Constructing the $r$-uniform supertrees with the same spectral radius and matching energy

Jin-Xiu Zhou, Wen-Huan Wang*

Department of Mathematics, Shanghai University, Shanghai 200444, China

(Dated: March 1, 2022)

An $r$-uniform supertree is a connected and acyclic hypergraph of which each edge has $r$ vertices, where $r \geq 3$. We propose the concept of matching energy for an $r$-uniform hypergraph, which is defined as the sum of the absolute value of all the eigenvalues of its matching polynomial. With the aid of the matching polynomial of an $r$-uniform supertree, three pairs of $r$-uniform supertrees with the same spectral radius and the same matching energy are constructed, and two infinite families of $r$-uniform supertrees with the same spectral radius and the same matching energy are characterized. Some known results about the graphs with the same spectra regarding to their adjacency matrices can be naturally deduced from our new results.

Keywords: Supertree; Matching polynomial; Spectral radius; Matching energy

1. INTRODUCTION

Let $\mathbb{C}$ and $\mathbb{R}$ be the sets of complex and real numbers, respectively. Let $r$ and $s$ be two positive integers not less than 2 and $[s] = \{1, \ldots, s\}$. We denote by $A = (a_{i_1i_2\ldots i_r})$ a real tensor (or hypermatrix) of order $r$ and dimension $s$, which is a multi-dimensional array with entries $a_{i_1i_2\ldots i_r} \in \mathbb{R}$, where $i_1, i_2, \ldots, i_r \in [s]$ and $r \geq 2$. If $r = 2$, then $A$ is a matrix. If $a_{i_1i_2\ldots i_r} = 1$ when $i_1 = i_2 = \cdots = i_r$ and $a_{i_1i_2\ldots i_r} = 0$ otherwise, then $A$ is the identity tensor. Let $x = (x_1, x_2, \ldots, x_s)^T \in \mathbb{C}^s$ be an $s$-dimensional complex column vector and $x^{[r]} = (x_1^r, x_2^r, \ldots, x_s^r)^T$. Then $Ax$ is a vector in $\mathbb{C}^s$ whose $i$-th component is given by

$$\langle Ax \rangle_i = \sum_{i_2, \ldots, i_r = 1}^s a_{i_1i_2\ldots i_r}x_1x_2\cdots x_r, \text{ for each } i \in [s].$$ (1)

Furthermore, we have

$$x^T(Ax) = \sum_{i_1, i_2, \ldots, i_r = 1}^s a_{i_1i_2\ldots i_r}x_1x_2\cdots x_r.$$ (2)

The concept of tensor eigenvalues and the spectra of tensors was introduced by Qi [1] and Lim [2] in 2005 independently as follows. If there exist $\lambda \in \mathbb{C}$ and $x \in \mathbb{C}^s$ satisfying $Ax = \lambda x^{[r-1]}$, namely, $(Ax)_i = \lambda x_i^{r-1}$ for any $i \in [s]$, then $\lambda$ is called an eigenvalue of $A$ and $x$ an eigenvector of $A$ corresponding to $\lambda$. The resultant of the $s$ element homogeneous equations $Ax = 0$ is called the determinant of $A$ and is denoted by $\det(A)$. The characteristic polynomial of $A$ is defined as $\Phi(A, x) = \det(xI - A)$, where $I$ is the identity tensor of order $r$ and dimension $s$. The eigenvalues of $A$ are the roots of $\Phi(A, x)$ [3]. The (multi)-set of all the roots of $\Phi(A, x)$ (counting multiplicities), denoted by $\text{Spec } A$, is called the spectra of $A$.

A hypergraph $\mathcal{H}$ is an ordered pair $(V(\mathcal{H}), E(\mathcal{H}))$, where $V(\mathcal{H}) = [s]$ is the set of vertices of $\mathcal{H}$ and $E(\mathcal{H}) \subseteq \mathcal{P}([s])$ the set of edges of $\mathcal{H}$ with $\mathcal{P}([s])$ being the power set of $[s]$. If each edge $e \in E(\mathcal{H})$ has $r$ vertices ($r \geq 2$), then $\mathcal{H}$ is an $r$-uniform hypergraph. If $r = 2$, then $\mathcal{H}$ reduces to an ordinary graph and we denote it by $H$. A hypergraph $\mathcal{H}$ is called linear if any two edges of $\mathcal{H}$ intersect on at most one common vertex. If $\mathcal{H}$ does not contain cycles, then $\mathcal{H}$ is acyclic or a superforest. If $\mathcal{H}$ is connected and acyclic, then $\mathcal{H}$ is a supertree [4]. In this paper, we consider $r$-uniform supertrees.

Let $\mathcal{H} = (V(\mathcal{H}), E(\mathcal{H}))$ be an $r$-uniform hypergraph on $s$ vertices. The adjacency tensor of $\mathcal{H}$ is the $r$-ordered and $s$-dimensional tensor $A(\mathcal{H}) = (a_{i_1i_2\ldots i_r})$, where $a_{i_1i_2\ldots i_r} = \delta_{i_1i_2\ldots i_r}$, the Kronecker delta.
\frac{1}{(r-1)!} \text{ if } \{i_1, i_2, \ldots, i_r\} \in E(H) \text{ and } 0 \text{ otherwise} [5]. \text{ The spectral radius of } H, \text{ denoted by } \rho(H), \text{ is defined as the maximum modulus of all the eigenvalues of the characteristic polynomial } \Phi(A(H), x).

Let } M \text{ be a matrix. It may stand for the adjacency matrix, the Laplacian matrix, the signless Laplacian matrix, and the distance matrix, etc. Two graphs are said to be } M\text{-cospectral if they have the same } M\text{-spectra, where } M\text{-spectra of a graph is the (multi-)set of all the eigenvalues of its corresponding } M\text{ matrix. Similarly, two hypergraphs are said to be adjacency cospectral, if their adjacency tensors have the same characteristic polynomial. A graph } G \text{ (a hypergraph } \mathcal{G}, \text{ respectively) is determined by its } M\text{-spectra (spectra, respectively) if there does not exist other non-isomorphic graph } H \text{ (hypergraph } \mathcal{H}, \text{ respectively) such that } H \text{ and } G \text{ (} \mathcal{G} \text{ and } \mathcal{H}, \text{ respectively) are } M\text{-cospectral (cospectral, respectively).}

Which graphs are determined by their spectra? Günthard and Primas [6] posed this fundamental problem in 1956 in the context of Hückel’s theory in chemistry. Constructions of cospectral non-isomorphic graphs have implications on the complexity of the graph isomorphism problem and reveal which graph properties cannot be deduced from the spectra of graphs. Therefore, it can help researchers understand the above question. The construction of cospectral graphs attracted many researcher’s attention and has been studied extensively.

When } M \text{ is an adjacency matrix, many results about the } M\text{-cospectral graphs have been obtained. In the 1960s, Van Lint and Seidel [7] introduced the Seidel switching for constructing families of cospectral graphs. By using the Seidel switching, recently Seress [8] constructed an infinite family of cospectral eight regular graphs. Godsil and McKay [9] further developed this concept and introduced the Godsil–McKay switching. Blázskik et al. [10] used the Godsil–McKay switching to construct two cospectral regular graphs such that one has a perfect matching while the other does not have any perfect matching. Langberg and Vilenchik [11] presented a new method which was based on bipartite graph product to construct an infinite family of cospectral graphs. Qiu et al. [12] constructed an infinite family of cospectral graphs by using new methods. For oriented graphs and signed graphs, Belardo et al. [13] extended the Godsil–McKay switching to signed graphs, and built pairs of cospectral switching nonisomorphic signed graphs and
Stanić [14] obtained infinite families of cospectral regular signed graphs and cospectral bipartite regular oriented graphs.

When $M$ is a Laplacian matrix and a distance matrix, for the construction of $M$-cospectral graphs, the readers can refer to Refs. [15–17].

To the authors’ best knowledge, the result on the construction of $E$-cospectral hypergraphs is as follows. Let $A$ be a tensor of order $r \geq 2$ and dimension $s \geq 2$. If there exists a nonzero vector $x \in \mathbb{C}^s$ such that $Ax = \lambda x$ and $x^\top x = 1$, then $\lambda \in \mathbb{C}^s$ is called an $E$-eigenvalue of $A$. The $E$-eigenvalues of $A$ are the roots of the $E$-characteristic polynomial $\phi_A(\lambda)$ of $A$ (see [18] for the definition of $\phi_A(\lambda)$). Recently, Bu et al. [19] deduced a method of constructing $E$-cospectral hypergraphs and obtained some hypergraphs which are determined by their spectra. However, as we know, the calculation of the characteristic polynomial of the adjacency tensor of hypergraph is NP-hard in any field [20]. Therefore, it is difficult for us to use the characteristic polynomial of hypergraph to study the cospectral hypergraph. Since the spectral radius of hypergraph is of practical significance [21], the characterization of the $r$-uniform hypergraph with the extremal spectral radius is interesting, and a lot of results have been obtained. The interested readers can refer to Refs. [4, 22, 23].

Let $H$ be an $r$-uniform hypergraph. The number of $k$-matchings in $H$, denoted by $m(H,k)$, is the number of selections of $k$ independent edges in $H$, where $k \geq 0$. For the sake of consistence, let $m(H,0) = 1$. The matching number $\nu(H)$ of $H$ is the maximum cardinality of a matching in $H$. The matching polynomial of $H$, denoted by $\phi(H, x) = \sum_{k=0}^{\nu(H)} (-1)^k m(H, k) x^{\nu(H)-k} r$, was first introduced by Zhang et al. [24] when they studied the spectra of $r$-uniform supertrees. In order to guarantee that the matching polynomials of the $r$-uniform hypergraphs with $n$ vertices have the same degree, $\phi(H, x)$ is redefined by Su et al. [25] as $\phi(H, x) = \sum_{k=0}^{\nu(H)} (-1)^k m(H, k) x^{n-kr}$. It is noted that when $r = 2$, $H$ is an ordinary graph (denoted by $H$) and $\phi(H, x)$ is the matching polynomial of $H$.

The matching energy of an ordinary graph $H$, denoted by $ME(H)$, was proposed by Gutman and Wagner [26] and it was defined as the sum of the absolute value of all the eigenvalues of $\phi(H, x)$. Gutman and Wagner [26] pointed out that $ME(H)$ is a quantity which has a close relationship with chemical applications and it can be traced back to the
1970s. For more details about the matching energy, one can refer to [26]. In this paper, we extend the definition of the matching energy of a graph $H$ to an $r$-uniform hypergraph $\mathcal{H}$ as follows. Similarly, we define the matching energy of $\mathcal{H}$ as the sum of the absolute value of all the eigenvalues of $\varphi(\mathcal{H}, x)$, and denote by $ME(\mathcal{H})$ the matching energy of $\mathcal{H}$. We expect that $ME(\mathcal{H})$ can be applied in chemistry as $ME(H)$ does.

Motivated by the above-mentioned results, in this paper, we will study the $r$-uniform supertrees with the same spectral radius of their adjacency tensors and the same matching energy. Hereinafter, for simplicity, the $r$-uniform supertrees with the same spectral radius and the same matching energy is abbreviated to the $r$-uniform supertrees with the same SR and ME, where SR and ME stand for the spectral radius and the matching energy, respectively. The main tool used is the matching polynomial of the $r$-uniform supertrees.

This paper is organized as follows. In Section 2, some basic definitions and necessary lemmas are introduced. In Sections 3 and 4, the first and the second pairs of $r$-uniform supertrees with the same SR and ME are characterized (as shown in Theorems 3.1 and 4.1, respectively) and two infinite families of $r$-uniform supertrees with the same SR and ME are constructed (as shown in Theorems 3.2 and 4.1). Three pairs of graphs which are $M$-cospectral are deduced (as shown in Theorems 3.4, 3.5 and 4.2) in Sections 3 and 4, where $M$ is the adjacency matrix. In Section 5, we characterize the third pair of $r$-uniform supertrees with the same SR and ME (as shown in Theorem 5.1) and get a graph which is not determined by its spectra of its adjacency matrix (as shown in Theorem 5.2).

2. PRELIMINARY

In this section, some notations and necessary lemmas are introduced.

Let $\mathcal{H}$ be a hypergraph and $v$ be a vertex of $\mathcal{H}$. Let $E_\mathcal{H}(v)$ be the set of the edges incident with $v$ and $d_\mathcal{H}(v)$ the degree of $v$. Namely, $d_\mathcal{H}(v) = |E_\mathcal{H}(v)|$. For $e = \{u_1, \ldots, u_r\} \in E(\mathcal{H})$, if $d_\mathcal{H}(u_1) \geq 2$ and $d_\mathcal{H}(u_i) = 1$ for $2 \leq i \leq r$, then we say that $e$ is a pendent edge at $u_1$ of $\mathcal{H}$. If $d_\mathcal{H}(v) = 1$ and $v$ is incident with a pendent edge of $\mathcal{H}$, then $v$ is said to be a pendent vertex.

Let $\mathcal{H} - v$ be the hypergraph obtained from $\mathcal{H}$ by deleting $v$ together with all the edges in $E_\mathcal{H}(v)$. For $e \in E(\mathcal{H})$ and $V(e) = \{u_1, \ldots, u_r\}$, $\mathcal{H} - V(e)$ is the hypergraph obtained from $\mathcal{H}$ by deleting all the vertices in $V(e)$. For a subset $E' \subseteq E(\mathcal{H})$ in $\mathcal{H}$, $\mathcal{H} \setminus E'$
is the hypergraph obtained from \( H \) by deleting all the edges in \( E' \). Namely, \( H \setminus E' = (V(H), E(H) \setminus E') \). If \( E' = \{e\} \), then we write \( H \setminus E' \) as \( H \setminus e \). Let \( N_k \) be the set of \( k \) isolated vertices, where \( k \geq 1 \). Let \( G \cup H \) be the union of \( G \) and \( H \), where \( G \) and \( H \) are two disjoint hypergraphs. If \( V' \subseteq V(H) \) and \( E' \subseteq E(H) \), then \( H' = (V', E') \) is a partial hypergraph of \( H \). Furthermore, if \( H' \neq H \), then \( H' \) is a proper partial hypergraph of \( H \).

Let \( G \) be a graph. We denote by \( \phi(G, x) \) and \( \varphi(G, x) \) the characteristic polynomial and the matching polynomial of \( G \), respectively.

**Lemma 2.1** ([27]) If \( G \) is a forest, then \( \phi(G, x) = \varphi(G, x) \).

Friedland et al. [28] defined the nonnegative weakly irreducible tensor and Yang et al. [29] restated it as follows.

**Definition 2.1** [29] Let \( A = (a_{i_1i_2...i_r}) \) be a nonnegative tensor of order \( r \) and dimension \( s \). If for any nonempty proper index subset \( I \subset [s] \), there is at least an entry \( a_{i_1i_2...i_r} > 0 \), where \( i_1 \in I \) and at least an \( i_j \in [s] \setminus I \) for \( j = 2, 3, \ldots, r \), then \( A \) is called a nonnegative weakly irreducible tensor.

It was proved that an \( r \)-uniform hypergraph \( H \) is connected if and only if its adjacency tensor \( A(H) \) is weakly irreducible (see [28] and [29]).

**Lemma 2.2** [28, 30] Let \( A \) be a nonnegative tensor of order \( r \) and dimension \( s \), where \( r \geq 2 \). Then we have the following statements.

(i). \( \rho(A) \) is an eigenvalue of \( A \) with a nonnegative eigenvector \( x \in \mathbb{R}^s_+ = \{ x \in \mathbb{R}^s \mid x \geq 0 \} \) corresponding to it.

(ii). If \( A \) is weakly irreducible, then \( \rho(A) \) is the only eigenvalue of \( A \) with a positive eigenvector \( x \in \mathbb{R}^s_+ = \{ x \in \mathbb{R}^s \mid x > 0 \} \), up to a positive scaling coefficient.

**Lemma 2.3** ([5, 31]) Suppose that \( H \) is a uniform hypergraph, and \( H' \) is a partial hypergraph of \( H \). Then \( \rho(H') \leq \rho(H) \). Furthermore, if \( H \) is connected and \( H' \) is a proper partial hypergraph, we have \( \rho(H') < \rho(H) \).

**Lemma 2.4** ([5]) Let \( H \) be an \( r \)-uniform hypergraph that is the disjoint union of hypergraphs \( H_1 \) and \( H_2 \). Then as sets, \( \text{Spec}(H) = \text{Spec}(H_1) \cup \text{Spec}(H_2) \). Considered as multisets, an eigenvalue \( \lambda \) with multiplicity \( m \) in \( \text{Spec}(H_1) \) contributes \( \lambda \) to \( \text{Spec}(H) \) with multiplicity \( m(r - 1)^{|H_2|} \).
A totally nonzero eigenvalue of hypergraph $H$ is a nonzero eigenvalue and all the entries of the eigenvectors corresponding to it are nonzero.

**Lemma 2.5** ([24, 25]) $\lambda$ is a totally nonzero eigenvalue of an $r$-uniform supertree $H$ with $n \geq 3$ vertices if and only if it is a root of the matching polynomial

$$
\varphi(H, x) = \sum_{k \geq 0} (-1)^k m(H, k)x^{n-kr}.
$$

**Lemma 2.6** ([25]) Let $G$ and $H$ be two $r$-uniform hypergraphs. Then the following statements hold.

(a) $\varphi(G \cup H, x) = \varphi(G, x)\varphi(H, x)$.

(b) If $u \in V(G)$ and $I = \{i \mid e_i \in E_G(u)\}$, then for any $J \subseteq I$, we have

$$
\varphi(G, x) = \varphi(G \setminus \{e_i : i \in J\}, x) - \sum_{i \in J} \varphi(G - V(e_i), x),
$$

$$
\varphi(G, x) = x\varphi(G - u, x) - \sum_{e \in E_G(u)} \varphi(G - V(e), x).
$$

**Lemma 2.7** Let $H$ be an $r$-uniform hypergraph with $n \geq 3$ vertices. Then $\rho(H)$ is the largest root of $\varphi(H, x) = \sum_{k \geq 0} (-1)^k m(H, k)x^{n-kr}$.

**Proof.** By Lemma 2.2, $\rho(H)$ is a totally nonzero eigenvalue of $H$. The set of totally nonzero eigenvalues of $H$ is denoted by $M = \{\lambda_1, \lambda_2, \ldots, \lambda_l, \rho(H)\}$, where $l$ is a positive integer. Without loss of generally, we suppose $|\lambda_1| \leq |\lambda_2| \leq \cdots \leq |\lambda_l| \leq \rho(H)$. Let $N = \{\mu_1, \mu_2, \ldots, \mu_{l'}\}$ be the set of the nonzero roots of $\varphi(H, x)$, where $|\mu_1| \leq |\mu_2| \leq \cdots \leq |\mu_{l'}|$ and $l'$ is a positive integer. It follows from Lemma 2.5 that $\rho(H) = \mu_{l'}$. □

### 3. THE FIRST PAIR OF $r$-UNIFORM SUPERTREES WITH THE SAME SPECTRAL RADIUS AND MATCHING ENERGY

In this section, we first characterize the first pair of $r$-uniform supertrees with the same SR and ME in Theorem 3.1. Then, from Theorem 3.1, we obtain an infinite family of $r$-uniform supertrees with the same SR and ME in Theorem 3.2. Furthermore, an example in Theorem 3.3 is given to show how to use Theorem 3.1 to determine whether two $r$-uniform supertrees have the same SR and ME or not. Finally, from our new results,
a known pair of graphs and a known infinite family of graphs which are $M$-cospectral are naturally deduced (as shown in Theorems 3.4 and 3.5, respectively), where $M$ is the adjacency matrix.

Let $G$ and $H$ be two $r$-uniform supertrees whose vertex sets are disjoint with $u \in V(G)$ and $v \in V(H)$, where $r \geq 2$. We denote by $G(u, v)H$ the supertree obtained from $G$ and $H$ by identifying $u$ with $v$. To obtain our results, we introduce Lemma 3.1 as follows.

**Lemma 3.1** Let $G$, $H$, and $\Gamma$ be three $r$-uniform supertrees, where $G$ and $H$ have the same number of vertices and $r \geq 2$. Let $u \in V(G)$ and $v \in V(H)$. If $\varphi(G, x) = \varphi(H, x)$ and $\varphi(G - u, x) = \varphi(H - v, x)$, then for any $w \in V(\Gamma)$, we have $\varphi(G(u, w)\Gamma, x) = \varphi(H(v, w)\Gamma, x)$.

**Proof.** In $G(u, w)\Gamma$, let $q$ be the vertex $u$ of $G$ (namely $w$ of $\Gamma$). For simplicity, let $G(u, w)\Gamma = G \cdot \Gamma$ and $H(v, w)\Gamma = H \cdot \Gamma$. By Lemma 2.6(b), we get

$$\varphi(G \cdot \Gamma, x) = x\varphi(G \cdot \Gamma - q, x) - \sum_{e \in E_{G \cdot \Gamma}(q)} \varphi(G \cdot \Gamma - V(e), x).$$

(3)

Since $G \cdot \Gamma - q \cong (G - u) \cup (\Gamma - w)$ and $E_{G \cdot \Gamma}(q) = E_G(u) \cup E_\Gamma(w)$, by Lemma 2.6(a), we get

$$\varphi(G \cdot \Gamma, x) = x\varphi(G - u, x)\varphi(\Gamma - w, x)$$

$$- \sum_{e \in E_G(u)} \varphi(G - V(e), x)\varphi(G - u, x)$$

$$- \sum_{e \in E_\Gamma(w)} \varphi(\Gamma - V(e), x)\varphi(G - u, x).$$

(4)

Furthermore, by Lemma 2.6(b), we obtain

$$\varphi(G \cdot \Gamma, x) = x\varphi(G - u, x)\varphi(\Gamma - w, x)$$

$$+ [\varphi(G, x) - x\varphi(G - u, x)]\varphi(\Gamma - w, x) + [\varphi(\Gamma, x) - x\varphi(\Gamma - w, x)]\varphi(G - u, x).$$

(5)

Therefore, by simplification, we get

$$\varphi(G \cdot \Gamma, x) = \varphi(G, x)\varphi(\Gamma - w, x) + \varphi(G - u, x)\varphi(\Gamma, x) - x\varphi(G - u, x)\varphi(\Gamma - w, x).$$

(6)

Similarly, we get

$$\varphi(H \cdot \Gamma, x) = \varphi(H, x)\varphi(\Gamma - w, x) + \varphi(H - v, x)\varphi(\Gamma, x) - x\varphi(H - v, x)\varphi(\Gamma - w, x).$$

(7)
If \( \varphi(G, x) = \varphi(H, x) \) and \( \varphi(G - u, x) = \varphi(H - v, x) \) hold, then by comparing (6) and (7), we get \( \varphi(G \cdot \Gamma, x) = \varphi(H \cdot \Gamma, x) \). \( \square \)

By Lemmas 2.7 and 3.1, we can directly get Theorem 3.1.

**Theorem 3.1** Let \( G, H \) and \( \Gamma \) be three \( r \)-uniform supertrees, where \( G \) and \( H \) have the same number of vertices and \( r \geq 3 \). Let \( u \in V(G) \) and \( v \in V(H) \). If \( \varphi(G, x) = \varphi(H, x) \) and \( \varphi(G - u, x) = \varphi(H - v, x) \), then for any \( w \in V(\Gamma) \), we have \( \rho(G(u, w)\Gamma) = \rho(H(v, w)\Gamma) \) and \( ME(G(u, w)\Gamma) = ME(H(v, w)\Gamma) \).

Let \( G, H \) and \( \Gamma \) be three \( r \)-uniform supertrees, where \( r \geq 2 \). Let \( u \in V(G) \), \( v \in V(H) \), and \( w \in V(\Gamma) \). Let \( m, n, a, \) and \( b \) be four positive integers. For simplicity, we denote \( G \cup \ldots \cup G \) by \( mG \). Let \( G^m_u \) be the hypergraph obtained from \( mG \) by coalescing \( u \) such that the \( m \) copies of \( G \) share a common vertex \( u \). Similarly, \( H^m_v \) is defined as that of \( G^m_u \).

We denote by \( G^m_u \cdot H^m_v \) the hypergraph obtained from \( G^m_u \) and \( H^m_v \) by identifying \( u \) of \( G^m_u \) with \( v \) of \( H^m_v \). In particular, \( G^1_u \cong G_u \). Let \( G^{a+b}_u = G^a_u \cdot G^b_u \) and \( H^{a+b}_v = H^a_v \cdot H^b_v \). The hypergraph \( G(u, v)H(v, w)\Gamma \) is obtained from \( G, H \) and \( \Gamma \) by identifying \( u, v \) and \( w \). If \( r = 2 \), we write \( G^m_u \) and \( G^m_u \cdot H^m_v \) as \( G^m_u \) and \( G^m_u \cdot H^m_v \), respectively. Obviously, both of them are graphs. In particular, \( G^1_u \cong G_u \). Let \( G^{a+b}_u = G^a_u \cdot G^b_u \) and \( H^{a+b}_v = H^a_v \cdot H^b_v \).

**Theorem 3.2** Let \( G \) and \( H \) be two \( r \)-uniform supertrees with the same number of vertices, where \( r \geq 3 \). Let \( u \in V(G) \), \( v \in V(H) \) and \( m \) be a positive integer. If \( \varphi(G, x) = \varphi(H, x) \) and \( \varphi(G - u, x) = \varphi(H - v, x) \), then we have (i). \( \rho(H^m_v) = \rho(H^{m-2}_v \cdot G^2_u) = \cdots = \rho(H^m_v \cdot G^{m-1}_u) = \rho(G^m_u) \); (ii). \( ME(H^m_v) = ME(H^{m-2}_v \cdot G^2_u) = \cdots = ME(H^m_v \cdot G^{m-1}_u) = ME(G^m_u) \).

**Proof.** Since \( H^m_v = H^{m-1}_v \cdot H_v \), if \( \varphi(G, x) = \varphi(H, x) \) and \( \varphi(G - u, x) = \varphi(H - v, x) \), then by Lemma 3.1, we have \( \varphi(H^m_v) = \varphi(H^{m-1}_v \cdot G_u) \). Furthermore, by Lemma 2.7, we have \( \rho(H^m_v) = \rho(H^{m-1}_v \cdot G_u) \). Similarly, we obtain \( \varphi(H_v \cdot G^{m-1}_u) = \varphi(G^m_u) \) and \( \rho(H_v \cdot G^{m-1}_u) = \rho(G^m_u) \). Next, we only need to prove \( \varphi(H^{m-k}_v \cdot G^k_u, x) = \varphi(H^{m-k-1}_v \cdot G^{k+1}_u, x) \), where \( k = 1, \ldots, m - 2 \).

Let \( k = 1, \ldots, m - 2 \). Let \( \Gamma = H^{m-k}_v \cdot G^k_u \) and \( w \) of \( \Gamma \) be \( u \) of \( G^k \) (namely \( v \) of \( H^{m-k}_v \)). Obviously, \( H^{m-k}_v \cdot G^k_u = H_v \cdot \Gamma_w \) and \( H^{m-k}_v \cdot G^{k+1}_u = G_u \cdot \Gamma_w \). Since \( \varphi(G, x) = \varphi(H, x) \) and \( \varphi(G - u, x) = \varphi(H - v, x) \), by Lemma 3.1, we obtain \( \varphi(H^{m-k}_v \cdot G^k_u, x) = \varphi(H^{m-k-1}_v \cdot G^{k+1}_u, x) \). Furthermore, by Lemma 2.7, we get \( \rho(H^{m-k}_v \cdot G^k_u, x) = \rho(H^{m-k-1}_v \cdot G^{k+1}_u, x) \).

\[ R(a, b, c, d) \]

**Figure 1.** \( T(a, b) \), \( Q(a, b, c) \) and \( R(a, b, c, d) \)

\[ \rho(H^{m-k-1}_v, G^{k+1}_a, x) \]. Therefore, we get Theorem 3.2(i). By the definition of the matching energy of an \( r \)-uniform hypergraph, we obtain Theorem 3.2(ii). □

For two given \( r \)-uniform supertrees, Theorem 3.2 can provide us with a simple method to investigate whether their SR and ME are the same or not. Next, we give an example to show how to apply Lemmas 2.7 and 3.1 to determine that the SR and ME of two \( r \)-uniform supertrees are the same, which is shown in Theorem 3.3.

Let \( H \) be an ordinary graph. The \( r \)-th power of \( H \), denoted by \( H^r \), is obtained from \( H \) by adding \((r - 2)\) new vertices into each edge of \( H \), where \( r \geq 3 \). Let \( P_t \) be a path of length \( t \) and \( P_t^r \) be its \( r \)-th power, where \( t \geq 0 \). When \( t = 0 \), \( P_0 \) is a vertex. We call \( P_t^r \) a loose path of length \( t \). Let \( P_t^r = v_1e_1v_2e_2v_3 \cdots v_te_tv_{t+1} \), where \( r \geq 2 \), \( t \geq 1 \) and \( e_i = \{v_i, u_{i,1}, \cdots, u_{i,r-2}, v_{i+1}\} \) with \( i = 1, 2, \cdots, t \). Let \( T(a, b) \), \( Q(a, b, c) \) and \( R(a, b, c, d) \) be three hypergraphs defined as follows, where \( a \), \( b \) and \( c \) are three positive integers. \( T(a, b) \) is obtained from \( P_{a+b}^r \) by attaching one pendent edge at vertex \( v_{a+1} \) of \( P_{a+b}^r \), \( Q(a, b, c) \) is obtained from \( P_{a+b+c}^r \) by attaching one pendent edge at vertices \( v_{a+1} \) and \( v_{a+b+1} \) of \( P_{a+b+c}^r \), and \( R(a, b, c, d) \) is obtained from \( P_{a+b+c+d}^r \) by attaching one pendent edge at vertices \( v_{a+1} \), \( v_{a+b+1} \) and \( v_{a+b+c+1} \) of \( P_{a+b+c+d}^r \). \( T(a, b) \), \( Q(a, b, c) \) and \( R(a, b, c, d) \) are shown in Fig. 1. In particular, in \( P_t^r \), if \( r = 2 \), then \( P_t^r \) is the path \( P_t \). Furthermore, when \( r = 2 \), \( T(a, b) \), \( Q(a, b, c) \) and \( R(a, b, c, d) \) are graphs and written as \( T(a, b) \), \( Q(a, b, c) \) and \( R(a, b, c, d) \), respectively.
Theorem 3.3 Let \( \Gamma \) be an \( r \)-uniform supertree with \( w \in V(\Gamma) \), where \( r \geq 3 \). We have \( \rho(\mathcal{R}(1, 1, 2, 4)_u \cdot \Gamma_w) = \rho(\mathcal{R}(1, 1, 3, 3)_v \cdot \Gamma_w) \) and \( ME(\mathcal{R}(1, 1, 2, 4)_u \cdot \Gamma_w) = ME(\mathcal{R}(1, 1, 3, 3)_v \cdot \Gamma_w) \), where \( u \) of \( \mathcal{R}(1, 1, 2, 4) \) (respectively, \( v \) of \( \mathcal{R}(1, 1, 3, 3) \)) is a pendent vertex of the pendent edge attached at \( v_3 \) of \( \mathcal{P}_r^g \) of \( \mathcal{R}(1, 1, 2, 4) \) (respectively, \( v_6 \) of \( \mathcal{P}_r^g \) of \( \mathcal{R}(1, 1, 3, 3) \)). \( \mathcal{R}(1, 1, 2, 4)_u \cdot \Gamma_w \) and \( \mathcal{R}(1, 1, 3, 3)_v \cdot \Gamma_w \) are shown in Fig. 2.

Proof. For simplicity, let \( \mathcal{R}(1, 1, 2, 4) = \mathcal{G}' \) and \( \mathcal{R}(1, 1, 3, 3) = \mathcal{H}' \). We have

\[
\varphi(\mathcal{G}', x) = x\varphi(\mathcal{G}' - u, x) - \sum_{e \in E_Q(u)} \varphi(\mathcal{G}' - V(e), x)
\]

\[
= x\varphi(\mathcal{Q}(1, 3, 4) \cup N_{r-2}, x) - \varphi[\mathcal{P}^r_{2} \cup \mathcal{T}(1, 4) \cup N_{2(r-2)}, x]
\]

\[
= x^{r-1}\varphi(\mathcal{Q}(1, 3, 4), x) - x^{2(r-2)}\varphi(\mathcal{P}^r_{2}, x)\varphi(\mathcal{T}(1, 4), x).
\]

It is noted that (8) follows from Lemma 2.6(b), (9) is derived from \( \mathcal{G}' - u \cong \mathcal{Q}(1, 3, 4) \cup N_{r-2} \) and \( \mathcal{G}' - V(e) \cong \mathcal{P}^r_{2} \cup \mathcal{T}(1, 4) \cup N_{2(r-2)} \), and (10) is deduced from Lemma 2.6(a). Similarly, we obtain that the expression of \( \varphi(\mathcal{H}', x) \) is the same as the right-hand side of (10). Namely, we obtain \( \varphi(\mathcal{G}', x) = \varphi(\mathcal{H}', x) \). Obviously, we can check that \( \mathcal{G}' - u \cong \mathcal{H}' - v \).

Thus, by Lemma 3.1, we get \( \varphi(\mathcal{R}(1, 1, 2, 4)_u \cdot \Gamma_w) = \varphi(\mathcal{R}(1, 1, 3, 3)_v \cdot \Gamma_w) \). Furthermore, by Lemma 2.7, we obtain \( \rho(\mathcal{R}(1, 1, 2, 4)_u \cdot \Gamma_w) = \rho(\mathcal{R}(1, 1, 3, 3)_v \cdot \Gamma_w) \). By the definition of the matching energy of an \( r \)-uniform hypergraph, we obtain \( ME(\mathcal{R}(1, 1, 2, 4)_u \cdot \Gamma_w) = ME(\mathcal{R}(1, 1, 3, 3)_v \cdot \Gamma_w) \).

From Theorem 3.3, we know that the problem of determining whether two \( r \)-uniform supertrees have the same SR and ME can be converted into the problem of investigating the properties of their subgraphs.

For graphs, by Lemmas 2.1 and 3.1, we have Theorem 3.4 as follows. It should be noted that Theorem 3.4(i) is a natural generalization of Lemma 3.1 when \( r = 2 \) and it can be found on Page 159 in Ref. [32].
Theorem 3.4 Let \( G, H \) and \( \Gamma \) be three trees, where \( G \) and \( H \) have the same number of vertices. Let \( u \in V(G) \) and \( v \in V(H) \). If \( \phi(G,x) = \phi(H,x) \) and \( \phi(G-u,x) = \phi(H-v,x) \), then for any \( w \in V(\Gamma) \), we have (i). \( \phi(G(u,w)\Gamma,x) = \phi(H(v,w)\Gamma,x) \). Namely, \( G(u,w)\Gamma \) and \( H(v,w)\Gamma \) are \( M \)-cospectral, where \( M \) is the adjacency matrix.

(ii). \( ME(G(u,w)\Gamma,x) = ME(H(v,w)\Gamma,x) \).

By Theorem 3.4 and the methods similar to those for Theorem 3.1, we get Theorem 3.5 as follows. It is noted that Theorem 3.5(i) can be found on Page 158 in Ref. [33].

Theorem 3.5 Let \( G \) and \( H \) be two trees with the same number of vertices. Let \( u \in V(G) \), \( v \in V(H) \) and \( m \) be a positive integer. If \( \phi(G,x) = \phi(H,x) \) and \( \phi(G-u,x) = \phi(H-v,x) \), then we have (i). \( \phi(H_u^m) = \phi(H_v^{m-1} \cdot G_u) = \phi(H_v^{m-2} \cdot G_u^2) = \cdots = \phi(H_v \cdot G_u^{m-1}) = \phi(G_u^m) \); (ii). \( ME(H_u^m) = ME(H_v^{m-1} \cdot G_u) = ME(H_v^{m-2} \cdot G_u^2) = \cdots = ME(H_v \cdot G_u^{m-1}) = ME(G_u^m) \).

4. THE SECOND PAIR OF \( r \)-UNIFORM SUPERTEES WITH THE SAME SPECTRAL RADIUS AND MATCHING ENERGY

In this section, we construct the second pair of \( r \)-uniform supertrees with the same SR and ME, which is shown in Theorem 4.1, where \( r \geq 3 \). In Theorem 4.1. Since \( m \) is a variable, an infinite families of \( r \)-uniform supertrees with the same SR and ME are also deduced. To obtain our results, Lemma 4.1 is introduced first. It is pointed out that Lemma 4.1 generalizes many known results in the previous literatures. A pair of graphs which is \( M \)-cospectral is deduced from Lemma 4.1 (as shown in Theorem 4.2), where \( M \) is the adjacency matrix.

Let \( \mathcal{G} \) and \( \mathcal{H} \) be two \( r \)-uniform supertrees with \( u \in V(\mathcal{G}) \) and \( v \in V(\mathcal{H}) \), where \( r \geq 2 \). Let \( m \) be a positive integer and \( e_i = \{v_{i,1}, \ldots, v_{i,r}\} \), where \( i = 1, \ldots, m \). Let \( \mathcal{G}_u \cdot m\mathcal{H}_v \) be the hypergraph obtained from \( \mathcal{G} \), \( m\mathcal{H} \) and \( e_1, \ldots, e_m \) by identifying \( v_{i,1} \) (\( i = 1, \ldots, m \)) with \( u \) of \( \mathcal{G} \) and identifying \( v_{i,r} \) (\( i = 1, \ldots, m \)) with \( v \) of each \( \mathcal{H} \) of \( m\mathcal{H} \) such that \( \mathcal{G}_u \cdot m\mathcal{H}_v \) is also an \( r \)-uniform supertree. \( \mathcal{G}_u \cdot m\mathcal{H}_v \cup (m-1)\mathcal{G} \) and \( (\mathcal{H}_v \cdot m\mathcal{G}_u) \cup (m-1)\mathcal{H} \) are shown in Fig. 3. Obviously, when \( m = 1 \), \( \mathcal{G}_u \cdot m\mathcal{H}_v \cup (m-1)\mathcal{G} \cong (\mathcal{H}_v \cdot m\mathcal{G}_u) \cup (m-1)\mathcal{H} \). When \( r = 2 \), \( \mathcal{G}_u \cdot m\mathcal{H}_v \cup (m-1)\mathcal{G} \) and \( (\mathcal{H}_v \cdot m\mathcal{G}_u) \cup (m-1)\mathcal{H} \) are graphs and are written as \( G_u \cdot mH_v \cup (m-1)G \) and \( (H_v \cdot mG_u) \cup (m-1)H \), respectively.
Lemma 4.1 Let $\mathcal{G}$ and $\mathcal{H}$ be two $r$-uniform hypergraphs with $u \in V(\mathcal{G})$ and $v \in V(\mathcal{H})$, where $r \geq 2$. We have $\varphi[(\mathcal{G}_u \cdot m \mathcal{H}_v) \cup (m - 1)\mathcal{G}] = \varphi[(\mathcal{H}_v \cdot m \mathcal{G}_u) \cup (m - 1)\mathcal{H}]$, where $m$ is a positive integer.

Proof. Since $\mathcal{G}_u \cdot m \mathcal{H}_v - u \cong (\mathcal{G} - u) \cup m \mathcal{H} \cup N_{m(r - 2)}$ and $E_{\mathcal{G}_u \cdot m \mathcal{H}_v}(u) = E_{\mathcal{G}}(u) \cup \{e_1, \ldots, e_m\}$, by Lemma 2.6(b), we obtain

$$\varphi(\mathcal{G}_u \cdot m \mathcal{H}_v, x) = x \varphi[(\mathcal{G}_u \cdot m \mathcal{H}_v) - u, x] - \sum_{e \in E_{\mathcal{G}_u \cdot m \mathcal{H}_v}(u)} \varphi[(\mathcal{G}_u \cdot m \mathcal{H}_v) - V(e), x]$$

$$= x \varphi[(\mathcal{G} - u) \cup m \mathcal{H} \cup N_{m(r - 2)}, x] - \sum_{e \in E_{\mathcal{G}}(u)} \varphi[(\mathcal{G} - V(e)) \cup m \mathcal{H} \cup N_{m(r - 2)}, x]$$

$$- m \varphi[(\mathcal{G} - u) \cup (\mathcal{H} - v) \cup (m - 1)\mathcal{H} \cup N(m - 1)(r - 2), x].$$

(11)

(12)

By Lemma 2.6(a) and extracting the common factors $x^{m(r - 2)}$ and $\varphi(m \mathcal{H}, x) = \varphi^m(\mathcal{H}, x)$ from the first and the second terms on the right-hand side of (12), we obtain

$$\varphi(\mathcal{G}_u \cdot m \mathcal{H}_v, x) = x^{m(r - 2)} \varphi^m(\mathcal{H}, x)[x \varphi(\mathcal{G} - u, x) - \sum_{e \in E_{\mathcal{G}}(u)} \varphi(\mathcal{G} - V(e), x)]$$

$$- m x^{(m - 1)(r - 2)} \varphi(\mathcal{G} - u, x) \varphi(\mathcal{H} - v, x) \varphi^{m - 1}(\mathcal{H}, x).$$

(13)

By replacing $x \varphi(\mathcal{G} - u, x) - \sum_{e \in E_{\mathcal{G}}(u)} \varphi(\mathcal{G} - V(e), x)$ by $\varphi(\mathcal{G}, x)$ (by Lemma 2.6(b)) in (13) and extracting the common factors $x^{(m - 1)(r - 2)}$ and $\varphi^{m - 1}(\mathcal{H}, x)$ from the first and the
second terms on the right-hand side of (13), we get

\[ \varphi(G_u \cdot mH_v, x) = x^{(m-1)(r-2)} \varphi^{-1}(H, x) \left[ x^{r-2} \varphi(G, x) \varphi(H, x) - m\varphi(G - u, x)\varphi(H - v, x) \right]. \]  

(14)

Therefore, by Lemma 2.6(a) and (14), we have

\[ \varphi [(G_u \cdot mH_v, x) \cup (m - 1)G, x] = \varphi(G_u \cdot mH_v, x) \varphi^{-1}(G, x) = x^{(m-1)(r-2)} [\varphi(G, x) \varphi(H, x)]^{m-1} \left[ x^{r-2} \varphi(G, x) \varphi(H, x) - m\varphi(G - u, x)\varphi(H - v, x) \right]. \]  

(15)

Similarly, we obtain

\[ \varphi [(H_v \cdot mG_u) \cup (m - 1)H, x] = \varphi(H_v \cdot mG_u, x) \varphi^{-1}(H, x) = x^{(m-1)(r-2)} [\varphi(G, x) \varphi(H, x)]^{m-1} \left[ x^{r-2} \varphi(G, x) \varphi(H, x) - m\varphi(G - u, x)\varphi(H - v, x) \right]. \]  

(16)

Since the right-hand sides of (15) and (16) are the same, it follows from (15) and (16) that Theorem 4.1 holds. \( \square \)

It should be noted that Lemma 4.1 generalizes many known results, for example, Equation (2a) derived by Cvetković et al. \[34\], Corollary 2.9 deduced by Shen et al. \[35\], and Lemma 3.5(2) obtained by Wang et al. \[36\]. The three results mentioned here are special cases of Lemma 4.1.

By Lemmas 2.7 and 4.1, we obtain Theorem 4.1.

**Theorem 4.1** Let \( m \) be a positive integer. Suppose that \( G \) and \( H \) are two \( r \)-uniform supertrees with \( u \in V(G) \) and \( v \in V(H) \), where \( r \geq 3 \). We have (i). \( \rho((G_u \cdot mH_v) \cup (m - 1)G) = \rho((H_v \cdot mG_u) \cup (m - 1)H) \) and \( \rho(G_u \cdot mH_v) = \rho(H_v \cdot mG_u) \); (ii). \( MG((G_u \cdot mH_v) \cup (m - 1)G) = MG((H_v \cdot mG_u) \cup (m - 1)H) \).

**Proof.** Obviously, \( \rho((G_u \cdot mH_v) \cup (m - 1)G) = \rho((H_v \cdot mG_u) \cup (m - 1)H) \) follows from Lemmas 2.7 and 4.1. Since \( G \) and \( H \) are respectively the proper subgraphs of \( G_u \cdot mH_v \) and \( H_v \cdot mG_u \), by Lemma 2.3, we get \( \rho(G) < \rho(G_u \cdot mH_v) \) and \( \rho(H) < \rho(H_v \cdot mG_u) \). It follows from Lemma 2.4 that \( \rho((G_u \cdot mH_v) \cup (m - 1)G) = \max\{ \rho(G_u \cdot mH_v), \rho(H) \} = \rho(G_u \cdot mH_v) \). Similarly, we have \( \rho((H_v \cdot mG_u) \cup (m - 1)H) = \rho(H_v \cdot mG_u) \). Thus, we obtain \( \rho(G_u \cdot mH_v) = \rho(H_v \cdot mG_u) \). Therefore, we have Theorem 4.1(i). By the definition
of the matching energy of an $r$-uniform hypergraph and Lemma 4.1, we obtain Theorem 4.1(ii). □

By Lemmas 2.1 and 4.1, we can directly get Theorem 3.2(ii) in Ref. [37] which was obtained by Wu et al. The result is shown in Theorem 4.2.

**Theorem 4.2** Let $m$ be a positive integer. Suppose that $G$ and $H$ are two trees with $u \in V(G)$ and $v \in V(H)$. Then $\varphi \left( (G_u \cdot mH_v) \cup (m-1)G, x \right) = \varphi \left( (H_v \cdot mG_u) \cup (m-1)H, x \right)$. Namely, $(G_u \cdot mH_v) \cup (m-1)G$ and $(H_v \cdot mG_u) \cup (m-1)H$ are $M$-cospectral, where $M$ is the adjacency matrix.

5. **THE THIRD PAIR OF $r$-UNIFORM SUPERTREES WITH THE SAME SPECTRAL RADIUS AND MATCHING ENERGY**

In this section, we characterize the third pair of $r$-uniform supertrees with the same SR and ME, and get a graph which is not determined by its spectra of its adjacency matrix. The two results are shown in Theorems 5.1 and 5.2. To obtain our results, Lemma 5.1 is introduced first.

Let $W_n = Q(1, n - 4, 1)$ with $n \geq 5$ and $Z_n = T(1, n - 2)$ with $n \geq 2$. $W_n$ and $Z_n$ are shown in Fig. 4. The loose path in $W_n$ is denoted by $P_{r-5} = v_1 e_1 v_2 e_2 v_3 \cdots v_{n-2} e_{n-2} v_{n-1}$, where $n \geq 5$.

**Lemma 5.1** We have $\varphi(P_{m-5} \cup W_{n-1}, x) = \varphi(P_{r-5} \cup W_n, x)$, where $m, n \geq 6$ and $r \geq 2$.

**Proof.** (1). The proof of Lemma 5.1 when $m = 6$ and $n \geq 6$.

When $m = 6$ and $n \geq 6$, we prove

$$ \varphi(P_r \cup W_{n-1}, x) = \varphi(P_{r-5} \cup W_n, x) \quad (17) $$
by induction on \( n \).

(i). When \( n = 6 \), obviously, \( \varphi(P_1^r \cup W_5, x) = \varphi(P_1^r \cup W_5, x) \).

When \( n = 7 \), by Lemma 2.5, we get \( \varphi(P_1^r, x) = x^r - 1 \), \( \varphi(W_6, x) = \varphi(Q(1, 2, 1), x) = x^{6r-5} - 6x^{5r-5} + 8x^{4r-5} \), \( \varphi(P_2^r, x) = x^{2r-1} - 2x^{r-1} \), and \( \varphi(W_5, x) = \varphi(Q(1, 1, 1), x) = x^{5r-4} - 5x^{4r-4} + 4x^{3r-4} \). Thus, we get

\[
\varphi(P_1^r \cup W_6, x) = \varphi(P_2^r \cup W_5, x) = x^{7r-5} - 7x^{6r-5} + 14x^{5r-5} - 8x^{4r-5}.
\]

(ii). When \( n = k \) with \( k \geq 7 \), we suppose that (17) hold. Namely, \( \varphi(P_1^r \cup W_{k-1}, x) = \varphi(P_{k-5}^r \cup W_5, x) \).

(iii). When \( n = k + 1 \) with \( k \geq 7 \), we prove that (17) hold.

We have

\[
\varphi(W_n, x) = x\varphi(W_n - v_{n-1}, x) - \sum_{e \in E_{W_n}(v_{n-1})} \varphi(W_n - V(e), x) \tag{18}
\]

\[
= x\varphi(Z_{n-1} \cup N_{r-2}, x) - \varphi(Z_{n-3} \cup N_{r-1} \cup N_{r-2}, x) \tag{19}
\]

\[
= x^{r-1}[\varphi(Z_{n-1}, x) - x^{r-2}\varphi(Z_{n-3}, x)], \tag{20}
\]

where (18) follows from Lemma 2.6(b), (19) holds since \( W_n - v_{n-1} \cong Z_{n-1} \cup N_{r-2} \) and \( E_{W_n}(v_{n-1}) = \{e_{n-2}\} \), and (20) is derived from Lemma 2.6(a). Similarly, we get

\[
\varphi(W_{n-1}, x) = x^{r-1}[\varphi(Z_{n-2}, x) - x^{r-2}\varphi(Z_{n-4}, x)], \tag{21}
\]

\[
\varphi(W_{n-2}, x) = x^{r-1}[\varphi(Z_{n-3}, x) - x^{r-2}\varphi(Z_{n-5}, x)]. \tag{22}
\]

Let the loose path of \( Z_{n-1} \) be \( P_{n-2}^r = v_1'e_1'v_2'e_2'v_3' \cdots v_{n-2}'e_{n-2}'v_{n-1}' \). We obtain

\[
\varphi(Z_{n-1}, x) = x\varphi(Z_{n-1} - v_{n-1}', x) - \sum_{e \in E_{Z_{n-1}}(v_{n-1}')} \varphi(Z_{n-1} - V(e), x)
\]

\[
= x\varphi(Z_{n-2} \cup N_{r-2}, x) - \varphi(Z_{n-3} \cup N_{r-2}, x)
\]

\[
= x^{r-2}[x\varphi(Z_{n-2}, x) - \varphi(Z_{n-3}, x)] \tag{23}
\]

Similarly, we have

\[
\varphi(Z_{n-3}, x) = x^{r-2}[x\varphi(Z_{n-4}, x) - \varphi(Z_{n-5}, x)]. \tag{24}
\]
Thus, by substituting (23) and (24) into (20), we obtain

\[
\varphi(W_n, x) = x^{r-1}[\varphi(Z_{n-1}, x) - x^{r-2}\varphi(Z_{n-3}, x)] \\
= x^{r-1}\left[x^{r-2}[x\varphi(Z_{n-2}, x) - \varphi(Z_{n-3}, x)] - x^{r-2}\left[x^{r-2}[x\varphi(Z_{n-4}, x) - \varphi(Z_{n-5}, x)]\right]\right] \\
= x^{r-2}\left[x^r[\varphi(Z_{n-2}, x) - x^{r-2}\varphi(Z_{n-4}, x)] - x^{r-1}[\varphi(Z_{n-3}, x) - x^{r-2}\varphi(Z_{n-5}, x)]\right] \\
= x^{r-2}[x\varphi(W_{n-1}, x) - \varphi(W_{n-2}, x)].
\] (25)

It is noted that (26) is derived from (21) and (22). Let \(k \geq 7\). Thus, we obtain

\[
\varphi(P_1^r \cup W_k, x) = \varphi(P_1^r, x)\varphi(W_k, x) \\
= \varphi(P_1^r, x)x^{r-2}[x\varphi(W_{k-1}, x) - \varphi(W_{k-2}, x)] \\
= x^{r-2}[x\varphi(P_1^r \cup W_{k-1}, x) - \varphi(P_1^r \cup W_{k-2}, x)] \\
= x^{r-2}[x\varphi(P_{k-5}^r \cup W_5, x) - \varphi(P_{k-6}^r \cup W_5, x)] \\
= x^{r-2}\varphi(W_5, x)\left[x\varphi(P_{k-5}^r, x) - \varphi(P_{k-6}^r, x)\right].
\] (31)

It is noted that (27) follows from Lemma 2.6(a), (28) is obtained by substituting (26) into (27), (29) is derived from Lemma 2.6(a), (30) follows from \(\varphi(P_1^r \cup W_{k-2}, x) = \varphi(P_{k-6}^r \cup W_5, x)\) and \(\varphi(P_1^r \cup W_{k-1}, x) = \varphi(P_{k-5}^r \cup W_5, x)\) (by the inductive hypothesis), and (31) is deduced from Lemma 2.6(a). Furthermore, we get

\[
\varphi(P_{k-4}^r, x) = x^{r-2}[x\varphi(P_{k-5}^r, x) - \varphi(P_{k-6}^r, x)].
\] (32)

By substituting (32) into (31), we have

\[
\varphi(P_1^r \cup W_k, x) = \varphi(W_5, x)\varphi(P_{k-4}^r, x) = \varphi(P_{k-4}^r \cup W_5, x).
\] (33)

Therefore, by the method of inductive hypothesis, when \(m = 6\) and \(n \geq 6\), we obtain (17).

(2). The proof of Lemma 5.1 when \(m \geq 7\) and \(n \geq 6\).

Let \(m \geq 7\) and \(n \geq 6\). By (17) and Lemma 2.6(a), we have \(\varphi(P_1^r \cup W_{n-1} \cup P_{m-5}^r, x) = \varphi(P_{n-5}^r \cup W_5 \cup P_{m-5}^r, x) = \varphi(P_{n-5}^r \cup W_{m-1} \cup P_1^r, x)\). Therefore, by Lemma 2.6(a), we get \(\varphi(P_{m-5}^r \cup W_{n-1}, x) = \varphi(P_{n-5}^r \cup W_{m-1}, x)\).

By combining the proofs of (1) and (2), we get Lemma 5.1. \(\square\)

By Lemmas 2.7 and 5.1, in Theorem 5.1, we obtain the third pair of \(r\)-uniform supertrees with the same SR and ME, where \(r \geq 3\).
Theorem 5.1 Let \( m, n \geq 6 \) and \( r \geq 3 \). We have \( \rho(P_{m-5}^r \cup W_{n-1}) = \rho(P_{n-5}^r \cup W_{m-1}) \) and \( ME(P_{m-5}^r \cup W_{n-1}) = ME(P_{n-5}^r \cup W_{m-1}) \).

In the following, all mentioned results are related with the spectra of adjacency matrix. Let \( W_n = Q(1, n - 4, 1) \) with \( n \geq 5 \) and \( Z_n = T(1, n - 2) \) with \( n \geq 2 \). Shen et al. [35] deduced that \( P_{n-1} \cup Z_{n+1} \) \((n \geq 1)\) is not determined by their spectra while \( Z_{n+1} \) \((n \geq 1)\) and \( Z_{n_1+1} \cup \cdots \cup Z_{n_k+1} \) \((n_1, n_2, \ldots, n_k \geq 2)\) are determined by their spectra. Wang et al. [36] obtained that \( P_0 \cup P_{n-1} \) is determined by their spectra if and only if \( n = 2k \) with \( k \geq 1 \). Cvetković and Jovanović [38] derived that \( Z_{n+1} \cup P_0 \) \((n \geq 9)\) is determined by their spectra. Inspired by all the above-mentioned results, in Theorem 5.2, we get that \( W_{n-1} \cup P_{m-5} \) \((n, m \geq 6 \text{ and } n \neq m)\) is not determined by its spectra.

Theorem 5.2 Let \( m, n \geq 6 \). We have \( \phi(P_{m-5}^r \cup W_{n-1}, x) = \phi(P_{n-5}^r \cup W_{m-1}, x) \). Namely, \( P_{m-5} \cup W_{n-1} \) and \( P_{n-5} \cup W_{m-1} \) are \( M \)-cospectral and \( ME(P_{m-5}^r \cup W_{n-1}) = ME(P_{n-5}^r \cup W_{m-1}) \), where \( M \) is the adjacency matrix.

Proof. Let \( m, n \geq 6 \). By Lemma 5.1, when \( r = 2 \), we get \( \varphi(P_{m-5}^r \cup W_{n-1}, x) = \varphi(P_{n-5}^r \cup W_{m-1}, x) \). Furthermore, by Lemma 2.1 and the definition of the matching energy of a graph, we get Theorem 5.2. \( \square \)
