FREE SUBPRODUCTS AND FREE SCALED PRODUCTS OF II₁–FACTORS

KEN DYKEMA

ABSTRACT. The constructions of free subproducts of von Neumann algebras and free scaled products are introduced, and results about them are proved, including rescaling results and results about free trade in free scaled products.

INTRODUCTION

The rescaling \( M_t \) of a II₁–factor \( M \) by a positive number \( t \) was introduced by Murray and von Neumann [8]. In the paper [5], F. Rădulescu and the author showed that if \( Q(1), \ldots, Q(n) \) are II₁–factors (\( n \in \{2, 3, \ldots\} \)) and if \( 0 < t < \sqrt{1 - 1/n} \) then
\[
(Q(1) * \cdots * Q(n))_t \cong Q(1) * \cdots * Q(n) * L(F_r),
\]
where \( r = (n - 1)(t^{-2} - 1) \). Here \( L(F_r) \), \( (r > 1) \), is an interpolated free group factor ([3, 4]). In the note [6], we defined the RHS of \( (1) \) for any \( 1 - n < r \leq \infty \).

Several natural formulae were shown to hold, including
\[
(Q(1) * \cdots * Q(n) * L(F_r))_t \cong Q(1) * \cdots * Q(n) * L(F_{t^{-2}+(n-1)(t^{-2}-1)})
\]
\( (1 - n < r \leq \infty, 0 < t < \infty) \).

This paper will study free subproducts of von Neumann algebras,
\[
\mathcal{M} = \mathcal{N} * \{ t_i, Q(i) \},
\]
where \( \mathcal{N} \) is a II₁–factor, each \( 0 < t_i \leq 1 \) and each \( Q(i) \) is a von Neumann algebra with specified normal faithful tracial state. This construction is like that of the free product except that, loosely speaking, each \( Q(i) \) is added (freely) with support projection \( p_i \in \mathcal{N} \), where the trace of \( p_i \) equals \( t_i \). We prove a number results about free subproducts when all the \( Q(i) \) are II₁–factors, including (Theorem 3.9)
\[
\mathcal{N} * \big[ t(i), Q(i) \big] \cong \mathcal{N} * Q(1) * \cdots * Q(n) * L(F_r),
\]
where \( r = -n + \sum_{i=1}^{n} t(i)^2 \), and (Theorem 3.10) if \( \mathcal{N} \cong \mathcal{N} * L(F_\infty) \) or \( Q(i) \cong Q(i) * L(F_\infty) \) for some \( i \) then
\[
\mathcal{N} * \big[ t_i, Q(i) \big] \cong \big( \bigcup_{i=1}^{\infty} Q(i) \big)_{t_i}.
\]

We then turn to compressions and rescalings of free subproducts of II\textsubscript{1}–factors. In order to elegantly express the rescaling of a free subproduct, we define

\[ M = N \ast_{\iota \in I} [t_{\iota}, Q(\iota)], \quad (2) \]

where every \( Q(\iota) \) is a II\textsubscript{1}–factor and where \( 0 < t_{\iota} < \infty \). This generalization of the free subproduct is called the free scaled product. Analogues of the above mentioned results hold for free scaled products. We also prove the rescaling result (Theorem 1.9)

\[ \left( N \ast_{\iota \in I} [t(\iota), Q(\iota)] \right)_{s} \cong N_{s} \ast_{\iota \in I} \left[ \frac{t(\iota)}{s}, Q(\iota) \right]. \]

We then introduce the technique we call free trade in a free scaled product of II\textsubscript{1}–factors. This allows, in a free scaled product,

\[ (N \ast L(F_{r})) \ast_{\iota \in I} [t_{\iota}, Q(\iota)], \]

increasing some \( t_{\iota} \) at the cost of decreasing \( r \), or increasing \( r \) at the cost of decreasing some \( t_{\iota} \). Of course, some \( t_{\iota} \) can increase while another decreases and \( r \) remains constant. Using free trade, we prove (Theorem 5.5(i)) that

\[ N \ast_{n=1}^{\infty} [t(n), Q(n)] \cong N \ast_{n=1}^{\infty} \left( Q(n) \right. \left. \frac{1}{t(n)} \right), \quad (3) \]

holds for a free scaled product whenever \( \sum_{n=1}^{\infty} t(n)^{2} = \infty \). We also show that isomorphism of free group factors is equivalent to the isomorphism (3) holding for free scaled products in general.

Rescaled free products and free subproducts can arise quite naturally in von Neumann algebras whose definitions involve freeness. For example, the results of this paper are used in [4] to describe von Neumann algebras generated by DT–operators. In proving isomorphism theorems involving free subproducts and free scaled products (2) and rescalings of them, we are careful to keep track of how the algebra \( N \) and its compressions are embedded in the free scaled products. Although this requires considerable extra effort, the results are important for this paper’s development and for applications.

In §4, the notation we use for von Neumann algebras with specified traces is layed out and results from [1] about free products of certain classes of von Neumann algebras with respect to traces are reviewed. This section includes a discussion of the heuristic quantity “free dimension”, which was introduced in [1] and is useful for proving isomorphisms involving free products of von Neumann algebras from a certain class.

In §2, the rescaling of free products of II\textsubscript{1}–factors is revisited and related results are proved.

In §3, free subproducts of von Neumann algebras are defined and a number of facts about them are proved.

In §4, free scaled products are introduced and used to describe rescalings of free subproducts of II\textsubscript{1}–factors.

In §5, the technique of free trade in free scaled products is developed.
1. Interpolated Free Group Factors and Free Dimension

In this section we describe some notation for specifying tracial states on certain sorts of von Neumann algebras, and recall some results from [1] about free products of von Neumann algebras. We will also describe the heuristic notion of free dimension, which was introduced in [1] and which is a useful tool for describing the von Neumann algebras resulting from these free products. However, whether this free dimension is truly an invariant of von Neumann algebras is still an open question, depending on whether the free group factors are isomorphic to each other or not. We will describe this in more detail, and also make a strictly rigorous interpretation of our free dimension.

Let us begin by recalling that the family of interpolated free group factors $L(F_r)$, $(1 < r \leq \infty)$, extending the family of usual free group factors $L(F_n)$, $(n \in \{2, 3, \ldots, \infty\})$, was defined in [9] and [2]; these factors satisfy the rescaling formula

$$L(F_r)_t \cong L(F_{1+t-2(r-1)}), \quad (1 < r \leq \infty, \ 0 < t < \infty)$$

and their index behaves additively with respect to free products:

$$L(F_r) \ast L(F_s) \cong L(F_{r+s}),$$

where the free product is taken with respect to the tracial states on $L(F_r)$ and $L(F_s)$. From these isomorphism, it was shown in [9] and [2] that the interpolated free group factors are either all isomorphic to each other or all mutually nonisomorphic; (however, assuming $L(F_r) \cong L(F_s)$ for some $1 < s < r \leq \infty$, the isomorphism of $L(F_r) \cong L(F_\infty)$ was shown by Rădulescu in [9], and not in [2]).

The operation of free product for von Neumann algebras,

$$(\mathcal{M}, \phi) = (A, \phi_A) \ast (B, \phi_B),$$

defined by Voiculescu in [10] (see also the book [13]) acts on the class of pairs $(\mathcal{N}, \psi)$ of von Neumann algebras $\mathcal{N}$ equipped with normal states $\psi$, whose GNS representations are faithful. In this paper, we will be concerned only with pairs $(\mathcal{N}, \phi)$ where $\psi$ is a faithful tracial state. Moreover, we will usually avoid writing the traces explicitly, using the notation $\mathcal{M} = A \ast B$ instead of the notation (5), with the understanding that the algebras $A$ and $B$ are equipped with specific traces and with $\mathcal{M}$ inheriting the free product trace. We use the following conventions for specifying traces on von Neumann algebras:

- Any $\text{II}_1$–factor is equipped with its unique tracial state.
- Any matrix algebra $M_n(\mathbb{C})$ is equipped with its unique tracial state.
- For any discrete group $G$, its group von Neumann algebra $L(G)$, which is the strong–operator closure of the span of its left regular representation on $\ell^2(G)$, is equipped with its canonical tracial state, $\tau_G(x) = \langle \delta_e, x\delta_e \rangle$, where $\delta_e \in \ell^2(G)$ is the characteristic function of the identity element of $G$.
- If $A$ is equipped with a tracial state $\tau$ and if $p \in A$ is a projection, then $pAp$ is equipped with the renormalized tracial state $\tau(p)^{-1}\tau|_{pAp}$.
(e) If $A = A_1 \oplus A_2$ and if $A_1$ and $A_2$ are equipped with tracial states $\tau_1$ and $\tau_2$, respectively, then each of the notations

$$ A = A_1 \ominus A_2, \quad A = A_1 \oplus A_2 \quad \text{and} \quad A = A_1 \oplus A_2 $$

indicates that the direct sum of von Neumann algebras $A = A_1 \oplus A_2$ is equipped with the tracial state

$$ \tau((a_1, a_2)) = \alpha \tau_1(a_1) + (1 - \alpha) \tau_2(a_2). $$

Moreover, if $A_i$ is equipped with tracial state $\tau_i$ then the notation

$$ A = A_1 \ominus A_2 \ominus \cdots \ominus A_n, $$

where $\alpha_j > 0$ and $\alpha_1 + \cdots + \alpha_n = 1$, indicates that the direct sum of von Neumann algebras $A = A_1 \ominus A_n$ is equipped with the tracial state

$$ \tau((a_1, \ldots, a_n)) = \sum_{i=1}^{n} \alpha_i \tau_i(a_i), $$

and we use a similar notation for countably infinite direct sums.

Let $\mathcal{F}$ be the class of all von Neumann algebras, equipped with specified faithful tracial states, that are either finite dimensional, hyperfinite, interpolated free group factors or direct sums of the form

$$ \bigoplus_{i \in I} L(F_{t_i}) \quad \text{or} \quad F \oplus \left( \bigoplus_{i \in I} L(F_{t_i}) \right), $$

where $I$ is finite or countably infinite and where $F$ is either finite dimensional or hyperfinite. In [1], it was shown that whenever $A, B \in \mathcal{F}$ and $\dim(A) \geq 2$, $\dim(B) \geq 3$, then their free product $\mathcal{M} = A \ast B$, satisfies

$$ \mathcal{M} \cong L(F_r) \quad \text{or} \quad \mathcal{M} \cong L(F_r) \oplus D \quad (6) $$

where $D$ is finite dimensional von Neumann algebra. Moreover, an algorithm was proved to determine whether $\mathcal{M}$ is a factor, and if it is not, to find $D$ and the restriction of the free product trace to $D$. (This information in turn depends only on information about minimal projections in $A$ and $B$ and their traces.) In the proof of the isomorphism (6), a value for the parameter $r$ was also found, although it is not yet known whether this parameter has any meaning. The best way to describe the calculus for finding $r$ is to use what we called “free dimension,” which is a quantity $\text{fdim}(A)$, ostensibly assigned to any von Neumann algebra with specified tracial state $A$ belonging to the class $\mathcal{F}$, according to the following rules:

(i) If $A$ is a hyperfinite von Neumann algebra that is diffuse (i.e. having no minimal projections) then $\text{fdim}(A) = 1$.

(ii) If $A = M_n(C)$, $n \in \mathbb{N}$, then $\text{fdim}(A) = 1 - n^{-2}$.

(iii) If $A = L(F_t)$ for $1 < t \leq \infty$ then $\text{fdim}(A) = t$. 
(iv) If
\[ A = A_1 \oplus \cdots \oplus A_n \quad \text{or} \quad A = \bigoplus_{i=1}^{\infty} A_i, \]
then
\[ \text{fdim} (A) = \sum_{i=1}^{m} 1 + \alpha_i^2 (\text{fdim} (A_i) - 1), \]
where \( m = n \) or \( m = \infty \), respectively.

These rules allow one to compute the free dimension of any von Neumann algebra with specified tracial state belonging to the class \( \mathcal{F} \). The rule for free products is that
\[ \text{fdim} (A \ast B) = \text{fdim} (A) + \text{fdim} (B). \] \hspace{1cm} (7)

Knowing the free dimension of \( \mathcal{M} = A \ast B \), one can then compute the index \( r \) appearing in (3) by employing rules (ii), (iii) and (iv) above. (Many examples are contained in [1], and one is found below in this section.)

Rule (iii) is problematic, since it is not known whether the free group factors are isomorphic or not. In fact, for \( A \in \mathcal{F} \), \( \text{fdim} (A) \) is presently known to be well-defined only if \( A \) is hyperfinite. However, the sole purpose of \( \text{fdim} (\cdot) \) is to compute \( r \) in \( L(\mathbf{F}_r) \), which is of interest only if the free group factors are non–isomorphic. As we should compute the values of \( r \) in all occurrences \( L(\mathbf{F}_r) \) in our results, it is necessary to continue using \( \text{fdim} \) in proofs.

If one desires, one can take a linguistic perspective to ensure that no undefined quantities are employed. We may think of \( \text{fdim} \) as being defined only on certain arrangements of symbols. Then \( \text{fdim} \) is defined by the rules (i)–(iv) above and is single–valued on all allowable arrangements of symbols. Now the question of whether \( \text{fdim} \) necessarily takes the same value on all arrangements of symbols corresponding to isomorphic von Neumann algebras is precisely the question of non–isomorphism of free group factors.

Regardless of whether free group factors are isomorphic or not, we can always use the values of \( \text{fdim} \) to write true statements about von Neumann algebras. We have for example
\[ \text{fdim} \left( L(\mathbf{F}_2) \oplus \frac{\mathbf{C}}{1/2} \right) = 1 \quad \text{and} \quad \text{fdim} \left( L(\mathbf{F}_4) \right) = 4, \]
and the additive rule for free products (7) then leads to the statement \( \text{fdim} (\mathcal{M}) = 5 \), where
\[ \mathcal{M} = \left( L(\mathbf{F}_2) \oplus \frac{\mathbf{C}}{1/2} \right) \ast L(\mathbf{F}_4). \]

On the other hand, the algorithm mentioned above (just below equation (6)) gives that \( \mathcal{M} \cong L(\mathbf{F}_r) \) for some \( r \). We may therefore write
\[ \left( L(\mathbf{F}_2) \oplus \frac{\mathbf{C}}{1/2} \right) \ast L(\mathbf{F}_4) \cong L(\mathbf{F}_5). \]

This statement is true if the free group factors are non–isomorphic, and, of course, also if they are isomorphic.
The results of \[1\] handle also free products of countably infinitely many von Neumann algebras from \(\mathcal{F}\) in a similar way.

The notion of free dimension as used in \[1\] and in this paper should not be confused with the free entropy dimensions which were defined by Voiculescu in \[11\] and \[12\]. While the former, as we have seen, is only a heuristic device to help in intermediate calculations in order to obtain true statements about certain isomorphisms of von Neumann algebras, the latter are intrinsically defined quantities which are defined on \(n\)-tuples of self-adjoint elements in von Neumann algebras having specified trace.

2. Rescalings of free products of II\(_1\)-factors revisited

The paper \[5\], where the compression formula
\[
\left( \sum_{i \in I} A(i) \right) \mathcal{T} = \left( \sum_{i \in I} A(i) \right) \ast L\left( F\left( |I| - 1 \right) (t - 2 - 1) \right)
\]
was proved for II\(_1\)-factors \(A(i)\), was concerned only with the isomorphism class of the compression. However, we will need to know that if \(p \in A(i_0)\) is a projection, then \(pA(i_0)p\) is itself freely complemented in \(p\left( \sum_{i \in I} A(i) \right)p\). The purpose of the next lemma is to prove this by modifying the proof of the formula (8) found in \[5\].

**Theorem 2.1.** Let \(I\) be a finite or countably infinite set and for each \(i \in I\) let \(A(i)\) be a II\(_1\)-factor. Let
\[
\mathcal{M} = \sum_{i \in I} A(i).
\]
Single out some \(i_0 \in I\) and let \(p \in A(i_0)\) be a projection of trace \(t\), where \(0 < t < 1\). Then \(pA(i_0)p\) is freely complemented in \(p\mathcal{M}p\) by an algebra isomorphic to
\[
\left( \sum_{i \in I \setminus \{i_0\}} A(i) \right) \ast L\left( F\left( |I| - 1 \right) (t - 2 - 1) \right).
\]

**Proof.** If \(t = 1/n\) for some \(n \in \mathbb{N}\) then this follows directly from the proof of Lemma 1.1 of \[5\].

Suppose \(t\) is not a reciprocal integer. From the proof of Lemma 1.2 of \[5\],
\[
p\mathcal{M}p = W^*\left( p\mathcal{N}p \cup pA(i_0)p \cup \bigcup_{i \in I \setminus \{i_0\}} u(i)^*A(i)u(i) \right),
\]
where \(u(i) \in \mathcal{N}\) are some partial isometries with \(u(i)^*u(i) = p\) and \(u(i)u(i)^* \in A(i)\). Moreover, the family
\[
p\mathcal{N}p, pA(i_0)p, \left( u(i)^*A(i)u(i) \right)_{i \in I \setminus \{i_0\}}
\]
of subalgebras of \(p\mathcal{M}p\) is free over a common two-dimensional subalgebra
\[
D = \mathbb{C} \oplus \mathbb{C},
\]
and
\[
p\mathcal{N}p \cong \begin{cases} L\left( F_x \right) & \text{if } t \leq 1 - \frac{1}{2|I|}; \\ L\left( F_w \right) \oplus \mathbb{C} & \text{if } t > 1 - \frac{1}{2|I|}; \end{cases}
\]
(10)
where
\[x = (|I| - 1)(t^{-2} - 1) + 2|I|r(1 - r),\]
\[w = 2 - (|I| + 1)(2|I| - 1)^{-2},\]
\[\alpha = 2|I| - (2|I| - 1)t^{-1}.
\]
Let
\[\mathcal{A} = \ast_{i \in I} (\mathcal{C}_r \oplus \mathcal{C}_{1/r}).\]
Note that \(\text{fdim}(\mathcal{A}) = 2|I|r(1 - r)\). We will find \(Q\) such that \(pNp \cong Q \ast \mathcal{A}\).

First suppose \((|I| - 1)(t^{-2} - 1) \geq 1\), i.e.
\[t \leq \sqrt{1 - \frac{1}{|I|}}.
\]
Then \(t \leq 1 - \frac{1}{2|I|}\), and it suffices to take
\[Q = \begin{cases} 
L(F(|I|-1)(t^{-2}-1)) & \text{if } t < \sqrt{1 - \frac{1}{|I|}}, \\
R & \text{if } t = \sqrt{1 - \frac{1}{|I|}}, 
\end{cases}
\]
where \(R\) is the hyperfinite \(\text{II}_1\)-factor.

Now suppose
\[\sqrt{1 - \frac{1}{|I|}} < t \leq 1 - \frac{1}{2|I|}.
\]
Then
\[\frac{1}{2|I| - 1} \leq r < \sqrt{\frac{|I|}{|I| - 1}} - 1,
\]
so \(|I|r < 1\) and
\[\mathcal{A} \cong \begin{cases} 
L^\infty[0, 1] \otimes M_2(\mathcal{C}) \oplus C_{1^{-2r}} & \text{if } |I| = 2 \\
L(F_v) \oplus C_{1^{-|I|r}} & \text{if } |I| \geq 3,
\end{cases}
\]
where \(v = (2|I| - 1)/|I|\). If we can find \(Q\) with
\[\text{fdim}(Q) = (|I| - 1)(t^{-2} - 1) = (|I| - 1)(r^2 + 2r)\]
and such that \(Q\) has no central and minimal projections of trace \(>|I|r\), then we will have \(\mathcal{A} \ast Q = L(F(|I|-1)(t^{-2}-1) + 2|I|r(1-r))\), as required. Since
\[|I|r \geq \frac{|I|}{2|I| - 1} > \frac{1}{2},
\]
it will suffice to let
\[Q = Q(1) \oplus C_{|I|r}.
\]
where $\mathcal{Q}(1) \in \mathcal{F}$ and (13) holds. We must show this is possible. Noting
\[ \text{fdim} (\mathcal{Q}) = 1 - (|I|r)^2 + (1 - |I|r)^2 (\text{fdim} (\mathcal{Q}(1)) - 1), \]
setting \( \text{fdim} (\mathcal{Q}) = (|I| - 1)(r^2 + 2r) \) and solving yields
\[ \text{fdim} (\mathcal{Q}(1)) = \frac{(2|I|^2 + |I| - 1)r^2 - 2r}{1 - |I|r^2}. \] (14)
But the lower bound (11) gives that \( (2|I|^2 + |I| - 1)r^2 - 2r > 0. \) We can take
\[ \mathcal{Q}(1) = L(F_u) \oplus C \]
for suitable \( u > 1 \) and \( \gamma > 0 \) making (14) hold, and this yields \( pNp \cong \mathcal{A} * \mathcal{Q}. \)

Finally, suppose \( t > 1 - \frac{1}{2|I|}. \)

Then \( 0 < r < 1/(2|I| - 1) \) and \( |I|r < 1, \) so (12) holds. In the isomorphism (10), \( \alpha = 1 - (2|I| - 1)r. \) So letting
\[ \mathcal{Q} = L(F_{2 + \frac{1}{|I|-1}}) \oplus C \]
we find that \( pNp \cong \mathcal{A} * \mathcal{Q}. \)

Therefore, in every case we have
\[ pNp = W^*(F \cup \bigcup_{i \in I} \tilde{D}_i) \]
where \( F \in \mathcal{F} \) with \( \text{fdim} (F) = (|I| - 1)(t - 1) \) and \( D \subseteq F, \) each \( \tilde{D}_i \) is a tracially identical copy of \( D \) and the family \( F, (\tilde{D}_i)_{i \in I} \) is free. Then
\[ pMp = W^* \left((F \cup \tilde{D}_{i_0}) \cup A(i_0)p \cup \bigcup_{i \in I \setminus \{i_0\}} (u(i)^*A(i)u(i) \cup \tilde{D}_i)\right) \]
and the family
\[ W^*(F \cup \tilde{D}_{i_0}), pA(i_0)p, \left(W^*(u(i)^*A(i)u(i) \cup \tilde{D}_i)\right)_{i \in I \setminus \{i_0\}} \]
is free over \( D. \) But \( \tilde{D}_{i_0} \) is in \( W^*(F \cup \tilde{D}_{i_0}) \) both freely complemented by \( F \) and unitarily equivalent to \( D. \) Hence \( D \) is freely complemented in \( W^*(F \cup \tilde{D}_{i_0}) \) by an algebra isomorphic to \( F. \) Similarly, as \( \tilde{D} \) is in \( W^*(u(i)^*A(i)u(i) \cup \tilde{D}_i) \) both freely complemented by an algebra isomorphic to \( A(i)_t \) and unitarily equivalent to \( D, \) we conclude that \( D \) is freely complemented in \( W^*(u(i)^*A(i)u(i) \cup \tilde{D}_i) \) by an algebra isomorphic to \( A(i)_t. \) Altogether, we have that \( pA(i_0)p \) is freely complemented in \( pNp \) by an algebra isomorphic to the algebra (9). \( \square \)

The following standard lemma will allow use of Theorem 2.1 in reverse. (See Corollary 2.3). For completeness, we indicate a proof.
Lemma 2.2. Suppose $\mathcal{N}$ is a II$_1$–factor, $\mathcal{M}(1)$ and $\mathcal{M}(2)$ are von Neumann algebras and $\pi_k : \mathcal{N} \to \mathcal{M}(k)$, ($k = 1, 2$) are normal, unital $*$-homomorphisms. Let $p \in \mathcal{N}$ be a nonzero projection and suppose there is an isomorphism

$$\rho : \pi_1(p)\mathcal{M}(1)\pi_1(p) \sim \pi_2(p)\mathcal{M}(2)\pi_2(p)$$

such that $\rho \circ \pi_1|_{\rho \pi_1(p)} = \pi_2|_{\rho \pi_1(p)}$. Then there is an isomorphism $\sigma : \mathcal{M}(1) \to \mathcal{M}(2)$ such that $\sigma \circ \pi_2 = \pi_2$ and $\sigma|_{\pi_1(p)\mathcal{M}(1)\pi_1(p)} = \rho$.

Proof. There is $n \in \mathbb{N} \cup \{0\}$ and there are $v_0, v_1, \ldots, v_n$ such that $\sum_{j=0}^n v_j^*v_j = 1$, $v_0v_0^* \leq p$ and $v_jv_j^* = p$ ($1 \leq j \leq n$). Define $\sigma$ by

$$\sigma(x) = \sum_{0 \leq i, j \leq n} \pi_2(v_i)^*\rho(\pi_1(v_i)x\pi_1(v_j)^*)\pi_2(v_j).$$

\[\square\]

Corollary 2.3. Let $\mathcal{N}$ be a II$_1$–factor unitally contained in a von Neumann algebra $\mathcal{M}$ with fixed tracial state. If $p \in \mathcal{N}$ is a projection of trace $t$ and if $p\mathcal{N}p$ is freely complemented in $p\mathcal{M}p$ by an algebra which is trace-preservingly isomorphic to

$$\left(\bigast_{i \in I} A(i)\right) \ast L(F_{n(t^2-1)}),$$

for some II$_1$–factors $A(i)$, then $\mathcal{N}$ is freely complemented in $\mathcal{M}$ by an algebra isomorphic to

$$\left(\bigast_{i \in I} A(i)\right) \frac{1}{t} \pi.$$

Proof. Let $\pi : \mathcal{N} \to \mathcal{M}$ denote the inclusion. Let $\widetilde{\mathcal{M}} = \mathcal{N} \ast \left(\bigast_{i \in I} A(i)\right)$ and let $\widetilde{\pi} : \mathcal{N} \to \widetilde{\mathcal{M}}$ denote the embedding arising from the free product construction. By Theorem [21] and the hypothesis on $p\mathcal{M}p$, there is an isomorphism $\rho : p\mathcal{M}p \sim \widetilde{\pi}(p)\widetilde{\mathcal{M}}\widetilde{\pi}(p)$ such that $\rho \circ \pi|_{\rho \pi_1(p)} = \widetilde{\pi}|_{\widetilde{\pi}(p)}$. By Lemma [22], $\rho$ extends to an isomorphism $\sigma : \mathcal{M} \to \widetilde{\mathcal{M}}$ such that $\sigma \circ \pi = \widetilde{\pi}$.

\[\square\]

In [3], Rădulescu and the author showed that if $A \in \mathcal{F}$ and $\mathcal{N}$ is a II$_1$–factor then $\mathcal{N} \ast A \cong \mathcal{N} \ast L(F_r)$ where $r = \text{fdim}(A)$. We now show that the resulting embedding $\mathcal{N} \hookrightarrow \mathcal{N} \ast L(F_r)$ is independent of the choice of the particular algebra $A$, so long as it has free dimension $r$.

Proposition 2.4. Let $\mathcal{N}$ be a II$_1$–factor and let $A_1, A_2 \in \mathcal{F}$ be such that $\text{fdim}(A_1) = \text{fdim}(A_2) > 0$. Let $\mathcal{M}(i) = \mathcal{N} \ast A_i$, ($i = 1, 2$). Then there is an isomorphism $\mathcal{M}(1) \sim \mathcal{M}(2)$ which intertwines the embeddings $\mathcal{N} \hookrightarrow \mathcal{M}(i)$ arising from the free product construction.

Proof. Let $k \in \mathbb{N}$ be so large that $A_i \ast M_k(\mathbb{C})$ is isomorphic to the interpolated free group factor $L(F_{r+1-k})$ for both $i = 1$ and $i = 2$. Let $(e_{ij})_{1 \leq i, j \leq k}$ be a system of matrix units in $\mathcal{N}$ and let

$$\mathcal{P}(i) = W^*(\{e_{ij} \mid 1 \leq i, j \leq k\} \cup A_i) \subseteq \mathcal{M}(i).$$
Then
\[ M(i) = W^*(\{e_{ij} \mid 1 \leq i, j \leq k\} \cup e_{11}N e_{11} \cup e_{11}P(i)e_{11}). \]
By [1, Thm. 1.2], \( e_{11}N e_{11} \) and \( e_{11}P(i)e_{11} \) are free. Choosing any isomorphism \( e_{11}P(1)e_{11} \sim e_{11}P(2)e_{11} \) and taking the identity maps on \( e_{11}N e_{11} \) and \( \{e_{ij} \mid 1 \leq i, j \leq k\} \), we construct the desired isomorphism \( M(1) \sim M(2). \)

**Definition 2.5.** Let \( N \) be a II\(_1\)–factor and let \( r > 0 \). By the canonical embedding \( N \hookrightarrow N^* L(F_r) \), we will mean any inclusion such that the image of \( N \) in \( N^* L(F_r) \) is freely complemented by an algebra \( A \) which (together with the restriction of the trace) belongs to the class \( F \) and satisfies \( \text{fdim} (A) = r \).

**Definition 2.6.** Let us extend the notation \( N^* L(F_r) \) to the case \( r = 0 \), defining \( N^* L(F_0) \) to be \( N \) and the canonical embedding \( N \hookrightarrow N^* L(F_0) \) to be the identity map.

### 3. Free subproducts of von Neumann algebras

**Proposition 3.1.** Let \( N \) be a II\(_1\)–factor. Let \( I \) be a set and for every \( \iota \in I \) let \( Q(\iota) \) be a von Neumann algebra with fixed normal, faithful, tracial state and let \( 0 < t_\iota < 1 \). Then there is a von Neumann algebra \( M \) with normal faithful tracial state \( \tau \), unique up to trace–preserving isomorphism, with the property that
\[ M = W^*(A \cup \bigcup_{\iota \in I} B_\iota), \]
where
(i) \( A \) is a unital subalgebra of \( M \) isomorphic to \( N \);
(ii) for all \( \iota \in I \), \( p_\iota \in B_\iota \subseteq p_\iota M p_\iota \) for a projection \( p_\iota \in A \) having trace \( t_\iota \) and there is a trace–preserving isomorphism \( B_\iota \sim Q(\iota) \);
(iii) for all \( \iota \in I \), \( B_\iota \) and \( p_\iota W^*(A \cup \bigcup_{j \in I \setminus \{\iota\}} B_j) p_\iota \)
are free with respect to \( t_\iota^{-1} \tau|_{p_\iota M p_\iota} \).

**Proof.** Let
\[ P = N^* \left( \bigast_{\iota \in I} \left( C \oplus Q(\iota) \right) \right). \]
(15)
Let \( \lambda_N : N \hookrightarrow P \) and \( \lambda_\iota : C \oplus Q(\iota) \hookrightarrow P \) be the embeddings arising from the free product construction. Let
\[ P(\iota) = W^*(\lambda_N(N) \cup \lambda_\iota(C \oplus C)). \]
Then by [8, Prop. 4(ix)], \( P(\iota) \) is the II\(_1\)–factor \( N * L(F_{2t_i(1-t_i)}) \). Let \( q_i = \lambda_i(0 \oplus 1) \in \mathcal{P}(\iota) \) and let \( v_i \in \mathcal{P}(\iota) \) be such that \( v_i v_i^* = q_i \) and \( p_i := v_i^* v_i \in \lambda_N(\mathcal{N}) \). By [1, Thm 1.2], \( \lambda_i(0 \oplus Q(\iota)) \) and

\[
q_\iota = \lambda_\iota(0 \oplus 1) \in P(\iota)
\]

are free. Let \( A = \lambda_N(\mathcal{N}) \), \( B_\iota = v_i^* \lambda_i(0 \oplus Q(\iota)) v_\iota \), let

\[
\mathcal{M} = W^*(A \cup \bigcup_{\iota \in I} B_\iota)
\]

and let \( \tau \) be the restriction of the free product trace on \( \mathcal{P} \) to \( \mathcal{M} \). Then the pair \((\mathcal{M}, \tau)\) satisfies the desired properties. Moreover, if the \( p_\iota \) are fixed then \( \mathcal{M} \) is clearly unique up to trace–preserving isomorphism. However, using partial isometries in \( A \), the projections \( p_\iota \in A \) may be chosen arbitrarily so long as \( \tau( p_\iota ) = t_\iota \). This shows the desired uniqueness.

**Remark 3.2.** For future use note that if \( C_\iota = W^*(A \cup B_\iota) \) then the family \((C_\iota)_{\iota \in I}\) is free over \( A \), with respect to the trace–preserving conditional expectation \( \mathcal{M} \to A \), which is the restriction of the canonical conditional expectation \( \mathcal{P} \to A = \lambda_N(\mathcal{N}) \) arising from the free product construction in [15].

**Definition 3.3.** The von Neumann algebra \( \mathcal{M} \) of Proposition [8.1] will be called the **free subproduct** of \( \mathcal{N} \) with \((Q(\iota))_{\iota \in I}\) at projections of traces \((t_\iota)_{\iota \in I}\), and will be denoted

\[
N *_{\iota \in I} [t_\iota, Q(\iota)].
\]

The inclusion \( A \hookrightarrow \mathcal{M} \) is called the **canonical embedding**

\[
N \hookrightarrow N *_{\iota \in I} [t_\iota, Q(\iota)].
\]

The following variants of the notation \((16)\) may be used:

\[
N *_{i=1}^n [t_i, Q(i)] \quad \text{if } I = \{1\}
\]

\[
N *_{i=1}^n [t_i, Q(i)] \quad \text{if } I = \{1, \ldots , n\}
\]

\[
N *_{i=1}^\infty [t_i, Q(i)] \quad \text{if } I = \mathbb{N}.
\]

We will be primarily interested in free subproducts \((16)\) where the \( Q(\iota) \) are either II\(_1\)–factors or belong to the class of algebras \( \mathcal{F} \). We begin, however, with a few easy properties of free subproducts.

**Proposition 3.4.** Let

\[
\mathcal{M} = N *_{\iota \in I} [t_\iota, Q(\iota)]
\]

be a free subproduct of von Neumann algebras.
(A) If $I = I_1 \cup I_2$ is a partition of $I$ then there is an isomorphism

$$\mathcal{M} \sim \left( \mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right] \right)_{\iota \in I_1} * \left[ t_\iota, \mathcal{Q}(\iota) \right]_{\iota \in I_2}$$

intertwining the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M}$ with the composition of the canonical embeddings

$$\mathcal{N} \hookrightarrow \mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right]_{\iota \in I_1}$$

and

$$\mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right] \hookrightarrow \left( \mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right] \right)_{\iota \in I_1 \setminus I_1 \cup I_2} * \left[ t_\iota, \mathcal{Q}(\iota) \right]_{\iota \in I_2}.$$

(B) If $I_1 = \{ \iota \in I \mid t_\iota = 1 \}$ then there is an isomorphism

$$\mathcal{M} \sim \left( \mathcal{N} * \left( \mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right] \right) \right)_{\iota \in I_1} * \left[ t_\iota, \mathcal{Q}(\iota) \right]_{\iota \in I_2}$$

intertwining the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M}$ with the composition of the embedding

$$\mathcal{N} \hookrightarrow \mathcal{N} * \left( \mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right] \right)_{\iota \in I_1}$$

arising from the free product construction and the canonical embedding

$$\mathcal{N} * \left( \mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right] \right) \hookrightarrow \left( \mathcal{N} * \left( \mathcal{N} * \left[ t_\iota, \mathcal{Q}(\iota) \right] \right) \right)_{\iota \in I_1 \setminus I_1 \cup I_2} * \left[ t_\iota, \mathcal{Q}(\iota) \right]_{\iota \in I_2}.$$

(C) If

$$\mathcal{Q}(\iota) = \mathcal{N}(\iota) * \left[ s_\jmath, \mathcal{P}(\jmath) \right]_{\jmath \in J_\iota} \quad (\iota \in I)$$

for a family $(J_\iota)_{\iota \in I}$ of pairwise disjoint sets, $II_1$–factors $\mathcal{N}(\iota)$ and von Neumann algebras $\mathcal{P}(\jmath)$, then letting $J = \bigcup_{\iota \in I} J_\iota$ and $r_\jmath = s_\jmath t_\iota$ whenever $\jmath \in J_\iota$, there is an isomorphism

$$\mathcal{M} \sim \left( \mathcal{N} * \left[ t_\iota, \mathcal{N}(\iota) \right] \right)_{\iota \in I} * \left[ r_\jmath, \mathcal{P}(\jmath) \right]_{\jmath \in J}$$

intertwining the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M}$ with the composition of the canonical embeddings

$$\mathcal{N} \hookrightarrow \mathcal{N} * \left[ t_\iota, \mathcal{N}(\iota) \right]_{\iota \in I}$$

and

$$\mathcal{N} * \left[ t_\iota, \mathcal{N}(\iota) \right] \hookrightarrow \left( \mathcal{N} * \left[ t_\iota, \mathcal{N}(\iota) \right] \right)_{\iota \in I} * \left[ r_\jmath, \mathcal{P}(\jmath) \right]_{\jmath \in J}.$$

(D) If $\mathcal{M}(i)$ is a $II_1$–factor, $(i \in \mathbb{N})$, if

$$\mathcal{M}(i+1) \cong \mathcal{M}(i) * \left[ t_\jmath, \mathcal{Q}(\jmath) \right]_{\jmath \in J_i}$$
with \((J_i)_{i \in \mathbb{N}}\) a family of pairwise disjoint sets and if \(\pi_i : M(i) \hookrightarrow M(i+1)\) is the canonical embedding then letting
\[
M = \lim_{\rightarrow \ i} (M(i), \pi_i)
\]
be the inductive limit, we have
\[
M \cong M(1) \ast_{j \in J} [t_j, Q(j)].
\]

**Proposition 3.5.** Let
\[
M = N \ast_{i \in I} [t_i, Q(i)]
\]
be any free subproduct. Then \(M\) is a II\(_1\)–factor.

**Proof.** By the results of [3], the free product of a II\(_1\)–factor with any von Neumann algebra is a factor. Hence if \(| I | = 1\) then \(M\) is a factor. By induction, it follows that \(M\) is a factor whenever \(I\) is finite.

For \(I\) infinite, factoriality of \(M\) can be proved by transfinite induction on the cardinality of \(I\). Let \(\prec\) be a well–ordering of \(I\) with the order structure of the least ordinal having the same cardinality as \(I\). Given \(k \in I\), let \(I(k) = \{i \in I \mid i \prec k\} \cup \{k\}\) and let \(M(k) = W^*(A \cup \bigcup_{i \in I(k)} B_i)\). Then
\[
M(k) \cong N \ast_{i \in I(k)} [t_i, Q(i)].
\]
By the induction hypothesis, each \(M(k)\) is a II\(_1\)–factor. As
\[
M = \bigcup_{k \in I} M(k),
\]
it follows that \(M\) is a factor. 

The following lemma prepares us to consider the case of a free subproduct \(N \ast_{i \in I} [t_i, Q(i)]\) where \(Q(i) \in \mathcal{F}\) for all \(i \in I\). Although we are concerned in this paper only with von Neumann algebras taken with faithful normal tracial states, it seems expedient for possible future use to prove the lemma for free products with respect to states.

**Lemma 3.6.** Let \((M, \phi) = (N, \psi) \ast (F, \rho)\) be a free product of von Neumann algebras, where \(\psi\) and \(\rho\) are normal states. Suppose that in the centralizer \(N_{\psi}\) of \(\psi\) in \(N\), there are projections \(p_k\) \((k \in K)\) such that \(\sum_{k \in K} p_k = 1\). For every \(k \in K\) let \(n(k) \in \mathbb{N}\) and suppose \((e_{ij}^{(k)})_{1 \leq i, j \leq n(k)}\) is a system of matrix units in \(N_{\psi}\) such that \(\sum_{i=1}^{n(k)} e_{ii}^{(k)} = p_k\). Let \(q = \sum_{k \in K} e_{11}^{(k)}\). Let
\[
P = W^*(\{e_{ij}^{(k)} \mid k \in K, 1 \leq i, j \leq n(k)\} \cup F) \subseteq M.
\]
Let \(D = \overline{\text{span}}^{\text{w}} \{e_{11}^{(k)} \mid k \in K\}\). Then \(qPq\) and \(qNq\) are free over \(D\), with respect to the \(\phi\)–preserving conditional expectation \(E : qMq \to D\).
Proof. In order to prove freeness over $D$ of $q\mathcal{P}q$ and $q\mathcal{N}q$, it will suffice to show
\[\Lambda^0(q\mathcal{P}q \cap \ker E, q\mathcal{N}q \cap \ker E) \subseteq \ker \phi,\] (17)
where for subsets $X$ and $Y$ of an algebra, $\Lambda^0(X, Y)$ is the set of all words which are products $a_1a_2\ldots a_n$, of elements $a_j \in X \cup Y$, satisfying $a_j \in X \Leftrightarrow a_{j+1} \in Y$.

Let $\mathcal{P}^o = \mathcal{P} \cap \ker \phi$, $\mathcal{N}^o = \mathcal{N} \cap \ker \psi$ and $F^o = F \cap \ker \rho$. Then $\mathcal{P}^o$ is the weak closure of the linear span of $\Theta$, where
\[
\Theta = \Lambda^0(\{e_{ij}^{(k)} \mid k \in K, 1 \leq i, j \leq n(k), i \neq j\} \cup \\
\cup \{e_{ii}^{(k)} - \phi(e_{ii}^{(k)})1 \mid k \in K, 1 \leq i \leq n(k)\}, F^o).
\]

The set $q\mathcal{P}q \cap \ker E$ is the weak closure of the linear span of
\[
\left( \bigcup_{k \in K} (e_{11}^{(k)}\mathcal{P}e_{11}^{(k)})^o \right) \cup \left( \bigcup_{k_1, k_2 \in K, k_1 \neq k_2} e_{11}^{(k_1)}\mathcal{P}e_{11}^{(k_2)} \right)
\]
and $(e_{11}^{(k)}\mathcal{P}e_{11}^{(k)})^o$, respectively $e_{11}^{(k_1)}\mathcal{P}e_{11}^{(k_2)}$, $(k_1 \neq k_2)$, is the weak closure of the linear span of $e_{11}^{(k)}\Theta_{k,k}e_{11}^{(k)}$, respectively $e_{11}^{(k_1)}\Theta_{k_1,k_2}e_{11}^{(k_2)}$, where for $k, k', \in K$, $\Theta_{k,k'}$ is the set of words in $\Theta$ whose first letter either belongs to $F^o$ or is $e_{ij}^{(k)}$, some $j > 1$

and whose last letter either belongs to $F^o$ or is $e_{j1}^{(k')}$, some $j > 1$.

Note that every element of $\Theta_{k,k'}$ has at least one letter from $F^o$. We have that $q\mathcal{N}q \cap \ker E$ is the weak closure of the linear span of
\[
\Psi = \left( \bigcup_{k \in K} (e_{11}^{(k)}\mathcal{N}e_{11}^{(k)})^o \right) \cup \left( \bigcup_{k_1, k_2 \in K, k_1 \neq k_2} e_{11}^{(k_1)}\mathcal{N}e_{11}^{(k_2)} \right).
\]

Thus, in order to prove (17), it will suffice to show
\[\Lambda^0(\Psi, \bigcup_{k, k' \in K} \Theta_{k,k'}) \subseteq \ker \phi.\] (18)

However, beginning with a word $x$ from the left hand side of (18), one can erase parentheses and regroup to show that $x$ is equal to a word from $\Lambda^0(\mathcal{N}^o, F^o)$. Then $\phi(x) = 0$ follows by freeness. \hfill \Box

Lemma 3.7. Let $\mathcal{M} = \mathcal{N} * [t, \mathcal{Q}]$ where $\mathcal{Q} \in \mathcal{F}$. Then there is an isomorphism $\mathcal{M} \sim \mathcal{N} * L(\mathcal{F}_s)$ which intertwines the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M}$ with the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{N} * L(\mathcal{F}_s)$, where $s = t^2 \text{fdim} (\mathcal{Q})$.

Proof. $\mathcal{M}$ is generated by a unital copy of $\mathcal{N} \subseteq \mathcal{M}$ and a subalgebra $p \in B \subseteq p\mathcal{M}p$ $B \cong \mathcal{Q}$, where $p \in \mathcal{N}$ is a projection of trace $t$ and where $p\mathcal{N}p$ and $B$ are free in $p\mathcal{M}p$. Let $F \in \mathcal{F}$ be such that $\text{fdim} (F) = s$. Recall that the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{N} * L(\mathcal{F}_s)$ is the embedding $\mathcal{N} \hookrightarrow \mathcal{N} * F$ arising from the free product construction.
Let $q, r \in \mathcal{N}$ be projections such that $q + r = 1$, let $m, n \in \mathbb{N}$ and let $(e_{ij})_{1 \leq i, j \leq m}$ and $(f_{ij})_{1 \leq i, j \leq n}$ be systems of matrix units in $\mathcal{N}$ such that

$$\sum_{i=1}^{m} e_{ii} = q, \quad \sum_{i=1}^{n} f_{ii} = r \quad \text{and} \quad p = e_{11} + r.$$  

We may and do choose $m$ and $n$ so large that if

$$A = \text{span}\{e_{ij} \mid 1 \leq i, j \leq m\} \cup \{f_{ij} \mid 1 \leq i, j \leq n\}$$

is equipped with the trace inherited from $\mathcal{N}$ then then $A \ast F$ is a factor and $(pAp) \ast Q$ is a factor.

Let $\alpha = \tau_{\mathcal{N}}(e_{11})$ and $\beta = \tau_{\mathcal{N}}(f_{11})$, where $\tau_{\mathcal{N}}$ is the tracial state on $\mathcal{N}$. We have

$$W^*(pAp \cup B) \cong (pAp) \ast Q \cong L(F_{s_1})$$

where

$$s_1 = \text{fdim}(Q) + 1 - \left(\frac{\alpha}{t}\right)^2 - \left(\frac{\beta}{t}\right)^2.$$  

Thus

$$(e_{11} + f_{11})(W^*(pAp \cup B))(e_{11} + f_{11}) \cong L(F_{s_2})$$

where

$$s_2 = 1 + \frac{t^2 \text{fdim}(Q)}{(\alpha + \beta)^2} - \left(\frac{\alpha}{\alpha + \beta}\right)^2 - \left(\frac{\beta}{\alpha + \beta}\right)^2.$$  

We have

$$\mathcal{M} = W^*(\{e_{ij} \mid 1 \leq i, j \leq m\} \cup \{f_{ij} \mid 1 \leq i, j \leq n\} \cup$$

$$\cup (e_{11} + f_{11})\mathcal{N}(e_{11} + f_{11}) \cup (e_{11} + f_{11})\{W^*(pAp \cup B)\}(e_{11} + f_{11})$$

and, by Lemma \[3.6\], \((e_{11} + f_{11})\mathcal{N}(e_{11} + f_{11})\) and \((e_{11} + f_{11})\{W^*(pAp \cup B)\}(e_{11} + f_{11})\) are free over $C_{e_{11}} + C_{f_{11}}$ with respect to the trace-preserving conditional expectation $(e_{11} + f_{11})\mathcal{M}(e_{11} + f_{11}) \rightarrow C_{e_{11}} + C_{f_{11}}$.

On the other hand, letting $\mathcal{P} = \mathcal{N} \ast F$, we have

$$\mathcal{P} = W^*((e_{11} + f_{11})\mathcal{N}(e_{11} + f_{11}) \cup W^*(A \cup F))$$

and $W^*(A \cup F) \cong L(F_{s_3})$ where $s_3 = 1 + \text{fdim}(F) - \alpha^2 - \beta^2$. Therefore $(e_{11} + f_{11})W^*(A \cup F)(e_{11} + f_{11}) \cong L(F_{s_2})$. Furthermore,

$$\mathcal{P} = W^*(\{e_{ij} \mid 1 \leq i, j \leq m\} \cup \{f_{ij} \mid 1 \leq i, j \leq n\} \cup$$

$$\cup (e_{11} + f_{11})\mathcal{N}(e_{11} + f_{11}) \cup (e_{11} + f_{11})\{W^*(A \cup F)\}(e_{11} + f_{11})$$

while by Lemma \[3.6\], \((e_{11} + f_{11})\mathcal{N}(e_{11} + f_{11})\) and \((e_{11} + f_{11})\{W^*(A \cup F)\}(e_{11} + f_{11})\) are free over $C_{e_{11}} + C_{f_{11}}$ with respect to the trace-preserving conditional expectation $(e_{11} + f_{11})\mathcal{P}(e_{11} + f_{11}) \rightarrow C_{e_{11}} + C_{f_{11}}$.

The von Neumann algebras $(e_{11} + f_{11})W^*(A \cup F)(e_{11} + f_{11})$ and $(e_{11} + f_{11})W^*(pAp \cup B)(e_{11} + f_{11})$ are isomorphic, and we can choose an isomorphism so that $e_{11} \mapsto e_{11}$ and $f_{11} \mapsto f_{11}$. Using this isomorphism, sending $(e_{11} + f_{11})\mathcal{N}(e_{11} + f_{11})$ identically to itself and sending $e_{ij} \mapsto e_{ij}$ and $f_{ij} \mapsto f_{ij}$, from \((19)\) and \((20)\) we get an isomorphism
\( \mathcal{M} \overset{\sim}{\longrightarrow} \mathcal{P} \) which is the identity on the embedded copies of \( \mathcal{N} \). By [3, Prop. 4(ix)], \( \mathcal{P} \cong \mathcal{N} * L(F_s) \).

**Theorem 3.8.** Let \( \mathcal{M} = \mathcal{N} * \left[ t(\iota), Q(\iota) \right] \)

where \( I \) is finite or countably infinite and where for all \( \iota \in I \), \( Q(\iota) \in \mathcal{F} \). Then \( \mathcal{M} \) is isomorphic to \( \mathcal{N} * L(F_r) \), where

\[
\text{by an isomorphism intertwining the canonical embedding } \mathcal{N} \hookrightarrow \mathcal{M} \text{ with the canonical embedding } \mathcal{N} \hookrightarrow \mathcal{N} * L(F_r). \]

**Proof.** Iterating Lemma 3.7, we see that the image of the canonical embedding \( \mathcal{N} \hookrightarrow \mathcal{M} \) is freely complemented by an algebra isomorphic to \( F = \ast_{\iota \in I} F_{\iota} \) where \( F_{\iota} \in \mathcal{F} \) and \( \text{fdim} (F_{\iota}) = t(\iota)^2 \text{fdim} (Q(\iota)) \), By the results of [1], \( F \in \mathcal{F} \) and \( \text{fdim} (F) = r \). \( \square \)

Henceforth in this section, we will concentrate on free subproducts \( \mathcal{N} *_{\iota \in I} [t_{\iota}, Q(\iota)] \) where every \( Q(\iota) \) is a \( II_1 \)-factor and where \( I \) is finite or countably infinite.

**Theorem 3.9.** Let \( \mathcal{M} = \mathcal{N} *_{i=1}^{n} \left[ t(i), Q(i) \right] \)

where \( n \in \mathbb{N} \). If \( Q(1), \ldots, Q(n) \) are \( II_1 \)-factors then

\[
\mathcal{M} \cong \mathcal{N} * Q(1) \cdot \cdot \cdot * Q(n) \cdot \cdot \cdot * L(F_r),
\]

where

\[
r = -n + \sum_{i=1}^{n} t(i)^2. \tag{21}
\]

**Proof.** Use induction on \( n \). When \( n = 1 \) then by construction,

\[
N * [t(1), Q(1)] \cong (N_{t(1)} * Q(1)) \cdot \cdot \cdot * L(F_r) \cdot \cdot \cdot * L(F_{t(1)^2 - 1}). \tag{22}
\]

For \( n \geq 2 \),

\[
\mathcal{N} *_{i=1}^{n} \left[ t(i), Q(i) \right] \cong \left( \mathcal{N} *_{i=1}^{n-1} \left[ t(i), Q(i) \right] \right) * [t(n), Q(n)]
\]

\[
\cong \left( \mathcal{N} * Q(1) \cdot \cdot \cdot * Q(n - 1) \cdot \cdot \cdot * L(F_{r'}) \right) * [t(n), Q(n)]
\]

\[
\cong \mathcal{N} * Q(1) \cdot \cdot \cdot * Q(n) \cdot \cdot \cdot * L(F_r),
\]

where \( r' = -n + 1 + \sum_{i=1}^{n-1} t(i)^2 \) and \( r \) is as in (21). The isomorphisms above are from the nesting result [3, Prop 4(A)], the induction hypothesis and, respectively, (22) combined with [3, Prop 4(vii)]. \( \square \)
Theorem 3.10. Let
\[ \mathcal{M} = \mathcal{N} \star \{ t_i, Q(i) \} \] (23)
where every \( Q(i) \) is a \( II_1 \)-factor. If \( \mathcal{N} \cong \mathcal{N} \star L(F_\infty) \) or if \( Q(k) \cong Q(k) \star L(F_\infty) \) for some \( k \in \mathbb{N} \), then
\[ \mathcal{M} \cong \mathcal{N} \star \left( \bigoplus_{i=1}^{\infty} Q(i) \right). \] (24)
Furthermore, regarding \( \mathcal{N} \) as contained in \( \mathcal{M} \) via the canonical embedding for the construction of the free subproduct (23), \( \mathcal{N} \) is freely complemented in \( \mathcal{M} \) by an algebra isomorphic to
\[ \bigoplus_{i=1}^{\infty} Q(i) \] (25).

Proof. Suppose \( \mathcal{N} \cong \mathcal{N} \star L(F_\infty) \). We will perform a variant of the construction in the proof of Proposition 3.1 for \( \mathcal{M} = (\mathcal{N} \star L(F_\infty)) \star \{ t_i, Q(i) \} \).

We may rewrite \( \mathcal{P} \) as
\[ \mathcal{P} = \left( \mathcal{N} \star \left( \bigoplus_{i=1}^{\infty} D_i \right) \right) \star \left( \bigoplus_{i=1}^{\infty} \left( C \oplus Q(i) \right) \right) \]
where \( D_i \cong L(F_\infty) \). Let \( \lambda_N : \mathcal{N} \hookrightarrow \mathcal{P} \), \( \lambda_i : C \oplus Q(i) \hookrightarrow \mathcal{P} \) and \( \kappa_i : D_i \hookrightarrow \mathcal{P} \) be the embeddings arising from the free product construction. We may choose, for each \( i \),\( v_i \in W^*(\kappa_i(D_i) \cup \lambda_i(C \oplus C)) \) so that \( v_i v_i^* = \lambda_i(0 \oplus 1) \) and \( v_i^* v_i \in \kappa_i(D_i) \). Then
\[ \mathcal{M} = W^* \left( \bigcup_{i=1}^{\infty} (\kappa_i(D_i) \cup v_i^* \lambda_i(0 \oplus Q(i)) v_i) \right). \]

But the family
\[ \lambda_N(\mathcal{N}), \left( W^* (\kappa_i(D_i) \cup v_i^* \lambda_i(0 \oplus Q(i)) v_i) \right)_{i=1}^{\infty} \]
is free with respect to the free product trace on \( \mathcal{P} \), while
\[ W^* (\kappa_i(D_i) \cup v_i^* \lambda_i(0 \oplus Q(i)) v_i) \cong D_i \star [t(i), Q(i)] \]
\[ \cong L(F_\infty) \star Q(i) \frac{1}{t(i)}, \]
so
\[ \mathcal{M} \cong \mathcal{N} \star \left( \bigoplus_{i=1}^{\infty} (L(F_\infty) \star Q(i)) \right) \]
\[ \cong \mathcal{N} \star \left( \bigoplus_{i=1}^{\infty} Q(i) \right) \star L(F_\infty) \]
\[ \cong \mathcal{N} \star \left( \bigoplus_{i=1}^{\infty} Q(i) \right), \]
where the third isomorphism above is because by [3, Thm. 1.5], every free product of infinitely many \( II_1 \)-factors is stable under taking the free product with \( L(F_\infty) \). This
proves the isomorphism (24) and that $\mathcal{N}$ is freely complemented in $\mathcal{M}$ by an algebra isomorphic to (25).

Now suppose $Q(k) \cong Q(k) \ast L(\text{F}_\infty)$, for some $k \in \mathbb{N}$. We may without loss of generality take $k = 1$. Let $Q(1)$ be generated by free subalgebras $D$ and $F$, where $D \cong Q(1)$ and $F \cong L(\text{F}_\infty)$. Then using the nesting result 3.4(A),

$$\mathcal{M} \cong \left( \mathcal{N} \ast [t(1), Q(1)] \right) \ast \{t(i), Q(i)\}$$

$$\cong \left( \mathcal{N} \ast [t(1), F] \right) \ast \{t(i), Q(i)\}.$$

By Theorem 3.8, $\mathcal{N} \ast [t(1), F] \cong \mathcal{N} \ast L(\text{F}_\infty)$ via an isomorphism intertwining the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{N} \ast [t(1), F]$ and the embedding $\mathcal{N} \hookrightarrow \mathcal{N} \ast L(\text{F}_\infty)$ coming from the free product construction. Therefore, there is an isomorphism

$$\mathcal{M} \overset{\sim}{\longrightarrow} \left( \mathcal{N} \ast L(\text{F}_\infty) \right) \ast \{t(i), Q(i)\}$$

intertwining the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M}$ and the composition of the embedding $\mathcal{N} \hookrightarrow \mathcal{N} \ast L(\text{F}_\infty)$ coming from the free product construction and the canonical embedding

$$\mathcal{N} \ast L(\text{F}_\infty) \hookrightarrow \left( \mathcal{N} \ast L(\text{F}_\infty) \right) \ast \{t(i), Q(i)\}.$$

Now applying the part of the theorem already proved shows the isomorphism (24) and that $\mathcal{N}$ is freely complemented in $\mathcal{M}$ by an algebra isomorphic to

$$L(\text{F}_\infty) \ast \left( \bigast_{i=1}^{\infty} Q(i) \right) \cong \bigast_{i=1}^{\infty} Q(i).$$

Lemma 3.11. Let

$$\mathcal{M} = \mathcal{N} \ast \left( \bigast_{i=1}^{\infty} [t(i), Q(i)] \right)$$

be a free subproduct of countably infinitely many $\text{II}_1$–factors. If there is $\epsilon > 0$ such that $t(i) > \epsilon$ for infinitely many $i \in \mathbb{N}$, then

$$\mathcal{M} \cong \mathcal{N} \ast \left( \bigast_{i=1}^{\infty} Q(i) \right).$$

Furthermore, regarding $\mathcal{N}$ as contained in $\mathcal{M}$ via the canonical embedding for the free subproduct construction (26), $\mathcal{N}$ is freely complemented in $\mathcal{M}$ by an algebra isomorphic to

$$\bigast_{i=1}^{\infty} Q(i).$$

Proof. Let $I_1$ be an infinite set of $i \in \mathbb{N}$ such that $t(i) > \epsilon$ and such that $I_0 := \mathbb{N} \setminus I_1$ is also infinite. By the nesting result 3.4(A),

$$\mathcal{M} \cong \mathcal{M}(1) \ast \left[ t(i), Q(i) \right]$$
where
\[ M(1) = N \ast \left( \bigotimes_{i \in I} [t(i), Q(i)] \right). \]
If we can show
\[ M(1) \cong N \ast \left( \bigotimes_{i \in I} Q(i) \right), \]
then, since \(|I_1| = \infty\), by \([3, \text{Thm 1.5}]\) \( M(1) \cong M(1) \ast L(F_\infty) \) and the isomorphism (27) will follow from Theorem 3.10. Hence we may without loss of generality assume \( t(i) > \epsilon \) for all \( i \in N \).

Let
\[ M = W^* \left( A \cup \bigcup_{i=1}^\infty B_i \right) \subseteq P = N \ast \left( \bigotimes_{i=1}^\infty (C \oplus Q(i)) \right) \]
with trace \( \tau \) be as in the proof of Proposition 3.1. Recall \( B_i = v_i^* \lambda_i (0 \oplus Q(i)) v_i \) where the projection \( v_i^* v_i \in A \) is arbitrary subject to its trace being \( t(i) \). Let us fix a projection \( p \in A \) of trace \( \epsilon \), and let us take \( p_i \geq p \) for all \( i \in N \). Let \( C_i = W^* (A \cup B_i) \) and recall from Remark 3.2 that the family \( (C_i)_{i=1}^\infty \) is free over \( A \) with respect to the canonical trace–preserving conditional expectation \( E_A^P : P \to A \). Using partial isometries from \( A \) to bring everything under \( p \), we see that
\[ pMp = W^* \left( \bigcup_{i=1}^\infty pC_i p \right) \]
and that the family \( (pC_i p)_{i=1}^\infty \) is free over \( pAp \) with respect to \( E_A^P \upharpoonright pMp \). Now \( p_i C_i p_i = W^* (p_i A p_i \cup B_i) \) and, moreover, \( p_i A p_i \) and \( B_i \) are free by Proposition 3.1. It follows from Theorem 2.1 that \( pAp \) is freely complemented in \( pC_i p \) by an algebra, let us call it \( D_i \), isomorphic to
\[ Q(i) \ast L(F_{y(i)}), \]
where \( y(i) = \left( \frac{t(i)}{\epsilon} \right)^2 - 1 \). Thus
\[ pMp = W^* \left( pAp \cup \bigcup_{i=1}^\infty D_i \right) \]
and the family \( pAp \), \( (D_i)_{i=1}^\infty \) is free with respect to \( \epsilon^{-1} \tau \upharpoonright pMp \), yielding
\[ pMp \cong (pN p) \ast \left( \bigotimes_{i=1}^\infty Q(i) \right) \ast L(F_\infty), \]
with \( pN p \) freely complemented in \( pMp \) by an algebra isomorphic to
\[ \bigotimes_{i=1}^\infty Q(i) \ast L(F_\infty). \]
Application of Corollary 2.3 gives the isomorphism (27), and that \( N \) is freely subcomplemented in \( M \) by an algebra isomorphic to the one displayed at (28).
4. Rescalings of Free Subproducts

The notation introduced below, though perhaps awkward to define, permits an elegant formulation of rescalings of free subproducts of II$_1$-factors.

**Definition 4.1.** Let $\mathcal{N}$ be a II$_1$-factor, let $I$ be a set and for every $i \in I$ let $Q(i)$ be a II$_1$-factor and let $0 < t(i) < \infty$. Then the free scaled product of II$_1$-factors

$$\mathcal{M} = \mathcal{N} \ast \bigotimes_{i \in I} [t(i), Q(i)]$$

is the free subproduct

$$\mathcal{M}(I) \ast \bigotimes_{i \in I_0} [t(i), Q(i)]$$

where $I_0 = \{i \in I \mid t(i) \leq 1\}$ and where

$$\mathcal{M}(I) = \mathcal{N} \ast \left( \bigotimes_{i \in I_1} (Q(i) \ast L(F_{t(i)^2-1})) \right),$$

with $I_1 = I \setminus I_0$.

**Remark 4.2.** Clearly the free scaled product $\mathcal{M}$ is always a II$_1$-factor. Let $\tau$ be the tracial state on $\mathcal{M}$. Then

$$\mathcal{M} = W^*(A \cup \bigcup_{i \in I} B_i)$$

for $*$-subalgebras $A$ and $B_i$ of $\mathcal{M}$, where

(i) $A \cong \mathcal{N}$;

(ii) for all $i \in I$, $p_i \in B_i \subseteq p_i M p_i$ for a projection $p_i \in A$;

(ii') for all $i \in I$, $\tau(p_i) = \min(1, t_i)$;

(ii'') for all $i \in I$,

$$B_i \cong \begin{cases} Q(i) & \text{if } i \in I_0 \\ Q(i) \ast L(F_{t(i)^2-1}) & \text{if } i \in I_1 \end{cases}$$

(iii) for all $i \in I$, $B_i$ and

$$p_i \left( W^*(A \cup \bigcup_{j \in I \setminus \{i\}} B_j) \right) p_i$$

are free with respect to $t_i^{-1} \tau |_{p_i M p_i}$.

**Definition 4.3.** The inclusion $A \hookrightarrow \mathcal{M}$ is called the canonical embedding

$$\mathcal{N} \hookrightarrow \mathcal{N} \ast \bigotimes_{i \in I} [t_i, Q(i)]$$

of free scaled products.

Clearly, the analogues of the properties spelled out in Proposition 3.4 hold for free scaled products as well.

Theorems 3.9, 3.10 and Lemma 3.11 imply their analogues for free scaled products:
Theorem 4.4. If
\[ M = N \ast \bigoplus_{i=1}^{n} [t(i), Q(i)] \]
is a free scaled product where \( n \in \mathbb{N} \), then
\[ M \cong N \ast Q(1) \ast \cdots \ast Q(n) \ast L(F_r) \]
where
\[ r = -n + \sum_{i=1}^{n} t(i)^2. \]

Theorem 4.5. Suppose
\[ M = N \ast \bigoplus_{i=1}^{\infty} [t_i, Q(i)] \]
is a free scaled product of countably infinitely many \( II_1 \)-factors and that either \( N \cong N \ast L(F_\infty) \) or \( Q(i) \cong Q(i) \ast L(F_\infty) \) for some \( i \in \mathbb{N} \). Then
\[ M \cong N \ast \bigoplus_{i=1}^{\infty} Q(i) \ast \bigoplus_{i=1}^{\infty} \frac{Q(i) \ast t(i)}{t(i)} \]
and regarding \( N \subseteq M \) by the canonical embedding for the construction (29), \( N \) is freely complemented in \( M \) by an algebra isomorphic to
\[ \bigoplus_{i=1}^{\infty} Q(i) \ast \frac{t(i)}{t(i)}. \]

Lemma 4.6. Let
\[ M = N \ast \bigoplus_{i=1}^{\infty} [t_i, Q(i)] \]
be a free scaled product. If there is \( \epsilon > 0 \) such that \( t(i) > \epsilon \) for infinitely many \( i \in \mathbb{N} \) then the conclusions of Theorem 4.3 hold.

We now begin proving the rescaling formula for free scaled products.

Lemma 4.7. Consider a free subproduct
\[ M = N \ast \bigoplus_{i=1}^{n} [t(i), Q(i)], \]
\( n \in \mathbb{N} \cup \infty \), of \( N \) with finitely or countably infinitely many \( II_1 \)-factors \( Q(i) \), where either \( n \in \mathbb{N} \) or \( \lim_{i \to \infty} t(i) = 0 \). Consider \( N \subseteq M \) via the canonical embedding. Let \( p \in N \) be a projection of trace \( s \). Then there is an isomorphism
\[ pMp \sim (pNp) \ast \bigoplus_{i=1}^{n} [t(i)/s, Q(i)] \]
intertwining the inclusion \( pNp \hookrightarrow pMp \) with the canonical embedding
\[ pNp \hookrightarrow (pNp) \ast \bigoplus_{i=1}^{n} [t(i)/s, Q(i)]. \]
Proof. Write
\[ \mathcal{M} = W^*(A \cup \bigcup_{i=1}^n B_i) \]
as in Proposition 3.1 with for every \( i, p_i \in B_i \subseteq p_i \mathcal{M} p_i \) for projections \( p_i \in A \) satisfying either \( p_i \geq p \) or \( p_i \leq p \). If \( t(i) \leq s \) for all \( i \in \mathbb{N} \) then
\[ p \mathcal{M} p = W^*(pAp \cup \bigcup_{i=1}^n B_i) \]
and the conclusions of the lemma are clear.

Assume \( t(i) \geq t(i+1) \) for all \( i \) and, for some \( m \in \mathbb{N} \), \( t(m) > s \) and either \( m = n \) or \( t(m+1) \leq s \). For every \( k \in \{1, \ldots, m\} \), let
\[ \mathcal{N}(k) = W^*(A \cup \bigcup_{1 \leq j \leq k} B_j) \].

Then \( p_k \mathcal{N}(k) p_k = W^*(p_k \mathcal{N}(k-1) p_k \cup B_k) \) and \( p_k \mathcal{N}(k-1) p_k \) and \( B_k \) are free. By Theorem 2.1, \( p \mathcal{N}(k-1) p \) is freely complemented in \( p \mathcal{N}(k) p \) by an algebra isomorphic to
\[ Q(k) * L(F_{\frac{r}{r-1}}) \].

Combining these embeddings, one obtains
\[ p \mathcal{N}(m) p \cong (p \mathcal{N} p) * Q(1) * \cdots * Q(m) * L(F_r), \]
where \( r = -m + \sum_{i=1}^m t(i)^2 \), and that the algebra \( p \mathcal{N}(0) p = pAp \) is freely complemented in \( p \mathcal{N}(n) p \) by an algebra, call it \( D \), isomorphic to
\[ Q(1) * \cdots * Q(m) * L(F_r). \]

Then
\[ p \mathcal{M} p = W^*(pAp \cup D \cup \bigcup_{i=m+1}^n B_i). \]

Now the conclusions of the lemma are clear. \( \Box \)

**Proposition 4.8.** Let \( \mathcal{M} = \mathcal{N} * L(F_r) \) for a II\(_1\)–factor \( \mathcal{N} \) and for some \( r > 0 \). Regard \( \mathcal{N} \subseteq \mathcal{M} \) via the canonical embedding. If \( p \in \mathcal{N} \) is a projection of trace \( s \), then there is an isomorphism
\[ p \mathcal{M} p \xrightarrow{\sim} (p \mathcal{N} p) * L(F_{\frac{r}{s^2}}) \] (30)
intertwining the inclusion \( p \mathcal{N} p \hookrightarrow p \mathcal{M} p \) with the canonical embedding \( p \mathcal{N} p \hookrightarrow (p \mathcal{N} p) * L(F_{\frac{r}{s^2}}) \).

**Proof.** By Theorem 3.8 we have isomorphisms
\[ \mathcal{M} \xrightarrow{\sim} \mathcal{N} * \left[ \sqrt{\frac{r}{r+1}}, L(F_{r+1}) \right] \]
\[ (p \mathcal{N} p) * L(F_{\frac{r}{s^2}}) \xrightarrow{\sim} (p \mathcal{N} p) * \left[ \frac{1}{s} \sqrt{\frac{r}{r+1}}, L(F_{r+1}) \right] \]
that intertwine the corresponding canonical embeddings. These combined with the isomorphism
\[ p \left( N * \left[ \sqrt{r_{r+1}}, L(F_{r+1}) \right] \right) p \sim (pNp) * \left[ \frac{1}{r_{r+1}}, L(F_{r+1}) \right] \]
obtained from Lemma [4.7] give the desired isomorphism (30).

\[ \square \]

Theorem 4.9. Let
\[ M = N * \left[ t(\iota), Q(\iota) \right] \]
be a free scaled product of II\(_1\)-factors \(Q(\iota)\) with \(I\) finite or countably infinite. If \(0 < s < \infty\) then
\[ M_s \cong N_s * \left[ t(\iota), Q(\iota) \right]. \quad (31) \]
Furthermore, if \(s \leq 1\) and if \(p \in N\) is a projection of trace \(s\), then regarding \(N \subseteq M\) via the canonical embedding, there is an isomorphism
\[ pMp \sim (pNp) * \left[ t(\iota), Q(\iota) \right] \quad (32) \]
intertwining the inclusion \(pNp \hookrightarrow pMp\) and the canonical embedding
\[ pNp \hookrightarrow (pNp) * \left[ t(\iota), Q(\iota) \right]. \]

Proof. In order to prove the isomorphism (31) for all \(s \in (0, \infty)\), it will suffice to show it for all \(s \in (0, 1)\). So assume \(0 < s < 1\). If there is \(\epsilon > 0\) such that \(t(\iota) > \epsilon\) for infinitely many \(\iota \in I\), then the existence of the isomorphism (32) with the required properties follows from Lemma [4.6] and Theorem [2.1]. Hence we may assume either \(I = \{1, \ldots, n\}\) for some \(n \in \mathbb{N}\) or \(I = \mathbb{N}\) and \(\lim_{\iota \to \infty} t(\iota) = 0\), (in which case we let \(n = \infty\)). Assume also \(t(1) \geq t(2) \geq \cdots\). If \(t(1) \leq 1\) then the conclusion of the theorem follows from Lemma [4.7]. So assume there is \(m \in I\) such that \(t(m) > 1\) and either \(m + 1 \notin I\) or \(t(m + 1) \leq 1\). Letting
\[ M(m) = N * \left[ t(\iota), Q(\iota) \right], \]
by definition \(N\) is freely complemented in \(M\) by an algebra isomorphic to
\[ Q(1) \frac{1}{t(1)} * \cdots * Q(m) \frac{1}{t(m)} * L(F_r) \]
where \(r = -m + \sum_{i=1}^{m} t(i)^2\). By Theorem [2.1], \(pNp\) is freely complemented in \(pM(m)p\) by an algebra isomorphic to
\[ \left( Q(1) \frac{1}{t(1)} * \cdots * Q(m) \frac{1}{t(m)} * L(F_r) \right)^s * L(F_{s-2r-1}) \cong \]
\[ \cong Q(1) \frac{1}{t(1)} * \cdots * Q(m) \frac{1}{t(m)} * L(F_{s-2(r+m)-m}). \quad (33) \]
If \(I = \{1, \ldots, m\}\) then we are done. Otherwise, by Proposition [3.4] A, there is an isomorphism
\[ M \sim M(m) * \left[ t(\iota), Q(\iota) \right], \]
interwining the inclusion $\mathcal{M}(m) \hookrightarrow \mathcal{M}$ and the canonical embedding

$$\mathcal{M}(m) \hookrightarrow \mathcal{M}(m) \overset{n}{\propto} [t(i), Q(i)].$$

Now Lemma 4.7 shows that there is an isomorphism

$$p\mathcal{M}p \sim (p\mathcal{M}(m)p) \overset{n}{\propto} [t(i), Q(i)]$$

interwining the inclusion $p\mathcal{M}(m)p \hookrightarrow p\mathcal{M}p$ and the canonical embedding

$$p\mathcal{M}(m)p \hookrightarrow (p\mathcal{M}(m)p) \overset{n}{\propto} [t(i), Q(i)].$$

This together with the fact that $p\mathcal{N}p$ is freely complemented in $p\mathcal{M}(m)p$ by an algebra isomorphic to (33) finishes the proof.

The following corollary is simply Theorem 4.9 in reverse, and can be proved using Lemma 2.2 similarly to how Corollary 2.3 was proved.

Corollary 4.10. Let $\mathcal{N}$ be a II$_1$-factor which is a unital subalgebra of a tracial von Neumann algebra $\mathcal{M}$. If $p \in \mathcal{N}$ is a projection of trace $s > 0$ and if there is an isomorphism

$$p\mathcal{M}p \sim (p\mathcal{N}p) \overset{i \in I}{\propto} [t(i), Q(i)],$$

where the RHS is a free scaled product, intertwining the inclusion $p\mathcal{N}p \hookrightarrow p\mathcal{M}p$ and the canonical embedding

$$p\mathcal{N}p \hookrightarrow (p\mathcal{N}(p)) \overset{i \in I}{\propto} [t(i), Q(i)],$$

then there is an isomorphism

$$\mathcal{M} \sim \mathcal{N} \overset{i \in I}{\propto} [t(i)s, Q(i)]$$

interwining the inclusion $\mathcal{N} \hookrightarrow \mathcal{M}$ and the canonical embedding

$$\mathcal{N} \hookrightarrow \mathcal{N} \overset{i \in I}{\propto} [t(i)s, Q(i)].$$

5. Free trade in free subproducts and free scaled products

In this section we will be concerned with free scaled products

$$(\mathcal{N} \ast L(F_r)) \overset{i \in I}{\propto} [t(i), Q(i)],$$

where $r \geq 0$, and with results allowing one to increase or decrease the $t_i$, compensating by rescaling $Q(i)$ and, if necessary, by changing $r$. This sort of exchange we call free trade in free scaled products.

Definition 5.1. Let $\mathcal{M}$ be the free scaled product (33) above. Then the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M}$ is the composition of the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M} \ast L(F_r)$ and the canonical embedding

$$(\mathcal{N} \ast L(F_r)) \hookrightarrow (\mathcal{N} \ast L(F_r)) \overset{i \in I}{\propto} [t(i), Q(i)].$$

Proposition 4.8 and Theorem 4.9 combine to give the following result.
Theorem 5.2. Let $\mathcal{M}$ be the free scaled product \((\ref{eq:free-scaled})\) above and let $0 < s < \infty$. Then
\[
\mathcal{M}_s \cong (N_s * L(F_{s^{-2}}r)) * \left[\frac{t(i)}{s}, Q(i)\right].
\]
Furthermore, regarding $\mathcal{N}$ as contained in $\mathcal{M}$ by the canonical embedding, if $s < 1$ and if $p \in \mathcal{N}$ is a projection of trace $s$, then there is an isomorphism
\[
p \mathcal{M} \to (pNp * L(F_{s^{-2}}r)) * \left[\frac{t(i)}{s}, Q(i)\right]
\]
intertwining the inclusion $p N p \hookrightarrow \mathcal{M}$ and the canonical embedding
\[
pNp \hookrightarrow (pNp * L(F_{s^{-2}}r)) * \left[\frac{t(i)}{s}, Q(i)\right].
\]

Lemma 5.3. Let $\mathcal{N}$ and $Q$ be $II_1$–factors, let $0 < t < \infty$, let $\max(0, 1 - t^2) \leq r \leq \infty$ and let
\[
\mathcal{M} = (\mathcal{N} * L(F_r)) * [t, Q].
\]
Then there is an isomorphism
\[
\mathcal{M} \to \mathcal{N} * \left(\mathcal{Q}_+ * L(F_{r-1+t^2})\right)
\]
intertwining the canonical embedding $\mathcal{N} \hookrightarrow \mathcal{M}$ and the embedding
\[
\mathcal{N} \hookrightarrow \mathcal{N} * \left(\mathcal{Q}_+ * L(F_{r-1+t^2})\right)
\]
arising from the free product construction.

Proof. If $t \geq 1$ then this is immediate from the definition of free scaled products, (Definition \([1,1]\)).

Let $\tau$ denote the tracial state on $\mathcal{M}$. Suppose first $t = 1/k$, $k \in \mathbb{N} \setminus \{1\}$. Then
\[
\mathcal{N} * L(F_r) \cong (\mathcal{N} * L(F_{r-1+t^2})) * M_k(C)
\]
and we may take
\[
\mathcal{M} = W^*(A \cup F \cup \{e_{ij} \mid 1 \leq i, j \leq k\} \cup B),
\]
where $A$ is a unital copy of $\mathcal{N}$, $1_\mathcal{M} \in F \in \mathcal{F}$ with $\mathrm{fdim}(F) = r - 1 + t^2$, $(e_{ij})_{1 \leq i, j \leq k}$ is a system of matrix units in $\mathcal{M}$, the family
\[
A, F, \{e_{ij} \mid 1 \leq i, j \leq k\}
\]
is free with respect to $\tau$, $e_{11} \in B \subseteq e_{11} \mathcal{M} e_{11}$ with $B$ a subalgebra of $e_{11} \mathcal{M} e_{11}$ isomorphic to $Q$ and the pair
\[
e_{11} W^*(A \cup F \cup \{e_{ij} \mid 1 \leq i, j \leq k\}) e_{11}, B
\]
is free with respect to $k \tau |_{e_{11} \mathcal{M} e_{11}}$. Let
\[
\mathcal{P} = W^*(A \cup F), \quad \mathcal{S} = W^*(\{e_{ij} \mid 1 \leq i, j \leq k\} \cup B).
\]
Then
\[
\mathcal{P} \cong \mathcal{N} * L(F_{r-1+t^2}), \quad \mathcal{S} \cong Q_k.
\]
We shall show that $P$ and $S$ are free with respect to $\tau$. Let 
\[ U^o = \{ e_{ij} \mid 1 \leq i, j \leq k, i \neq j \} \cup \{ e_{ii} - \frac{1}{k} \mid 1 \leq i \leq k \}. \]
Then we have 
\[
P^o = \text{span} \Lambda^o(A^o, F^o), \\
S^o = \text{span} \left( U^o \cup \bigcup_{1 \leq i, j \leq k} e_{ii}B^oe_{1j} \right).
\]
Hence, for freeness of $P$ and $S$, it will suffice to show 
\[
\Lambda^o(C^o, F^o, U^o \cup \bigcup_{1 \leq i, j \leq k} e_{ii}B^oe_{1j}) \subseteq \ker \tau.
\]
After regrouping, any word $x$ belonging to the LHS of (37) is seen to be equal to 
$e_{ii}x'e_{1j}$, for some $i, j \in \{1, \ldots, k\}$, where 
\[ x' \in \Lambda^o(e_{ii}A^o, F^o, e_{11}, B^o). \]
But freeness of the pair (36) shows $\tau(x') = 0$ and thus $\tau(e_{ii}x'e_{1j}) = 0$. This shows the existence of the isomorphism (35) in the case $t = 1/k$. 

Now suppose $t < 1$ is not a reciprocal integer. Let $k \in \mathbb{N}$ be such that 
$\frac{1}{k} < t < \frac{s}{2}$ and let 
\[ s = \frac{1}{kt}, \tilde{N} = N_s, \]
and 
\[ \tilde{M} = (N \ast L(F_{s^2r})) \ast [\frac{1}{k}, Q]. \]
By the case just proved, regarding $\tilde{N}$ as contained in $\tilde{M}$ via the canonical embedding, $\tilde{N}$ is freely complemented in $\tilde{M}$ by a copy of $Q_k \ast L(F_{\frac{s^2r}{k} + \frac{1}{2}})$. Let $q \in \tilde{N}$ be a projection of trace $s$. By Theorem 2.1, $q\tilde{N}q$ is freely complemented in $q\tilde{M}q$ by a copy of 
\[ (Q_k \ast L(F_{\frac{s^2r}{k} + \frac{1}{2}})) \ast L(F_{s^2r - 1}) \cong Q_{\frac{s}{2}} \ast L(F_{r - \frac{s^2}{2} + \frac{1}{2}}). \]
On the other hand, by Proposition 4.8 and Theorem 4.9, there is an isomorphism 
\[ q\tilde{M}q \sim \sim (q\tilde{N}q \ast L(F_r)) \ast [t, Q] \]
intertwining the inclusion $q\tilde{N}q \hookrightarrow q\tilde{M}q$ and the canonical embedding $q\tilde{N}q \hookrightarrow ((q\tilde{N}q \ast L(F_r)) \ast [t, Q]$. As $q\tilde{N}q \cong \tilde{N}$, we are done. 

\textbf{Lemma 5.4.} Let $\mathcal{N}$ and $\mathcal{Q}$ be $\text{II}_1$–factors, let $0 < t < s < \infty$, let $s^2 - t^2 \leq r \leq \infty$ and let 
\[ \mathcal{M} = (\mathcal{N} \ast L(F_r)) \ast [t, Q]. \]
Then there is an isomorphism 
\[ \mathcal{M} \sim \sim (\mathcal{N} \ast L(F_{r - s^2 + t^2})) \ast [s, Q_{\frac{s}{2}}] \]
intertwining the canonical embeddings $\mathcal{N} \hookrightarrow \mathcal{M}$ and 
\[ \mathcal{N} \hookrightarrow (\mathcal{N} \ast L(F_{r - s^2 + t^2})) \ast [s, Q_{\frac{s}{2}}]. \]
Proof. If \( s = 1 \) then this is just Lemma 5.3. Suppose \( s > 1 \). Then by Lemma 5.3, since \( r > 1 - t^2 \), the image of \( \mathcal{N} \) in \( \mathcal{M} \) under the canonical embedding is freely complemented by an algebra isomorphic to \( Q_{1/t} \ast L(\mathcal{F}_{r-1+t^2}) \). On the other hand, by the definition of free scaled products (Definition 4.1), the image of \( \mathcal{N} \) in \((\mathcal{N} \ast L(\mathcal{F}_{r-s^2+t^2})) \ast [s, Q_+^t] \) under the canonical embedding is freely complemented by an algebra isomorphic to

\[
\left( L(\mathcal{F}_{s^{-2}(r+t^2)}) \ast Q_{s^t} \right) \ast \left( L(\mathcal{F}_{s^2-1}) \right) \cong L(\mathcal{F}_{r-1+t^2}) \ast Q_{s^t}.
\]

From this, we can construct the isomorphism (38) in the case \( s > 1 \).

Now suppose \( s < 1 \). Denote by \( \pi : \mathcal{N} \to \mathcal{M} \) the canonical embedding, let

\[
\widetilde{\mathcal{M}} = (\mathcal{N} \ast L(\mathcal{F}_{r-s^2+t^2})) \ast [s, Q_+^t]
\]

and let \( \tilde{\pi} : \mathcal{N} \to \widetilde{\mathcal{M}} \) denote the canonical embedding. Let \( p \in \mathcal{N} \) be a projection of trace \( s \). Then using Theorem 5.2, there is an isomorphism

\[
\pi(p) \mathcal{M} \pi(p) \sim \to (p \mathcal{N} p \ast L(\mathcal{F}_{s^{-2}r})) \ast [s^t, Q]
\]

intertwining \( \pi \rvert_{p\mathcal{N}p} \) and the canonical embedding

\[
p \mathcal{N} p \sim \to (p \mathcal{N} p \ast L(\mathcal{F}_{s^{-2}r})) \ast [s^t, Q].
\]

Since \( s^{-2}r \geq 1 - s^{-2}t^2 \), Lemma 5.3 gives an isomorphism

\[
\pi(p) \mathcal{M} \pi(p) \sim \to p \mathcal{N} p \ast (Q_{s^t} \ast L(\mathcal{F}_{s^{-2}r-1+s^{-2}t^2}))
\]

(39)

intertwining \( \pi \rvert_{p\mathcal{N}p} \) and the canonical embedding

\[
p \mathcal{N} p \sim \to p \mathcal{N} p \ast (Q_{s^t} \ast L(\mathcal{F}_{s^{-2}r-1+s^{-2}t^2})).
\]

(40)

On the other hand, by Theorem 5.2, there is an isomorphism

\[
\tilde{\pi}(p) \tilde{\mathcal{M}} \tilde{\pi}(p) \sim \to p \mathcal{N} p \ast (Q_{s^t} \ast L(\mathcal{F}_{s^{-2}r-1+s^{-2}t^2}))
\]

(41)

intertwining \( \tilde{\pi} \rvert_{p\mathcal{N}p} \) with the canonical embedding (38). The isomorphisms (39) and (41) together with Lemma 2.2 give the desired isomorphism (38).

\[\square\]

Theorem 5.5. Let \( \mathcal{M} = (\mathcal{N} \ast L(\mathcal{F}_{r})) \ast_{i=1}^n [t(i), Q(i)] \), for \( n \in \mathbb{N} \cup \{ \infty \} \), \( 0 \leq r < \infty \) and \( 0 < t(i) < \infty \) be a free scaled product of finitely or countably infinitely many \( II_1 \)-factors \( \mathcal{N} \) and \( Q(i) \).

(i) If \( \sum_{i=1}^n t(i)^2 = \infty \) then there is an isomorphism

\[
\mathcal{M} \sim \to \mathcal{N} \ast ( \ast_{i=1}^\infty Q(i) \ast_{i=1}^\infty )
\]

(42)

intertwining the canonical embedding \( \mathcal{N} \hookrightarrow \mathcal{M} \) and the embedding

\[
\mathcal{N} \hookrightarrow \mathcal{N} \ast ( \ast_{i=1}^\infty Q(i) \ast_{i=1}^\infty )
\]

arising from the free product construction.
(ii) Suppose $\sum_{i=1}^{n} t(i)^2 < \infty$, let $0 < s(i) < \infty$ and let

$$r' = r + \sum_{i=1}^{n} (t(i)^2 - s(i)^2).$$

(43)

If $r' \geq 0$ then there is an isomorphism

$$\mathcal{M} \xrightarrow{\sim} (\mathcal{N} \ast L(F_{r'})) \ast \left[ s(i), Q(i)_{s(i)} \right]$$

(44)

interwining the canonical embeddings $\mathcal{N} \hookrightarrow \mathcal{M}$ and

$$\mathcal{N} \hookrightarrow (\mathcal{N} \ast L(F_{r'})) \ast \left[ s(i), Q(i)_{s(i)} \right].$$

Proof. We begin by proving (i) and a special case of (ii) simultaneously. Suppose $W_i$.

Remark 3.2). Using Lemma 5.4, we get

$$\text{this proves (ii) in the case}$$

and, finally,

$$\text{we get an isomorphism (44), with}$$

$$\text{interwining the canonical embeddings. This proves (ii) in the case} s(i) < t(i)$$

for all $i$. For (i), if $\sum_{i=1}^{n} t(i)^2 = \infty$, then $0 < s(i) < t(i)$ can be chosen making $r' = \infty$. Then the isomorphism (42) follows by Theorem 4.5.

In order to prove the general case of (ii), let

$$I = \begin{cases} 
\{1, \ldots, n\} & \text{if } n \in \mathbb{N} \\
\mathbb{N} & \text{if } n = \infty
\end{cases}$$

and we get an isomorphism (44), with $r'$ as in (43), intertwining the canonical embeddings. This proves (ii) in the case $s(i) < t(i)$ for all $i$. For (i), if $\sum_{i=1}^{n} t(i)^2 = \infty$, then $0 < s(i) < t(i)$ can be chosen making $r' = \infty$. Then the isomorphism (42) follows by Theorem 4.5.

In order to prove the general case of (ii), let
Proof.

Suppose the free group factors are isomorphic. Then

\[ I_1 = \{ i \in I \mid s(i) > t(i) \} \]
\[ I_0 = I \setminus I_1. \]

Using the nesting result 3.4(A) and, twice in succession, the case of (ii) just proved, we get isomorphisms

\[
\mathcal{M} \xrightarrow{\sim} (\left( \mathcal{N} \ast L(F_{r, r'}) \right) \ast \left[ \left[ t(i), Q(i) \right] \right] \ast \left[ t(i), Q(i) \right])
\]
\[
\xrightarrow{\sim} (\left( \mathcal{N} \ast L(F_{r, r'}) \right) \ast \left[ \left[ s(i), Q(i) \ast (i) \right] \right] \ast \left[ t(i), Q(i) \right])
\]
\[
\xrightarrow{\sim} \left( \left( \mathcal{N} \ast \left[ s(i), Q(i) \ast (i) \right] \right) \ast L(F_{r, r'}) \right) \ast \left[ t(i), Q(i) \right])
\]
\[
\xrightarrow{\sim} \left( \left( \mathcal{N} \ast \left[ s(i), Q(i) \ast (i) \right] \right) \ast L(F_{r, r'}) \right) \ast \left[ s(i), Q(i) \ast (i) \right]
\]
\[
\xrightarrow{\sim} (\mathcal{N} \ast L(F_{r, r'}) \ast \left[ s(i), Q(i) \ast (i) \right],
\]

where \( r'' = r + \sum_{i \in I_0} t(i)^2 - s(i)^2 \), whose composition intertwines the canonical embeddings. \( \square \)

We know from [7] (see also [2]) that the interpolated free group factors \((L(F_t))_{1 \leq t \leq \infty}\) are either all isomorphic to each other or all mutually nonisomorphic. Some statements equivalent to isomorphism of free group factors were found in [1]. The following theorem gives another equivalent statement involving free scaled products.

**Theorem 5.6.** The free group are isomorphic if and only if the isomorphism

\[
\mathcal{N} \ast \left[ t(i), Q(i) \right] \xrightarrow{\sim} \mathcal{N} \ast \left( \ast_{i=1}^{\infty} Q(i) \ast (i) \right)
\]

(45)

holds for every free scaled product of countably infinitely many II\(_1\)-factors.

**Proof.** Suppose the free group factors are isomorphic. Then

\[
\mathcal{N} \ast \left[ t(i), Q(i) \right] \xrightarrow{\sim} \left( \mathcal{N} \ast \left[ t(1), Q(1) \right] \right) \ast_{i=2}^{\infty} \left[ t(i), Q(i) \right]
\]
\[
\xrightarrow{\sim} (\mathcal{N} \ast Q \ast (i) \ast \left( L(F_{t(1)^2-1}) \right) \ast_{i=2}^{\infty} \left[ t(i), Q(i) \right])
\]
\[
\xrightarrow{\sim} (\mathcal{N} \ast Q \ast (i) \ast \left( L(F_{\infty}) \right) \ast_{i=2}^{\infty} \left[ t(i), Q(i) \right])
\]
\[
\xrightarrow{\sim} \mathcal{N} \ast \left( \ast_{i=1}^{\infty} Q(i) \ast (i) \right),
\]

where the second isomorphism is from Theorem 4.4, the third isomorphism is a consequence of isomorphism of free group factors by [1, Thm. 6] and the last isomorphism is from Theorem 4.5.

On the other hand, suppose (45) holds in general. From Theorem 3.8 we have

\[
L(F_4) \cong \left( L(F_2) \ast_{k=1}^{\infty} [2^{-k/2}, L(F_2)] \right).
\]
while the isomorphism (13) gives
\[ L(F_2)^* \otimes \left( \bigotimes_{k=1}^{\infty} L(F_2) \right) \cong L(F_2)^* \otimes \left( \bigotimes_{k=1}^{\infty} L(F_{1+2^{-k}}) \right) \cong L(F_\infty). \]
