estimates for wave equations are known to fail, in general, for coefficients rougher than $C^{1,1}$, see [34,35].

Our proof is based on a new approach to Seeger-Sogge-Stein’s $L^p$ boundedness theorem for FIOs, initiated by Hassell, Rozendaal, and the second author in [21], building on earlier work of Smith [32]. The approach consists in developing a scale of Hardy spaces $H^p_{FIO,a}$, that are invariant under the action of FIOs. One then shows that this scale relates to the Sobolev scale through the embedding $W^{\frac{s_p}{2},p} \subset H^p_{FIO,a} \subset W^{-\frac{s_p}{2},p}$, for $p \in (1, \infty)$. This is similar, in spirit, to the theory of Hardy spaces associated with operators, which has been extensively developed over the past 15 years, starting with [7,16,20] (see also the memoir [19]). In this theory, one first constructs a scale of spaces $H^p_{\Delta}$ by lifting functions from $L^p$ to one of the tent spaces introduced by Coifman, Meyer, and Stein in [14], using the functional calculus of the operator $\mathcal{L}$ (rather than convolutions). One then shows that the spaces are invariant under the action of the functional calculus of $\mathcal{L}$. Finally, one relates these spaces to more classical ones. For instance $H^p_{\Delta}(\mathbb{R}^d) = L^p(\mathbb{R}^d)$ for all $p \in (1, \infty)$. More generally, when one considers Hodge-Dirac operators $\Pi_B$, $H^p_{\Pi_B} = L^p$ precisely for those $p$ for which Hodge projections are $L^p$ bounded (a result proven by McIntosh and the authors in [17]).

In the present paper, we go one step further in connecting both theories, by developing a scale of Hardy-Sobolev spaces $H^{s,p}_{FIO,a}$ on which $\exp(i \sqrt{L})$ is bounded, and proving analogues of the embedding $W^{\frac{s_p}{2},p}(\mathbb{R}^d) \subset H^{0,0}_{FIO,a}(\mathbb{R}^d) \subset W^{-\frac{s_p}{2},p}(\mathbb{R}^d)$ such as, for $p \in (1, 2)$, $H^{0,0}_{FIO,a} \subset L^p$ and $(I + \sqrt{\mathcal{E}})^{-\frac{s_p}{2}} \in B(L^p, H^{0,0}_{FIO,a})$. This gives our $L^p$ boundedness with loss of derivatives result, and more. Indeed, one can apply the half wave group $\exp(i \sqrt{\mathcal{E}})$ repeatedly on $H^{s,p}_{FIO,a}$, and only loose derivatives when one compares $H^{s,p}_{FIO,a}$ to classical Sobolev spaces. This allows for iterative arguments in constructing parametrices (an idea used recently in [22]). One can also perturb the half wave group using abstract operator theory on the Banach space $H^{s,p}_{FIO,a}$ (see Corollary 10.3).

The paper is structured as follows. In Section 3, we treat the problem in dimension 1. In this simple situation, arguments based on bilipschitz changes of variables can be used.
In Section 4 we consider the transport group generated, on $L^2(\mathbb{R}^d; \mathbb{C}^2)$, by

$$i\xi.D_a := \sum_{j=1}^d \xi_j \begin{pmatrix} 0 & -ia_{j+d}\partial_j \\ ia_j\partial_j & 0 \end{pmatrix},$$

for $\xi \in \mathbb{R}^d$. The dimension 1 results from Section 3 allow us to prove that the commuting one dimensional wave groups $(\exp(it\sqrt{\langle e_j.D_a \rangle^2}))_{t \in \mathbb{R}}$ are bounded in $L^p$ for all $p \in [1, \infty)$ and $j = 1, \ldots, d$. The Phillips functional calculus associated with the corresponding commutative $d$-parameter group can then replace convolutions/Fourier multipliers in the context of our Lipschitz metric, and includes functions of

$$L := D_a.D_a = \begin{pmatrix} L_1 & 0 \\ 0 & L_2 \end{pmatrix},$$

where $L_1 := -\sum_{j=1}^d a_{j+d}\partial_ja_j\partial_j$ and $L_2 := -\sum_{j=1}^d a_j\partial_ja_{j+d}\partial_j$. Using this calculus, we use the approach of [5] to construct an adapted scale of Hardy-Sobolev spaces in Section 5. For all integrability parameters $p \in (1, \infty)$ and regularity parameter $s \in [0, 2]$, these spaces coincide with classical Sobolev spaces, thanks to the regularity properties of the heat kernel of $L$ arising from the Lipschitz continuity of its coefficients. To go from these spaces to $H^{p,s}_{FIO,a}$, one needs to directionally refine the Littlewood-Paley decomposition, as in the proof of Seeger-Sogge-Stein’s theorem. This is done in [21] using a wave packet transform defined by Fourier multipliers. In Section 6 we construct a similar wave packet transform, replacing Fourier multipliers by the Phillips calculus of the transport group. This allows us to define $H^{p,s}_{FIO,a}$ in Section 7 and to prove its embedding properties in Section 8. In Section 9 we prove that the half wave group $(\exp(it\sqrt{L}))_{t \in \mathbb{R}}$ is bounded on $H^{p,s}_{FIO,a}$ for all $1 < p < \infty$ and $s \in \mathbb{R}$. To do so, we first notice that the one dimensional wave groups are. We then realise that, in a given direction $\omega$, $\exp(i\sqrt{D_a.D_a})$ is close to $\exp(i\sum_{j=1}^d \omega_j\sqrt{\langle e_j.D_a \rangle^2})$, when acting on an appropriate wave packet, in the sense that operators of the form $(\exp(i\sqrt{D_a.D_a}) - \exp(i\sum_{j=1}^d \omega_j\sqrt{\langle e_j.D_a \rangle^2}))\varphi_\omega(D_a)$ are $L^p$ bounded. Finally, in Section 10 we show that $\exp(it\sqrt{L})$ remains bounded if one appropriately perturbs $L$ by first order terms. This is based on Theorem 10.1, a result about multiplication operators on $H^p_{FIO,a}$ that is of independent interest, even in the case where $a_j = 1$ for all $j = 1, \ldots, 2d$.

Our approach relies heavily on algebraic properties: the wave group commutes with the wave packet localisation operators, and can be expressed in the Phillips functional calculus of a commutative group. Although our coefficients are merely Lipschitz continuous, these algebraic properties match those of the standard Euclidean wave group. However, in dimension $d > 1$, the problem does not reduce to its euclidean counterpart through a change of variables (see Remark 1.5).

In the same way as Peral-Miyachi’s result for the standard half wave group is a starting point for the well-posedness theory of wave equations with coefficients that are smooth enough perturbations of constant coefficients, we expect the results proven here to provide
a basis for the development of a well-posedness theory of wave equations with coefficients that are smooth enough perturbations of structured Lipschitz continuous coefficients.

Acknowledgments. We thank Andrew Hassell and Jan Rozendaal for many interesting discussions on the relations between this work and theirs. We particularly want to thank Jan Rozendaal for pointing out a mistake in a previous version of Section 10. We also thank the anonymous referee of a previous version of this paper for pointing out the change of variable approach that we now use in Section 3 before moving on to more general operators for which such an approach is not available.

2. Preliminaries

We first recall (a special case of) the following Banach space valued Marcinkiewicz-Lizorkin Fourier multiplier’s theorem (see [37, Theorem 4.5]).

Theorem 2.1. (Fernandez/ Štrkalj-Weis) Let \( p \in (1, \infty) \). Let \( m \in C^1(\mathbb{R}^d \setminus \{0\}) \) be such that, for all \( \alpha \in \mathbb{N}_0^d \) with \( |\alpha|_\infty \leq 1 \) there exists a constant \( C = C(\alpha) > 0 \) such that

\[
|\xi^\alpha \partial^\alpha m(\xi)| \leq C \quad \forall \xi \in \mathbb{R}^d \setminus \{0\}.
\]

Let \( T_m \) denote the Fourier multiplier with symbol \( m \). Then \( T_m \otimes I_{L^p(\mathbb{R}^d)} \) extends to a bounded operator on \( L^p(\mathbb{R}^d; L^p(\mathbb{R}^d)) \).

This theorem will be combined with the following version of the Coifman-Weiss transfer-ence principle (see [24, Theorem 10.7.5]). Note that the extension of this theorem from a one parameter group to a \( d \) parameter group generated by a tuple of commuting operators is straightforward.

Theorem 2.2. (Coifman-Weiss) Let \( p \in (1, \infty) \). Let \( iD_1, \ldots, iD_d \) generate bounded commuting groups \( \exp(itD_j) \) on \( L^p(\mathbb{R}^d) \), and consider the \( d \) parameter group defined by

\[
\exp(iD) = \prod_{j=1}^d \exp(i\xi_jD_j) \quad \forall \xi \in \mathbb{R}^d.
\]

Then, for all \( \psi \in S(\mathbb{R}^d) \), we have that

\[
\left\| \int_{\mathbb{R}^d} \hat{\psi}(\xi) \exp(i\xi D)f d\xi \right\|_{L^p(\mathbb{R}^d)} \lesssim \|T\psi \otimes I_{L^p(\mathbb{R}^d)}\|_{B(L^p(\mathbb{R}^d), L^p(\mathbb{R}^d))} \|f\|_{L^p(\mathbb{R}^d)} \quad \forall f \in L^p(\mathbb{R}^d).
\]

To define our Hardy-Sobolev spaces, we use the tent spaces introduced by Coifman, Meyer, and Stein in [14], and used extensively in the theory of Hardy spaces associated with operators (see e.g. the memoir [19] and the references therein). These tent spaces \( T^{p,2}(\mathbb{R}^d) \) are defined as follows. For \( F : \mathbb{R}^d \times (0, \infty) \to \mathbb{C}^N \) measurable and \( x \in \mathbb{R}^d \), set

\[
AF(x) := \left( \int_0^\infty \int_{B(x, \sigma)} |F(y, \sigma)|^2 \frac{d\sigma}{\sigma} \right)^{1/2} \in [0, \infty],
\]

where \(|\cdot|\) denotes the euclidean norm on \( \mathbb{C}^N \).

Definition 2.3. Let \( p \in [1, \infty) \). The tent space \( T^{p,2}(\mathbb{R}^d) \) is defined as the space of all \( F \in L^p_{\text{loc}}(\mathbb{R}^d \times (0, \infty), dx \frac{d\sigma}{\sigma}) \) such that \( AF \in L^p(\mathbb{R}^d) \), endowed with the norm

\[
\|F\|_{T^{p,2}(\mathbb{R}^d)} := \|AF\|_{L^p(\mathbb{R}^d)}.
\]
Recall that the tent space $T^{1,2}$ admits an atomic decomposition (see [14]) in terms of atoms $A$ supported in sets of the form $B(c_B, r) \times [0, r]$, and satisfying

$$r^d \int_{\mathbb{R}^d} \int_0^r |A(y, \sigma)|^2 \frac{dyd\sigma}{\sigma} \leq 1.$$ 

Recall also that the classical Hardy space $H^1(\mathbb{R}^d)$ norm can be obtained as

$$\|f\|_{H^1(\mathbb{R}^d)} := \|(t, x) \mapsto \psi(t^2 \Delta) f(x)\|_{T^{1,2}(\mathbb{R}^d)},$$

where $\psi(t^2 \Delta)$ denotes the Fourier multiplier with symbol $\xi \mapsto t^2|\xi|^2 \exp(-t^2|\xi|^2)$. This is the starting point of the theory of Hardy spaces associated with operators (or equations): one replaces the Fourier multiplier by an appropriately adapted operator. To do so, one often uses the holomorphic functional calculus of a (bi)sectorial operator. The relevant theory is presented in [24]. We use it here with the following notation.

**Definition 2.4.** Let $0 < \theta < \frac{\pi}{2}$. Define the open sector in the complex plane by

$$S^\theta := \{z \in \mathbb{C} \setminus \{0\} : |\arg(z)| < \theta\},$$

as well as the bisector $S^\theta = S^\theta_+ \cup S^\theta_-$, where $S^\theta_- = -S^\theta_+$. We denote by $H(S^\theta)$ the space of holomorphic functions on $S^\theta$, and set

$$H^\infty(S^\theta) := \{g \in H(S^\theta) : \|g\|_{L^\infty(S^\theta)} < \infty\},$$

$$\Psi^\beta(S^\theta) := \{\psi \in H^\infty(S^\theta) : \exists C > 0 : |\psi(z)| \leq C|z|^{\alpha(1 + |z|^{\alpha+\beta})^{-1}} \forall z \in S^\theta\}$$

for every $\alpha, \beta > 0$. We say that $\psi \in H^\infty(S^\theta)$ is non-degenerate if neither of its restrictions to $S^\theta_+$ or $S^\theta_-$ vanishes identically.

For bisectorial operators $D$ such that $iD$ generates a bounded group on $L^p$, we also use the Phillips calculus defined by

$$\psi(D)f := \frac{1}{2\pi} \int_{\mathbb{R}} \hat{\psi}(\xi) \exp(i\xi D)f d\xi,$$

for $f \in L^p$ and $\psi \in \mathcal{S}(\mathbb{R})$. See [5,25] for more information on how these two functional calculi interact in the theory of Hardy spaces associated with operators. The results in Section 5 are fundamentally inspired by these papers.

3. The one dimensional case

In dimension one, the type of wave equations we are studying in this paper can be treated through a combination of simple changes of variables and perturbation arguments. In this section, we present this method both for pedagogical reasons, and because its results are used to set up our approach to higher dimensional problems in the next sections.

Let $a, b \in C^{0,1}(\mathbb{R})$ with $\frac{d}{dx}a, \frac{d}{dx}b \in L^\infty$, and assume that there exist $0 < \lambda \leq \Lambda$ such that $\lambda \leq a(x) \leq \Lambda$ and $\lambda \leq b(x) \leq \Lambda$ for all $x \in \mathbb{R}$. We consider the wave equation $\partial_x^2 u = (a\partial_x b\partial_x)u$. 

Proposition 3.1. The operators $a \frac{d}{dx}$ and $i \sqrt{-a \frac{d^2}{dx^2} a \frac{d}{dx}}$ generate bounded $C_0$ groups on $L^p(\mathbb{R})$ for all $p \in (1, \infty)$.

Proof. Define $\phi : x \mapsto \int_0^x \frac{1}{a(y)} dy$, and note that it is a $C^1$ diffeomorphism from $\mathbb{R}$ onto $\mathbb{R}$. The map $\chi \in C^1(\mathbb{R}^2)$ defined by

$$\chi : (t, x) \mapsto \phi^{-1}(t + \phi(x)),$$

is then a solution to

$$\frac{\partial}{\partial t} \chi(t, x) = a(\chi(t, x)) \quad \forall t, x \in \mathbb{R}.$$

It is such that

$$t = \int_{\chi(0,x)}^{\chi(t,x)} \frac{1}{a_j(y)} dy \quad \forall t, x \in \mathbb{R}. \quad (3.1)$$

and thus:

$$\frac{d}{dx} \chi(x, t) = \frac{a(\chi(x, t))}{a(x)} \quad \forall x, t \in \mathbb{R}.$$

Therefore $x \mapsto \frac{d}{dx} \chi(x, t)$ is bounded above and below, uniformly in $t$, and $\chi$ is a thus a bi-Lipschitz flow. We now define the associated transport group by

$$T_t f(x) = f(\chi(t, x)) \quad \forall t, x \in \mathbb{R}$$

for $f \in C^\infty_c(\mathbb{R})$. It extends to a bounded group on $L^p(\mathbb{R}^d)$ for all $p \in [1, \infty]$, with finite speed of propagation. Strong continuity $\|T_t f - f\|_p \to 0$ for $p < \infty$ follows by dominated convergence for $f$ continuous, and then density for general $f$. To identify the generator, let $f \in W^{1,p}$, and note that, for all $x \in \mathbb{R}^d$,

$$\frac{\partial}{\partial t} T(t) f(x)|_{t=0} = \frac{\partial}{\partial t} f(\chi(x, t))|_{t=0} = \nabla f(x) \cdot \frac{\partial}{\partial t} \chi(x, t)|_{t=0} = a(x) \frac{\partial}{\partial x} f(x).$$

For $f \in C^\infty_c(\mathbb{R})$, we have that

$$T_t (f \circ \phi)(x) = f(t + \phi(x)) = (\exp(it \frac{d}{dx}) f)(\phi(x)) \quad \forall t, x \in \mathbb{R}.$$

For $f \in C^\infty_c(\mathbb{R})$, $s \in \mathbb{R}$, and $\varepsilon > 0$, we have that

$$\exp(-\varepsilon + is) \sqrt{-a \frac{d^2}{dx^2} a} \frac{d}{dx} f = \frac{1}{\sqrt{2\pi}} \int_\mathbb{R} \tilde{\psi}_s(t) T_t f dt$$

for $\psi_s : x \mapsto \exp(-\varepsilon + is)|x|$. We thus have that

$$\exp(-\varepsilon + is) \sqrt{-a \frac{d^2}{dx^2} a} \frac{d}{dx} (f \circ \phi)(x) = (\exp(-\varepsilon + is) \frac{d}{dx} f)(\phi(x)) \quad \forall x \in \mathbb{R},$$
for all \( f \in C_c^\infty(\mathbb{R}) \), \( s \in \mathbb{R} \), and \( \varepsilon > 0 \). On \( L^2(\mathbb{R}) \), \( i\sqrt{-a\frac{d}{dx}a\frac{d}{dx}} \) generates a bounded group and \( -\sqrt{-a\frac{d}{dx}a\frac{d}{dx}} \) generates an analytic semigroup. We thus have that

\[
\exp(is\sqrt{-a\frac{d}{dx}a\frac{d}{dx}})(f \circ \phi)(x) = (\exp(is\frac{d}{dx})f)(\phi(x)) \quad \forall x \in \mathbb{R},
\]

for all \( f \in C_c^\infty(\mathbb{R}) \), and \( s \in \mathbb{R} \). Since \( \phi \) is a \( C^1 \) diffeomorphism from \( \mathbb{R} \) onto \( \mathbb{R} \), this gives that \( i\sqrt{-a\frac{d}{dx}a\frac{d}{dx}} \) generates a bounded \( C_0 \) group on \( L^p(\mathbb{R}) \) for all \( p \in [1, \infty) \).

**Corollary 3.2.** The operators \( i\sqrt{-a\frac{d}{dx}a\frac{d}{dx}} \) and \( i\sqrt{-a\frac{d}{dx}b\frac{d}{dx}} \) generate bounded \( C_0 \) groups on \( L^p(\mathbb{R}) \) for all \( p \in [1, \infty) \).

**Proof.** We have that \( \frac{d}{dx}a^2\frac{d}{dx} = a\frac{d}{dx}a\frac{d}{dx} + a'\frac{d}{dx}a\frac{d}{dx} \) and \( a\frac{d}{dx}b\frac{d}{dx} = \frac{d}{dx}ab\frac{d}{dx} - a'b\frac{d}{dx} \). For all \( p \in [1, \infty) \) and all \( f \in W^{1,p}(\mathbb{R}) \), we have that \( \|a'b'f''\|_p \leq \|ba''\|_\infty\|f''\|_p \). The result thus follows from perturbation theory and square root reduction for cosine families, see [2] Proposition 3.16.3 and Corollary 3.14.13].

4. **The transport groups**

The method developed in this paper applies to wave equations of the form \( \partial_t^2 u = \sum_{j=1}^d D_j^2 u \).

What we need from \( D \) is that \( iD_j \) and \( i\sqrt{D_j^2} \) generates a bounded \( C_0 \) group on \( L^p \) for each \( j \), the operators \( D_1^2, \ldots, D_d^2 \) commute, and \( L = \sum_{j=1}^d D_j^2 \) is such that appropriate Riesz transform bounds and Hardy space estimates hold. In this section, we consider the simplest non-trivial example of such a Dirac operator. We then use this example throughout the paper, but indicate when the results hold for more general Dirac operators, with the same proofs.

For \( j \in \{1, \ldots, 2d\} \), let \( a_j \in C^{0,1}(\mathbb{R}) \) with \( \frac{d}{dx}a_j \in L^\infty \), and assume that there exist \( 0 < \lambda \leq \Lambda \) such that \( \lambda \leq a_j(x) \leq \Lambda \) for all \( x \in \mathbb{R} \). We denote by \( \tilde{a}_j \in C^{0,1}(\mathbb{R}^d) \) the map defined by \( \tilde{a}_j : x \mapsto a_j(x_j) \).

**Definition 4.1.** For \( \xi = (\xi_1, \ldots, \xi_d) \in \mathbb{R}^d \), define

\[
\xi. D_a := \sum_{j=1}^d \xi_j \begin{pmatrix} 0 & -\tilde{a_j} a_j \partial_j \\ \tilde{a_j} a_j \partial_j & 0 \end{pmatrix}, \quad \xi. \sqrt{D_a^2} := \sum_{j=1}^d \xi_j \begin{pmatrix} \sqrt{-\tilde{a_j} a_j a_j \partial_j \partial_j} & 0 \\ 0 & \sqrt{-\tilde{a_j} a_j a_j \partial_j \partial_j} \end{pmatrix},
\]

as an unbounded operator acting on \( L^2(\mathbb{R}^d; \mathbb{C}^2) \), with domain \( W^{1,2}(\mathbb{R}^d; \mathbb{C}^2) \).

Note that \( W^{1,2}(\mathbb{R}^d; \mathbb{C}^2) \) is an appropriate domain for \( \xi. \sqrt{D_a^2} \) thanks to the boundedness of the relevant Riesz transforms proven in [8] Corollary 5.19.

As in [23] Section 4, Case II], \( i\varepsilon_j. D_a \) generates a bounded \( C_0 \) group on \( L^2(\mathbb{R}^d; \mathbb{C}^2) \) for all \( j = 1, \ldots, d \), since \( \varepsilon_j. D_a \) is self-adjoint with respect to an equivalent inner product of the form \( \langle u, v \rangle \mapsto \langle A^{-1}u, v \rangle \), where \( A \) is a diagonal multiplication operator with \( C^{0,1} \) entries.
**Remark 4.2.** For $E, F \subset \mathbb{R}^d$ Borel sets and $\omega \in S^{d-1}$, we set $\omega.d(E, F) := \inf_{x \in E, y \in F} |\langle \omega, x - y \rangle|$. By [23, Remark 3.6], we have the following (strong) form of finite speed of propagation: there exists $\kappa > 0$ such that for all $f \in L^2(\mathbb{R}^d; \mathbb{C}^2)$, all Borel sets $E, F \subset \mathbb{R}^d$, all $j = 1, ..., d$, all $\xi \in \mathbb{R}^d$, and all $\omega \in S^{d-1}$ we have
\[
1_E \exp(i\xi_j D_\omega)(1_F f) = 0,
\]
whenever $\frac{\kappa}{\sqrt{d}}|\langle \omega, \xi_j \rangle| < \omega.d(E, F)$. Consequently,
\[
1_E \prod_{j=1}^d \exp(i\xi_j D_\omega)(1_F f) = 0,
\]
whenever $\kappa|\langle \omega, \xi \rangle| < \omega.d(E, F)$. Indeed, we have that
\[
1_E \prod_{j=1}^d \exp(i\xi_j D_\omega)(1_F f) = 1_E \exp(i\xi_1 D_\omega)1_E \prod_{j=2}^d \exp(i\xi_j D_\omega)(1_F f),
\]
for $E_1 = \{(y_1, x_2, ..., x_d) \in \mathbb{R}^d ; (x_1, ..., x_d) \in E \text{ and } |y_1 - x_1| \leq \frac{\kappa}{\sqrt{d}}|\xi_1|\}$. Iterating this argument gives us that
\[
1_E \prod_{j=1}^d \exp(i\xi_j D_\omega)(1_F f) = 1_E \prod_{j=1}^d \exp(i\xi_j D_\omega)1_{\tilde{E}}(1_F f),
\]
for $\tilde{E} = \{(y_1, ..., y_d) \in \mathbb{R}^d ; (x_1, ..., x_d) \in E \text{ and } |y_j - x_j| \leq \frac{\kappa}{\sqrt{d}}|\xi_j| \forall j = 1, ..., d\}$. Assuming that there exists $y \in \tilde{E} \cap F$ when $\kappa|\langle \omega, \xi \rangle| < \omega.d(E, F)$, we obtain that, for all $x \in E$,
\[
|\langle \omega, x - y \rangle| \leq \kappa \max_{j=1, ..., d} |\langle \xi, e_j \rangle| \omega_j| < \omega.d(E, F),
\]
which is a contradiction.

**Proposition 4.3.** Let $\xi \in \mathbb{R}^d$ and $p \in (1, \infty)$. The group $(\exp(it\xi, \sqrt{D^2}))(t \in \mathbb{R})$ is bounded on $L^p(\mathbb{R}^d; \mathbb{C}^2)$.

**Proof.** Let $p \in (1, \infty)$. Using linearity and freezing $d - 1$ of the variables, it suffices to show that the group generated by $i\left(\begin{array}{cc} 0 & -b \frac{d}{dx} \\ a \frac{d}{dx} & 0 \end{array}\right)$ is bounded on $L^p(\mathbb{R}; \mathbb{C}^2)$ for $a := a_1$ and $b := a_{d+1}$. For $f, g \in C^\infty_c(\mathbb{R})$, and $t \in \mathbb{R}$, let us consider
\[
\begin{pmatrix} u(t, \cdot) \\ v(t, \cdot) \end{pmatrix} := \exp\left(it\begin{pmatrix} 0 & -b \frac{d}{dx} \\ a \frac{d}{dx} & 0 \end{pmatrix}\right)\begin{pmatrix} f \\ g \end{pmatrix}.
\]
We have that
\[
\begin{pmatrix} \partial_t u(t, \cdot) \\ \partial_t v(t, \cdot) \end{pmatrix} = i\begin{pmatrix} -b \frac{d}{dx} v(t, \cdot) \\ a \frac{d}{dx} u(t, \cdot) \end{pmatrix} \quad \forall t, x \in \mathbb{R},
\]
and
\[
\begin{pmatrix} \partial^2_t u(t, \cdot) \\ \partial^2_t v(t, \cdot) \end{pmatrix} = \begin{pmatrix} -b \frac{d}{dx} a \frac{d}{dx} v(t, \cdot) \\ -a \frac{d}{dx} b \frac{d}{dx} v(t, \cdot) \end{pmatrix} \quad \forall t, x \in \mathbb{R}.
\]
Using Corollary 3.2 and solving these wave equations using the relevant cosine families (see [2, Corollary 3.14.12]), this gives

\[ \| u(t, \cdot) \| \lesssim \| f \|_p + \| (-b \frac{d}{dx} \frac{d}{dx})^{-\frac{1}{2}} g' \|_p \lesssim \| f \|_p + \| g \|_p, \]

\[ \| v(t, \cdot) \| \lesssim \| g \|_p + \| (-a \frac{d}{dx} \frac{d}{dx})^{-\frac{1}{2}} f' \|_p \lesssim \| f \|_p + \| g \|_p, \]

with constants independent of \( t \), using the boundedness of the Riesz transforms \( \frac{d}{dx} (-b \frac{d}{dx} \frac{d}{dx})^{-\frac{1}{2}} \) proven in [6,9].

\[ \square \]

Remark 4.4. Given the vector-valued nature of the Dirac operator \( D_a \), all function spaces considered in the remaining of the paper will be implicitly \( \mathbb{C}^2 \)-valued.

Remark 4.5. The transport group generated by \( iD_a \) is, even in dimension one, substantially more complicated than the transport group generated by \( a \frac{d}{dx} \) considered in Section 3. Its \( L^p \) boundedness, for instance, does not follow from the boundedness of the translation group through bi-Lipschitz changes of variables. Indeed, for non-constant coefficients \( a \in C^{0,1}(\mathbb{R}) \), no intertwining relation

\[ U \begin{pmatrix} 0 & -\frac{d}{dx} \\ a \frac{d}{dx} & 0 \end{pmatrix} = \begin{pmatrix} 0 & -\frac{d}{dx} \\ \frac{d}{dx} & 0 \end{pmatrix} U \]

can hold for \( U \) of the form \( U : (f, g) \mapsto (f \circ \phi, g \circ \psi) \) where \( \phi, \psi : \mathbb{R} \to \mathbb{R} \) are bi-Lipschitz changes of variables.

5. Hardy spaces associated with the transport groups

Definition 5.1. Given \( \Psi \in S(\mathbb{R}^d) \), we define \( \Psi(\sqrt{D^2_a}) \) using the Phillips functional calculus associated with the commutative group \( (\exp(i\xi \cdot \sqrt{D^2_a}))_{\xi \in \mathbb{R}^d} \):

\[ \Psi(\sqrt{D^2_a}) := \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} \hat{\Psi}(\xi) \exp(i\xi \cdot \sqrt{D^2_a}) d\xi. \]

We restrict our attention to functions \( \Psi \) that satisfy \( \Psi = \Psi^s \), where

\[ \Psi^s(x) := 2^{-d} \sum_{(\delta)_j = 1} \Psi(\delta_1 x_1, ..., \delta_d x_d). \]

For such functions, we have that

\[ \Psi^s(\sqrt{D^2_a}) \]

\[ = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^{d-1}} \int_{\mathbb{R}} \hat{\Psi}(\xi) \frac{1}{2} (\exp(i\xi_1 e_1 \sqrt{D^2_a}) + \exp(-i\xi_1 e_1 \sqrt{D^2_a})) d\xi_1 \exp(i(\xi - \xi_1 e_1) \sqrt{D^2_a}) d\xi_2, ..., d\xi_d \]

\[ = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^{d-1}} \int_{\mathbb{R}} \hat{\Psi}(\xi) \frac{1}{2} (\exp(i\xi_1 e_1 D_a) + \exp(-i\xi_1 e_1 D_a)) d\xi_1 \exp(i(\xi - \xi_1 e_1) \sqrt{D^2_a}) d\xi_2, ..., d\xi_d \]

\[ = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} \hat{\Psi}(\xi) \prod_{j=1}^d \exp(i\xi_j e_j D_a) d\xi, \]
since $e_j, D_a$ and $e_j, \sqrt{D_a^2}$ generate the same cosine family. We write $\Psi(D_a)$ instead of $\Psi(\sqrt{D_a^2})$ when $\Psi = \Psi^s$.

**Lemma 5.2.** There exists $C > 0$ such that, for all $\Psi \in \mathcal{S}(\mathbb{R}^d)$ such that $\Psi = \Psi^s$, all $E, F \subset \mathbb{R}^d$ Borel sets and all $\omega \in S^{d-1}$, we have that

$$\|1_E \Psi(D_a)(1_F f)\|_2 \leq C \|1_F f\|_2 \int_{\{||\xi|| \geq \frac{d(E,F)}{\kappa}\} \cap \{(\omega,\xi) \geq \frac{d(E,F)}{\kappa}\}} \hat{\Psi}(\xi)|d\xi| \quad \forall f \in L^2(\mathbb{R}^d).$$

Consequently, for every $\Psi \in \mathcal{S}(\mathbb{R}^d)$ and every $M \in \mathbb{N}$, there exists $C_M > 0$ such that

$$\|1_E \Psi(\sigma D_a)(1_F f)\|_2 \leq C_M (1 + \frac{d(E,F)}{\kappa \sigma})^{-M} \|1_F f\|_2 \quad \forall f \in L^2(\mathbb{R}^d)$$

for all Borel sets $E, F \subset \mathbb{R}^d$ and all $\sigma > 0$.

**Proof.** Let $f \in L^2(\mathbb{R}^d)$ and $\xi \in \mathbb{R}^d$. By Remark 1.2 we have that

$$1_E \prod_{j=1}^d \exp(i \xi_j e_j, D_a)(1_F f) = 0,$$

whenever $\kappa ||\xi|| < d(E,F)$ or $\kappa ||\omega, \xi|| < \omega, d(E,F)$. Therefore, using Phillips functional calculus, we have that

$$\|1_E \Psi(D_a)(1_F f)\|_2 \leq \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} \hat{\Psi}(\xi) ||1_E \prod_{j=1}^d \exp(i \xi_j e_j, D_a)(1_F f)\|_2 d\xi,$$

$$\leq C \|1_F f\|_2 \int_{\{||\xi|| \geq \frac{d(E,F)}{\kappa}\} \cap \{(\omega,\xi) \geq \frac{d(E,F)}{\kappa}\}} \hat{\Psi}(\xi)|d\xi|,$$

where $C := \frac{1}{(2\pi)^d} \sup\{\|\prod_{j=1}^d \exp(i \xi_j e_j, D_a)\|_{B(L^2)} : \xi \in \mathbb{R}^d\}$. The last statement then follows from a change of variables and $\Psi \in \mathcal{S}(\mathbb{R}^d)$. \qed

We recall the following fact, which is a corollary of the results in [S], using that the coefficients $a_j$ are Lipschitz continuous.

**Theorem 5.3.** (Auscher, McIntosh, Tchamitchian) Let $p \in (1, \infty)$. On $L^p(\mathbb{R}^d)$, the operator $L = D_a^2$, with domain $W^{2,p}(\mathbb{R}^d)$, generates an analytic semigroup, and has a bounded $H^\infty$ calculus of angle 0. Moreover, $\{\exp(-tL) : t > 0\}$ satisfies Gaussian estimates.

**Corollary 5.4.** Let $p \in (1, \infty)$, $\theta > 0$, $g \in H^\infty(S^\theta_0)$, and let $\Psi \in C^\infty_0(\mathbb{R}^d)$ be supported away from 0 and such that $\Psi = \Psi^s$. Then there exists a constant $C > 0$ independent of $g$ such that, for all $F \in T^{2,p}(\mathbb{R}^d)$,

$$\|\langle \sigma, x \rangle \mapsto \Psi(\sigma D_a)g(L)F(\sigma, .)(x)\|_{T^{2,p}(\mathbb{R}^d)} \leq C \|g\|_{L^\infty(S^\theta_0)} \|\langle \sigma, x \rangle \mapsto F(\sigma, .)(x)\|_{T^{2,p}(\mathbb{R}^d)}.$$
On the other hand, we have by assumption $\zeta \mapsto \Psi(\zeta)q_M^{-1}(\zeta^2) \in \mathcal{S}(\mathbb{R}^d)$, so that an application of \cite[Theorem 5.2]{23} together with Lemma 5.2 yields the assertion. \hfill \Box

**Lemma 5.5.** Let $\alpha \in \mathbb{R}$, and non-degenerate $\Psi, \tilde{\Psi} \in C^\infty_c(\mathbb{R}^d)$ be supported away from 0 and such that $\tilde{\Psi} = \Psi^*, \tilde{\Psi} = \tilde{\Psi}^*$. Let $p \in [1, \infty)$. Then
\[
\|(\sigma, x) \mapsto \sigma^\alpha \Psi(\sigma D_a)f(x)\|_{L^p(\mathbb{R}^d)} \sim \|(\sigma, x) \mapsto \sigma^\alpha \tilde{\Psi}(\sigma D_a)f(x)\|_{L^p(\mathbb{R}^d)},
\]
for all $f$ such that the above quantities are finite. Moreover, for $L = -D_a^2$, we have that
\[
\|(\sigma, x) \mapsto \Psi(\sigma D_a)f(x)\|_{L^p(\mathbb{R}^d)} \sim \|(\sigma, x) \mapsto \sigma^2L\exp(-\sigma^2L)f(x)\|_{L^p(\mathbb{R}^d)}.
\]

**Proof.** Since
\[
\|(\sigma, x) \mapsto \sigma^\alpha \Psi(\sigma D_a)f(x)\|_{L^p(\mathbb{R}^d)} \sim \|(\sigma, x) \mapsto \int_0^\infty \sigma^\alpha\Psi(\sigma D_a)(\tilde{\Psi}(\tau D_a)f(x)\frac{d\tau}{\tau})\|_{L^p(\mathbb{R}^d)},
\]
by \cite[Corollary 5.1]{23}, it suffices to show that, for all $\sigma, \tau > 0$, $(\frac{\sigma}{\tau})^\alpha\Psi(\sigma D_a)\tilde{\Psi}(\tau D_a) = \min\left((\frac{\sigma}{\tau})^\alpha, \frac{\tau}{\sigma}\right)^N S_{\sigma, \tau}$ for some $N > \frac{d}{2}$ and a family of operators $S_{\sigma, \tau} \in B(L^2)$ such that for every $M \in \mathbb{N}$, there exists $C_N > 0$ such that
\[
\|1_{E}\sigma_{\tau}(1_{E}f)\|_2 \leq C_M(1 + \frac{d(E, F)}{\kappa \max(\sigma, \tau)})^{-M}\|1_{F}f\|_2 \quad \forall f \in L^2(\mathbb{R}^d)
\]
for all Borel sets $E, F \subset \mathbb{R}^d$ and all $\sigma > 0$. This follows from Lemma 5.2 using that, for all $\xi \in \mathbb{R}^d \setminus \{0\}$,
\[
\left(\frac{\sigma}{\tau}\right)^\alpha\Psi(\sigma \xi)\tilde{\Psi}(\tau \xi) = \left(\frac{\sigma}{\tau}\right)^{N'}\tilde{\Psi}(\sigma \xi)\bar{\Psi}(\tau \xi) = \left(\frac{\tau}{\sigma}\right)^{N'}\Psi(\sigma \xi)\bar{\Psi}(\tau \xi),
\]
for $\tilde{\Psi} : \xi \mapsto \Psi(\xi)$ and $\Psi : \xi \mapsto \tilde{\Psi}(\xi)$ with $\beta \in \mathbb{N}^d$, $|\beta|_1 = N'$, for $N' > |\alpha| + N$. For the second statement, we first show the comparison of $\Psi(\sigma D_a)$ with $(\sigma^2L)^M\exp(-\sigma^2L)$ for some $M \in \mathbb{N}$, $M > \frac{d}{4}$ in the exact same way as above. For the comparison of $(\sigma^2L)^M\exp(-\sigma^2L)$ with $\sigma^2L\exp(-\sigma^2L)$, we use \cite[Proposition 10.1]{17} instead of \cite[Corollary 5.1]{23}, together with the Gaussian estimates for $\exp(-tL)$ as stated in Theorem 5.3. \hfill \Box

**Theorem 5.6.** Let $s \in \mathbb{R}$, let $p \in (1, \infty)$. For all non-degenerate $\Psi \in C^\infty_c(\mathbb{R}^d)$ supported away from 0 such that $\Psi = \Psi^*$, and all $M \in \mathbb{N}$, we have that
\[
\|(\sigma, x) \mapsto 1_{[0, 1]}(\sigma)\sigma^{-s}\Psi(\sigma D_a)f(x) + 1_{[1, \infty]}(\sigma)\Psi(\sigma D_a)f(x)\|_{L^p(\mathbb{R}^d)} \sim \|(I + \sqrt{L})^s f\|_p,
\]
for all $f \in D((I + \sqrt{L})^s)$. Moreover, for $s \in [0, 2]$, we have that
\[
\|(\sigma, x) \mapsto 1_{[0, 1]}(\sigma)\sigma^{-s}\Psi(\sigma D_a)f(x) + 1_{[1, \infty]}(\sigma)\Psi(\sigma D_a)f(x)\|_{L^p(\mathbb{R}^d)} \sim \|f\|_{W^{s, p}(\mathbb{R}^d)}.
\]

**Proof.** We use the Hardy space $H^p_L$ associated with $L$, as defined in \cite{15}. For all $f \in L^p \cap L^2$, we have, by Lemma 5.5,
\[
\|(\sigma, x) \mapsto \Psi(\sigma D_a)f(x)\|_{L^p(\mathbb{R}^d)} \sim \|f\|_{L^p_L}.
\]
It is a folklore fact that $H^p_L = L^p$ for $p \in (1, \infty)$, thanks to the heat kernel bounds of $(e^{tL})_{t \geq 0}$. This result appeared in draft form in an unpublished manuscript of Auscher, Duong, McIntosh, and inspired the proofs of many similar results. For our particular $L$,
an appropriate version of the result does not seem to have appeared in the literature. It can however be proven as follows. By \cite[Theorem 4.19]{8}, the operators $tL \exp(-tL)$ have standard kernels satisfying the assumptions of \cite[Theorem 4.4]{18}. Therefore, for all $f \in L^p \cap L^2$, $f \in H^p_L$ and

$$\|f\|_{H^p_L} \lesssim \|f\|_p.$$ 

The reverse inequality is proven in \cite[Proposition 4.2]{15} for $p \leq 2$. Given that the above reasoning also applies to $L^*$, we obtain the full result by duality. Combined with Lemma \ref{lem:5.3} this gives the result for $s = 0$. For $s \in \mathbb{N}$, using Lemma \ref{lem:5.3} with an appropriate $\tilde{\Psi} \in C^\infty_c(\mathbb{R}^d)$, we then have that

$$\|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\sigma^{-s}\tilde{\Psi}(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\tilde{\Psi}(\sigma D_a)\tilde{L}^s f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \|\tilde{L}^s f\|_p \lesssim \|(I + \sqrt{L})^s f\|_p.$$ 

We also have that

$$\|(\sigma, x) \mapsto 1_{[1,\infty)}(\sigma)\Psi(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \|f\|_p \lesssim \|(I + \sqrt{L})^s f\|_p.$$ 

For $-s \in \mathbb{N}$, we have that

$$\|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\sigma^{-s}\tilde{\Psi}(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \sum_{k=0}^{\lfloor s \rfloor} \|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\tilde{\Psi}(\sigma D_a)(I + \sqrt{L})^{-|s|} f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \sum_{k=0}^{\lfloor s \rfloor} \|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\tilde{\Psi}(\sigma D_a)(I + \sqrt{L})^{-|s|} f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \|(I + \sqrt{L})^s f\|_p,$$

as well as

$$\|(\sigma, x) \mapsto 1_{[1,\infty)}(\sigma)\Psi(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \sum_{k=0}^{\lfloor s \rfloor} \|(\sigma, x) \mapsto 1_{[1,\infty)}(\sigma)\tilde{\Psi}(\sigma D_a)(I + \sqrt{L})^{-|s|} f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \sum_{k=0}^{\lfloor s \rfloor} \|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\tilde{\Psi}(\sigma D_a)(I + \sqrt{L})^{-|s|} f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \|(I + \sqrt{L})^s f\|_p.$$ 

Reverse inequalities are proven similarly, using that, for all $s \in \mathbb{R}$,

$$\|(I + \sqrt{L})^s f\|_p \sim \|(\sigma, x) \mapsto (I + \sqrt{L})^s \Psi(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)}.$$ 

This gives \ref{5.1} for all $s \in \mathbb{Z}$, and the result for all $s \in \mathbb{R}$ then follows by complex interpolation of weighted tent spaces as in \cite[Theorem 2.1]{11}.

To obtain \ref{5.2} one first remarks that, for $s \in \{0, 1, 2\}$, the above reasoning also gives

$$\|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\sigma^{-s}\tilde{\Psi}(\sigma D_a)f(x) + 1_{[1,\infty)}(\sigma)\Psi(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)} \sim \sum_{m=0}^{s} \|D_m^a f\|_p,$$
for all \( f \in \bigcap_{m=0}^{n} D(D_m^a) \). We then notice that, for all \( j = 1, \ldots, d \), we have that \( \| \partial_j f \|_p \sim \| \tilde{a}_j \partial_j f \|_p \), and thus \( \| f \|_{W^{1,p}} \sim \| f \|_p + \| D_a f \|_p \), for all \( f \in W^{1,p} \). Moreover, \( \tilde{a}_j \partial_j f = \tilde{a}_j \partial_j f + \tilde{a}_j \partial_j f \) \( \forall f \in W^{2,p} \), and thus
\[
\| f \|_{W^{2,p}} \sim \| f \|_p + \| D_a f \|_p + \| D_a^2 f \|_p \quad \forall f \in W^{2,p}.
\]

**Corollary 5.7.** Let \( \alpha \geq 0, \ p \in (1, \infty), \) and \( q \in [p, \infty) \) be such that
\[
\alpha = \frac{d}{2} \left( \frac{1}{p} - \frac{1}{q} \right).
\]
Then there exists \( C > 0 \) such that, for all \( f \in L^p(\mathbb{R}^d) \) with \( L^\alpha f \in L^p(\mathbb{R}^d) \), we have that
\[
\| f \|_{L^q(\mathbb{R}^d)} \lesssim C \| L^\alpha f \|_{L^p(\mathbb{R}^d)}.
\]

**Proof.** For \( f \in L^p(\mathbb{R}^d) \) with \( L^\alpha f \in L^p(\mathbb{R}^d) \), Theorem 5.6 gives that
\[
\| f \|_{L^q(\mathbb{R}^d)} \lesssim \| (s, x) \mapsto L^{-\alpha} \Psi(\sigma D_a) L^\alpha f(x) \|_{T^q,2(\mathbb{R}^d)} \lesssim \| (s, x) \mapsto \sigma^{2\alpha} \Psi(\sigma D_a) L^\alpha f(x) \|_{T^q,2(\mathbb{R}^d)}
\]
for \( \Psi : \xi \mapsto |\xi|^{-\alpha} \Psi(\xi) \). Using the embedding properties of weighted tent spaces proven in [11] Theorem 2.19, we have that
\[
\| (\sigma, x) \mapsto \sigma^{2\alpha} \Psi(\sigma D_a) L^\alpha f(x) \|_{T^q,2(\mathbb{R}^d)} \lesssim \| (\sigma, x) \mapsto \Psi(\sigma D_a) L^\alpha f(x) \|_{T^q,2(\mathbb{R}^d)}.
\]
and thus
\[
\| f \|_{L^q(\mathbb{R}^d)} \lesssim \| L^\alpha f \|_{L^p(\mathbb{R}^d)},
\]
by Theorem 5.6. \( \square \)

**Remark 5.8.** All results in this section, except (5.2), hold for a general Dirac operator \( D_a \) such that \( ie_j D_a \) and \( ie_j \sqrt{D_a} \) generate bounded \( C_0 \) group on \( L^p \) for each \( j \), the operators \( D_1^2, \ldots, D_a^2 \) commute, \( \exp(it \xi \cdot D_a) \) is \( \{ t \} \) has finite speed of propagation as in Remark 4.2, and \( H^{D_a^2} = L^p \). Property (5.2) also holds as long as \( D(D_a) = W^{1,p} \) and \( D(D_a^2) = W^{2,p} \) with equivalence of norms. All results in the next sections also hold for such Dirac operators.

### 6. Wave packet transform

We use a wave packet transform which is similar to the ones used in [21][29], but symmetrised to ensure \( \Psi_{\omega, \sigma} = \Psi^*_{\omega, \sigma} \).

Let \( \Psi \in C^\infty_c(\mathbb{R}^d) \) be a non-negative radial function with \( \Psi(\zeta) = 0 \) for \( |\zeta| \notin \left[ \frac{1}{2}, 2 \right] \), and
\[
(6.1) \quad \int_0^\infty \Psi(\zeta) \frac{d\sigma}{\sigma} = 1
\]
for \( \zeta \neq 0 \). Let \( \varphi \in C^\infty_c(\mathbb{R}^d) \) be a radial, non-negative function with \( \varphi(\zeta) = 1 \) for \( |\zeta| \leq \frac{1}{2} \) and \( \varphi(\zeta) = 0 \) for \( |\zeta| > 1 \). These functions \( \Psi, \varphi \) are now fixed for the remainder of the paper.
For $\omega \in S^{d-1}$, $\sigma > 0$ and $\zeta \in \mathbb{R}^d \setminus \{0\}$, set $\varphi_{\omega,\sigma}(\zeta) := c_\sigma \varphi \left( \frac{\zeta - \omega}{\sqrt{\sigma}} \right)$, and $\varphi_{\omega,\sigma} = \varphi_{\omega,\sigma}^*$, where $c_\sigma := \left( \int_{S^{d-1}} \varphi \left( \frac{e_1 - \nu}{\sqrt{\sigma}} \right) \, d\nu \right)^{-1/2}$. Set $\varphi_{\omega,\sigma}(0) := 0$. Set furthermore $\Psi_\sigma(\zeta) := \Psi(\sigma \zeta)$ and $\psi_{\omega,\sigma}(\zeta) := \Psi_\sigma(\zeta) \varphi_{\omega,\sigma}(\zeta)$ for $\omega \in S^{d-1}$, $\sigma > 0$ and $\zeta \in \mathbb{R}^d$. By construction, we then have

\begin{equation}
\int_0^\infty \int_{S^{d-1}} \psi_{\omega,\sigma}(\zeta)^2 \, d\omega \frac{d\sigma}{\sigma} = 1
\end{equation}

for all $\zeta \in \mathbb{R}^d \setminus \{0\}$, see [21] Lemma 4.1. For $\omega \in S^{d-1}$ and $\zeta \in \mathbb{R}^d$, we moreover set

$$\varphi_\omega(\zeta) := \int_0^d \psi_{\omega,\tau}(\zeta) \, d\tau.$$ 

For the convenience of the reader, we recall the following properties of $\psi_{\omega,\sigma}$ stated in [20] Lemma 3.2. Note that the symmetrisation (using $\varphi_{\omega,\sigma}$ instead of $\varphi_{\omega,\sigma}^*$) only affects formula (6.3). See also Remark 6.3 below.

**Lemma 6.1.** Let $\omega \in S^{d-1}$ and $\sigma \in (0,1)$. Each $\zeta \in \text{supp}(\psi_{\omega,\sigma})$ satisfies

\begin{equation}
\frac{1}{2\sigma} \leq |\zeta| \leq \frac{2}{\sigma}; \quad \min_{(\varepsilon_j)_{j=1}^d \in \{-1,1\}^d} |(\varepsilon_1 \hat{\zeta}_1, \ldots, \varepsilon_d \hat{\zeta}_d) - \omega| \leq 2\sqrt{\sigma}.
\end{equation}

For all $\alpha \in \mathbb{N}_0^d$ and $\beta \in \mathbb{N}_0$ there exists a constant $C = C(\alpha, \beta) > 0$ such that

\begin{equation}
|(\omega, \nabla_\zeta)^\beta \partial_\zeta^\alpha \psi_{\omega,\sigma}(\zeta)| \leq C \sigma^{-\frac{d+1}{4} + \frac{|\alpha|}{2} + \beta}
\end{equation}

for all $(\zeta, \omega, \sigma) \in \mathbb{R}^d \times S^{d-1} \times (0,\infty)$. For every $N \geq 0$ there exists a constant $C_N > 0$ such that

\begin{equation}
|\mathcal{F}^{-1}(\psi_{\omega,\sigma})(x)| \leq C_N \sigma^{-\frac{d+1}{4}} (1 + \sigma^{-1}|x|^2 + \sigma^{-2}(\omega, x)^2)^{-N}
\end{equation}

for all $(x, \omega, \sigma) \in \mathbb{R}^d \times S^{d-1} \times (0,\infty)$. In particular, $\{\sigma^{\frac{d-1}{4}} \mathcal{F}^{-1}(\psi_{\omega,\sigma}) | \omega \in S^{d-1}, \sigma > 0\} \subseteq L^1(\mathbb{R}^d)$ is uniformly bounded.

We also recall important properties of the family $(\varphi_\omega)_{\omega \in S^{d-1}}$ from [20] Remark 3.3.

**Lemma 6.2.** Let $\omega \in S^{d-1}$. By construction, $\varphi_\omega \in C^\infty(\mathbb{R}^d)$, and for $\zeta \neq 0$, $\varphi_\omega(\zeta) = 0$ for $|\zeta| < \frac{1}{8}$ or $\min_{(\varepsilon_j)_{j=1}^d \in \{-1,1\}^d} |(\varepsilon_1 \hat{\zeta}_1, \ldots, \varepsilon_d \hat{\zeta}_d) - \omega| > 2|\zeta|^{-1/2}$. Moreover, for all $\alpha \in \mathbb{N}_0^d$ and $\beta \in \mathbb{N}_0$, there exists a constant $C = C(\alpha, \beta) > 0$ such that

$$|(\omega, \nabla_\zeta)^\beta \partial_\zeta^\alpha \varphi_\omega(\zeta)| \leq C |\zeta|^{-\frac{d+1}{4} + \frac{|\alpha|}{2} - \beta}$$

for all $\omega \in S^{d-1}$ and $\zeta \neq 0$, and

\begin{equation}
|(\hat{\zeta}, \nabla_\zeta)^\beta \partial_\zeta^\alpha \left( \int_{S^{d-1}} \varphi_\nu(\zeta)^2 \, d\nu \right) | \leq C |\zeta|^{-\frac{d-1}{2} - \beta}
\end{equation}

for all $\zeta \in \mathbb{R}^d \setminus \{0\}$.
Remark 6.3. For $\omega = e_1$ and $\zeta, \sigma$ chosen as in (6.3) with $\sigma \in (0, 2^{-8})$, we have

$$14\sigma < |\zeta_1| \leq 2\sigma, \quad |\zeta_j| \leq \frac{4}{\sqrt{\sigma}}, \quad j \in \{2, \ldots, d\}. \tag{6.7}$$

This follows from

$$|/(\varepsilon_1 \hat{\zeta}_1, \ldots, \varepsilon_d \hat{\zeta}_d) - e_1| = |\varepsilon_1( (\varepsilon_1 \hat{\zeta}_1, \ldots, \varepsilon_d \hat{\zeta}_d) - e_1) + \sum_{j=2}^d |\varepsilon_j( (\varepsilon_1 \hat{\zeta}_1, \ldots, \varepsilon_d \hat{\zeta}_d) - e_1)|^2$$

$$= |\varepsilon_1| \frac{|\zeta_1| - 1}{|\zeta_1|} + \sum_{j=2}^d |\zeta_j|^2,$$

for all $(\varepsilon_j)_{j=1}^d \in \{-1, 1\}^d$. Therefore we have that, for some $\varepsilon_1 \in \{-1, 1\}$,

$$|\varepsilon_1| |\zeta_1 - |\zeta_1| - \sum_{j=2}^d |\zeta_j|^2 \leq 4\sigma |\zeta_1|^2 \leq \frac{16}{\sigma},$$

which directly yields (6.7) for $j \geq 2$. The case $j = 1$ then follows from

$$|\zeta_1| = |\varepsilon_1| |\zeta_1| > |\zeta| - 4\sqrt{\sigma} \geq \frac{1}{2\sigma} - \frac{4}{\sqrt{\sigma}}.$$

Lemma 6.4. For all $\sigma \in (0, 1)$, and all $f \in L^2(\mathbb{R}^d)$, we have that

$$|S^{d-1}|^{-1} \int_{S^{d-1}} \int_1^\infty \Psi(\sigma D_\alpha)^2 f \frac{d\sigma}{\sigma} d\omega + \int_{S^{d-1}} \int_0^1 \varphi_\omega(D_\alpha)^2 \Psi(\sigma D_\alpha)^2 f \frac{d\sigma}{\sigma} d\omega = f \tag{6.8}$$

$$\int_{S^{d-1}} \varphi_\omega(D_\alpha)^2 f d\omega = f, \tag{6.9}$$

$$\sigma^{-\frac{d-1}{2}} \int_{S^{d-1}} \varphi_\omega(D_\alpha) f d\omega = C_\sigma f, \tag{6.10}$$

with constant $C_\sigma$ such that $\sigma \mapsto C_\sigma$ is bounded above and below.

Proof. These identities follow (respectively) from (6.2), the fact that $\int_{S^{d-1}} \varphi_\omega(\xi)^2 d\omega = 1$ for all $\xi \neq 0$, and [21, Formula (7.4)], using the Philipps functional calculus of $\sqrt{D_\alpha^2}$. □

Lemma 6.5. For all $\sigma \in (0, 1)$, we have that

$$\int_{S^{d-1}} \|\varphi_\omega(D_\alpha) f\|_2^2 d\omega \lesssim \|f\|_2^2 \quad \forall f \in L^2(\mathbb{R}^d).$$

Moreover,

$$\int_{S^{d-1}} \int_0^\infty \|\psi_\omega(D_\alpha) f\|_2^2 \frac{d\sigma}{\sigma} d\omega \lesssim \|f\|_2^2 \quad \forall f \in L^2(\mathbb{R}^d).$$
Lemma 6.8. We also define (anisotropic) operators associated with this parabolic distance by
\[ \Delta_{\omega^\perp} := \sum_{j=1}^{d-1} \langle \omega_j, \nabla \rangle^2, \quad L_{\omega^\perp} := -\sum_{j=1}^{d-1} \langle \omega_j, D_a \rangle^2. \]

Lemma 6.8. (i) Let \( N \in \mathbb{N}, N > \frac{d+1}{2} \). There exists \( C > 0 \) such that for all \( \sigma \in (0,1) \) and \( \omega \in S^{d-1} \), we have
\[ \| (1 + \sigma L_{\omega^\perp} + \sigma^2 \langle \omega, D_a \rangle^2)^{-N} f \|_{L^2(\mathbb{R}^d)} \leq C \sigma^{-\frac{d+1}{2}} \| f \|_{L^1(\mathbb{R}^d)} \]
for all \( f \in L^1(\mathbb{R}^d) \).

(ii) For every \( M \in \mathbb{N} \), there exists \( C_M > 0 \) such that for all \( E, F \subset \mathbb{R}^d \) Borel sets,
\( \sigma \in (0, 1) \) and \( \omega \in S^{d-1} \), we have
\[
\|1_E \psi_{\omega, \sigma}(D_a)(1_F f)\|_{L^2(\mathbb{R}^d)} \leq C_M \sigma^{-\frac{d}{2}} (1 + \frac{d(\omega, F)}{\sigma})^{-M} \|1_F f\|_{L^1(\mathbb{R}^d)}
\]
for all \( f \in L^1(\mathbb{R}^d) \).

(iii) Let \( 1 \leq p \leq r < \infty \). For every \( M \in \mathbb{N} \), there exists \( C_M > 0 \) such that for all \( E, F \subseteq \mathbb{R}^d \) Borel sets, \( \sigma \in (0, 1) \) and \( \omega \in S^{d-1} \), we have
\[
\|1_E \psi_{\omega, \sigma}(D_a)(1_F f)\|_{L^r(\mathbb{R}^d)} \leq C_M \sigma^{-\frac{d}{p} - \frac{1}{2}} \sigma^{-\frac{d-1}{r}} (1 + \frac{d(\omega, F)}{\sigma})^{-M} \|1_F f\|_{L^p(\mathbb{R}^d)}
\]
for all \( f \in L^p(\mathbb{R}^d) \).

**Proof.** Part (i) follows from [8, Proposition 4.3], tracking the scaling factor \( \sigma \) in its proof.

(ii) Let \( \omega \in S^{d-1} \). For given Borel sets \( E, F \subseteq \mathbb{R}^d \) with \( d(\omega, F) > 0 \), let \( \chi_\omega \in C^\infty(\mathbb{R}^d) \) be a function with values in \([0, 1]\) such that \( \chi_\omega = \chi_\omega^0 \), \( \chi_\omega(\zeta) = 0 \) for \( |\zeta| \leq \frac{1}{2} \kappa^{-1} d_\omega(\omega, F) \) and \( \chi_\omega(\zeta) = 1 \) for \( |\zeta| \geq \kappa^{-1} d_\omega(\omega, F) \), and \( \|\langle \omega, \nabla \rangle \chi_\omega \|_\infty + \|\Delta_\omega \chi_\omega \|_\infty \lesssim \frac{1}{d_\omega(\omega, F)} \). Lemma 5.2 implies
\[
c d_1 1_E \psi_{\omega, \sigma}(D_a) 1_F f = 1_E \int_{\mathbb{R}^d} \chi_\omega(\zeta) \mathcal{F}^{-1}(\psi_{\omega, \sigma})(\zeta) e^{i \zeta D_s} 1_F f d\zeta.
\]
Now note that \( (1 - \sigma \Delta_\omega - \sigma^2 \langle \omega, \nabla \rangle^2) e^{i \zeta D_s} = (1 + \sigma L_\omega + \sigma^2 \langle \omega, D_a \rangle^2) e^{i \zeta D_s} \), thus for \( N \in \mathbb{N} \),
\[
e^{i \zeta D_s} = (1 + \sigma L_\omega + \sigma^2 \langle \omega, D_a \rangle^2)^{-N} (1 - \sigma \Delta_\omega - \sigma^2 \langle \omega, \nabla \rangle^2)^N e^{i \zeta D_s}.
\]
From integration by parts we then get for \( j \in \{0, 1\} \)
\[
c d_1 1_E \psi_{\omega, \sigma}(D_a) 1_F f = (1 + \sigma L_\omega + \sigma^2 \langle \omega, D_a \rangle^2)^{-N} \circ \int_{\mathbb{R}^d} ((1 - \sigma \Delta_\omega - \sigma^2 \langle \omega, \nabla \rangle^2)^N (\chi_\omega^0 \cdot \mathcal{F}^{-1}(\psi_{\omega, \sigma}))(\zeta) e^{i \zeta D_s} (1_F f) d\zeta.
\]
Consider first the case \( d_\omega(E, F) \leq \sigma \), for which we take \( j = 0 \). According to Lemma 6.1 we have \( \|\mathcal{F}^{-1}(\psi_{\omega, \sigma})\|_{L^1(\mathbb{R}^d)} \lesssim \sigma^{-\frac{d-1}{2}} \). Similarly, one can check that
\[
\|\zeta \mapsto (\sigma \langle \omega, \nabla \rangle \zeta)^\beta (\sigma \Delta_\omega \zeta)^\alpha \mathcal{F}^{-1}(\psi_{\omega, \sigma})(\zeta)\|_{L^1(\mathbb{R}^d)} \lesssim \sigma^{-\frac{d-1}{2}}
\]
for all \( \alpha \in \mathbb{N}_0^d \) and \( \beta \in \mathbb{N}_0 \). We use this estimate together with Proposition 1.3 and Part (i) to obtain for \( N > \frac{d+1}{2} \)
\[
\|\psi_{\omega, \sigma}(D_a) f\|_{L^2(\mathbb{R}^d)} \lesssim \sigma^{-\frac{d-1}{2}} \|(1 + \sigma L_\omega + \sigma^2 \langle \omega, D_a \rangle^2)^{-N} \|1_{\mathbb{R}^d}\|_1\|f\|_{L^2(\mathbb{R}^d)} \lesssim \sigma^{-\frac{d}{2}} \|f\|_{L^2(\mathbb{R}^d)}.
\]
In the case \( d_\omega(E, F) > \sigma \), we choose \( j = 1 \) in (6.11). Then note that according to the choice of \( \chi_\omega \), we have for \( \sigma \in (0, 1) \) that \( \|\zeta \mapsto (\sigma \langle \omega, \nabla \rangle \zeta)^\beta (\sigma \Delta_\omega \zeta)^\alpha \chi_\omega(\zeta)\|_\infty \lesssim (\frac{\sigma}{d_\omega(E, F)})^{\alpha + \beta} \lesssim 1 \), for all \( \alpha \in \mathbb{N}_0^d \), \( \beta \in \mathbb{N}_0 \). Using the product rule, a version of (6.5) for derivatives of
\[ \|1_E \psi_{\omega, \sigma}(D_a)(1_F f)\|_2 \]
\[ \lesssim \sigma^{-\frac{d+1}{2}} \|1_F f\|_1 \sup_{\alpha \in \mathbb{N}, \beta \in \mathbb{N}_0}^{\alpha + 2\beta \leq N} \int_{\{\|\xi\| \geq \frac{d(E, F)}{\sigma} \} \cap \{\|\omega, \xi\| \geq \frac{d(E, F)}{\sigma} \}} |(\sigma \omega, \nabla \zeta)|^\beta (\sqrt{\sigma} \partial_\zeta)^\alpha F^{-1}(\psi_{\omega, \sigma})(\zeta) \, d\zeta \]
\[ \lesssim \sigma^{-\frac{d+1}{2}} \sigma^{-\frac{d+1}{2}} \|1_F f\|_1 \int_{\{\|\xi\| \geq \frac{d(E, F)}{\sigma} \} \cap \{\|\omega, \xi\| \geq \frac{d(E, F)}{\sigma} \}} (1 + \sigma^{-1}\|\zeta\|^2 + \sigma^{-2}(\omega, \zeta)^2)^{-\tilde{N}} \, d\zeta \]
\[ \lesssim \sigma^{-\frac{d}{2}} \int (1 + \frac{d\omega(E, F)}{\sigma})^{-(2N-d)} \|1_F f\|_1. \]

Choosing \( \tilde{N} \) large enough in (6.5) yields the result.

(iii) This is similar to (i) and (ii), but simpler. By Theorem 5.3, we have that
\[ \|1 + a^2 L\|_{L^p(\mathbb{R}^d)} \leq C \sigma^{-d(\frac{1}{p} - \frac{1}{2})} \|f\|_{L^p(\mathbb{R}^d)}, \]
for \( N > \frac{d-1}{2} \). Integrating by parts, and using Lemma 5.2 together with Proposition 4.3, we obtain that
\[ \|1_E \psi_{\omega, \sigma}(D_a)(1_F f)\|_{L^p(\mathbb{R}^d)} \lesssim \sigma^{-d(\frac{1}{p} - \frac{1}{2})} (1 + \frac{d(E, F)}{\sigma})^{-M} \int_{\mathbb{R}^d} |(\sigma^2 \Delta)^\alpha F^{-1}(\psi_{\omega, \sigma})(\zeta)| \, d\zeta \cdot \|1_F f\|_{L^p(\mathbb{R}^d)} \]
\[ \lesssim \sigma^{-d(\frac{1}{p} - \frac{1}{2})} \sigma^{-\frac{d-1}{2}} (1 + \frac{d(E, F)}{\sigma})^{-M} \|1_F f\|_{L^p(\mathbb{R}^d)}, \]
using that, for all \( \alpha \in \mathbb{N}, \|\zeta \mapsto (\sigma^2 \Delta)^\alpha F^{-1}(\psi_{\omega, \sigma})(\zeta)\|_{L^1(\mathbb{R}^d)} \lesssim \sigma^{-\frac{d+1}{2}}, \) by Lemma 6.1 \( \square \)

7. The Hardy-Sobolev spaces \( H_{FIO, \alpha}^{p, s}(\mathbb{R}^d) \)

In the following, we denote by \( \Psi \in C^\infty_c(\mathbb{R}^d) \) the function defining the wave packet transforms from Section 6. We denote by \( H^1_\alpha(\mathbb{R}^d) \) the Hardy space associated with \( L \) as defined in [15]. Recall that for all \( f \in H^1_\alpha(\mathbb{R}^d) \), we have by Lemma 5.5
\[ \|f\|_{H^1_\alpha(\mathbb{R}^d)} \sim \| (\sigma, x) \mapsto \Psi(\sigma D_a) f(x) \|_{T^{1, 2}(\mathbb{R}^d)}. \]

Definition 7.1. Define
\[ S_1 = \{ f \in H^1_\alpha(\mathbb{R}^d) : \exists \sigma \in L^1(\mathbb{R}^d) \cap L^2(\mathbb{R}^d) \ \exists \tau > 0 \ \ f = \Psi(\tau D_a) g \}, \]
and for \( p \in (1, \infty) \)
\[ S_p = \{ f \in L^p(\mathbb{R}^d) : \exists \sigma \in L^p(\mathbb{R}^d) \cap L^2(\mathbb{R}^d) \ \exists \tau > 0 \ \ f = \Psi(\tau D_a) g \}. \]

Lemma 7.2. Let \( p \in [1, \infty) \) and \( f \in S_p \). Then, for all \( \omega \in S^{d-1} \), \( \varphi_\omega(D_a) f \in L^p(\mathbb{R}^d) \), and, in the case \( p = 1 \), \( \varphi_\omega(D_a) f \in H^1_\alpha(\mathbb{R}^d) \), each with norm independent of \( \omega \).

Proof. We have that \( \varphi_\omega(D_a) f = \psi_{\omega, \tau}(D_a) g \) for some \( g \in L^p(\mathbb{R}^d) \), up to a change of constants in the support conditions of \( \psi_{\omega, \tau} \). By Lemma 6.8, we have \( \psi_{\omega, \tau}(D_a) \in B(L^p(\mathbb{R}^d)) \), and thus \( \|\varphi_\omega(D_a) f\|_p \lesssim \|g\|_p \). In the case \( p = 1 \), we obtain that \( \|\psi_{\omega, \tau}(D_a) g\|_{L^1} \lesssim \|g\|_{H^1_\alpha} \) by reasoning as in the proof of 6.8 (iii), using the boundedness of Riesz transforms associated with \( L \) from \( H^1_\alpha \) to \( L^1 \) to deduce the \( H^1_\alpha \) to \( L^1 \) uniform boundedness of the transport
group \((\exp(i\xi D_a))_{\xi \in \mathbb{R}^d}\). We moreover have that \(\psi_{\omega,\tau}(D_a)g \in R(L)\), since \(\Psi\) is supported away from 0, hence \(\psi_{\omega,\tau}(D_a)g \in H^s_{L^2}(\mathbb{R}^d)\). 

\[\square\]

**Corollary 7.3.** Let \(p \in [1, \infty)\), \(s \in \mathbb{R}\), and \(f \in S_p\). Then \(\omega \mapsto [(\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\Psi(\sigma D_a)f(x) + 1_{[0,1]}(\sigma)\sigma^{-s}\varphi_\omega(D_a)\Psi(\sigma D_a)f(x)] \in L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))\).

**Proof.** This follows from Lemma 7.2 and Theorem 5.6. 

\[\square\]

**Lemma 7.4.** Let \(\tilde{\Psi} \in C^\infty_c(\mathbb{R}^d)\) be non-degenerate, supported away from 0 and such that \(\tilde{\Psi} = \tilde{\Psi}^\ast\). Let \(p \in (1, \infty)\), \(s \in \mathbb{R}\), and \(f \in S_p\). Then, we have that \(\omega \mapsto [(\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\tilde{\Psi}(\sigma D_a)f(x) + 1_{[0,1]}(\sigma)\sigma^{-s}\varphi_\omega(D_a)\tilde{\Psi}(\sigma D_a)f(x)] \in L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))\), with an equivalent norm to the corresponding map in Corollary 7.3, and

\[
\| (I + \sqrt{L})^{-M} f \|_{L^p} 
\lesssim \| \omega \mapsto [(\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\Psi(\sigma D_a)f(x) + 1_{[0,1]}(\sigma)\sigma^{-s}\varphi_\omega(D_a)\Psi(\sigma D_a)f(x)] \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))},
\]

for all \(M \in \mathbb{N}\) such that \(M \geq \frac{d-1}{2} - s\).

**Proof.** Let \(M \in \mathbb{N}\) be such that \(M \geq \frac{d-1}{2} - s\). Lemma 5.5 and Corollary 7.3 give the first part, and Corollary 7.4, Lemma 5.5 together with Theorem 5.6 give

\[
\| (I + \sqrt{L})^{-M} f \|_{L^p} \lesssim \| (\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\tilde{\Psi}(\sigma D_a)f(x) \|_{T^{p,2}(\mathbb{R}^d)} + \| (\sigma, x) \mapsto 1_{[0,1]}(\sigma)\sigma^M \tilde{\Psi}^2(\sigma D_a)f(x) \|_{T^{p,2}(\mathbb{R}^d)}.
\]

Using Corollary 7.4 again, we then have that

\[
\| (I + \sqrt{L})^{-M} f \|_{L^p} \lesssim \| (\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\Psi(\sigma D_a)f(x) \|_{T^{p,2}(\mathbb{R}^d)} + \| (\sigma, x) \mapsto 1_{[0,1]}(\sigma)\sigma^M \Psi^2(\sigma D_a)f(x) \|_{T^{p,2}(\mathbb{R}^d)}.
\]

We then use the reproducing formula (6.10) to obtain that

\[
\| (I + \sqrt{L})^{-M} f \|_{L^p} \lesssim \| (\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\Psi(\sigma D_a)f(x) + 1_{[0,1]}(\sigma)\varphi_\omega(D_a)\Psi(\sigma D_a)f(x) \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))},
\]

since \(M \geq \frac{d-1}{2} - s\). 

\[\square\]

**Definition 7.5.** Let \(p \in [1, \infty)\), and \(s \in \mathbb{R}\). We define the space \(H^{p,s}_{FIO,a}(\mathbb{R}^d)\) as the completion of \(S_p\) for the norm defined by

\[
\| f \|_{H^{p,s}_{FIO,a}(\mathbb{R}^d)} := \| \omega \mapsto [(\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\Psi(\sigma D_a)f(x) + 1_{[0,1]}(\sigma)\sigma^{-s}\varphi_\omega(D_a)\Psi(\sigma D_a)f(x)] \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))}.
\]

We write \(H^p_{FIO,a}(\mathbb{R}^d) := H^{p,0}_{FIO,a}(\mathbb{R}^d)\).

**Remark 7.6.** By Lemma 7.4, we have that \(H^p_{FIO,a}(\mathbb{R}^d)\) is a subspace of the \(M\)-th extrapolation space associated with \(L\), and is independent of the choice of \(\Psi \in C^\infty_c(\mathbb{R}^d)\setminus\{0\}\), supported away from 0, and such that \(\tilde{\Psi} = \tilde{\Psi}^\ast\).
Remark 7.7. By Lemma 6.4, interpolation properties of $H^{p,s}_{FIO,a}(\mathbb{R}^d)$ follow from the interpolation properties of weighted tent spaces (see [14]) with the same proof as in [21, Proposition 6.7].

We also have the following versions of [29, Theorem 4.1] and [29, Corollary 4.4], respectively.

Proposition 7.8. Let $p \in (1, \infty)$, and $s \in \mathbb{R}$. Let $q \in C_c^\infty(\mathbb{R}^d)$ radial with $q(\zeta) \equiv 1$ for $|\zeta| \leq \frac{1}{8}$. Then

$$
\|f\|_{H^{p,s}_{FIO,a}(\mathbb{R}^d)} \lesssim \|q(D_a)f\|_{L^p(\mathbb{R}^d)} + \left(\int_{S^{d-1}} \|\varphi_\omega(D_a)(I + \sqrt{L})^s f\|_{L^p(\mathbb{R}^d)}^p d\omega\right)^{1/p} \quad \forall f \in \mathcal{S}_p,
$$

Proof. Let $f \in \mathcal{S}_p$. By Lemma 5.5, we can choose $\Psi$ with an appropriate support, such that $\Psi(\sigma D_a)f = \Psi(\sigma D_a)q(D_a)f$ for all $\sigma \geq 1$, $\Psi(\sigma D_a)q(D_a) = 0$ for all $\sigma \leq \frac{1}{8}$, and $\varphi_\omega(D_a)\Psi(\sigma D_a) = 0$ for all $\sigma \geq 1$ and $\omega \in S^{d-1}$. Then, by Theorem 5.6, we have that

$$
\|f\|_{H^{p,s}_{FIO,a}(\mathbb{R}^d)} \lesssim \|\varphi_\omega(D_a)(I + \sqrt{L})^s f\|_{L^p(\mathbb{R}^d)} \quad \forall \omega \in S^{d-1}.
$$

In the other direction, Theorem 5.6 and the support properties of $q$ and $\Psi$ give us that

$$
\|q(D_a)f\|_{L^p(\mathbb{R}^d)} \lesssim \|f\|_{H^{p,s}_{FIO,a}(\mathbb{R}^d)} + \|\varphi_\omega(D_a)(I + \sqrt{L})^s f\|_{L^p(\mathbb{R}^d)} \quad \forall \omega \in S^{d-1}.
$$

With the same proof as in Lemma 5.5, we then have that, for all $M \geq \frac{d-1}{4} - s$,

$$
\|\varphi_\omega(D_a)(I + \sqrt{L})^s f\|_{L^p(\mathbb{R}^d)} \lesssim \|\varphi_\omega(D_a)(I + \sqrt{L})^s f\|_{L^p(\mathbb{R}^d)} \quad \forall \omega \in S^{d-1}.
$$

Therefore, using Lemma 7.2, we have that $\|q(D_a)f\|_{L^p(\mathbb{R}^d)} \lesssim \|f\|_{H^{p,s}_{FIO,a}(\mathbb{R}^d)}$. For the second term, we use Theorem 5.6 and the support properties of $\Psi$ again to get that

$$
\left(\int_{S^{d-1}} \|\varphi_\omega(D_a)(I + \sqrt{L})^s f\|_{L^p(\mathbb{R}^d)}^p d\omega\right)^{1/p} \lesssim \|\varphi_\omega(D_a)(I + \sqrt{L})^s f\|_{L^p(\mathbb{R}^d)} \quad \forall f \in \mathcal{S}_p.
$$

Proposition 7.9. Let $p \in (1, \infty)$. Let $q \in C_c^\infty(\mathbb{R}^d)$ radial with $q(\zeta) \equiv 1$ for $|\zeta| \leq \frac{1}{8}$, and $\Phi \in \mathcal{S}(\mathbb{R})$ with $\Phi(0) = 1$ and $\Phi_\sigma(\zeta) = \Phi(\sigma \zeta)$ for $\sigma > 0$, $\zeta \in \mathbb{R}^d$. Then

$$
\|q(D_a)f\|_{L^p(\mathbb{R}^d)} + \left(\int_{S^{d-1}} \|\varphi_\omega(D_a)f\|_{L^p(\mathbb{R}^d)}^p d\omega\right)^{1/p} \lesssim \|f\|_{H^{p,s}_{FIO,a}(\mathbb{R}^d)} \quad \forall f \in \mathcal{S}_p,
$$
and
\[
\left( \int_{S^{d-1}} \| (\sigma, \cdot) \mapsto \sigma \overline{\Phi}(D) \varphi_\omega(D) \|_{T^p, \infty; \mathbb{R}^d}^p \right)^{1/p} d\omega \lesssim \| f \|_{H^p_{FIO,n}(\mathbb{R}^d)} \quad \forall f \in S_p.
\]

Proof. Let \( r \in [1, p) \). For the first assertion, note that Theorem 5.3 implies \( L^r-L^\infty \) off-diagonal estimates for \( \Phi_\sigma(D) \) of the following form: For every \( M \in \mathbb{N} \), there exists \( C_M > 0 \) such that for all \( F, E \subset \mathbb{R}^d \) Borel sets, \( \sigma \in (0, 1) \), we have
\[
\| 1_E \Phi_\sigma(D)(1_F g) \|_{L^\infty(\mathbb{R}^d)} \leq C_M \sigma^{-\frac{d}{2}} (1 + \frac{d(E, F)}{\sigma})^{-M} \| f \|_{L^r(\mathbb{R}^d)}
\]
for all \( g \in L^r(\mathbb{R}^d) \). This implies that for \( x \in \mathbb{R}^d \),
\[
\sup_{|y-x| \leq \sigma} |\Phi_\sigma(D)g(y)| \leq \sup_{|y-x| \leq \sigma} \sum_{j=0}^\infty 2^{-jM} (\sigma^{-d} \int_{B(y, \sigma)} |g(z)|^r dz)^{1/r} \lesssim M_r g(x),
\]
where \( M_r g = (M(g^r))^{1/r} \), with \( M \) the Hardy-Littlewood maximal function, \( S_j(B_{\sigma, \theta}) := \{ z \in \mathbb{R}^d : 2^{j-1} \sigma \leq |y-z| < 2^j \sigma \} \) for \( j \geq 1 \), and \( S_0(B_{\sigma, \theta}) = \{ z \in \mathbb{R}^d : |y-z| < \sigma \} \). The conclusion follows from the \( L^p(\mathbb{R}^d) \) boundedness of \( M_r \) together with Proposition 7.8.

For the second assertion, we first note that by renormalisation, we can change \( \Phi_\sigma(D)\varphi_\omega(D) \) to \( \Phi_\sigma(D)\varphi_\omega(D) \). We slightly change the above argument by noting that for \( q \in (r, \infty) \), we have \( L^q-L^\infty \) off-diagonal estimates for \( \Phi_\sigma(D) \). On the other hand, we have by Lemma 6.8 \( L^r-L^q \) off-diagonal estimates for \( \Phi_\sigma(D)\varphi_\omega(D) \) of the form
\[
\| 1_E \Phi_\sigma(D)\varphi_\omega(D)(1_F g) \|_{L^q(\mathbb{R}^d)} \leq C_M \sigma^{-\frac{d}{2}} (1 + \frac{d(E, F)}{\sigma})^{-M} \| f \|_{L^r(\mathbb{R}^d)}
\]
for all \( g \in L^r(\mathbb{R}^d) \). We then conclude as above, using composition of off-diagonal bounds as in [11, Theorem 2.3].

8. Sobolev embedding properties of \( H^p_{FIO,n}(\mathbb{R}^d) \)

We use a variation of the arguments in [21, Section 7].

We let \( m(D) = (I + \sqrt{L})^{-\frac{d+1}{4}} \).

Lemma 8.1. For every \( 0 < \theta < \frac{\pi}{2} \) there exist \( C_\theta, c_\theta > 0 \) such that for all atoms \( A \in T^{1,2}(\mathbb{R}^d) \), and all \( s \in \mathbb{R} \)
\[
(8.1) \quad \int_{S^{d-1}} \| (\sigma, x) \mapsto 1_{[0,1]}(\sigma)m(\sqrt{L})^{1+s} \psi_{\omega, \sigma}(D) A(\sigma, \cdot)(x) \|_{T^{1,2}(\mathbb{R}^d)} d\omega \leq C_\theta e^{l|s|c_\theta}.
\]

Proof. Let \( A \) be a \( T^{1,2}(\mathbb{R}^d) \) atom associated with a ball \( B = B(c_B, r) \). Without loss of generality, we assume that \( A(\sigma, \cdot) = 0 \) for all \( \sigma \geq 1 \).

By renormalisation, we can replace \( \psi_{\omega, \sigma}(D) \) in [8.1] by \( \Psi_\sigma(D) \psi_{\omega, \sigma}(D) \). Noting that \( \| m \|_{L^\infty(S^d)} \leq c e^{l|s|c_\theta} \), for \( c_\theta = \frac{\theta}{4} \), we use Corollary 5.3 to obtain for every \( \omega \in S^{d-1} \) and given \( \theta \in (0, \frac{\pi}{2}) \)
\[
\| (\sigma, x) \mapsto 1_{[0,1]}(\sigma)m(D)^{1+s} \Psi_\sigma(D) \psi_{\omega, \sigma}(D) A(\sigma, \cdot)(x) \|_{T^{1,2}(\mathbb{R}^d)}
\]
\[
= \| (\sigma, x) \mapsto 1_{[0,1]}(\sigma)L^{\frac{d+1}{4}} m(D)^{1+s} \Psi_\sigma(D) L^{-\frac{d+1}{4}} \psi_{\omega, \sigma}(D) A(\sigma, \cdot)(x) \|_{T^{1,2}(\mathbb{R}^d)}
\]
\[
\leq C_\theta e^{l|s|c_\theta} \| (\sigma, x) \mapsto 1_{[0,1]}(\sigma)L^{-\frac{d+1}{4}} \psi_{\omega, \sigma}(D) A(\sigma, \cdot)(x) \|_{T^{1,2}(\mathbb{R}^d)},
\]
with $C_{\theta}$ independent of $s \in \mathbb{R}$.

For $j \in \mathbb{N}^*$, and $\omega \in S^{d-1}$, define $C_{j,\omega} := \{ y \in \mathbb{R}^d : 2^{j-1}r < |\langle \omega, c_B - y \rangle| + |c_B - y|^2 \leq 2^j r \}$ and $C_{0,\omega} := \{ y \in \mathbb{R}^d : |\langle \omega, c_B - y \rangle| + |c_B - y|^2 \leq r \}$. Remark that $|C_{j,\omega}| \sim (2^j r)^{\frac{d+1}{2}}$, and that $d_\omega(C_{j,\omega}, C_{0,\omega}) > 2^{j-1}r$. Using a slight generalisation of Lemma 6.5 and Corollary 5.7 for $p = \frac{4d-1}{3d-1}$, we have that

$$\left( \int_{S^{d-1}} \| (\sigma, x) \mapsto 1_{C_{0,\omega}}(x) 1_{[0,1]}(\sigma) L^{-\frac{d+1}{8}} \psi_{\omega,\sigma}(D_a) A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)} \right)^2$$

$$\lesssim r^{\frac{d+1}{2}} \int_{S^{d-1}} \int_0 \| L^{-\frac{d+1}{8}} \psi_{\omega,\sigma}(D_a) A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)} \frac{d\sigma}{\sigma} d\omega$$

$$\lesssim r^{\frac{d+1}{2}} \int_0^r \| A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)} \frac{d\sigma}{\sigma}$$

$$\lesssim r^{d} \int_0^r \| A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)}^2 \frac{d\sigma}{\sigma} \lesssim r^d \| A \|_{L^2_2}^2 \lesssim 1.$$

Let $M > d + 1$, and define $\widetilde{\Psi} : \xi \mapsto \frac{|\xi|^{\frac{d+1}{2}}}{\int |\xi|^{\frac{d+1}{2}} |\Psi(\xi)|^2 \frac{d\xi}{\sigma}}$, and $\widetilde{\psi}_{\omega,\sigma} : \xi \mapsto \varphi_{\omega,\sigma}(\xi) \widetilde{\Psi}(\sigma \xi)$.

For all $j \in \mathbb{N}^*$, we obtain from Lemma 5.8 for $\widetilde{\psi}_{\omega,\sigma}$ instead of $\psi_{\omega,\sigma}$

$$\left( \int_{S^{d-1}} \| (\sigma, x) \mapsto 1_{C_{j,\omega}}(x) 1_{[0,1]}(\sigma) L^{-\frac{d+1}{8}} \psi_{\omega,\sigma}(D_a) A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)} \right)^2$$

$$\lesssim (2^j r)^{\frac{d+1}{2}} \int_{S^{d-1}} \int_0 \| \psi_{\omega,\sigma}(D_a) A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)}^2 \frac{d\sigma}{\sigma} d\omega$$

$$\lesssim (2^j r)^{\frac{d+1}{2}} \int_0 \| A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)}^2 \frac{d\sigma}{\sigma} d\omega$$

$$\lesssim r^d \int_0 \| A(\sigma, .)(x) \|_{L^2(\mathbb{R}^d)}^2 \frac{d\sigma}{\sigma} d\omega$$

$$\lesssim 2^{-j(M-\frac{d+1}{2})} r^d \| A \|_{L^2_2}^2 \lesssim 2^{-j(M-\frac{d+1}{2})}.$$
Remark 8.2. Note that basically the same proof as above also yields the statement that for all $s \in \mathbb{R}$,

$$\|((\omega, \sigma, .) \mapsto \sigma^{d+1}s\psi_{\omega,\sigma}(D_a)F(\sigma, .))\|_{L^1(S^{d-1}; T^{1,2}(\mathbb{R}^d))} \lesssim \|F\|_{T^{1,2}(\mathbb{R}^d)}$$

for all $F \in T^{1,2}(\mathbb{R}^d)$. By a slight modification of Lemma 8.2 we obtain on the other hand

$$\|((\omega, \sigma, .) \mapsto \psi_{\omega,\sigma}(D_a)F(\sigma, .))\|_{L^2(S^{d-1}; T^{2,2}(\mathbb{R}^d))} \lesssim \|F\|_{T^{2,2}(\mathbb{R}^d)}$$

for all $F \in T^{2,2}(\mathbb{R}^d)$. Stein interpolation and duality then yield for all $p \in (1, \infty)$,

$$\|((\omega, \sigma, .) \mapsto \sigma^{\frac{4}{m}}\psi_{\omega,\sigma}(D_a)F(\sigma, .))\|_{L^p(S^{d-1}; T^{0,2}(\mathbb{R}^d))} \lesssim \|F\|_{T^{0,2}(\mathbb{R}^d)},$$

for all $F \in T^{0,2}(\mathbb{R}^d)$.

Lemma 8.3. For all $p \in [1, 2]$, and $s_p = (d - 1)(\frac{1}{p} - \frac{1}{2})$, we have the continuous inclusion

$$H_{FIO,a}^p(\mathbb{R}^d) \subset H_{L}^p(\mathbb{R}^d),$$

where $H_{L}^p(\mathbb{R}^d) = L^p(\mathbb{R}^d)$ for $p > 1$. For $p \in (1, \infty)$, and $b : \xi \mapsto |\xi|^\frac{d-1}{2}m(\xi)$, we have that

$$\|(\sigma, x) \mapsto m(D_a)\psi(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \|(b(D_a) + m(D_a))f\|_{H_{FIO,a}^p(\mathbb{R}^d)} \lesssim \|f\|_{H_{FIO,a}^p(\mathbb{R}^d)},$$

for all $f \in S_p$.

Proof. Let $f$ be an $H_{L}^1$ atom. We have, using the reproducing formula (6.10), that

$$\|f\|_{H_{L}^1} \sim \|(\sigma, x) \mapsto \psi(\sigma D_a)f(x)\|_{T^{1,2}(\mathbb{R}^d)}$$

$$\lesssim \int_{S^{d-1}} \|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)\sigma^{-\frac{d-1}{2}}\psi_{\omega,\sigma}(D_a)f(x) + 1_{[1,\infty]}(\sigma)\psi(\sigma D_a)f(x)\|_{T^{1,2}(\mathbb{R}^d)}d\omega$$

$$\lesssim \|f\|_{H_{FIO,a}^{\frac{d-1}{2}}(\mathbb{R}^d)},$$

where the last inequality follows from the comparability of $\psi_{\omega,\sigma}$ with $\varphi_{\omega,\sigma}$ for $\sigma \in (0, 1)$. Since $H_{FIO,a}^2 = L^2$, the continuous inclusion $H_{FIO,a}^{p,\frac{d-1}{2}}(\mathbb{R}^d) \subset H_{L}^p(\mathbb{R}^d)$ follows by interpolation. In the same way,

$$\|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)m(D_a)\psi(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)}$$

$$\lesssim \int_{S^{d-1}} \|(\sigma, x) \mapsto 1_{[0,1]}(\sigma)b(D_a)\varphi_{\omega,\sigma}(D_a)\tilde{\psi}(\sigma D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)}d\omega,$$

for $\tilde{\psi}$ such that $\psi(\xi) = |\xi|^\frac{d-1}{2}\tilde{\psi}(\xi)$ for all $\xi \in \mathbb{R}^d$. Turning to the low frequency term, we note that, for $\sigma > 1$, we have that $\psi(\sigma \xi) = \Psi(\sigma \xi)q(\xi)$ for all $\xi \in \mathbb{R}^d$. Therefore, by Theorem 5.6 and Proposition 7.8 we have that

$$\|(\sigma, x) \mapsto 1_{(1,\infty)}(\sigma)\Psi(\sigma D_a)m(D_a)f(x)\|_{T^{p,2}(\mathbb{R}^d)} \lesssim \|m(D_a)q(D_a)f\|_{L^p(\mathbb{R}^d)} \lesssim \|m(D_a)f\|_{H_{FIO,a}^p(\mathbb{R}^d)}.$$ 

To conclude the proof, we use Theorem 2.1 and Theorem 2.2 along with Proposition 1.3 to show that $b(D_a)$ and $m(D_a)$ are bounded operators on $L^p(\mathbb{R}^d)$, and thus also on $H_{FIO,a}^p(\mathbb{R}^d)$, thanks to Proposition 7.8.

Corollary 8.4. Let $p \in (1, 2]$. Then

$$\|(I + \sqrt{L})^{-\frac{2}{p}}f\|_{H_{FIO,a}^p(\mathbb{R}^d)} \lesssim \|f\|_{L^p(\mathbb{R}^d)},$$

for all $f \in S_p$. 

\[\square\]
Proof. For $z \in \mathbb{C}$ such that $\text{Re}(z) \in [0, 1]$, we consider the operators defined by
\[ T_z f(x, \omega, \sigma) := 1_{[0,1]}(\sigma)(I + \sqrt{L})^{-\frac{d-1}{2}} \psi_{\omega, \sigma}(D_a) f(x) \quad \forall f \in L^2(\mathbb{R}^d). \]
For $\text{Re}(z) = 0$, they are well defined as operators from $L^2(\mathbb{R}^d)$ to $L^2(\mathbb{R}^d \times S^{d-1} \times (0, \infty); dx d\omega \frac{d\sigma}{\sigma})$ by Lemma 6.5 with norm independent of $\text{Im}(z)$. For $\text{Re}(z) = 1$, by Lemma 8.1, $T_z$ extends to a bounded operator from $H^1(\mathbb{R}^d)$ to $L^1(S^{d-1} ; T^{1,2}(\mathbb{R}^d))$ with norm bounded by $C_{\theta} e^{\text{Im}(z)|e_{\theta}|}$ for fixed $\theta > 0$. Therefore, by Stein interpolation [36] with admissible growth, $T_z \in B(L^p(\mathbb{R}^d), L^p(S^{d-1} ; T^{p,2}(\mathbb{R}^d))$) for $\text{Re}(z) = \frac{2}{p} - 1$. To conclude the proof, we thus only have to show the low frequency estimate
\[ \| (\sigma, x) \mapsto 1_{(1, \infty)}(\sigma) \Psi(\sigma D_a)(I + \sqrt{L})^{-\frac{d-1}{2}} f(x) \|_{T^{p,2}(\mathbb{R}^d)} \lesssim \| f \|_{L^p(\mathbb{R}^d)}. \]
This follows from Theorem 5.6 and the $L^p$ boundedness of $(I + \sqrt{L})^{-\frac{d-1}{2}}$. \qed

9. THE WAVE GROUP

Theorem 9.1. Let $p \in (1, \infty)$, and $s \in \mathbb{R}$. Then
\[ e^{it\sqrt{T}} : H^{p,s}_{FIO,a}(\mathbb{R}^d) \rightarrow H^{p,s}_{FIO,a}(\mathbb{R}^d) \]
is bounded for each $t > 0$.

For simplicity, we set $t = 1$ and $s = 0$. All the proofs extend verbatim to other values of $t$. The case $s \in \mathbb{R}$ is an immediate consequence of the case $s = 0$ by Proposition 7.8. For the transport groups, and the one dimensional wave groups, the $L^p$ boundedness is clear.

Lemma 9.2. Let $p \in (1, \infty)$ and $\omega \in S^{d-1}$. Then
\[ e^{i\omega \cdot \sqrt{D^2}} \in B(L^p(\mathbb{R}^d)) \cap B(H^{p}_{FIO,a}(\mathbb{R}^d)). \]

Proof. The $L^p$ boundedness is proven in Proposition 4.3. The boundedness on $H^{p}_{FIO,a}(\mathbb{R}^d)$ is an immediate consequence of the $L^p$ boundedness, by Proposition 7.8. \qed

For the low frequency estimate, we need the following lemma.

Lemma 9.3. Let $p \in (1, \infty)$, let $q \in C_c^\infty(\mathbb{R}^d)$ be radial. Then $q(D_a)e^{i\sqrt{T}} : L^p(\mathbb{R}^d) \rightarrow L^p(\mathbb{R}^d)$ is bounded.

Proof. Because of the compact support of $q$, the symbol $m : \zeta \mapsto q(\zeta)e^{i|\zeta|}$ clearly satisfies the Marcinkiewicz-Lizorkin multiplier condition of Theorem 2.1. The result thus follows from Theorem 2.1 and Theorem 2.2 using that $(e_j \sqrt{D^2}_{a})_{j=1,...,d}$ generates a bounded commutative $d$-parameter group (as shown in Proposition 4.3), along with the fact that
\[ m(D_a) = m_s(D_a) = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} \hat{m}(\xi) \exp(i\xi \sqrt{D^2}) d\xi, \]
as explained in Definition 5.1. \qed

Proof of Theorem 7.7. For $f \in S_p$, Proposition 7.8 yields
\[ \| e^{i\sqrt{T}} f \|_{H^{p}_{FIO,a}(\mathbb{R}^d)} \lesssim \| q(D_a)e^{i\sqrt{T}} f \|_{L^p(\mathbb{R}^d)} + \left( \int_{S^{d-1}} \| \varphi_{\omega}(D_a)e^{i\sqrt{T}} f \|_{L^p(\mathbb{R}^d)} d\omega \right)^{1/p}. \]
For the low frequency part, recall that \( q \in C_c^\infty(\mathbb{R}^d) \) with \( q(\zeta) \equiv 1 \) for \( |\zeta| \leq \frac{1}{8} \). Choose \( q' \in C_c^\infty(\mathbb{R}^d) \) radial with \( q'(\zeta) \equiv 1 \) on \( \text{supp } q \). Then \( q(D_a)e^{i\sqrt{T}} = q(D_a)e^{i\sqrt{T}}q(D_a) \), since \( \sqrt{D_a^2} \) and \( \sqrt{T} \) are commuting, and \( q(D_a)e^{i\sqrt{T}} \) is \( L^p \) bounded according to Lemma 9.3. Thus, 
\[
\|q(D_a)e^{i\sqrt{T}}f\|_{L^p(\mathbb{R}^d)} = \|q(D_a)e^{i\sqrt{T}}q(D_a)f\|_{L^p(\mathbb{R}^d)} \lesssim \|q(D_a)f\|_{L^p(\mathbb{R}^d)}.
\]

Let us now consider the high frequency part. For fixed \( \omega \in S^{d-1} \), we decompose 
\[
\varphi_\omega(D_a)e^{i\sqrt{T}} = \varphi_\omega(D_a)e^{i\omega \sqrt{D_a^2}} + \varphi_\omega(D_a)(e^{i\sqrt{T}} - e^{i\omega \sqrt{D_a^2}}).
\]

The first part can be dealt with Lemma 9.2, which directly yields 
\[
\left( \int_{S^{d-1}} \|\varphi_\omega(D_a)e^{i\omega \sqrt{D_a^2}}f\|_{L^p(\mathbb{R}^d)}^p d\omega \right)^{1/p} \lesssim \|f\|_{H^p_{\text{FO},a}(\mathbb{R}^d)}.
\]

For the second part, we use (6.8) to write 
\[
\varphi_\omega(D_a)(e^{i\omega \sqrt{D_a^2}} - e^{i\omega \sqrt{D_a^2}}) = \varphi_\omega(D_a)e^{i\omega \sqrt{D_a^2}}(e^{-i\omega \sqrt{D_a^2}}e^{i\sqrt{T}} - I)\pi_a W_a.
\]

Since \( e^{i\omega \sqrt{D_a^2}} \) is bounded on \( L^p(\mathbb{R}^d) \) by Lemma 9.2, it suffices to show that 
\[
\|\varphi_\omega(D_a)(e^{-i\omega \sqrt{D_a^2}}e^{i\sqrt{T}} - I)\pi_a W_a f\|_{L^p(\mathbb{R}^d)} \lesssim \|\varphi_\omega(D_a)f\|_{L^p(\mathbb{R}^d)}.
\]

We can write 
\[
\varphi_\omega(D_a)(e^{-i\omega \sqrt{D_a^2}}e^{i\sqrt{T}} - I)\pi_a W_a = m_\omega(D_a)\varphi_\omega(D_a) + q_\omega(D_a)\varphi_\omega(D_a)
\]

for the symbols 
\[
m_\omega(\zeta) = \hat{\varphi}_\omega(\zeta)\tilde{m}_\omega(\zeta) = \psi_{\nu,\sigma}(\zeta)^2 d\nu d\sigma
\]

and 
\[
q_\omega(\zeta) = \hat{\varphi}_\omega(\zeta)\tilde{q}_\omega(\zeta) r(\zeta)^2
\]

with \( \tilde{m}_\omega(\zeta) = e^{-i\sum_{j=1}^d \omega_j |\zeta| + |\zeta|} - 1 \), \( \hat{\varphi}_\omega \in C_c^\infty(\mathbb{R}^d) \) a function with \( \hat{\varphi}_\omega \equiv 1 \) on \( \text{supp } \varphi_\omega \) and \( \hat{\varphi}_\omega(\zeta) = 0 \) for \( |\zeta| < \frac{1}{16} \) or \( (\epsilon_\omega)_{j=1}^d \in \{-1,1\}^d \), \( |(\epsilon_1 \zeta_1, ..., \epsilon_d \zeta_d) - \omega| > 4|\zeta|^{-1/2} \), and 
\[
r(\zeta) := \left( \int_1^\infty \Psi_\sigma(\zeta)^2 d\sigma \right)^{1/2} \quad \zeta \neq 0,
\]

and \( r(0) := 1 \). As noted in [21] Section 4.1, we have \( r \in C_c^\infty(\mathbb{R}^d) \).

The proof will be concluded by applying Theorem 2.1 and Theorem 2.2 using Proposition 1.3. We only have to check that \( m_\omega \) and \( q_\omega \) satisfy the assumption of Theorem 2.1. For \( q_\omega \), this directly follows from the fact that \( r \in C_c^\infty(\mathbb{R}^d) \). For \( m_\omega \), this is proven in Lemma 9.3 below.

**Remark 9.4.** Let \( \omega \in S^{d-1} \). Let \( \tilde{\varphi}_\omega \in C_c^\infty(\mathbb{R}^d) \) a function with \( \tilde{\varphi}_\omega \equiv 1 \) on \( \text{supp } \varphi_\omega \) and \( \tilde{\varphi}_\omega(\zeta) = 0 \) for \( |\zeta| < \frac{1}{16} \) or \( (\epsilon_\omega)_{j=1}^d \in \{-1,1\}^d \), \( |(\epsilon_1 \zeta_1, ..., \epsilon_d \zeta_d) - \omega| > 4|\zeta|^{-1/2} \). By the choice of
the cut-off function \( \hat{\varphi}_\omega \) and the support properties of \( \varphi_\omega \), we have the following: For all \( \alpha \in \mathbb{N}_0^d \) and \( \beta \in \mathbb{N}_0 \), there exists a constant \( C = C(\alpha, \beta) > 0 \) such that

\[
|\langle \omega, \nabla_\zeta \rangle^\beta \partial_\zeta^\alpha \hat{\varphi}_\omega(\zeta)| \leq C|\zeta|^{-\alpha - \beta}
\]

for all \( \omega \in S^{d-1} \) and \( \zeta \in \mathbb{R}^d \setminus \{0\} \).

**Lemma 9.5.** Let \( \omega \in S^{d-1} \), let \( m_\omega \) be as defined in (9.1). For all \( \alpha \in \mathbb{N}_0^d \) with \( |\alpha| \leq 1 \) there exists a constant \( C = C(\alpha) > 0 \) such that

\[
|\zeta^\alpha \partial_\zeta^\alpha m_\omega(\zeta)| \leq C
\]

for all \( \zeta \in \mathbb{R}^d \setminus \{0\} \).

**Proof.** By rotational invariance it suffices to consider the case \( \omega = e_1 \). Let \( \zeta \in \mathbb{R}^d \setminus \{0\} \). The bound \( |m_{e_1}(\zeta)| \leq C \) directly follows from (6.2) and the boundedness of \( \hat{m}_{e_1} \) and \( \hat{\varphi}_{e_1} \). Moreover, by the specific form of \( \hat{m}_{e_1}(\zeta) = e^{ib(\zeta)} - 1 \) with \( b(\zeta) = -|\zeta_1| + |\zeta| \), it can easily be seen that the condition

\[
|\zeta^\alpha \partial_\zeta^\alpha b(\zeta)| \leq c
\]

for \( |\alpha| \leq 1 \) immediately implies \( |\zeta^\alpha \partial_\zeta^\alpha \hat{m}_{e_1}(\zeta)| \leq c \) for \( |\alpha| \leq 1 \). We check (9.2):

\[
|\zeta_1 \partial_1 b(\zeta)| = |\zeta_1 \partial_1 (-|\zeta_1| + |\zeta|)| \leq |\zeta_1| |1 - \frac{|\zeta_1|}{|\zeta|}| = \left| \frac{\zeta_1}{|\zeta|} \right| |\zeta| - |\zeta_1| |
\]

\[
\leq ||\zeta| - |\zeta_1|| = |\zeta_1| \left( \sqrt{1 + \sum_{j=2}^d \frac{\zeta_j^2}{|\zeta_1|^2}} - 1 \right).
\]

According to the support properties of \( \hat{\varphi}_{e_1} \) and \( \psi_{\nu, \sigma} \), we have \( |\nu - \epsilon_1 e_1| \lesssim \sqrt{\sigma} \) for some \( \epsilon_1 \in \{-1, 1\} \). Thus a slight modification of (6.7) yields that there exist constants \( c_1, c_2 > 0 \) such that for \( 0 < \sigma \ll 1 \), one has

\[
|\zeta_1| > \frac{c_1}{\sigma} \quad \text{and} \quad |\zeta_j| \leq \frac{c_2}{\sqrt{\sigma}}, \quad j \in \{2, \ldots, d\},
\]

on the support of \( m_{e_1} \). Thus, for such choice of \( \zeta \),

\[
|\zeta_1 \partial_1 b(\zeta)| \lesssim |\zeta_1| \left( \sqrt{1 + \frac{c}{|\zeta_1|}} - 1 \right).
\]

This expression remains bounded for \( |\zeta_1| \to \infty \) or equivalently \( |\zeta| \to \infty \), since replacing \( h = \frac{1}{k_{1\nu}} \), we see that

\[
\lim_{h \to 0} \frac{\sqrt{1 + ch} - 1}{h} = \frac{c}{2}.
\]

Again using (9.3) and \( |\zeta| \geq |\zeta_1| > \frac{c}{\sigma} \), we obtain for \( j \in \{2, \ldots, d\} \) that

\[
|\zeta_j \partial_j b(\zeta)| = |\zeta_j \partial_j (-|\zeta_1| + |\zeta|)| \leq |\zeta_j \frac{\zeta_j}{|\zeta|}| \leq c.
\]
Concerning the mixed derivatives, one can inductively show that for \( \alpha \in \mathbb{N}_0^d \) with \( |\alpha|_{\infty} \leq 1 \) and \( \alpha_1 = 0 \), \( |\zeta^\alpha \partial_1^\beta b(\zeta)| = |\frac{\zeta^\alpha}{|\zeta|^{\alpha_1 + 1}}| \leq c \), for \( \zeta \) as in (9.3). Finally, for \( j \neq 1 \),
\[
|\zeta_1 \zeta_j \partial_1 \partial_j b(\zeta)| = |\zeta_1 \zeta_j \partial_1 (-|\zeta_1| + |\zeta_j|)| = |\zeta_1 \zeta_j| \frac{|\zeta_1 \zeta_j|}{|\zeta_j|^3} | \leq c.
\]

Putting all arguments together shows (9.2). The bound \( |\zeta^\alpha \partial_1^\beta \tilde{c}_\varepsilon(\zeta)| \leq c \) follows from Remark 9.4 together with (9.3), whereas the analogous bound for the last factor in (9.1) concerning \( \psi_{\nu, \sigma} \) is a consequence of (9.6) together with (9.3). \( \square \)

Combining Corollary 8.3 with Theorem 9.1 and Theorem 5.6 then gives our main result.

**Theorem 9.6.** Let \( p \in (1, \infty) \) and \( s_p = (d-1)\left|\frac{1}{p} - \frac{1}{2}\right| \). For each \( t \in \mathbb{R} \), the operator \((I + \sqrt{L})^{-s_p} \exp(it\sqrt{L}) \) is bounded on \( L^p(\mathbb{R}^d) \). Moreover, if \( s_p \leq 2 \), the operator \( \exp(it\sqrt{L}) \) is bounded from \( W^{s_p,p}(\mathbb{R}^d) \) to \( L^p(\mathbb{R}^d) \).

**Proof.** By duality, it suffices to consider the case \( p \in (1, 2) \). Let \( f \in S_p \). By Lemma 8.3 and Theorem 9.1, we have that
\[
\| \exp(it\sqrt{L}) f \|_{L^p(\mathbb{R}^d)} \lesssim \| \exp(it\sqrt{L}) f \|_{H_{FIO,a}^{p, sp}(\mathbb{R}^d)} \lesssim \| f \|_{H_{FIO,a}^{p, sp}(\mathbb{R}^d)}.
\]

Using Proposition 7.3 and Corollary 8.3, we then have that
\[
\| \exp(it\sqrt{L}) f \|_{L^p(\mathbb{R}^d)} \lesssim \| (I + \sqrt{L})^{\frac{sp}{2}} f \|_{H_{FIO,a}^{p, sp}(\mathbb{R}^d)} \lesssim \| (I + \sqrt{L})^{s_p} f \|_{L^p(\mathbb{R}^d)}.
\]

For \( s_p \leq 2 \), Theorem 5.6 then gives \( \| f \|_{W^{s_p,p}} \sim \| (I + \sqrt{L})^{s_p} f \|_{L^p(\mathbb{R}^d)} \). \( \square \)

### 10. Lower Order Perturbations

We consider the operators \( L_1 := -\sum_{j=1}^d (\tilde{a}_j + a) \tilde{a}_j \partial_j \) and \( L_2 := -\sum_{j=1}^d a_j \partial_j (\tilde{a}_j + a) \partial_j \). For a function \( g : \mathbb{R}^d \to \mathbb{R} \), we denote by \( M_g \) the multiplication operator \((f, F) \mapsto (gf, gF)\). We will evaluate the norm of \( g \) in Besov spaces \( \dot{B}^{0, \delta}_{\infty, \infty} \) associated with the operators \( L_k \), in the sense of [12], as well as in \( BMO_{L_k} \) spaces, in the sense of [16].

**Theorem 10.1.** Let \( p \in (1, \infty) \) and \( s_p = (d-1)\left|\frac{1}{p} - \frac{1}{2}\right| \). Let \( g \in L^\infty \) be such that \( g \in \dot{B}^{0, L_m}_{\infty, \infty} \), \( \nabla L_m^{-\frac{1}{2}} g \in \dot{B}^{0, L_m}_{\infty, \infty} \) and \( L_m^s g \in BMO_{L_m} \) for \( m = 1, 2 \). Then \( M_g \in B(H_{FIO,a}^{p, sp}(\mathbb{R}^d)) \).

**Proof.** For \( p = 2 \), there is nothing to prove. For \( p \neq 2 \), this is a consequence of Lemma 10.4 and Lemma 10.6 below. \( \square \)

**Remark 10.2.** If the coefficients \( (a_j)_{j=1, \ldots, 2d} \) are \( C^{1, \alpha} \) for some \( \alpha \in (0, 1) \), then [8, Theorem 4.19] implies that
\[
\max_{m=1,2} \| g \|_{\dot{B}^{0, L_m}_{\infty, \infty}} + \max_{m=1,2} \| \nabla L_m^{-\frac{1}{2}} g \|_{\dot{B}^{0, L_m}_{\infty, \infty}} \lesssim \| g \|_{\infty}.
\]

If the coefficients \( (a_j)_{j=1, \ldots, 2d} \) are \( C^{1, 1} \), then, for all \( t \geq 0 \) and \( m = 1, 2 \), \( \exp(-tL_m)(1) = 1 \) in \( L^\infty \) by Feynman-Kac’s formula. Therefore [16, Proposition 6.7] gives that, for \( m = 1, 2 \),
\[
\| L_m^s g \|_{BMO_{L_m}} \lesssim \| L_m^s g \|_{BMO}.
\]
If the coefficients \((a_j)_{j=1,...,2d}\) are constant, then the assumptions on \(g\) reduce to \(g \in W^{2s_p,\infty}\).

In the special case where \(L_1 = L_2 = \frac{\Delta}{2}\), a more general result for pseudo-differential operators has been proven recently in \([30, \text{Theorem } 1.1]\) for symbols which are \(C^r\) regular in the spatial variable, with \(r > s_p\). Even just for multiplication operators, we do not fully recover this result, partly because our abstract setting prevents us from using arguments about the Fourier support of products. In this Section, we are merely demonstrating that adding lower perturbations with smooth enough coefficients is possible. We intend to develop a more complete perturbation theory in subsequent work.

We state our perturbation result for first order perturbations of the wave equation under consideration.

**Corollary 10.3.** Let \(p \in (1,\infty)\) and \(s_p = (d-1)|\frac{1}{p} - \frac{1}{2}|\). Assume that \(s_p \leq 2\). For \(j = 1, ..., d\), let \(g_j \in L^\infty\) be such that \(g_j \in \dot{B}^{0,L_m}_{\infty,\infty} \nabla L_m \frac{1}{2} g_j \in \dot{B}^{0,L_m}_{\infty,\infty} \) and \(L_m^s g_j \in BMO_{L_m}\) for \(m = 1, 2\). Consider

\[
\hat{L} : (f, F) \mapsto (L_1 f, L_2 F) + \sum_{j=1}^d (g_j \partial_j f, \partial_j F).
\]

For each \(t \in \mathbb{R}\), the operator \((I + \sqrt{L})^{-s_p} \exp(it \sqrt{L})\) is bounded on \(L^p(\mathbb{R}^d)\).

**Proof.** Without loss of generality, we assume that \(p \leq 2\) (using duality to get the full result). By Theorem \([9, \text{Example 3.14.15}]\) and Proposition \([7, 8]\) the operator \(L\) generates a cosine family on \(H^p_{FIO,a}(\mathbb{R}^d)\), with Kisyński space \(D(\sqrt{L}) = H_{FIO,a}^{p,1}(\mathbb{R}^d)\) (see \([2]\) for the theory of cosine families). By Theorem \([10, 1]\) boundedness of Riesz transforms \([8, \text{Corollary } 5.19]\), and Proposition \([7, 8]\) we have, for all \(j = 1, ..., d\), that

\[
\|M_{g_j}(\partial_j f, \partial_j F)\|_{H^p_{FIO,a}(\mathbb{R}^d)} \lesssim \|\partial_j f, \partial_j F\|_{H^p_{FIO,a}(\mathbb{R}^d)} \lesssim \|(f, F)\|_{H^p_{FIO,a}(\mathbb{R}^d)} \quad \forall (f, F) \in H^p_{FIO,a}(\mathbb{R}^d).
\]

We thus obtain from \([8, \text{Corollary } 3.14.13]\) that \(\exp(it \sqrt{L}) \in B(H^p_{FIO,a}(\mathbb{R}^d))\). Another application of \([8, \text{Corollary } 5.19]\), also gives that

\[
\|(I + \sqrt{L})^{-\frac{sp}{2}} (f, F)\|_{L^p} \sim \|(I + \sqrt{L})^{-\frac{sp}{2}} (f, F)\|_{L^p} \quad \forall f, F \in W^{1,p},
\]

since \(s_p \leq 2\). Using Lemma \([8, 3]\) and Corollary \([8, 4]\) we thus have that

\[
\|(I + \sqrt{L})^{-\frac{sp}{2}} \exp(it \sqrt{L}) f\|_{L^p} \lesssim \|(I + \sqrt{L})^{-\frac{sp}{2}} \exp(it \sqrt{L}) f\|_{L^p} \lesssim \|\exp(it \sqrt{L}) f\|_{H^p_{FIO,a}(\mathbb{R}^d)} \lesssim \|f\|_{H^p_{FIO,a}(\mathbb{R}^d)} \lesssim \|(I + \sqrt{L})^{-\frac{sp}{2}} f\|_{L^p} \quad \forall f \in L^p(\mathbb{R}^d; C^2).
\]

\(\square\)

For the proof of Theorem \([10, 1]\) we use the following paraproduct decomposition.

Let \(\Phi \in \mathcal{S}(\mathbb{R}^d), \phi \in \mathcal{S}(\mathbb{R}^d)\) with \(\phi(0) = 1\) and \(\Phi_\sigma(\xi) = \phi(\sigma^2 |\xi|^2)\) for \(\sigma > 0, \xi \in \mathbb{R}^d\). We denote by \(M_{\phi(L_1)g}\) the multiplication operator \((f, F) \mapsto (\phi(L_1)g.f, \phi(L_2)g.F)\). We denote by \(M_{\phi(L_2)g}\) the multiplication operator \((f, F) \mapsto (\phi(L_2)g.f, \phi(L_1)g.F)\).
For $f \in \mathcal{S}_p$ and $g \in \mathcal{S}(\mathbb{R}^d)$, we use (6.8) to decompose the product $gf$ as follows.

$$M_g f = \int_1^\infty M_{\phi(\tau L)g} \Psi(\tau D_a)^2 f \frac{d\tau}{\tau} + \int_1^\infty (M_g - M_{\phi(\tau L)g}) \Psi(\tau D_a)^2 f \frac{d\tau}{\tau}$$

$$+ \int_{S^{d-1}} \int_0^1 M_{\phi(\tau L)g} \varphi_\nu(D_a)^2 \Psi(\tau D_a)^2 f \frac{d\tau}{\tau} \, d\nu$$

$$+ \int_{S^{d-1}} \int_0^1 (M_g - M_{\phi(\tau L)g}) \varphi_\nu(D_a)^2 \Psi(\tau D_a)^2 f \frac{d\tau}{\tau} \, d\nu.$$ 

Since the two low-frequency terms in the first line are similar but simpler than the two high-frequency terms, we only consider the two latter in the following. Moreover, note that we can choose $\Phi$ and $\Psi$ such that by integration by parts, the last integral is - up to a low-frequency term - equal to

$$\int_{S^{d-1}} \int_0^1 M_{\Psi(\tau L)g} \varphi_\nu(D_a)^2 \Phi(\tau D_a) f \frac{d\tau}{\tau} \, d\nu,$$

where $\Psi(\sigma\zeta) =: \psi(\sigma^2|\zeta|^2)$ for $\sigma > 0$, $\zeta \in \mathbb{R}^d$.

**Lemma 10.4.** Let $p \in (1, \infty)$. Let $g \in L^\infty$ be such that $g \in \dot{B}^0_{0,\infty}$ and $\nabla L_m^{-\frac{1}{2}} g \in \dot{B}^0_{0,\infty}$ for $m = 1, 2$. For all $f \in H^p_{FIO,a}(\mathbb{R}^d)$, we have that

$$\| (\omega, \sigma, \cdot) \mapsto \psi_{\omega,\sigma}(D_a) \int_{S^{d-1}} \int_0^1 M_{\phi(\tau L)g} \varphi_\nu(D_a)^2 \Psi(\tau D_a)^2 f \frac{d\tau}{\tau} \, d\nu \|_{L^p(S^{d-1}; T^p, 2(\mathbb{R}^d))}$$

$$\lesssim (\|g\|_\infty + \max_{m=1,2} \|g\|_{\dot{B}^0_{0,\infty,m}} + \max_{m=1,2} \|\nabla L_m^{-\frac{1}{2}} g\|_{\dot{B}^0_{0,\infty,m}}) \|f\|_{H^p_{FIO,a}(\mathbb{R}^d)}.$$ 

**Proof.** We split the integral in $\tau$ into two parts, corresponding to $\tau \in (0, \min(\sigma, 1))$ and $\tau \in (\min(\sigma, 1), 1)$. We also split the integral over $S^{d-1}$ into two parts, corresponding to $|\nu + \omega| \leq \sqrt{\tau}$ and $|\nu + \omega| > \sqrt{\tau}$. Consider first $\tau \in (0, \min(\sigma, 1))$ and $|\nu + \omega| \leq \sqrt{\tau}$. Using Lemma [6.8] and [23] Theorem 5.2], we have that

$$\| (\omega, \sigma, \cdot) \mapsto \psi_{\omega,\sigma}(D_a) \int_0^{\min(1,\sigma)} M_{\phi(\tau L)g} \varphi_\nu(D_a)^2 \Psi(\tau D_a)^2 f d\nu \frac{d\tau}{\tau} \|_{L^p(S^{d-1}; T^p, 2(\mathbb{R}^d))}$$

$$\lesssim \| (\omega, \sigma, \cdot) \mapsto \sigma^{-\frac{d+1}{2}} \int_0^{\min(1,\sigma)} \int_{|\nu + \omega| \leq \sqrt{\tau}} M_{\phi(\tau L)g} \varphi_\nu(D_a)^2 \Psi(\tau D_a)^2 f d\nu \frac{d\tau}{\tau} \|_{L^p(S^{d-1}; T^p, 2(\mathbb{R}^d))}.$$ 

On the other hand, Hardy’s inequality implies that

$$\langle \sigma, \cdot \rangle \int_0^\sigma \left( \frac{\tau}{\sigma} \right)^{\frac{d+1}{2}} F(\tau, \cdot) \frac{d\tau}{\tau}$$
is bounded on $T^{p,2}(\mathbb{R}^d)$. We thus have that

\[
\|(\omega, \sigma, \cdot) \mapsto \sigma^{-\frac{d+1}{4}} \int_0^{\min(1,\sigma)} \int_{|\nu| \leq \sqrt{\tau}} M_{\phi(\tau L)g}(D_a)^2 |\psi(\tau D_a)|^2 f d\nu \frac{d\tau}{\tau} \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))} \]
\[
\lesssim \sup_{\tau > 0} \|\phi(\tau L)g\|_{L^\infty}\|(\omega, \tau, \cdot) \mapsto \sigma^{-\frac{d+1}{4}} \int_{|\nu| \leq \sqrt{\tau}} \varphi(\tau D_a)^2 |\psi(\tau D_a)|^2 f d\nu \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))} \]
\[
\lesssim \|g\|_{L^\infty}\|(\omega, \tau, \cdot) \mapsto \sigma^{-\frac{d+1}{4}} \int_{|\nu| \leq \sqrt{\tau}} \varphi(\tau D_a)^2 |\psi(\tau D_a)|^2 f d\nu \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))},
\]

for some $\tilde{\psi}_{\omega,\tau}$ that satisfies the same assumptions as $\psi_{\omega,\tau}$ in Section 6. Noting that

\[
\sigma^{-\frac{d+1}{4}} \int_{|\nu| \leq \sqrt{\tau}} \|F^{-1}(\psi_{\nu,\tau})\|_{L^1} d\nu \lesssim \sigma^{-\frac{d+1}{4}} \int_{|\nu| \leq \sqrt{\tau}} d\nu \lesssim 1,
\]

uniformly in $\tau$, we can apply a slight modification of Lemma 6.8 together with Theorem 5.2, and get that

\[
\|(\omega, \tau, \cdot) \mapsto \tau^{-\frac{d+1}{4}} \int_{|\nu| \leq \sqrt{\tau}} \varphi(\tau D_a)^2 |\psi(\tau D_a)|^2 f d\nu \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))} \lesssim \|(\omega, \tau, \cdot) \mapsto \psi_{\omega,\tau}(D_a) f \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))} \lesssim \|f\|_{H_{f,10,0}^p(\mathbb{R}^d)}.
\]

We now turn to the part where $\tau \in (0, \min(\sigma, 1))$ and $|\nu| \lesssim \sqrt{\tau}$. Denoting by $(\omega_1, \omega_2, \ldots, \omega_{d-1})$ an orthonormal basis of $\mathbb{R}^d$, we remark that, in this region,

\[
\tau(\nu.D_a)\psi_{\omega,\sigma}(D_a) = \frac{\tau}{\sigma}(\nu.\omega)\psi_{\omega,\sigma}(D_a) + \sqrt{\tau} \sum_{j=1}^{d-1} \sqrt{\frac{\tau}{\sigma}} (\nu.\omega_j) \psi_{\omega,\sigma}(D_a)
\]
\[
= \sqrt{\frac{\tau}{\sigma}} + \sqrt{\frac{\tau}{\sigma}} \tilde{\psi}_{\omega,\sigma}(D_a),
\]

for some $\tilde{\psi}_{\omega,\sigma}$ that satisfies the same assumptions as $\psi_{\omega,\sigma}$ in Section 6 (integrating by parts as in Lemma 6.8), since $|\omega.| \lesssim \sqrt{\tau} \leq \sqrt{\tau}$. We combine this fact with the following version of the product rule:

\[
M_{\phi(\tau L)g}(e_j.D_a) = (e_j.D_a)M_{\phi(\tau L)g} - M_{(e_j.D_a)\phi(\tau L)g},
\]

for $j = 1, \ldots, d$, where $M_{(e_j.D_a)\phi(\tau L)g} : (f, F) \mapsto (\tilde{a}_{j}\partial_j \phi(\tau L_1)g \cdot F, \tilde{a}_{j}\partial_j \phi(\tau L_2)g \cdot f)$. We obtain that, for any $M \in \mathbb{N}$,

\[
\|(\omega, \sigma, \cdot) \mapsto \psi_{\omega,\sigma}(D_a) \int_0^{\min(1,\sigma)} \int_{|\nu| \leq \sqrt{\tau}} M_{\phi(\tau L)g}(D_a)^2 |\psi(\tau D_a)|^2 f d\nu \frac{d\tau}{\tau} \|_{L^p(S^{d-1}; T^{p,2}(\mathbb{R}^d))} \]
\[
\lesssim \max_{j=0,\ldots,2M} \|(\omega, \sigma, \cdot) \mapsto \tau^M \tilde{\psi}_{\omega,\sigma}(D_a) \int \int M_{(\nu.D_a)\phi(\tau L)g}(D_a)^2 |\psi(\tau D_a)|^2 f d\nu \frac{d\tau}{\tau} \|
\]
\[
+ \max_{j=0,\ldots,2M} \|(\omega, \sigma, \cdot) \mapsto \tau^M \tilde{\psi}_{\omega,\sigma}(D_a) \int \int M_{(\nu.D_a)\phi(\tau L)g}(D_a)^2 |\psi(\tau D_a)|^2 f d\nu \frac{d\tau}{\tau} \|,
\]

where $\tilde{\psi}_{\omega,\sigma}(D_a)$ is the orthonormal basis of $\mathbb{R}^d$.
for some $\tilde{\psi}_{\omega,\sigma}$ and $\psi_{\omega,\sigma}$ that satisfy the same assumptions as $\psi_{\omega,\sigma}$ in Section 6. From Remark 8.2 we know that

$$\| (\omega, \sigma, \cdot ) \mapsto \sigma \tilde{T} \psi_{\omega,\sigma}(D_a) F(\sigma, \cdot ) \|_{L^p(S^{d-1}; \mathbb{T}^2_{\mathbb{R}^d})} \lesssim \| F \|_{L^p(\mathbb{R}^d)}. $$

Picking $M > \frac{d-1}{4} + \frac{\sigma}{2}$, and using Hardy’s inequality again, we thus get that - suppressing a similar estimate with $L$ replaced by $L -$

$$\max_{j=0, \ldots, 2M} \| (\omega, \sigma, \cdot ) \mapsto \tau^M \tilde{\psi}_{\omega,\sigma}(D_a) \int \tau^M \tilde{M}_{\omega,\sigma}(D_a) \int M(\sqrt{\tau}D_a) \cdot \phi(\tau L) g \varphi(D_a) \Psi(\tau D_a) \psi_{\omega,\sigma}(D_a) f d\nu \frac{d\tau}{\tau} \|$$

$$\lesssim \max_{j=0, \ldots, 2M} \| (\tau, \cdot ) \mapsto \tau^{\frac{d-1}{4}} M(\sqrt{\tau}D_a) \cdot \phi(\tau L) g \varphi(D_a) \Psi(\tau D_a) \psi_{\omega,\sigma}(D_a) f \|_{L^p(\mathbb{R}^d)} d\nu$$

$$\lesssim (\| g \|_{\infty} + \max_{m=1,2} \| r^{0, \ell_m} g \|_{L^{\infty} S_m}) \int_{S^{d-1}} \| (\tau, \cdot ) \mapsto \psi_{\omega,\sigma}(D_a) f \|_{L^p(\mathbb{R}^d)} d\nu$$

For the integral over $\tau \in (\min(\sigma, 1), 1)$, we slightly rewrite the above argument, by picking $M \in \mathbb{N}$ such that $M > \frac{d-1}{4}$, and using that $\tilde{\psi}_{\omega,\sigma}(D_a) := \psi_{\omega,\sigma}(D_a) (\sigma^2 L)^{-M}$ satisfies the same assumptions as $\psi_{\omega,\sigma}$ in Section 6. In the region where $|\nu - \omega| \leq \sqrt{\tau}$, we first use Lemma 6.8 [23] Theorem 5.2], and Hardy’s inequality as before to obtain that

$$\| (\omega, \sigma, \cdot ) \mapsto \psi_{\omega,\sigma}(D_a) \int_{\min(1, \sigma)}^1 \int_{|\nu - \omega| \leq \sqrt{\tau}} M(\sqrt{\tau}D_a) \varphi(D_a) \Psi(\tau D_a) \psi_{\omega,\sigma}(D_a) f d\nu \frac{d\tau}{\tau} \|_{L^p(S^{d-1}; \mathbb{T}^2_{\mathbb{R}^d})}$$

$$\lesssim \| (\omega, \sigma, \cdot ) \mapsto \sigma^{2M - \frac{d-1}{4}} \tilde{\psi}_{\omega,\sigma}(D_a) \int_{\min(1, \sigma)}^1 \int_{|\nu - \omega| \leq \sqrt{\tau}} L^M [M(\sqrt{\tau}D_a) \varphi(D_a) \Psi(\tau D_a) f] d\nu \frac{d\tau}{\tau} \|$$

For $j = 1, \ldots, d$, we now use the following version of the product rule:

$$(e_j D_a) M(\tau L) g = M(\tau L) g(e_j D_a) + M(e_j D_a) \phi(\tau L) g.$$ 

Let $k \in \{0, \ldots, 2M\}$ be even, and $j = 1, \ldots, d$. Letting $\phi_k : x \mapsto x^k \phi(x)$, $m = 1, 2$, and $\delta \in \{0, 1\}$, we can estimate further by multiples of terms of the form

$$\| (\omega, \tau, \cdot ) \mapsto \tau^{\frac{d-1}{4}} \int_{|\nu - \omega| \leq \sqrt{\tau}} M(\tau D_a) \varphi(D_a) \Psi(\tau D_a) f d\nu \|_{L^p(S^{d-1}; \mathbb{T}^2_{\mathbb{R}^d})}$$

$$\lesssim \sup_{\tau \in [0, 1]} \| (\tau, \cdot ) \mapsto (\tau \partial_\tau)^{\frac{d}{2}} (\tau L_m)^{\frac{d}{2}} \varphi(\tau L_m) g \|_{L^\infty(\mathbb{R}^d)}$$

$$\cdot \| (\omega, \tau, \cdot ) \mapsto \tau^{\frac{d-1}{4}} \tau^{\frac{k}{2}} \int_{|\nu - \omega| \leq \sqrt{\tau}} \varphi(D_a) \Psi(\tau D_a) \tilde{\psi}_{\omega,\tau}(D_a) f d\nu \|_{L^p(S^{d-1}; \mathbb{T}^2_{\mathbb{R}^d})},$$

for some $\tilde{\psi}_{\omega,\tau}$ that satisfies the same assumptions as $\psi_{\omega,\tau}$ in Section 6.
For $k \in \{0, \ldots, 2M - 1\}$ even, $m = 1, 2$, and $j = 1, \ldots, d$, we also obtain multiples of terms of the form
\[
(\omega, \tau, \cdot) \mapsto \tau^{-\frac{d+1}{2}} \int_{|\nu| \leq \sqrt{\tau}} \psi(D_\nu) \varphi(D) (D_\nu)^{2M-k-1} \varphi(D)^2 \Psi(D)^2 f d\nu \|_{L^p(S^{d-1}; L^2(\mathbb{R}^d))}.
\]
\[
\lesssim \sup_{\tau \in [0, 1]} \| (\tau, \cdot) \mapsto \tau^{-\frac{d+1}{2}} \int_{|\nu| \leq \sqrt{\tau}} \varphi(D) (D_\nu)^{2M-k-1} \varphi(D)^2 \Psi(D)^2 f d\nu \|_{L^p(S^{d-1}; L^2(\mathbb{R}^d))}.
\]
The result for the region where $\tau \in (\min(\sigma, 1), 1)$ and $|\nu \pm \omega| \leq \sqrt{\tau}$ then follows as in the case of the region where $\tau \in (0, \min(\sigma, 1))$ and $|\nu \pm \omega| \leq \sqrt{\tau}$. Finally, we consider the region where $\tau \in (\min(\sigma, 1), 1)$ and $|\nu \pm \omega| > \sqrt{\tau}$. We first apply the product rule as we did in the region where $\tau \in (0, \min(\sigma, 1))$ and $|\nu \pm \omega| > \sqrt{\tau}$ to obtain that, for any $M' \in \mathbb{N}$,
\[
(\omega, \sigma, \cdot) \mapsto \psi_{\sigma, \omega}(D) \int_{\min(1, \sigma)}^1 \int_{|\nu| \geq \sqrt{\tau}} M(\omega(\tau), \sigma) \psi(D)^2 \Psi(D)^2 f d\nu \frac{d\tau}{\tau} \|_{L^p(S^{d-1}; L^2(\mathbb{R}^d))}.
\]
\[
\lesssim \max_{j=0, \ldots, 2M'} \| (\omega, \sigma, \cdot) \mapsto \tau^{-\frac{d+1}{2}} \psi_{\omega, \sigma}(D) \int \psi(D)^2 \Psi(D)^2 f d\nu \|_{L^p(S^{d-1}; L^2(\mathbb{R}^d))},
\]
for some $\psi_{\omega, \sigma}$ and $\psi_{\omega, \sigma}$ that satisfy the same assumptions as $\psi_{\omega, \sigma}$ in Section 6. We then fix $M' > s_p + \frac{d+1}{2}$, and argue as we did in the region $\tau \in (\min(\sigma, 1), 1)$ and $|\nu \pm \omega| \leq \sqrt{\tau}$, to obtain that, for all $M > M'$, again suppressing similar terms with $L$ replaced by $L$,
\[
\max_{j=0, \ldots, 2M'} \| (\omega, \sigma, \cdot) \mapsto \tau^{\frac{M'}{2}} \psi_{\omega, \sigma}(D) \int \psi(D)^2 \Psi(D)^2 f d\nu \|_{L^p(S^{d-1}; L^2(\mathbb{R}^d))},
\]
\[
\lesssim \max_{j=0, \ldots, 2M'} \| \tau^{\frac{M'}{2}} \psi_{\omega, \sigma}(D) \int \psi(D)^2 \Psi(D)^2 f d\nu \|_{L^p(S^{d-1}; L^2(\mathbb{R}^d))},
\]
\[
\lesssim \max_{j=0, \ldots, 2M'} \int_{S^{d-1}} \| (\tau, \cdot) \mapsto \tau^{\frac{d+1}{2}} \varphi(D) \psi(D)^2 \Psi(D)^2 f d\nu \|_{L^p(S^{d-1}; L^2(\mathbb{R}^d))},
\]
Finally, using the product rule as we did in the region where $\tau \in (\min(\sigma, 1), 1)$ and $|\nu \pm \omega| \leq \sqrt{\tau}$, we estimate further by terms of the form
\[
\int_{S^{d-1}} \| (\tau, \cdot) \mapsto \tau^{\frac{d+1}{2}} \varphi(D) \psi(D)^2 \Psi(D)^2 f d\nu \lesssim \| \nabla L_{m}^{-\frac{1}{2}} g \|_{H^{p}_{\mathcal{F}L^{2}}(\mathbb{R}^d)}.
\]
For the second paraproduct, we make use of the following factorisation result for tent spaces (see \cite{12} for the definition of the tent spaces $T^{p,q}$ when $p = \infty$ or $q \neq 2$).

**Theorem 10.5** (\cite{12}, Theorem 1.1). Let $p, q \in (1, \infty)$. If $F \in T^{p,\infty}(\mathbb{R}^d)$ and $G \in T^{\infty,q}(\mathbb{R}^d)$, then $FG \in T^{p,q}(\mathbb{R}^d)$ and

$$
\|F \cdot G\|_{T^{p,q}(\mathbb{R}^d)} \leq C \|F\|_{T^{p,\infty}(\mathbb{R}^d)} \|G\|_{T^{\infty,q}(\mathbb{R}^d)},
$$

with a constant $C > 0$ which is independent of $F$ and $G$.

**Lemma 10.6.** Let $p \in (1, \infty)$. Let $g \in L^\infty$ be such that $L_m^p g \in BMO_{L_m}$ for $m = 1, 2$, and let $f \in H^p_{FIO,a}(\mathbb{R}^d)$. Then

$$
\|(\omega, \sigma, \cdot) \mapsto \psi_{\omega,\sigma}(D_a) \int_{S^{d-1}} \int_0^{1} M_{\Psi_r(L) g} \cdot \varphi_\nu(D_a)^2 \Phi(\tau D_a) f \, d\tau \, d\nu\|_{L^p(T^{p,2})} \lesssim \max_{m=1,2} \|L_m^p g\|_{BMO_{L_m}} \|f\|_{H^p_{FIO,a}(\mathbb{R}^d)}.
$$

**Proof.** Using Remark 10.5 and Hardy’s inequality as in the proof of Lemma 10.4 we have that

$$
\|(\omega, \sigma, \cdot) \mapsto \psi_{\omega,\sigma}(D_a) \int_{S^{d-1}} \int_0^{\min(\sigma,1)} M_{\Psi_r(L) g} \cdot \varphi_\nu(D_a)^2 \Phi(\tau D_a) f \, d\tau \, d\nu\|_{L^p(T^{p,2})} \lesssim \int_{S^{d-1}} \|(\tau, \cdot) \mapsto \tau^{-\frac{sp}{2}} M_{\Psi_r(L) g} \cdot \varphi_\nu(D_a)^2 \Phi(\tau D_a) f\|_{T^{p,2}(\mathbb{R}^d)} \, d\nu.
$$

Applying Theorem 10.3, the above is bounded by a constant times

$$
\|(\tau, \cdot) \mapsto \tau^{-sp} \Psi_r(L) g\|_{T^{\infty,2}(\mathbb{R}^d)} \int_{S^{d-1}} \|(\tau, \cdot) \mapsto \tau^{-\frac{sp}{2}} \varphi_\nu(D_a)^2 \Phi(\tau D_a) f\|_{T^{\infty,2}(\mathbb{R}^d)} \, d\nu \lesssim \max_{m=1,2} \|L_m^p g\|_{BMO_{L_m}} \|f\|_{H^p_{FIO,a}(\mathbb{R}^d)},
$$

where we use \cite{16} Lemma 4.3., and Proposition 7.9 in the last line (together with the fact that $s_p \geq \frac{d-1}{2}$).

For the integral over $\tau \in (\min(\sigma,1), 1)$, we again have to use the product rule. With the same arguments as in the proof of Lemma 10.4 we end up with terms of the form

$$
\|(\tau, \cdot) \mapsto \tau^{-sp} \Psi_r(L) g\|_{T^{\infty,2}(\mathbb{R}^d)} \int_{S^{d-1}} \|(\tau, \cdot) \mapsto \tau^{-\frac{sp}{2}} (\tau^2 L)^{M-\frac{1}{2}} (\tau e_j, D_a)^{\frac{1}{2}} (\tau D_a)^{1-\delta} \varphi_\nu(D_a)^2 \Phi(\tau D_a)^2 f\|_{T^{\infty,2}(\mathbb{R}^d)} \, d\nu \lesssim \max_{m=1,2} \|L_m^p g\|_{BMO_{L_m}} \|f\|_{H^p_{FIO,a}(\mathbb{R}^d)},
$$

for $k \in \{0, \ldots, 2M\}$ even, and $\delta \in \{0, 1\}$ (and similar terms for $k$ odd, as in Lemma 10.4). \hfill \Box
