Abstract

This paper is concerned with traveling wave solutions of the following full parabolic Keller-Segel chemotaxis system with logistic source,

\[
\begin{aligned}
    u_t &= \Delta u - \chi \nabla \cdot (u \nabla v) + u(a-bu), \quad x \in \mathbb{R}^N \\
    \tau v_t &= \Delta v - \lambda v + \mu u, \quad x \in \mathbb{R}^N,
\end{aligned}
\]  

(0.1)

where \( \chi, \mu, \lambda, a, \) and \( b \) are positive numbers, and \( \tau \geq 0 \). Among others, it is proved that if \( b > 2\chi\mu \) and \( \tau \geq \frac{1}{2}(1 - \frac{\lambda}{a})_+ \), then for every \( c \geq 2\sqrt{\frac{a}{b}} \), (0.1) has a traveling wave solution \((u,v)(t,x) = (U^{\tau,c}(x \cdot \xi - ct), V^{\tau,c}(x \cdot \xi - ct)) \) (\( \forall \xi \in \mathbb{R}^N \)) connecting the two constant steady states \((0,0)\) and \((\frac{a}{b}, \frac{\mu}{\lambda})\), and there is no such solutions with speed \( c \) less than \( 2\sqrt{\frac{a}{b}} \), which improves considerably the results established in [30], and shows that (0.1) has a minimal wave speed \( c^*_0 = 2\sqrt{\frac{a}{b}} \), which is independent of the chemotaxis.

Key words. Full parabolic chemotaxis system, logistic source, traveling wave solution, minimal wave speed

1 Introduction

This work is concerned with traveling wave solutions of the following full parabolic chemotaxis system

\[
\begin{align*}
    u_t &= \Delta u - \chi \nabla \cdot (u \nabla v) + u(a - bu), \quad x \in \mathbb{R}^N \\
    \tau v_t &= \Delta v - \lambda v + \mu u, \quad x \in \mathbb{R}^N,
\end{align*}
\]  

(1.1)

where \( \chi, \mu, \lambda, a, \) and \( b \) are positive real numbers, \( \tau \) is a nonnegative real number, and \( u(t, x) \) and \( v(t, x) \) denote the concentration functions of some mobile species and chemical substance, respectively. Biologically, the positive constant \( \chi \) measures the sensitivity effect on the mobile species by the chemical substance which is produced over time by the mobile species; the reaction \( u(a - bu) \) in the first equation of (1.1) describes the local dynamics of the mobile species; \( \lambda \) represents the degradation rate of the chemical substance; and \( \mu \) is the rate at which the mobile species produces the chemical substance. The constant \( \frac{1}{\tau} \) in the case \( \tau > 0 \) measures the diffusion rate of the chemical substance, and the case that \( \tau = 0 \) is supposed to model the situation when the chemical substance diffuses very quickly.

System (1.1) is a simplified version of the chemotaxis system proposed by Keller and Segel in their works [18, 19]. Chemotaxis models describe the oriented movements of biological cells and organisms in response to certain chemical substances. These mathematical models play very important roles in a wide range of biological phenomena and accordingly a considerable literature is concerned with its mathematical analysis. The reader is referred to [11, 12] for some detailed introduction into the mathematics of Keller-Segel models.

One of the central problems about (1.1) is whether a positive solution blows up at a finite time. This problem has been studied in many papers in the case that \( a = b = 0 \) (see [11, 14, 16, 17, 25, 38, 39, 40]). It is shown that finite time blow-up may occur if either \( N = 2 \) and the total initial population mass is large enough, or \( N \geq 3 \). It is also shown that some radial solutions to (1.1) in plane collapse into a persistent Dirac-type singularity in the sense that a globally defined measure-valued solution exists which has a singular part beyond some finite time and asymptotically approaches a Dirac measure (see [23, 34]). We refer the reader to [2, 13] and the references therein for more insights in the studies of chemotaxis models.

When the constant \( a \) and \( b \) are positive, the finite time blow-up phenomena in (1.1) may be suppressed to some extent. In fact in this case, it is known that when the space dimension is equal to one or two, solutions to (1.1) on bounded domains with Neumann boundary conditions and initial functions in a space of certain integrable functions are defined for all time. And it is enough for the self limitation coefficient \( b \) to be big enough comparing to the chemotaxis sensitivity coefficient to prevent finite time blow-up, see [15, 31, 35].

Traveling wave solutions constitute another class of important solutions of (1.1). Observe that, when \( \chi = 0 \), the chemotaxis system (1.1) reduces to

\[
    u_t = \Delta u + u(a - bu), \quad x \in \mathbb{R}^N.
\]  

(1.2)

Due to the pioneering works of Fisher [7] and Kolmogorov, Petrowsky, Piskunov [20] on traveling wave solutions and take-over properties of (1.2), (1.2) is also referred to as the Fisher-KPP equation. The following results are well known about traveling wave solutions of (1.2). Equation (1.2) has traveling wave solutions of the form \( u(t, x) = \phi(x \cdot \xi - ct) \) (\( \xi \in S^{N-1} \)) connecting 0 and \( \frac{a}{b} \) \( (\phi(-\infty) = \frac{a}{b}, \phi(\infty) = 0) \) of all speeds \( c \geq 2\sqrt{a} \) and has no such traveling wave solutions.
of slower speed. \(c^*_0 = 2\sqrt{a}\) is therefore the minimal wave speed of traveling wave solutions of (1.2) connecting 0 and \(\frac{a}{b}\). Since the pioneering works by Fisher [7] and Kolmogorov, Petrovsky, Piscunov [20], a huge amount of research has been carried out toward the front propagation dynamics of reaction diffusion equations of the form,

\[ u_t = \Delta u + uf(t, x, u), \quad x \in \mathbb{R}^N, \]  

where \(f(t, x, u) < 0\) for \(u \gg 1\), \(\partial_u f(t, x, u) < 0\) for \(u \geq 0\) (see [11] 32 33 36 37 41, etc.).

In [30], the authors of the current paper studied the existence of traveling wave solutions of (1.1) connecting the two constant steady states \((0, 0)\) and \((\frac{a}{b}, \frac{\mu a}{b^2})\). Roughly, it is proved in [30] that, when the chemotaxis sensitivity \(\chi\) is small relative to the logistic damping \(b\), (1.1) has traveling wave solutions connecting \((0, 0)\) and \((\frac{a}{b}, \frac{\mu a}{b^2})\) with speed \(c\), which is bounded below by some constant \(c^* > c^*_0 = 2\sqrt{a}\) and is bounded above by some constant \(c^{**} < \infty\). But many fundamental questions remain open, for example, whether (1.1) has traveling wave solutions connecting \((0, 0)\) and \((\frac{a}{b}, \frac{\mu a}{b^2})\) with speed \(c \gg 1\); whether there is a minimal wave speed of traveling wave solutions of (1.1) connecting \((0, 0)\) and \((\frac{a}{b}, \frac{\mu a}{b^2})\), and if so, how the chemotaxis affects the minimal wave speed.

The objective of the current paper is to investigate those fundamental open questions. To state the main results of the current paper, we first introduce the definition of traveling wave solutions of (1.1) and the induced problems to be studied.

### 1.1 Traveling wave solutions and the induced problems

An entire solution of (1.1) is a classical solution \((u(t, x), v(t, x))\) of (1.1) which is defined for all \(x \in \mathbb{R}^N\) and \(t \in \mathbb{R}\). Note that the constant solutions \((u(t, x), v(t, x)) = (0, 0)\) and \((u(t, x), v(t, x)) = (\frac{a}{b}, \frac{\mu a}{b^2})\) are clearly two particular entire solutions of (1.1). An entire solution of (1.1) of the form \((u(t, x), v(t, x)) = (U^{r,c}(x \cdot \xi - ct), V^{r,c}(x \cdot \xi - ct))\) for some unit vector \(\xi \in \mathbb{S}^{N-1}\) and some constant \(c \in \mathbb{R}\) is called a traveling wave solution with speed \(c\). A traveling wave solution \((u(t, x), v(t, x)) = (U^{r,c}(x \cdot \xi - ct), V^{r,c}(x \cdot \xi - ct))\) \((\xi \in \mathbb{S}^{N-1})\) of (1.1) with speed \(c\) is said to connect \((0, 0)\) and \((\frac{a}{b}, \frac{\mu a}{b^2})\) if

\[
\liminf_{x \to -\infty} U^{r,c}(x) = \frac{a}{b} \quad \text{and} \quad \limsup_{x \to -\infty} U^{r,c}(x) = 0. \tag{1.4}
\]

We say that a traveling wave solution \((u(t, x), v(t, x)) = (U^{r,c}(x \cdot \xi - ct), V^{r,c}(x \cdot \xi - ct))\) of (1.1) is nontrivial and connects \((0, 0)\) at one end if

\[
\liminf_{x \to -\infty} U^{r,c}(x) > 0 \quad \text{and} \quad \limsup_{x \to -\infty} U^{r,c}(x) = 0. \tag{1.5}
\]

Observe that for given \(c \in \mathbb{R}\), a traveling solution \((u(t, x), v(t, x)) = (U^{r,c}(x \cdot \xi - ct), V^{r,c}(x \cdot \xi - ct))\) \((\xi \in \mathbb{S}^{N-1})\) of (1.1) with speed \(c\) connecting the states \((0, 0)\) and \((\frac{a}{b}, \frac{\mu a}{b^2})\) gives rise to a stationary solution \((u, v) = (U^{r,c}(x), V^{r,c}(x))\) of the parabolic-elliptic system

\[
\begin{cases}
 u_t = u_{xx} + ((c - \chi v_x)u)_x + (a - bu)u, & x \in \mathbb{R} \\
 0 = v_{xx} + \tau cv_x - \lambda v + \mu u, & x \in \mathbb{R}.
\end{cases} \tag{1.6}
\]

Connecting the states \((0, 0)\) and \((\frac{a}{b}, \frac{\mu a}{b^2})\).
Conversely, if \((u, v) = (U^{r,c}(x), V^{r,c}(x))\) is a stationary solution of (1.6) connecting the states \((0, 0)\) and \((\frac{\mu a}{\lambda b}, \frac{a}{\lambda b})\), then \((u(t, x), v(t, x)) = (U^{r,c}(x \cdot \xi - ct), V^{r,c}(x \cdot \xi - ct))\) is a traveling wave solution of (1.1) with speed \(c\) connecting the states \((0, 0)\) and \((\frac{\mu a}{\lambda b}, \frac{a}{\lambda b})\) for any \(\xi \in S^{N-1}\).

To study traveling wave solutions of (1.1) with speed \(c\) connecting the states \((0, 0)\) and \((\frac{\mu a}{\lambda b}, \frac{a}{\lambda b})\) is then equivalent to study stationary solutions of (1.6) connecting the states \((0, 0)\) and \((\frac{\mu a}{\lambda b}, \frac{a}{\lambda b})\).

It is clear that (1.6) is equivalent to

\[
\begin{align*}
  u_t & = u_{xx} + (c - \chi v_x)ux + (a - \chi v_{xx} - bu)u, \quad x \in \mathbb{R} \\
  0 & = v_{xx} + \tau cv_x - \lambda v + \mu u, \quad x \in \mathbb{R}.
\end{align*}
\]

Hence, to study traveling wave solutions of (1.1) connecting the states \((0, 0)\) and \((\frac{\mu a}{\lambda b}, \frac{a}{\lambda b})\) we shall study steady states solutions of (1.7) connecting the states \((0, 0)\) and \((\frac{\mu a}{\lambda b}, \frac{a}{\lambda b})\).

Before stating the main results of the current paper, we next recall some existing results on the existence of solutions of (1.7) with given initial functions and existence of steady states solutions of (1.7) or traveling wave solutions of (1.1) connecting the states \((0, 0)\) and \((\frac{\mu a}{\lambda b}, \frac{a}{\lambda b})\).

1.2 Existing results

Let

\[
C^{\text{unif}}_R = \{u \in C(\mathbb{R}) \mid u(x) \text{ is uniformly continuous in } x \in \mathbb{R} \text{ and } \sup_{x \in \mathbb{R}} |u(x)| < \infty \}
\]
equipped with the norm \(\|u\|_\infty = \sup_{x \in \mathbb{R}} |u(x)|\).

**Proposition 1.1** (Local existence). For every nonnegative initial function \(u_0 \in C^{\text{unif}}(\mathbb{R})\) and \(c \in \mathbb{R}\), there is a unique maximal time \(T_{\text{max}}(u_0)\), such that (1.7) has a unique classical solution \((u(t, x; u_0, c), v(t, x; u_0, c))\) defined for every \(x \in \mathbb{R}\) and \(0 \leq t < T_{\text{max}}(u_0)\) with \(u(0, x; u_0, c) = u_0(x)\). Moreover if \(T_{\text{max}}(u_0) < \infty\) then

\[
\lim_{t \to T_{\text{max}}(u_0)^-} \|u(t, \cdot; u_0, c)\|_\infty = \infty.
\]

The above proposition can proved by similar arguments as those in [31, Theorem 1.1]. The following proposition follows from the arguments of [30, Theorems A and B] (it is proved in [30, Theorems A and B] for the case that \(\lambda = \mu = 1\)).

**Proposition 1.2** (Global existence). Consider (1.7).

1. Assume that \(0 \leq \frac{\lambda \mu c}{2\sqrt{\lambda}} < b - \chi \mu\). Then for any \(u_0 \in C^{\text{unif}}_R\) with \(0 \leq u_0\), \(T_{\text{max}}(u_0) = \infty\). Moreover,

\[
\|u(t, \cdot; u_0, c)\|_\infty \leq \max\{\|u_0\|_\infty, \frac{a}{b - \chi \mu - \frac{\lambda \mu c}{2\sqrt{\lambda}}}\}
\]

for every \(t \geq 0\).

2. Assume that \(0 \leq \frac{\lambda \mu c}{\sqrt{\lambda}} < b - 2\chi \mu\). Then for any \(u_0 \in C^{\text{unif}}_R\) with \(\inf_{x \in \mathbb{R}} u_0(x) > 0\),

\[
\lim_{t \to \infty} \left[\|u(t, \cdot; u_0, c)\|_\infty - \frac{a}{b} + \|v(\cdot, t; u_0, c)\|_\infty - \frac{\mu a}{\lambda b} \|v(\cdot, t; u_0, c)\|_\infty\right] = 0.
\]
Proposition 1.3. (1) For every \( \tau > 0 \), there is \( 0 < \chi^* < \frac{1}{2\tau} \) such that for every \( 0 < \chi < \chi^* \), there exist two positive numbers \( 0 < c^*(\chi, \tau) < c^{**}(\chi, \tau) \) satisfying that for every \( c \in (c^*(\chi, \tau), c^{**}(\chi, \tau)) \), \( (1.1) \) has a traveling wave solution \((u, v) = (U(x \cdot \xi - ct), V(x \cdot \xi - ct))\) \((\forall \xi \in S^{N-1})\) connecting the constant solutions \((0, 0)\) and \((\frac{\theta}{\lambda}, \frac{\mu}{\lambda})\). Moreover,

\[
\lim_{\chi \to 0^+} c^{**}(\chi, \tau) = \infty,
\]

\[
\lim_{\chi \to 0^+} c^*(\chi, \tau) = \begin{cases} 2\sqrt{a} & \text{if } 0 < a \leq \frac{\lambda + \tau \alpha}{(1-\tau)_+} \\ \frac{\lambda + \tau \alpha}{(1-\tau)_+} + \frac{a(1-\tau)_+}{\lambda + \tau \alpha} & \text{if } a \geq \frac{\lambda + \tau \alpha}{(1-\tau)_+}, \end{cases}
\]

and

\[
\lim_{x \to \infty} \frac{U(x; \tau)}{e^{k x}} = 1,
\]

where \( k \) is the only solution of the equation \( k + \frac{\alpha}{\lambda} = c \) in the interval \((0, \min\{\sqrt{a}, \sqrt{\frac{\lambda + \tau \alpha}{(1-\tau)_+}}\})\).

(2) For any given \( \tau \geq 0 \) and \( \chi \geq 0 \), \( (1.1) \) has no traveling wave solutions \((u, v) = (U(x \cdot \xi - ct), V(x \cdot \xi - ct))\) \((\forall x \in S^{N-1})\) with \((U(-\infty), V(-\infty)) = (\frac{\theta}{\lambda}, \frac{\mu}{\lambda}), (U(\infty), V(\infty)) = (0, 0)\), and \( c < 2\sqrt{a} \).

As mentioned before, in the absence of chemotaxis (i.e. \( \chi = 0 \)), \( c^*_0 = 2\sqrt{a} \) is the minimal wave speed of the Fisher-KPP equation \((1.2)\). Both biologically and mathematically, it is interesting to know whether the results stated in Proposition 1.3(1) can be improved to the following: for any \( c \geq c^*_0 \), \( (1.1) \) has a traveling wave solution \((u(t,x), v(t,x)) = (U(x \cdot \xi - ct), V(x \cdot \xi - ct))\) \((\forall \xi \in S^{N-1})\) connecting \((\frac{\theta}{\lambda}, \frac{\mu}{\lambda})\) and \((0, 0)\), which implies that \( (1.1) \) has a minimal wave speed, and the chemotaxis does not affect the magnitude of the minimal wave speed.

Also, as mentioned before, the objective of the current paper is to investigate the above open problems or to improve the results obtained in \([30]\). Roughly, we will show that there is no upper bound for the speeds of traveling wave solutions of \((1.1)\) and under some natural conditions, \( c^*_0 = 2\sqrt{a} \) is the minimal wave speed of \((1.1)\). The precise statements of the main results are stated in next subsection.

1.3 The statements of the main results

In order to state our main results, we first introduce some notations. For given \( c \in \mathbb{R} \), let

\[
B_{\lambda, c, \tau} = \frac{1}{\sqrt{4\lambda + \tau^2 c^2}},
\]

\[
\lambda_1^c = \frac{(\tau c + \sqrt{4\lambda + \tau^2 c^2})}{2}, \quad \lambda_2^c = \frac{(\sqrt{4\lambda + \tau^2 c^2} - \tau c)}{2},
\]

and

\[
c_\kappa = \frac{\alpha + \kappa^2}{\kappa} \quad \forall \, 0 < \kappa < \sqrt{a}.
\]

Note that \( \lambda_2^c \) and \(-\lambda_1^c\) are the positive and negative roots of the quadratic equations

\[
m^2 + \tau cm - \lambda = 0.
\]
Note also that
\[ \lambda_1^c \lambda_2^c = \lambda, \quad \lambda_1^c + \lambda_2^c = \frac{1}{B_{\lambda,c,\tau}}. \] (1.8)

All the above quantities are defined for any \( \tau \geq 0 \).

Throughout this work, we shall always suppose that \( c > 0 \). This restriction is justified by the fact that (1.1) does not have a non-trivial traveling wave with speed \( c \leq 0 \) (see Proposition 1.3(2)).

Note that, by (1.8),
\[ \frac{\lambda_2^c B_{\lambda,c,\tau}}{\lambda_2 + \kappa} (\kappa - \lambda \lambda_2^c) \leq \lambda_2^c (\kappa - \lambda_2^c) (\kappa + \lambda_2^c) < 1. \] (1.9)

Hence the following quantity is well defined
\[ b^*_\tau = \sup \{ 1 + \frac{\lambda_2^c (\kappa - \lambda_2^c)}{\lambda_2 + \kappa} | 0 < \kappa < \sqrt{a} \}. \] (1.10)

It is clear that \( b^*_\tau \) is defined for all \( \tau \geq 0 \), \( b^*_\tau \leq 2 \) for all \( \tau \geq 0 \), and \( b^*_0 = 1 + \frac{(\sqrt{a} - \sqrt{\lambda})_+}{2(\sqrt{\lambda} + \sqrt{a})} \).

For the sake of simplicity in the statements of our results, let us introduce the following standing hypotheses.

(H1) \( b > \chi \mu \).

(H2) \( b > b^*_\tau \chi \mu \).

(H3) \( b > 2 \chi \mu \).

(H4) \( \tau \geq \frac{1}{2} (1 - \frac{\lambda}{a})_+ \).

Observe that (H3) implies (H2), and (H2) implies (H1).

The following results about the global existence of bounded classical solutions and the stability of the positive constant equilibria of (1.7) will be of great use in our arguments.

**Theorem 1.1.** For any \( \tau \geq 0 \) and \( c > 0 \), the following hold.

(i) If (H1) holds, then for every \( u_0 \in C^b_{\text{unif}}(\mathbb{R}) \), with \( u_0 \geq 0 \), (1.7) has a unique global classical solution \((u(t,x;u_0,c),v(t,x;u_0,c))\) on \((0,\infty) \times \mathbb{R}\) satisfying \( \lim_{t \to 0^+} \|u(0,\cdot;u_0,c)-u_0(\cdot)\|_\infty = 0 \). Moreover it holds that
\[ \|u(t,\cdot;u_0,c)\|_\infty \leq \max \left\{ \|u_0\|_\infty, \frac{a}{b - \chi \mu} \right\}, \quad t \geq 0. \] (1.11)

(ii) If (H3) holds, then for every \( u_0 \in C^b_{\text{unif}}(\mathbb{R}) \), with \( \inf_{x \in \mathbb{R}} u_0(x) > 0 \), we have that
\[ \lim_{t \to \infty} \left( \|u(t,\cdot;u_0,c) - \frac{a}{b}\|_\infty + \|v(t,\cdot;u_0,c) - \frac{a \mu}{b \lambda}\|_\infty \right) = 0. \] (1.12)

**Remark 1.1.** When \( \tau = 0 \), we recover [31, Theorems 1.5 & 1.8]. For \( \tau > 0 \), Theorem 1.1 improves the results stated in Proposition 1.2.
Observe that the function
\[(0, \sqrt{a}) \ni \kappa \mapsto \lambda_1^{c_\kappa} - \kappa\]
is strictly decreasing. Hence the quantity
\[
\kappa^*_\tau := \sup\{0 < \kappa < \sqrt{a} | \lambda_1^{c_\kappa} - \kappa \geq 0\}
\]
is well defined. It holds that
\[
\lambda_1^{c_\kappa} - \kappa > 0
\]
whenever \(0 < \kappa < \kappa^*_\tau\). Note also that
\[
\kappa^*_\tau = \min\left\{\sqrt{a}, \sqrt{\lambda + \tau a}\right\},
\]
Indeed, it holds that \(\lambda_1^{c_\kappa} > \sqrt{a}\) for every \(\tau \geq 1\). On the other hand, for \(0 \leq \tau < 1\), if \(\lambda_1^{c_\kappa} = \kappa\) for some \(0 < \kappa \leq \sqrt{a}\), then it holds that
\[
\lambda + \kappa \tau c_\kappa - \kappa^2 = 0 \iff \lambda + \tau a = (1 - \tau)\kappa^2, \quad \kappa = \sqrt{\frac{\lambda + \tau a}{1 - \tau}}.
\]
Hence (1.14) holds.

Let
\[
c^*(\tau) = \kappa^*_\tau + \frac{a}{\kappa^*_\tau}.
\]
Note that \(\kappa^*_\tau\) and \(c^*(\tau)\) are defined for all \(\tau \geq 0\), and
\[
\kappa^*_0 = \min\{\sqrt{\lambda}, \sqrt{a}\}, \quad c^*(0) = \min\{\sqrt{\lambda}, \sqrt{a}\} + \frac{a}{\min\{\sqrt{\lambda}, \sqrt{a}\}}.
\]
We have the following theorem on the existence of traveling wave solutions of (1.1).

**Theorem 1.2.** For any \(\tau \geq 0\), the following hold.

1. If (H2) holds, then for any \(c > c^*(\tau), \quad (1.1)\) has a nontrivial traveling wave solution 
\[(u, v)(t, x) = (U(x \cdot \xi - c_\kappa t), V(x \cdot \xi - c_\kappa t)) \ (\forall \xi \in S^{N-1})\] satisfying (1.5), where \(\kappa \in (0, \kappa^*_\tau)\) is such that \(c_\kappa = c\). Furthermore, it holds that
\[
\lim_{x \to \infty} U(x) e^{-\kappa x} = 1.
\]

If in addition, (H3) holds, then
\[
\lim_{x \to \infty} |U(x) - \frac{a}{b}| = 0.
\]

1. If (H2) and (H4) hold, then \(\kappa^*_\tau = \sqrt{a}\) and \(c^*(\tau) = 2\sqrt{a}\). Hence for any \(c > 2\sqrt{a}\), the results in (1) hold true.

1. Suppose that (H3) holds. Then (1.1) has a traveling wave solution 
\[(u, v)(t, x) = (U^{\tau,c}(x \cdot \xi - ct), V^{\tau,c}(x \cdot \xi - ct)) \ (\forall \xi \in S^{N-1})\] with speed \(c^*(\tau)\) connecting \((0, 0)\) and \((\frac{a}{b}, \frac{a}{b\lambda})\).
Remark 1.2. (1) Note that the conditions in Proposition 1.3 are $\chi < \chi_0^*$ and $b > 2\chi\mu$, which imply both (H2) and (H3). Hence the assumptions in Theorem 1.2(1) are weaker than those in Proposition 1.3 for the existence of traveling wave solutions. Note also that, by Theorem 1.2(4), the lower bound $c^*(\tau)$ for the wave speed is independent of $\chi$, and the upper bound is $\infty$. By the proof of [28, Theorem C], $\kappa_0^* = \min\{\sqrt{a}, \frac{\lambda + \tau a}{(1 - \tau)c}\}$ is an upper bound found for the decay rate of traveling wave solutions found in [28]. Hence $c^*(\chi, \tau) \geq c_0^* = c^*(\tau)$, that is, the lower bound provided in Theorem 1.2 for the wave speed of traveling wave solutions of (1.1) is not larger than that provided in Proposition 1.3. Moreover, under the assumptions (H2) and (H4), $c^*(\tau) = 2\sqrt{a} < c^*(\chi, \tau)$. Therefore Theorem 1.2 improves considerably Proposition 1.3.

(2) Recall that $b_0^* = 1 + \frac{(\sqrt{a} - \sqrt{\lambda})}{2(a + \sqrt{\lambda})}$, $\kappa_0^* = \min\{\sqrt{a}, \sqrt{\lambda}\}$, and $c^*(0) = \min\{\sqrt{a}, \sqrt{\lambda}\} + \frac{a}{\min\{\sqrt{a}, \sqrt{\lambda}\}}$. Hence Theorem 1.2 in the case $\tau = 0$ recovers [28, Theorem 1.4].

(3) When $\lambda \geq a$, $c^*(\tau) = c_0^* = 2\sqrt{a}$ for any $\tau \geq 0$. Hence if $\lambda \geq a$ and $0 < \chi\mu < \frac{b}{2}$ hold, by Theorem 1.2 for every $\tau \geq 0$ and $c \geq 2\sqrt{a}$, (1.1) has a traveling wave solution $(u, v)(t, x) = (U^{c^*\tau}, V^{c^*\tau})(x - ct)$ with speed $c$ connecting $(0, 0)$ and $(\frac{\lambda}{\beta}, \frac{a\mu}{\beta\lambda})$. Whence, if $\lambda \geq a$ and $0 < \chi < \frac{b}{2^\mu}$, Theorem 1.2 implies that $c_0^* = 2\sqrt{a}$ is the minimal wave speed of traveling wave solutions of (1.1) connecting $(0, 0)$ and $(\frac{\lambda}{\beta}, \frac{a\mu}{\beta\lambda})$, and that the chemotaxis does not affect the magnitude of the minimal wave speed of (1.1). Biologically, $\lambda \geq a$ means that the degradation rate $\lambda$ of the chemical substance is greater than the intrinsic growth rate $a$ of the mobile species, and $0 < \chi\mu < \frac{b}{2}$ indicates that the product of the chemotaxis sensitivity $\chi$ and the rate $\mu$ at which the mobile species produces the chemical substance is less than half of the logistic damping $b$.

(4) When $\lambda < a$, $c^*(\tau) = c_0^* = 2\sqrt{a}$ for $\tau > \frac{1}{2}(1 - \frac{1}{\lambda})$. Hence if $\lambda < a$ and $0 < \chi\mu < \frac{b}{2}$ hold, by Theorem 1.2 for every $\tau > \frac{1}{2}(1 - \frac{1}{\lambda})$ and $c \geq 2\sqrt{a}$, (1.1) has a traveling wave solution $(u, v)(t, x) = (U^{c^*\tau}, V^{c^*\tau})(x - ct)$ with speed $c$ connecting $(0, 0)$ and $(\frac{\lambda}{\beta}, \frac{a\mu}{\beta\lambda})$. Thus in this case, Theorem 1.2 also implies that $c_0^* = 2\sqrt{a}$ is the minimal wave speed of traveling wave solutions of (1.1) connecting $(0, 0)$ and $(\frac{\lambda}{\beta}, \frac{a\mu}{\beta\lambda})$, and that the chemotaxis does not affect the magnitude of the minimal wave speed of (1.1). Biologically, $\tau > \frac{1}{2}(1 - \frac{1}{\lambda})$ indicates that diffusion rate of the chemical substance is not big.

(5) By Theorem 1.2 it holds that $c^*(\tau) = 2\sqrt{a}$ whenever $\tau \geq \frac{1}{2}$ and (1.1) has a minimal wave speed, which is $c^*(\tau)$. When $\lambda < a$ and $0 \leq \tau < \frac{1}{2}$, it remains open whether (1.1) has a minimal wave speed, and if so, whether the minimal wave speed equals $2\sqrt{a}$. It would be interesting to study the stability of the traveling wave solutions of (1.1). When $\tau = 0$, the spreading speeds of solutions of (1.1) with compactly supported initial functions are studied in [28]. It would be also interesting to study these spreading results when $\tau > 0$, which we plan to carry out in our future work.

The rest of the paper is organized as follow. In Section 2, we prove some preliminaries results to use in the subsequent sections. Section 3 is devoted to the proof of Theorem 1.1 while the proof of Theorem 1.2 will be presented in Section 4.
2 Preliminary lemmas

In this section, we prove some lemmas to be used in the proofs of the main results in the later sections. Throughout of this section, we assume $\tau \geq 0$.

For every $u \in C^b_{\text{uni}}(\mathbb{R})$ and $c \in \mathbb{R}$, let

$$\Psi(x; u, c, \tau) = \mu \int_0^\infty \int_{\mathbb{R}} e^{-\lambda s} e^{-\frac{|x + \tau c - y|^2}{4s}} u(y) dy ds.$$  \hspace{1cm} (2.1)

It is well known that $\Psi(x; u, c, \tau) \in C^2_{\text{uni}}(\mathbb{R})$ and solves the elliptic equation

$$\frac{d^2}{dx^2} \Psi(x; u, c, \tau) + \tau \frac{d}{dx} \Psi(x; u, c, \tau) - \lambda \Psi(x; u, c, \tau) + \mu u = 0.$$  

**Lemma 2.1.** It holds that

$$\Psi(x; u, c, \tau) = \mu B_{\chi, c, \tau} \int_{-\infty}^{\infty} e^{-\lambda_1^2 x} y u(y) dy + e^{\lambda_1 x} \int_{x}^{\infty} e^{-\lambda_2 y} u(y) dy,$$  \hspace{1cm} (2.2)

and

$$\frac{d}{dx} \Psi(x; u, c, \tau) = \mu B_{\chi, c, \tau} \left( - \lambda_1^2 e^{-\lambda_1^2 x} \int_{-\infty}^{x} e^{\lambda_1 y} u(y) dy + \lambda_1^2 e^{\lambda_1 x} \int_{x}^{\infty} e^{-\lambda_2 y} u(y) dy \right).$$  \hspace{1cm} (2.3)

**Proof.** For the case that $\tau = 0$, the lemma is proved in [28, Lemma 2.1].

In the following, we prove the case that $\tau > 0$. Observe that it is enough to prove the result for $\tau = 1$. The general case follows by replacing $c$ by $\tau c$. So, without loss of generality, we set $\tau = 1$. First, observe that the following identity holds,

$$\int_0^\infty e^{-\frac{z^2}{4\pi s}} ds = \frac{e^{-\beta}}{2}, \hspace{1cm} \forall \beta > 0.$$  \hspace{1cm} (2.4)

Next using Fubini’s Theorem, one can exchange the order of integration in (2.1) to obtain

$$\Psi(x; u, c, 1) = \mu \int_0^\infty \int_{\mathbb{R}} e^{-\lambda s} e^{-\frac{|x + \tau c - y|^2}{4s}} u(y) dy ds$$

$$= \mu \int_{\mathbb{R}} \left[ \int_0^\infty e^{-\frac{|x + \tau c - y|^2}{4s} - \lambda s} ds \right] u(y) dy$$

$$= \int_{\mathbb{R}} e^{\frac{(x-y)^2}{2}} \left[ \int_0^\infty e^{-\frac{(x-y)^2}{4s} - \frac{\lambda(c^2 + 4\lambda x^2)}{4}} ds \right] u(y) dy$$  \hspace{1cm} (2.5)

By the change of variable $z = \frac{(4\lambda + c^2)^2}{4}$ and taking $\beta = \frac{\sqrt{4\lambda + c^2}}{2} |x - y|$, it follows from (2.4) that

$$\int_0^\infty e^{-\frac{(x-y)^2}{4s} - \frac{\lambda(c^2 + 4\lambda x^2)}{4}} ds = \frac{2}{\sqrt{4\lambda + c^2}} \int_0^\infty e^{-\frac{\beta^2}{4z}} dz = \frac{1}{\sqrt{4\lambda + c^2}} e^{-\frac{\sqrt{4\lambda + c^2}|x-y|}{2}}.$$
This together with (2.5) implies that
\[
\Psi(x; u, c, 1) = \frac{\mu}{\sqrt{4\lambda + c^2}} \int_{\mathbb{R}} e^{-\sqrt{4\lambda + c^2} |x-y| - c(x-y)} u(y) dy.
\]
Thus (2.2) holds. Note that (2.3) then follows from a direction calculation. \( \square \)

**Lemma 2.2.** For every \( u \in C^b_{\text{unif}}(\mathbb{R}) \), \( u(x) \geq 0 \), it holds that
\[
\frac{d}{dx} \Psi(x; u, c, \tau) \leq \lambda_1 \Psi(x; u, c, \tau), \quad \forall x \in \mathbb{R}, \; c \in \mathbb{R}.
\] (2.6)
Furthermore, it holds that
\[
\chi \kappa \Psi_x(\cdot; u, c, \tau) - \chi \Psi_{xx}(\cdot; u, c, \tau) \leq \chi \mu \left( \frac{B_{\lambda, c, \tau}((\tau c + \kappa)\lambda_2 - \lambda)}{\lambda_2 + \kappa} + 1 \right) M e^{-\kappa x}
\] (2.7)
whenever \( 0 \leq u(x) \leq M e^{-\kappa x} \) for some \( \kappa \geq 0 \) and \( M > 0 \).
In particular, if
\[
\chi \mu \left( \frac{B_{\lambda, c, \tau}((\tau c + \kappa)\lambda_2 - \lambda)}{\lambda_2 + \kappa} + 1 \right) \leq b,
\] (2.8)
holds, then
\[
\chi \kappa \Psi_x(x; u, c, \tau) - \chi \Psi_{xx}(x; u, c, \tau) - be^{-\kappa x} \leq 0, \quad \forall x \in \mathbb{R},
\] (2.9)
whenever \( 0 \leq u(x) \leq e^{-\kappa x} \) for some positive real numbers \( \kappa > 0 \) and \( M > 0 \).

**Proof.** For the case that \( \tau = 0 \), the lemma is proved in [28, Lemma 2.2]. In the following, we prove the lemma for any \( \tau \geq 0 \).

First, by (2.2) and (2.3), we have
\[
\frac{d}{dx} \Psi(x; u, c, \tau) \leq \frac{\sqrt{4\lambda + \tau^2c^2 + \tau c}}{2} \Psi(x; u, c, \tau).
\]
This implies (2.6).

Next, we prove (2.9). It follows from (2.1) and (2.3) that
\[
\chi \kappa \Psi_x(x; u, c, \tau) - \chi \Psi_{xx}(x; u, c, \tau) = \chi \kappa \Psi_x(x; u, c, \tau) - \chi (\lambda \Psi(x; u, c, \tau) - \tau c \Psi_x(x; u, c, \tau) - \mu u)
\]
\[
= \chi (\tau c + \kappa) \Psi_x(x; u, c, \tau) - \chi \lambda \Psi(x; u, c, \tau) + \chi \mu u
\]
\[
= - \chi \mu B_{\lambda, c, \tau} ((\tau c + \kappa)\lambda_1 + \lambda) e^{-\lambda_1 x} \int_{-\infty}^{x} e^{\lambda_1 y} u(y) dy
\]
\[
+ \chi \mu B_{\lambda, c, \tau} ((\tau c + \kappa)\lambda_2 + \lambda) e^{\lambda_2 x} \int_{x}^{\infty} e^{-\lambda_2 y} u(y) dy + \chi \mu u.
\] (2.10)
Hence, since \( 0 \leq u \leq M e^{-\kappa x} \), it follows that
\[
\chi (\kappa \Psi_x(x; u, c, \tau) - \Psi_{xx}(x; u, c, \tau)) \leq \chi \mu B_{\lambda, c, \tau} ((\tau c + \kappa)\lambda_2 + \lambda) + M e^{\lambda_2 x} \int_{x}^{\infty} e^{-\lambda_2 y} u(y) dy + \chi \mu M e^{-\kappa x}
\]
\[
= \chi \mu \left( \frac{B_{\lambda, c, \tau}((\tau c + \kappa)\lambda_2 + \lambda)}{\lambda_2 + \kappa} + 1 \right) M e^{-\kappa x}
\]
Hence, (2.7) follows. \( \square \)
Remark 2.1. Observe that
\[
\tau c\lambda_2^c - \lambda = \frac{\tau c}{2} \left( \sqrt{4\lambda + \tau^2c^2} - \tau c \right) - \lambda
\]
\[
= \frac{2\lambda\tau c}{\sqrt{4\lambda + \tau^2c^2} + \tau c} - \lambda
\]
\[
= -\frac{\lambda\lambda_2^c}{\lambda_1^c} < 0.
\] (2.11)

Hence
\[
\frac{B_{\lambda,c,\tau}(\tau c\lambda_2^c - \lambda)}{\lambda_2^c} = 0,
\]
and
\[
\frac{B_{\lambda,c,\tau}}{\lambda_2^c + \kappa} \left( (\tau c + \kappa)\lambda_2^c - \lambda \right) = \frac{\lambda_2^c B_{\lambda,c,\tau}}{\lambda_2^c + \kappa} \left( \kappa - \frac{\lambda}{\lambda_1^c} \right) +
\] (2.12)

These identities will be frequently used later.

For every \(0 < \kappa < \bar{\kappa} < \sqrt{a}\) with \(\bar{\kappa} < 2\kappa\) and \(M, D \geq 1\), consider the functions \(\varphi_{\kappa}(x), U_{\kappa,D}(x), \) and \(\underline{U}_{\kappa,D}(x)\) given by
\[
\varphi_{\kappa}(x) = e^{-\kappa x},
\]
\[
U_{D}(x) = \varphi_{\kappa}(x) - D\varphi_{\bar{\kappa}}(x), \quad x \in \mathbb{R},
\] (2.13)
\[
\underline{U}_{\kappa,M}(x) = \min\{M, \varphi_{\kappa}(x)\},
\] (2.14)
and
\[
\underline{U}_{\kappa,D}(x) = \begin{cases} 
\varphi_{\kappa}(x) - D\varphi_{\bar{\kappa}}(x), & x \geq \underline{x}_{\kappa,D} \\
\varphi_{\kappa}(x_{\kappa,D}) - D\varphi_{\bar{\kappa}}(x_{\kappa,D}), & x \leq \underline{x}_{\kappa,D},
\end{cases}
\] (2.15)
where \(\underline{x}_{\kappa,D}\) satisfies
\[
\max\{\varphi_{\kappa}(x) - D\varphi_{\bar{\kappa}}(x) \mid x \in \mathbb{R}\} = \varphi_{\kappa}(\underline{x}_{\kappa,D}) - D\varphi_{\bar{\kappa}}(\underline{x}_{\kappa,D}).
\] (2.16)

Letting \(x_{\kappa,D} := \ln(D) / (\kappa - \bar{\kappa})\), there holds that
\[
U_{D}(x) \begin{cases} 
> 0 & \text{if } x > \underline{x}_{\kappa,D}, \\
< 0 & \text{if } x < \underline{x}_{\kappa,D}.
\end{cases}
\]

For every \(u \in C^b_{\text{unif}}(\mathbb{R})\), let
\[
A_{u,c}(U) = U_{xx} + (c - \chi_{\Psi}(\cdot; u, c, \tau))U_x + (a - \chi_{\Psi_{xx}}(\cdot; u, c, \tau) - bU)U.
\] (2.17)

Lemma 2.3. For given \(\tau \geq 0\), assume that \((H2)\) holds and \(\kappa < \kappa^*_\tau\). Then there is \(D^* > 1\) such that for every \(D \geq D^*, M > 0\), and
\[
u \in \tilde{\mathcal{E}} := \{u \in C^b_{\text{unif}}(\mathbb{R}) \mid \max\{|U_{D}(x), 0\} \leq u(x) \leq \min\{M, \varphi_{\kappa}(x)\} \quad \forall \ x \in \mathbb{R}\}
\]
it holds that
\[
A_{u,c}(U_{D}) \geq 0 \quad \forall x \in (\underline{x}_{\kappa,D}, \infty).
\] (2.18)
Proof. We first note that (H2) implies \( \frac{2}{\kappa} \), and \( \kappa < \kappa^* \) implies
\[
\lambda_i^{c_\kappa} > \kappa. \tag{2.19}
\]

Let \( u \in \check{\mathcal{E}} \) be given and \( U^-(x) = U_D^-(x) \). Then
\[
\mathcal{A}_{u,c_\kappa}(U^-) = U^+ - (c_\kappa - \chi \Psi_x(-;u,c_\kappa))U^- + (a - \chi \Psi_x - bU^-)U^-
= (\kappa^2 e^{-\kappa x} - \kappa^2 D e^{-\kappa x}) + (c_\kappa - \chi \Psi_x)(-\kappa e^{-\kappa x} + \kappa D e^{-\kappa x}) + a(e^{-\kappa x} - D e^{-\kappa x})
- (\chi \Psi_x + bU^-)U^-
= D(\kappa c_\kappa - \kappa^2 - a)e^{-\kappa x} - \chi \Psi_x(-\kappa e^{-\kappa x} + \kappa D e^{-\kappa x}) - (\chi \lambda \Psi - \lambda \mu u - \tau c_\kappa \Psi_x + bU^-)U^-
= DA_\kappa e^{-\kappa x} - \chi \Psi_x(-\kappa e^{-\kappa x} + \kappa D e^{-\kappa x}) - (\chi \lambda \Psi - \kappa \mu - \tau c_\kappa \Psi_x + bU^-)U^-
\geq DA_\kappa e^{-\kappa x} + \chi \Psi_x(\kappa e^{-\kappa x} - \kappa D e^{-\kappa x}) + (\chi \lambda \Psi - \kappa \mu - \tau c_\kappa \Psi_x - (b - \chi \mu)U^-)U^-
\]
where \( \mathcal{A}_\kappa : = \kappa c_\kappa - \kappa^2 - a \). Next, observe that since \( \lambda_1^{c_\kappa} > \kappa \), it holds that
\[
\mathcal{I}_1 = \mu \lambda_1^{c_\kappa} e^{-\lambda_1^{c_\kappa} x} \int_{-\infty}^{x} e^{\lambda_1^{c_\kappa} y} u(y)dy + \lambda_2^{c_\kappa} e^{\lambda_2^{c_\kappa} x} \int_{-\infty}^{x} e^{-\lambda_2^{c_\kappa} x} u(y) \end{equation}
\geq - \mu \lambda_1^{c_\kappa} e^{-(\lambda_1^{c_\kappa} + \kappa)x} \int_{-\infty}^{x} e^{\lambda_1^{c_\kappa} y} u(y)dy + \lambda_2^{c_\kappa} e^{(\lambda_2^{c_\kappa} - \kappa)x} \int_{-\infty}^{x} e^{-\lambda_2^{c_\kappa} x} u(y)dy
\geq - \mu \lambda_1^{c_\kappa} e^{-(\lambda_1^{c_\kappa} + \kappa)x} \int_{-\infty}^{x} e^{\lambda_1^{c_\kappa} y} e^{-\kappa y} dy + \lambda_2^{c_\kappa} e^{(\lambda_2^{c_\kappa} - \kappa)x} \int_{-\infty}^{x} e^{-\lambda_2^{c_\kappa} y} e^{-\kappa y} dy
= - \mu \lambda_1^{c_\kappa} \left( \frac{\kappa \lambda_1^{c_\kappa}}{\lambda_1^{c_\kappa} - \kappa} \right) e^{-(2\kappa - \kappa)x} + \lambda_2^{c_\kappa} e^{(\lambda_2^{c_\kappa} - \kappa)x} e^{-\kappa x}
\]
and
\[
\mathcal{I}_2 = \chi \mu \lambda_1^{c_\kappa} e^{-(\lambda_1^{c_\kappa} + \kappa)x} \int_{-\infty}^{x} e^{\lambda_1^{c_\kappa} y} u(y)dy + (\tau c_\kappa - \lambda) \lambda_2^{c_\kappa} e^{\lambda_2^{c_\kappa} x} \int_{-\infty}^{x} e^{-\lambda_2^{c_\kappa} y} u(y)dy
- (b - \chi \mu) e^{-2\kappa x} - DU^-(x) e^{-\kappa x} - D e^{-(\kappa + \kappa)x}
\geq - \chi \mu \lambda_1^{c_\kappa} e^{-(\lambda_1^{c_\kappa} + \kappa)x} \int_{-\infty}^{x} e^{\lambda_1^{c_\kappa} y} u(y)dy + (\tau c_\kappa - \lambda) \lambda_2^{c_\kappa} e^{(\lambda_2^{c_\kappa} - \kappa)x} \int_{-\infty}^{x} e^{-\lambda_2^{c_\kappa} y} u(y)dy
- (b - \chi \mu) e^{-2\kappa x} - D e^{-(\kappa + \kappa)x}
\geq - \chi \mu \lambda_1^{c_\kappa} e^{-(\lambda_1^{c_\kappa} + \kappa)x} \int_{-\infty}^{x} e^{\lambda_1^{c_\kappa} y} e^{-\kappa y} dy + (\tau c_\kappa - \lambda) \lambda_2^{c_\kappa} e^{(\lambda_2^{c_\kappa} - \kappa)x} \int_{-\infty}^{x} e^{-\lambda_2^{c_\kappa} y} e^{-\kappa y} dy
- (b - \chi \mu) e^{-2\kappa x} - D e^{-(\kappa + \kappa)x}
\geq - \chi \mu \lambda_1^{c_\kappa} e^{-2\kappa x} - D e^{-(\kappa + \kappa)x}
= - \chi \mu \lambda_1^{c_\kappa} e^{-2\kappa x} - D e^{-(\kappa + \kappa)x}
\]
Thus, with \( D > 1 \), \( 0 < \kappa_1 := 2\kappa - \kappa < \kappa \), and \( x > \frac{2\kappa}{\kappa + D} > 0 \), it holds that
\[
\mathcal{A}(U^-) \geq DA_\kappa - \left( \chi \mu \lambda_1^{c_\kappa} \left( \frac{\kappa + (\tau c_\kappa + \lambda) \lambda_1^{c_\kappa}}{\lambda_1^{c_\kappa} - \kappa} + \frac{\kappa D + (\tau c_\kappa - \lambda) \lambda_2^{c_\kappa}}{\lambda_2^{c_\kappa} + \kappa} \right) e^{-2\kappa x} - (b - \chi \mu) \right) e^{-\kappa x}. 
\]
Setting \( \tilde{\kappa} = \kappa + \eta \), we have \( A_\kappa > 0 \),
\[
e^{-\kappa_1 x_\kappa_D} = e^{-\frac{(\kappa - \eta)}{\eta} \ln(D)} = \frac{1}{D^{\frac{\kappa}{\eta}}},
\]
Therefore, for \( 0 < \eta < \min\{ \frac{\kappa}{2}, \sqrt{a - \kappa} \} \), it holds that
\[
\kappa < \tilde{\kappa} = \kappa + \eta < \min\{ 2\kappa, \sqrt{a} \},
\]
and
\[
\lim_{D \to \infty} \left( D A_\kappa - \left[ \chi \mu B_{\lambda, c, \tau} \left( \frac{(\kappa + D(c + \lambda))\lambda_1}{\lambda_1 - \kappa} + \frac{(\tilde{\kappa} D + (c - \lambda)\lambda_2)}{\lambda_2 + \kappa} \right) + (b - \chi \mu) \right] e^{-\kappa_1 x_\kappa_D} \right) = \infty.
\]
Therefore, there is \( D^* > 1 \) such that (2.18) holds for every \( D \geq D^* \) and \( u \in \tilde{\mathcal{E}} \).

3 Proof of Theorem 1.1

In this section, we prove Theorem 1.1.

Proof of Theorem 1.1. (1) Let \((u(t, x; u_0, c), v(t, x; u_0, c))\) be defined on \([0, T_{\text{max}}]\). Note by Proposition 1.1 that in order to show that \( T_{\text{max}} = \infty \), it is enough the prove that (1.11) holds. For every \( T \in (0, T_{\text{max}}) \) let \( M_T := \sup_{0 \leq t \leq T} \| u(t, \cdot; u_0, c) \|_\infty \). With \( \kappa = 0 \) and \( M = M_T \), it follows from (2.7) that
\[
 u_t \leq u_{xx} + (c - \chi v_x)u_x + \left( a + \chi \mu \left( \frac{B_{\lambda, c, \tau}(\tau c \lambda_2 - \lambda)_+}{\lambda_2} + 1 \right) M_T - bu \right) u, \quad 0 < t < T
\]
Hence, by comparison principle for parabolic equations, it holds that
\[
\|u(t, \cdot; u_0, c)\|_\infty \leq \max \left\{ \|u_0\|_\infty, \frac{a + \chi \mu \left( \frac{B_{\lambda, c, \tau}(\tau c \lambda_2 - \lambda)_+}{\lambda_2} + 1 \right) M_T}{b} \right\}, \quad \forall \ t \in [0, T],
\]
Hence, if \( M_T > \|u_0\|_\infty \), we must have
\[
M_T \leq \frac{a + \chi \mu \left( \frac{B_{\lambda, c, \tau}(\tau c \lambda_2 - \lambda)_+}{\lambda_2} + 1 \right) M_T}{b}.
\]
By (2.11), \((\tau c \lambda_2 - \lambda)_+ = 0\). Hence
\[
M_T \leq \frac{a}{b - \chi \mu}.
\]
Thus, it holds that
\[
M_T \leq \max \left\{ \|u_0\|_\infty, \frac{a}{b - \chi \mu} \right\}, \quad 0 < T < T_{\text{max}}.
\]
Which yield that \( T_{\text{max}} = \infty \), and by Remark 2.1 we conclude that (1.11) holds.

(2) We show that (1.12) holds. We follow the ideas of the proof of [31, Theorem 1.8].
Let
\[
\overline{\mu} = \lim \sup \| u(t, \cdot; u_0, c) \| \infty \quad \text{and} \quad \underline{\mu} := \lim \inf \inf \limits_{t \to \infty} u(t, x; u_0, c).
\]
Since \( \inf_{x \in \mathbb{R}} u_0(x) > 0 \), it follows from the arguments of [29, Theorem 1.2 (i)] that

\[
0 < \underline{\mu} \leq \overline{\mu} < \infty.
\]

It suffices to prove that

\[
\underline{\mu} = \bar{u} = \frac{a}{b}.
\quad (3.1)
\]

To this end, for every \( T > 0 \), let

\[
\overline{\mu}_T := \sup \sup \limits_{t \geq T} u(t, x; u_0, c) \quad \text{and} \quad \underline{\mu}_T := \inf \inf \limits_{t \geq T} u(t, x; u_0, c).
\]

Let

\[
\mathcal{L}(u) = u_{xx} + (c - \chi v_x) u_x.
\]

By (2.10) (with \( \kappa = 0 \)), for every \( t \geq T \) and \( x \in \mathbb{R} \), there holds

\[
u_t \leq \mathcal{L}(u) + \left( a - \chi \mu B_{\lambda, c, \tau} (\tau c \lambda_1^2 + \lambda) e^{-\lambda x} \int_{-\infty}^{\infty} e^{\lambda y} u_T dy - (b - \chi \mu) u \right) u
\]

\[+ \chi \mu B_{\lambda, c, \tau} \left( (\tau c \lambda_2^2 - \lambda) + e^{\lambda x} \int_{-\infty}^{\infty} e^{-\lambda y} u_T dy - (\tau c \lambda_2^2 - \lambda) - e^{\lambda x} \int_{x}^{\infty} e^{-\lambda y} u_T dy \right) u
\]

\[= \mathcal{L}(u) + \left( a + \chi \mu B_{\lambda, c, \tau} \left( - (\tau c + \frac{\lambda}{\lambda_1^2}) \underline{\mu}_T + (\tau c - \frac{\lambda}{\lambda_1^2}) \underline{\mu}_T - (\tau c - \frac{\lambda}{\lambda_2^2}) \underline{\mu}_T \right) - (b - \chi \mu) u \right) u.
\]

Hence, by comparison principle for parabolic equations, it holds that

\[
(b - \chi \mu) \overline{\mu} \leq a + \chi \mu B_{\lambda, c, \tau} \left( - \frac{\tau c \lambda_1^2 + \lambda}{\lambda_1^2} \overline{\mu} + \frac{\tau c \lambda_2^2 - \lambda}{\lambda_2^2} \overline{\mu} - \frac{\tau c \lambda_2^2 - \lambda}{\lambda_2^2} \overline{\mu} \right).
\quad (3.2)
\]

Similarly, from (2.10) (with \( \kappa = 0 \)) it follows for every \( t \geq T \) and \( x \in \mathbb{R} \) that

\[
u_t \geq \mathcal{L}(u) + \left( a - \chi \mu B_{\lambda, c, \tau} (\tau c \lambda_1^2 + \lambda) e^{-\lambda x} \int_{-\infty}^{\infty} e^{\lambda y} u_T dy - (b - \chi \mu) u \right) u
\]

\[+ \chi \mu B_{\lambda, c, \tau} \left( (\tau c \lambda_2^2 - \lambda) + e^{\lambda x} \int_{-\infty}^{\infty} e^{-\lambda y} u_T dy - (\tau c \lambda_2^2 - \lambda) - e^{\lambda x} \int_{x}^{\infty} e^{-\lambda y} u_T dy \right) u
\]

\[= \mathcal{L}(u) + \left( a + \chi \mu B_{\lambda, c, \tau} \left( - (\tau c + \frac{\lambda}{\lambda_1^2}) \overline{\mu}_T + (\tau c - \frac{\lambda}{\lambda_1^2}) \overline{\mu}_T - (\tau c - \frac{\lambda}{\lambda_2^2}) \overline{\mu}_T \right) - (b - \chi \mu) u \right) u.
\]

Hence, by comparison principle for parabolic equations, it holds that

\[
(b - \chi \mu) \overline{\mu} \geq a + \chi \mu B_{\lambda, c, \tau} \left( - (\tau c + \frac{\lambda}{\lambda_1^2}) \overline{\mu}_T + (\tau c - \frac{\lambda}{\lambda_1^2}) \overline{\mu}_T - (\tau c - \frac{\lambda}{\lambda_2^2}) \overline{\mu}_T \right).
\]
Letting \( T \to \infty \), we obtain that

\[
(b - \chi \mu) \overline{u} \geq a + \chi \mu B_{\lambda, c, \tau} \left( - \frac{(\tau c \lambda_1^c + \lambda)}{\lambda_1^c} \overline{u} + \frac{(\tau c \lambda_2^c - \lambda)}{\lambda_2^c} \overline{u} - \frac{(\tau c \lambda_2^c - \lambda)}{\lambda_2^c} \overline{u} \right). \tag{3.3}
\]

Since \((\tau c \lambda_2^c - \lambda) \geq 0\) by (2.11), by adding side-by-side inequalities (2.10) and (3.2), we obtain

\[
(b - \chi \mu)(\overline{u} - \overline{u}) \leq \chi \mu B_{\lambda, c, \tau} \left( \frac{\lambda}{\lambda_1^c} \overline{u} + \frac{\lambda}{\lambda_2^c} \overline{u} \right).
\]

By (2.12), \( B_{\lambda, c, \tau} \left( \frac{\lambda}{\lambda_1^c} + \frac{\lambda}{\lambda_2^c} \right) = 1 \). Thus, since (H3) holds, we conclude that \( \overline{u} = \overline{u} \). By (2.11), (3.2), and (3.3),

\[
(b - \chi \mu) \overline{u} = a + \chi \mu B_{\lambda, c, \tau} \left( - \frac{(\tau c \lambda_1^c + \lambda)}{\lambda_1^c} \overline{u} + \frac{(\tau c \lambda_2^c - \lambda)}{\lambda_2^c} \overline{u} \right)
\]

This implies (3.1) and (2) thus follows. \( \Box \)

4 Proof of Theorem 1.2

In this section, following the techniques developed in \[30\], we present the proof of Theorem 1.2. Without loss of generality, we assume that \( N = 1 \) in (1.1).

Through this section we suppose that (H2) holds and \( 0 < \kappa < \kappa^*_x \). We choose \( 0 < \eta < \min\{2\kappa, \sqrt{a - \kappa}\} \) and set \( \kappa = \kappa + \eta \) and \( M = \frac{a}{b - \chi \mu} \). We fix a constant \( D \geq D^* \), where \( D^* \) is given by Lemma 2.15. Define

\[ E := \{ u \in C^0(\mathbb{R}) : \underline{U}_{\kappa,D} \leq u \leq \overline{U}_{\kappa,M} \} \]

where \( \underline{U}_{\kappa,M} \) and \( \overline{U}_{\kappa,D} \) are given by (2.14) and (2.15) respectively. For every \( u \in E \), we let \( U(t, x; u) \) denote the solution of the parabolic equation

\[
\begin{cases}
U_t = A_{u,c_k}(U), & x \in \mathbb{R}, t > 0 \\
U(0, x) = \underline{U}_{\kappa,M}, & x \in \mathbb{R}.
\end{cases} \tag{4.1}
\]

The following result holds.

**Lemma 4.1.** \( (i) \) For every \( u \in \tilde{E} \), the function \( U(t, x) \equiv M \) satisfies \( A_{u,c_k}(U) \leq 0 \) on \( \mathbb{R} \times \mathbb{R} \).

\( (ii) \) For every \( u \in \tilde{E} \), the function \( U(t, x) = e^{-\kappa x} \) satisfies \( A_{u,c_k}(U) \leq 0 \) on \( \mathbb{R} \times \mathbb{R} \).

\( (iii) \) For every \( u \in \tilde{E} \), the function \( U(t, x) = U_D^- \), where \( U_D^- \) is given by (2.13), satisfies \( A_{u,c_k}(U) \geq 0 \) on \( \mathbb{R} \times (\underline{U}_{\kappa,D}, \infty) \).

\( (iv) \) Suppose that (H3) holds. There \( 0 < \delta \ll 1 \) such that for every \( u \in \tilde{E} \), the function \( U(t, x) = \delta \) satisfies \( A_{u,c_k}(U) \geq 0 \) on \( \mathbb{R} \times \mathbb{R} \).

**Proof.** Using Lemmas 2.2 and 2.3, the results follow. \( \Box \)
Proof of Theorem 1.2. (1) Thanks to Lemma 4.1 for \( D \gg D^\ast \), it follows by comparison principle for parabolic equations that
\[
U(t_2, x; u) < U(t_1, x; u), \quad \forall \ x \in \mathbb{R}, 0 \leq t_1 < t_2, \forall u \in \tilde{E}.
\]
Hence the function
\[
U(x; u) = \lim_{t \to \infty} U(t, x; u, c_\kappa), \quad u \in \tilde{E}
\]
is well defined. Moreover, by estimates for parabolic equations, it follows that
\[
U_{xx} + (c_\kappa - \Psi_x(\cdot; u, c_\kappa))U_x + (a - \chi \Psi_{xx}(\cdot; u, c_\kappa) - bU)U = 0, \quad x \in \mathbb{R},
\]
and
\[
U(\cdot; u, c_\kappa) \in \tilde{E} \quad \forall u \in \tilde{E}.
\]
Next we endow \( \tilde{E} \) with the compact open topology. From this point, it follows from the arguments of the proof of [30, Theorem 4.1] that the function
\[
\tilde{E} \ni u \mapsto U(\cdot; u, c_\kappa) \in \tilde{E}
\]
is compact and continuous. Hence, by the Schauder’s fixed point theorem, it has a fixed point, say \( u^* \). Clearly, \((u, v)(t, x) = (u^*, \Psi(\cdot; u^*, c_\kappa))(x - c_\kappa t)\) is a nontrivial traveling wave solution of (1.1) satisfying (1.16). The proof that
\[
\lim_{x \to -\infty} u^*(x) > 0
\]
follows from [10, Theorem 1.1 (i)].

If (H3) holds, it follows from Lemma 4.1 (iv) that for \( D \gg D^\ast \), it holds that
\[
\mathcal{E} \ni u \mapsto U(\cdot; u, c_\kappa) \in \mathcal{E}.
\]
Hence
\[
\lim_{x \to -\infty} u^*(x) > 0.
\]
Therefore, by the stability of the positive constant equilibrium established in Theorem 1.1, it follows that
\[
\lim_{x \to -\infty} u^*(x) = \frac{a}{b}.
\]
This completes the proof of Theorem 1.2 (1).

(2) Observe that \( c^*(\tau) = c_{\kappa^+}^\ast \), and, by (1.14),
\[
\kappa^+_\tau = \min \left\{ \sqrt{a_1}, \frac{\sqrt{\lambda + \tau a}}{(1 - \tau)_+} \right\}.
\]
This implies that, if \( \lambda \geq a \) or \( \tau \geq 1 \), \( \kappa^+_\tau = \sqrt{a} \) and then \( c^*(\tau) = 2\sqrt{a} \). In the case \( \lambda < a \) and \( \tau < 1 \), (H4) implies that
\[
\tau \geq \frac{1}{2} \left( 1 - \frac{\lambda}{a} \right).
\]
This implies that
\[
2\tau a \geq a - \lambda
\]
and then
\[ a \leq \frac{\lambda + \tau a}{1 - \tau}. \]

Hence we also have \( \kappa^* = \sqrt{a} \) and \( c^*(\tau) = 2\sqrt{a}. \) (2) then follows from (1).

(3) Let \( \{c_n\}_{n \geq 1} \) be a sequence of real numbers satisfying \( c_n > c^*(\tau) \) and \( c_n \to c^*(\tau) \) as \( n \to \infty. \) For each \( n \geq 1, \) let \( (U^{c_n,\tau}(x), V^{c_n,\tau}(x)) \) denote a traveling wave solution of (1.1) with speed \( c_n \) connecting \((0, 0)\) and \((\frac{n}{\tau}, \frac{2n}{\tau})\) given by Theorem 1.2 (1). For each \( n \geq 1, \) since the set \( \{x \in \mathbb{R} : U^{c_n,\tau}(x) = \frac{a}{2b}\} \) is bounded and closed, hence compact, then it has a minimal element, say \( x_n. \) Next, consider the sequence \( \{U^n(x), V^n(x)\}_{n \geq 1} \) defined by
\[ (U^n(x), V^n(x)) = (U^{c_n,\tau}(x + x_n), V^{c_n,\tau}(x + x_n)), \quad \forall x \in \mathbb{R}, \quad n \geq 1. \]

Then, for every \( n \geq 1, \) \( (u(t, x), v(t, x)) = (U^n(x - c_nt), V^n(x - c_nt)) \) it a traveling wave solution of (1.1) with speed \( c_n \) satisfying
\[ U^n(-\infty) = \frac{a}{b}, \quad U^n(\infty) = 0, \quad U^n(0) = \frac{a}{2b}, \quad \text{and} \quad U^n(x) \geq \frac{a}{2b} \quad \text{for every} \quad x \leq 0. \]

Note that
\[ \|U^n\|_{\infty} = \|U^{c_n,\tau}\|_{\infty} \leq \frac{a}{b - \chi \mu}, \quad \forall \ n \geq 1. \]

Hence by estimates for parabolic equations, without loss of generality, we may suppose that \( (U^n, V^n) \to (U^*, V^*) \) locally uniformly in \( C^2(\mathbb{R}). \) Moreover, the function \((U^*, V^*)\) satisfies
\[ \begin{cases} 0 = U^*_{xx} + (c^*(\tau) - \chi V^*_x)U^*_x + (a - \chi V^*_x - bU^*)U^*, \quad x \in \mathbb{R} \\ 0 = V^*_xx + \tau c^*(\tau)V^*_x - \lambda V^* + \mu U^*, \quad x \in \mathbb{R}, \end{cases} \tag{4.2} \]
\[ \|U^*\|_{\infty} \leq \frac{a}{b - \chi \mu}, \quad U^*(0) = \frac{a}{2b}, \quad U^*(x) \geq \frac{a}{2b} \quad \forall \ x \leq 0, \quad \text{and} \quad U^*(x) > 0, \quad \forall \ x \in \mathbb{R}. \tag{4.3} \]

Hence, since \((H3)\) holds, it follows by the stability of the positive constant equilibrium giving by Theorem 1.1 (2) that
\[ \lim_{x \to -\infty} U^*(x) = \frac{a}{b}. \]

So, in order to complete this proof, it remains to show that
\[ \limsup_{x \to \infty} U^*(x) = 0. \tag{4.4} \]

Suppose by contradiction that (4.4) does not hold. Whence, there is a sequence \( \{y_n\}_{n \geq 1} \) with \( y_1 = 0, \ y_n < y_{n+1}, \ y_n \to \infty \) as \( n \to \infty, \) and
\[ \lim_{n \to \infty} U^*(y_n) = \limsup_{x \to \infty} U^*(x) > 0. \tag{4.5} \]

Consider a sequence \( \{z_n\}_{n \geq 1} \) given by
\[ U^*(z_n) = \min\{U^*(z) \mid y_n \leq z \leq y_{n+1}\}, \quad \forall \ n \geq 1. \]
Thus
\[ \lim_{n \to \infty} U^*(z_n) = \inf_{x \in \mathbb{R}} U^*(x). \]
Note that \( \inf_{x \in \mathbb{R}} U^*(x) = 0 \), otherwise since (H3) holds, we would have from Theorem 1.1 (2) that \( U^*(x) \equiv \frac{a}{b} \), which contradicts to (4.3). Thus, there is some \( n_0 \gg 1 \) such that \( z_n \) is a local minimum point for every \( n \geq n_0 \), and hence

\[
U^*_x(z_n) \geq 0 \quad \text{and} \quad U^*_x(z_n) = 0, \quad \forall n \geq n_0. \quad (4.6)
\]

By (4.3), \( \| U^* \|_\infty \leq \frac{a}{b - \chi \mu} \), then it follows from the first equation of (4.2), from (2.10) with \( \kappa = 0 \) and \( M = \frac{a}{b - \chi \mu} \), that

\[
0 \geq U^*_{xx} + (c^*(\tau) - \chi V^*_x)U^*_x + \left( a - \chi \mu B_{\lambda, c^*(\tau)} + \frac{\lambda}{\chi \mu} \right) \frac{a}{b - \chi \mu} - (b - \chi \mu)U^*U^*. 
\]

Which combined with (2.12) yields,

\[
0 \geq U^*_{xx} + (c^*(\tau) - \chi V^*_x)U^*_x + \left( a(b - 2\chi \mu) \right) \frac{a}{b - \chi \mu} - (b - \chi \mu)U^*U^*. \quad (4.7)
\]

But \( \lim_{n \to \infty} U^*(z_n) = 0 \) and (4.6) imply that there is \( n_1 \gg n_0 \) such that

\[
U^*_x(z_{n_1}) \geq 0, \quad U^*_x(z_{n_1}) = 0, \quad \frac{a(b - 2\chi \mu)}{b - \chi \mu} - U^*(z_{n_1}) > 0.
\]

This contradicts to (4.7), since \( U^*(z_{n_1}) > 0 \). Therefore, (4.4) holds.

\[\Box\]
