SOME INVERSE ANISOTROPIC CONDUCTIVITY PROBLEM INDUCED BY
TWISTING A HOMOGENEOUS CYLINDRICAL DOMAIN

MOURAD CHOULLI† AND ERIC SOCCORSI‡

Abstract. We consider the inverse problem of determining the unknown function $\alpha : \mathbb{R} \rightarrow \mathbb{R}$ from the
DN map associated to the operator $\text{div}(A(x', \alpha(x_3))\nabla \cdot \cdot \cdot)$ acting in the infinite straight cylindrical waveguide
$\Omega = \omega \times \mathbb{R}$, where $\omega$ is a bounded domain of $\mathbb{R}^2$. Here $A = (A_{ij}(x))$, $x = (x', x_3) \in \Omega$, is a matrix-valued
metric on $\Omega$ obtained by straightening a twisted waveguide. This inverse anisotropic conductivity problem
remains generally open, unless the unknown function $\alpha$ is assumed to be constant. In this case we prove
Lipschitz stability in the determination of $\alpha$ from the corresponding DN map. The same result remains valid
upon substituting a suitable approximation of the DN map, provided the function $\alpha$ is sufficiently close to
some a priori fixed constant.

Key words: Dirichlet Laplacian, twisted infinite cylindrical domain, inverse anisotropic conductivity prob-
lem, DN map, stability estimate.

1. Introduction

In the present paper we consider an inverse conductivity problem in an anisotropic medium arising from
the twisting of a homogeneous infinite straight cylindrical waveguide. Generically the inverse conductivity
problem in an arbitrary domain $\Omega \subset \mathbb{R}^n$, $n \geq 1$, is to determine a symmetric, positive definite matrix
$A = A(x)$, $x \in \Omega$, representing the conductivity tensor of $\Omega$, from the Dirichlet-to-Neumann (abbreviated to
DN in the following) map associated to $A$:

$\Lambda_A : u|_{\partial \Omega} \mapsto A \nabla u \cdot \nu.$

Here $u$ is the solution to the elliptic equation $\text{div}(A \nabla u) = 0$ in $\Omega$ and $\nu$ denotes the unit outward normal
vector to the boundary $\partial \Omega$ of $\Omega$.

If $A$ is isotropic (i.e. $A$ is the identity matrix of $\mathbb{R}^n$ up to some multiplicative scalar -unknown- function
of $x \in \Omega$) Silvester and Uhlmann [SU] proved that the conductivity is uniquely determined from the
knowledge of $\Lambda_A$. Similar results were derived by Lionheart in [L] upon substituting a suitable given matrix
$A_0(x)$ for the identity. For a conductivity of the form $A(x) = A_0(x, \alpha(x))$ where $A_0$ is given and $\alpha$ is an
unknown scalar function, Alessandrini and Gaburro [AG1, AG2] obtained uniqueness and stability under
the monotonicity assumption

$$\partial_t A_0(x, t) \geq cI, \quad x \in \Omega, \quad t \in \mathbb{R}. \tag{1.1}$$
Here $c$ is some positive constant and $I$ stands for the identity of $\mathbb{R}^n$. The case $A(x) = A_0(\alpha(x))$ was treated earlier by Alessandrini in [A] under the same kind of monotonicity condition.

All the above mentioned results were obtained in a bounded domain of $\mathbb{R}^n$. In this paper we will rather consider an infinite cylindrical straight waveguide $\Omega = \omega \times \mathbb{R}$, where $\omega$ is a bounded domain of $\mathbb{R}^2$. To $\theta \in C^1(\mathbb{R})$ we then associate the twisted waveguide

$$\Omega_\theta = \{(R_\theta(x_3)x', x_3); x' = (x_1, x_2) \in \omega, x_3 \in \mathbb{R}\},$$

where $R_\xi$ denotes the rotation in $\mathbb{R}^2$ of angle $\xi \in \mathbb{R}$. Twisted waveguides modeled by $\Omega_\theta$ exhibit interesting propagation properties such as the occurrence of propagating modes with phase velocities slower than those of similar modes in a straight waveguide. This explains why these peculiar structures are at the center of the attention of many theoretical and applied physicists (see e.g. [Ka, DR, KF, NZG, Sh, Wi, YM]). From a mathematical viewpoint twisted waveguides are the source of challenging spectral and PDE problems, some of them having been extensively studied in the mathematical literature (see e.g. [BK, EKK, KK, KS, KZ1, KZ2]). Moreover the cylindrical geometry is well suited to the construction of complex geometrical optics solutions [DKSU, CKS], which motivates for the analysis of inverse problems occuring in waveguides.

We consider the following boundary value problem (abbreviated to BVP) for the Laplacian in $\Omega_\theta$:

\begin{equation}
\begin{cases}
\Delta v(y) = 0, & y \in \Omega_\theta, \\
v(y) = g(y), & y \in \partial \Omega_\theta.
\end{cases}
\end{equation}

Upon straightening $\Omega_\theta$, (1.2) may be brought into an equivalent BVP stated in $\Omega$. This can be seen by introducing

$$T_\xi = \begin{pmatrix} R_\xi & 0 \\
0 & 1 \end{pmatrix},$$

putting $u(x) = v(T_\theta(x_3)(x', x_3))$, $x = (x', x_3) \in \Omega$, and performing the change of variable $y = T_\theta(x_3)(x', x_3)$. We get using direct calculation that $u$ is solution to the following elliptic BVP in the divergence form

\begin{equation}
\begin{cases}
\text{div}(A_0(x', \alpha(x_3))\nabla u) = 0, & x \in \Omega, \\
u(x) = f(x), & x \in \partial \Omega,
\end{cases}
\end{equation}

where $\alpha = \theta'$, $f(x) = g(T_\theta(x_3)(x', x_3))$ for $x \in \partial \Omega$, and the matrix $A_0$ is given by

$$A_0(x', t) = \begin{pmatrix}
1 + x_2^2t^2 & -x_2x_1t^2 & -x_2t \\
-x_2x_1t^2 & 1 + x_1^2t^2 & x_1t \\
x_2t & -x_1t & 1
\end{pmatrix}, \quad x' \in \omega, \ t \in \mathbb{R}.$$

At this point it is worth stressing out that the BVP (1.3) is stated on the straight waveguide $\Omega_\theta$ and not on the twisted waveguide $\Omega_\theta$ itself. Nevertheless we notice that the geometry of $\Omega_\theta$ is expressed in (1.3) through the metric $A = (A_{ij}(x)) = A_0(x', \alpha(x_3))$.

The problem we examine in this paper is to know whether the unknown function $\alpha$ can be determined from the DN map

$$\Lambda_\alpha : f \mapsto A \nabla u \cdot \nu.$$

This is the same kind of inverse anisotropic conductivity problem, but stated here in the unbounded straight waveguide $\Omega$, as the one studied in [A1, AG1, AG2, GL] in a bounded domain. However, it turns out that the usual monotonicity assumption (1.1) on the conductivity, which is essential to the identification of $A$ from the DN map in this approach, is not verified in our framework. This explains why the inverse problem associated to (1.3) is still open for general unknown functions $\alpha \in C(\mathbb{R})$. However, if $\alpha$ is sufficiently close to some a priori fixed constant we prove in Theorem [1.1] that this unknown function may well be determined from the knowledge of some suitable approximation of the DN map (see [1.12]). Moreover, in the particular case where $\alpha$ is known to be constant so the conductivity matrix $A$ is invariant w.r.t. the infinite variable $x_3$, the original problem is equivalent to some inverse anisotropic conductivity problem stated in $\omega$. The corresponding conductivity matrix satisfies a weak monotonicity condition in this case implying Lipschitz stability in the determination of $\alpha$ from $\Lambda_\alpha$ (see Theorem [1.1]).

The paper is organized as follows. Section 2 gathers the definition and the main properties of $\Lambda_\alpha$. In the first part of section 3 we adapt the method developed by Alessandrini and Gaburro in [AG1, AG2] to
determine the conductivity in a bounded anisotropic medium from the DN map, to the particular framework of an infinite cylindrical waveguide under consideration in this text. Although this technique does not allow for the identification of general unknown functions $\alpha$, we prove stability in the determination of $\alpha$ from some suitable approximation of the DN map, provided $\alpha$ is sufficiently close to some arbitrarily fixed constant. The case of constant unknown functions is examined in section 4 and we prove Lipschitz stability in the determination of $\alpha$ from the knowledge of $\Lambda_\alpha$ in this case. Finally, for the sake of completeness, we gather several properties (which are not directly useful for the analysis of the inverse problem under study) of the DN map $\Lambda_\alpha$ in Appendix.

Acknowledgments. We thank Gunther Uhlmann for valuable suggestions and comments during the completion of this work.

2. The DN map $\Lambda_\alpha$

Solution to the BVP \cite{LM}. As we are dealing with an infinitely extended domain $\Omega$, we start by defining the Sobolev spaces on $\partial \Omega$ required by our analysis. Let $s$ be either 1/2 or 3/2. Since the trace operator
\[
\tau : C_0^\infty (\mathbb{R}, H^{s+1/2}(\omega)) \to L^2(\mathbb{R}, H^s(\partial \omega))
\]
extends to a bounded operator, still denoted by $\tau$, from $L^2(\mathbb{R}, H^{s+1/2}(\omega))$ into $L^2(\mathbb{R}, H^s(\partial \omega))$, we put
\[
(2.1) \quad \tilde{H}^s(\partial \Omega) = \{ g \in L^2(\mathbb{R}, H^s(\partial \omega)); \text{ there exists } G \in H^{s+1/2}(\Omega) \text{ such that } \tau G = g \}.
\]
The space $\tilde{H}^s(\partial \Omega)$ is Hilbertian for the quotient norm
\[
(2.2) \quad \| g \|_{\tilde{H}^s(\partial \Omega)} = \inf \{ \| G \|_{H^{s+1/2}(\Omega)}; G \in H^{s+1/2}(\Omega) \text{ is such that } \tau G = g \}.
\]
For the sake of simplicity we write $G = g$ on $\partial \Omega$ instead of $\tau G = g$ in the sequel.

Remark 2.1. The definition in \cite{LM} (Chap. 1) of fractional Sobolev spaces $H^s(\partial \Omega)$, $s \in \mathbb{Q}$, on compact manifolds without boundary, may as well be adapted to the manifold $\partial \Omega = \partial \omega \times \mathbb{R}$ and it is not hard to check that the two spaces $H^s(\partial \Omega)$ and $\tilde{H}^s(\partial \Omega)$ then coincide both algebraically and topologically in this case.

As a direct consequence of (2.1)–(2.2) we have the following extension lemma:

Lemma 2.1. Let $g \in \tilde{H}^s(\partial \Omega)$ for $s \in \{1/2, 3/2\}$. Then there exists $G \in H^{s+1/2}(\Omega)$ such that $G = g$ on $\partial \Omega$ and
\[
(2.3) \quad \| G \|_{H^{s+1/2}(\Omega)} \leq 2 \| g \|_{\tilde{H}^s(\partial \Omega)}.
\]

The main ingredient in the analysis of the BVP \cite{LM} is the uniform ellipticity of $A$, where $A$ denotes either $A(x', t)$ or $A_0(x', \alpha(x_3))$, as defined in section 1. Indeed, for all $\zeta \in \mathbb{R}^3$ we have
\[
A(x', t)\zeta \cdot \zeta = \zeta_1^2 + \zeta_2^2 + \zeta_3^2 - 2tx_2\zeta_1\zeta_3 + 2tx_1\zeta_2\zeta_3 + t^2(x_2\zeta_1 - x_1\zeta_2)^2
\]
\[
= \zeta_1^2 + \zeta_2^2 + (\zeta_3 + t(x_2\zeta_1 - x_1\zeta_2))^2, \quad x' = (x_1, x_2) \in \omega, \quad t \in \mathbb{R},
\]
by straightforward computations, which entails that $A(x', t)\zeta \cdot \zeta = 0$ if and only if $\zeta = 0$. Since $\mathbb{R} \times [\ell, \bar{\ell}]$ is compact for all real numbers $\ell < \bar{\ell}$, there is thus $\lambda \geq 1$, depending on $\omega$, $\ell$ and $\bar{\ell}$, such that we have
\[
(2.4) \quad \lambda^{-1}|\zeta|^2 \leq A(x', t)\zeta \cdot \zeta \leq \lambda|\zeta|^2 \quad \text{for all } x' \in \omega, \quad t \in [\ell, \bar{\ell}], \quad \zeta \in \mathbb{R}^3.
\]

We turn now to studying the direct problem associated to \cite{LM}. We pick $f \in \tilde{H}^{1/2}(\partial \Omega)$ and $F = f$ on $\partial \Omega$. In light of (2.3) and the Lax-Milgram lemma, there exists a unique $v \in H_0^1(\Omega)$ solving the variational problem
\[
(2.5) \quad \int_{\Omega} A\nabla v \cdot \nabla w dx = - \int_{\Omega} A\nabla F \cdot \nabla w dx, \quad \text{for all } w \in H_0^1(\Omega).
\]
Hence $u = v + F$ is the unique weak solution to the BVP (1.3). That is, $u$ satisfies the first equation in (1.3) in the distributional sense and the second equation in the trace sense. By taking $w = v$ in (2.5), we get $\|u\|_{H^1(\Omega)} \leq C\|F\|_{H^1(\Omega)}$ from (2.4) and Poincaré's inequality\(^1\) whence

$$\|u\|_{H^1(\Omega)} \leq C\|F\|_{H^1(\Omega)},$$

where $C$ denotes some generic positive constant depending on $\omega$. Finally, by choosing $F \in H^1(\Omega)$ in accordance with Lemma 2.1 so that $\|F\|_{H^1(\Omega)} \leq 2\|f\|_{H^{1/2}(\partial\Omega)}$, we find out that

$$\|u\|_{H^1(\Omega)} \leq C\|f\|_{H^{1/2}(\partial\Omega)}.$$  

**Definition of the DN map.** Let us first introduce the following $H(\text{div})$-type space,

$$H(\text{div}_A, \Omega) = \{P \in L^2(\Omega)^3; \text{div}(AP) \in L^2(\Omega)\},$$

and prove that $P \in C^\infty_0(\Omega) \mapsto AP \cdot \nu \in C^\infty(\partial\Omega)$ may be extended to a bounded operator from $H(\text{div}_A, \Omega)$ into the space $\tilde{H}^{-1/2}(\partial\Omega)$ dual of $\tilde{H}^{1/2}(\partial\Omega)$.

**Proposition 2.1.** Let $P \in H(\text{div}_A, \Omega)$. Then $AP \cdot \nu \in \tilde{H}^{-1/2}(\partial\Omega)$ and we have

$$\|AP \cdot \nu\|_{\tilde{H}^{-1/2}(\partial\Omega)} \leq C\|P\|_{L^2(\Omega)} + \|\text{div}(AP)\|_{L^2(\Omega)},$$

for some constant $C = C(\omega, \theta) > 0$. In addition, the following identity

$$\langle AP \cdot \nu, g \rangle = \int_\Omega G\text{div}(AP)dx + \int_\Omega A\nabla G \cdot Pdx,$$

holds for $g \in \tilde{H}^{1/2}(\partial\Omega)$ and $G \in H^1(\Omega)$ such that $G = g$ on $\partial\Omega$. Here $\langle \cdot, \cdot \rangle$ denotes the duality pairing between $H^{1/2}(\partial\Omega)$ and its dual $\tilde{H}^{-1/2}(\partial\Omega)$.

**Proof.** We first consider the case of $P \in C^\infty_0(\Omega)^3$. Fix $g \in \tilde{H}^{1/2}(\partial\Omega)$ and choose $G \in H^1(\Omega)$ such that $G = g$ on $\partial\Omega$. Since $P$ has a compact support, we have

$$\int_\Omega G\text{div}(AP)dx = -\int_\Omega A\nabla G \cdot Pdx + \int_{\partial\Omega} gAP \cdot \nu d\sigma,$$

by Green’s formula, whence

$$\left| \int_{\partial\Omega} gAP \cdot \nu d\sigma \right| \leq C\|G\|_{H^1(\Omega)}(\|P\|_{L^2(\Omega)} + \|\text{div}(AP)\|_{L^2(\Omega)}).$$

Taking the infimum over $\{G \in H^1(\Omega), G = g$ on $\partial\Omega\}$ in the right hand side of above estimate, we find that (2.7) holds true for every $P \in C^\infty_0(\Omega)^3$.

Further, we pick $P \in H(\text{div}_A, \Omega)$. The set $C^\infty_0(\Omega)^3$ being dense in $H(\text{div}_A, \Omega)$, as can be seen by mimicking the proof of [GR][Theorem 2.4], we may find a sequence $(P_k)_k$ in $C^\infty_0(\Omega)^3$ converging to $P$ in $H(\text{div}_A, \Omega)$. Moreover, $(AP_k \cdot \nu)_k$ being a Cauchy sequence in $\tilde{H}^{-1/2}(\partial\Omega)$ by (2.4), then $(AP_k \cdot \nu)_k$ admits a limit, denoted by $AP \cdot \nu$, in $\tilde{H}^{-1/2}(\partial\Omega)$. Now (2.8) follows readily from this and (2.9). \[\square\]

Let $u$ be the $H^1(\Omega)$-solution to (1.3). Applying Proposition 2.1 to $P = \nabla u$, we deduce from (2.6) that

$$\Lambda_a : f \mapsto A\nabla u \cdot \nu$$

is well defined as a bounded operator from $\tilde{H}^{1/2}(\partial\Omega)$ into $\tilde{H}^{-1/2}(\partial\Omega)$. Moreover the following identity

$$\langle \Lambda_a f, g \rangle = \int_\Omega A\nabla u \cdot \nabla Gdx,$$

holds for all $g \in \tilde{H}^{1/2}(\partial\Omega)$ and $G \in H^1(\Omega)$ such that $G = g$ on $\partial\Omega$.

Further, by taking $G = v$ in (2.10), where $v$ is the solution to (1.3) with $f$ replaced by $g$, we find out that

$$\langle \Lambda_a f, g \rangle = \int_\Omega A\nabla u \cdot \nabla vdx = \int_\Omega \nabla u \cdot A\nabla vdx,$$

\(^1\)Which holds true for $\Omega$ since $\omega$ is bounded.
entailing
\[(2.11)\]
\[\langle \alpha \gamma f, g \rangle = \langle f, \Lambda \alpha g \rangle, \text{ for all } f, g \in \tilde{H}^{1/2}(\partial \Omega).\]
This proves that \(\Lambda^*_\alpha|_{\tilde{H}^{1/2}(\partial \Omega)} = \Lambda_\alpha\), where \(\tilde{H}^{1/2}(\partial \Omega)\) is identified with a subspace of its bidual space.

Finally, for \(i = 1, 2\), we put \(A_i = A(x', \alpha_i(x_3))\) and \(\Lambda_i = \Lambda_{\alpha_i}\), and let \(u_i \in H^1(\Omega)\) denote a weak solution to the equation
\[
\text{div}(A_i \nabla u_i) = 0 \text{ in } \Omega.
\]
Applying \((2.10)\) to \(f = u_i|_{\partial \Omega}\) and \(g = u_{3-i}|_{\partial \Omega}\), we thus get
\[
\langle \Lambda_1 u_1, u_2 \rangle = \int_\Omega A_1 \nabla u_1 \cdot \nabla u_2 \, dx \quad \text{and} \quad \langle \Lambda_2 u_2, u_1 \rangle = \int_\Omega A_2 \nabla u_2 \cdot \nabla u_1 \, dx.
\]
which finally yields
\[(2.12)\]
\[\langle (\Lambda_1 - \Lambda_2) u_1, u_2 \rangle = \int_\Omega (A_1 - A_2) \nabla u_1 \cdot \nabla u_2 \, dx,
\]
according to \((2.11)\).

3. Can we determine the unknown function \(\alpha\) from \(\Lambda_\alpha\)?

In this section we examine the inverse problem of identifying \(\alpha\) from the knowledge of \(\Lambda_\alpha\).

**Analysis of the problem for general unknown functions.** Let \(\gamma\) be a nonempty open subset of \(\partial \omega\).

We put \(\Gamma = \gamma \times (-2L, 2L)\) for some fixed \(L > 0\), and define the functional space
\[(3.1)\]
\[\tilde{H}^{1/2}(\partial \Omega) = \{ f \in \tilde{H}^{1/2}(\partial \Omega); \text{supp} f \subset \Gamma \}.
\]
For \(\alpha_i \in W^{1, \infty}(\mathbb{R}), i = 1, 2\), we note \(A_i = A(x', \alpha_i(x_3))\) and \(\Lambda_i = \Lambda_{\alpha_i}\). In light of \((2.12)\), we have
\[(3.2)\]
\[\langle (\Lambda_1 - \Lambda_2) u_1, u_2 \rangle = \int_\Omega (A_1 - A_2) \nabla u_1 \cdot \nabla u_2 \, dx,
\]
for any function \(u_i \in H^1(\Omega)\) which is a weak solution to the equation
\[
\text{div}(A_i \nabla u_i) = 0 \text{ in } \Omega, \ i = 1, 2.
\]
Putting \(\Omega^L = \omega \times (-L, L)\) and assuming that
\[(3.3)\]
\[\alpha_1(x_3) = \alpha_2(x_3), \ |x_3| > L,
\]
we may rewrite \((3.2)\) as
\[(3.4)\]
\[\langle (\Lambda_1 - \Lambda_2) u_1, u_2 \rangle = \int_{\Omega^L} (A_1 - A_2) \nabla u_1 \cdot \nabla u_2 \, dx.
\]
The following analysis is essentially based on the method built in \(\text{AG2}\) for bounded domains, that will be adapted to the case of the infinite waveguide \(\Omega\) under consideration. To this purpose we set
\[\Gamma_\rho = \{ x \in \Gamma; \text{dist}(x, \partial \Gamma) > \rho \} \text{ and } U_\rho = \{ x \in \mathbb{R}^3; \text{dist}(x, \Gamma_\rho) < \rho/4 \},
\]
for all \(\rho \in (0, \rho_0]\), where \(\rho_0\) is some characteristic constant depending only on \(\omega\) and \(L\), which is defined in \(\text{AG2}\). Upon eventually shortening \(\rho_0\), we can assume without loss of generality that \(\Gamma_0 = \gamma_0 \times [-L, L] \subset \Gamma_\rho\) for some \(\gamma_0 \subset \gamma\). In view of \(\text{AG2}\), we thus may find a Lipschitz domain \(\Omega_\rho\) satisfying simultaneously:
\[\Omega \subset \Omega_\rho, \ \Gamma_0 \subset \partial \Omega \cap \Omega_\rho \subset \Gamma \text{ and } \text{dist}(x, \partial \Omega_\rho) \geq \rho/2 \text{ for all } x \in U_\rho.
\]
Moreover we know from \(\text{AG1}\) [Section 3] that there is a unitary \(C^\infty\) vector field \(\hat{v}\), defined in some suitable neighborhood of \(\partial \omega \times (-2L, 2L)\), which is non tangential to \(\partial \Omega\) and points to the exterior of \(\Omega\). For \(x^0 \in \Gamma_\rho\), the point \(z_\tau = x^0 + \tau \hat{v}\) obeys \(C \tau \leq \text{dist}(z_\tau, \partial \Omega) \leq \tau\) for all \(0 < \tau \leq \tau_0\), according to \(\text{AG1}\) [Lemma 3.3]. Here \(C\) and \(\tau_0\) are two positive constants depending only on \(\Omega\) and \(\lambda, L\) and \(\hat{v}\) are the same as in \(\text{AG1}\).
In light of [HK], the operator $\text{div}(A_i \nabla \cdot)$, $i = 1, 2$, has a Dirichlet Green function $G_i = G_i(x, y)$ on $\Omega_\rho$. More specifically, $G_i(x) = G_i(x, z_r)$ is the solution to the BVP

\begin{equation}
\begin{cases}
\text{div}(A_i \nabla G_i) = -\delta(x - z_r) & \text{in } \mathcal{D}'(\Omega_\rho) \\
G_i = 0 & \text{on } \partial \Omega_\rho,
\end{cases}
\tag{3.5}
\end{equation}

and we will see in the coming lemma that the claim of [AG2] (Corollary 3.4) remains essentially unchanged for the unbounded domain $\Omega_\rho$ arising in this framework.

**Lemma 3.1.** There are two constants $t_0 = \tau_0(\Omega, \rho) > 0$ and $C = C(\Omega, \lambda, \ell, \overline{\ell})$ such that the restriction $G_i(\cdot, z_r)$ to $\Omega$, $i = 1, 2$, belongs to $H^1(\Omega)$, and satisfies

\begin{equation}
\|G_i(\cdot, z_r)\|_{H^1(\Omega)} \leq C\tau^{-1/2}, \quad 0 < \tau \leq \tau_0.
\tag{3.6}
\end{equation}

**Proof.** Let the space $Y^{2,1}(\Omega) = \{u \in L^6(\Omega); \nabla u \in L^2(\Omega)^3\}$ be endowed with the norm $\|v\|_{Y^{2,1}(\Omega)} = \|v\|_{L^6(\Omega)} + \|\nabla v\|_{L^2(\Omega)}$, and choose $\tau_0 = \tau_0(\Omega, \rho)$ so small relative to $\rho$ that $\text{dist}(z_r, \partial \Omega_\rho) > \tau$ for all $\tau \in (0, \tau_0]$. Since the ball $B_{\tau/3}(z_r)$ centered at $z_r$ with radius $\tau/3$, is embedded in $\Omega_\rho \setminus \overline{\Omega}$, we have

\begin{equation}
\|G_i(\cdot, z_r)\|_{Y^{2,1}(\Omega)} \leq \|G_i(\cdot, z_r)\|_{Y^{2,1}(\Omega_\rho \setminus B_{\tau/3}(z_r))} \leq C\tau^{-1/2}, \quad 0 < \tau \leq \tau_0,
\tag{3.7}
\end{equation}

directly from [HK] (Formula (4.45)). Here $C$ is some positive constant depending only on $\Omega, \lambda, \ell$ and $\overline{\ell}$.

Finally, the domain $\Omega$ having the Poincaré inequality property since $\omega$ is bounded, we may deduce (3.6) from (3.7). \(\square\)

Further, as a Green function is a Levi function, it behaves locally like a parametrix. Hence, by applying [MI] (Formula (8.4)), $G_i$ can be brought into the form

\begin{equation}
G_i(x) = C(\det (A_i(z_r)))^{-1/2} (A(z_r)^{-1}(x - z_r) \cdot (x - z_r))^{-1/2} + R_i(x), \quad i = 1, 2,
\tag{3.8}
\end{equation}

where $C > 0$ is a constant and the reminder $R_i$ obeys the condition:

\[ \exists (r_0, \alpha) \in \mathbb{R}^*_+ \times (0, 1), \ |R_i(x)| + |x - z_r| \cdot |\nabla R_i| \leq C|x - z_r|^{-1 + \alpha}, \ x \in \Omega_\rho, \ |x - z_r| \leq r_0. \]

On the other hand it holds true that $\text{div}(A_i \nabla G_i) = 0$ in the weak sense in $\Omega$ for $i = 1, 2$, so (3.4) entails

\[ \langle (\Lambda_1 - \Lambda_2)G_1, G_2 \rangle = \int_{\Omega} (A_1 - A_2) \nabla G_1 \cdot \nabla G_2 \, dx. \]

Taking into account that $G_i|_{|\partial \Omega} \in \widetilde{H}^{1/2}(\partial \Omega)$, this yields

\[ \int_{\Omega} (A_1 - A_2) \nabla G_1 \cdot \nabla G_2 \, dx \leq \|\Lambda_1^\Gamma - \Lambda_2^\Gamma\|_{\widetilde{H}^{1/2}(\partial \Omega)} \|G_1\|_{\widetilde{H}^{1/2}(\partial \Omega)} \|G_2\|_{\widetilde{H}^{1/2}(\partial \Omega)}, \]

where $\Lambda_1^\Gamma$ is the restriction of $\Lambda_1$ to the closed subspace $\widetilde{H}^{1/2}(\partial \Omega)$, and consequently

\begin{equation}
\int_{\Omega} (A_1 - A_2) \nabla G_1 \cdot \nabla G_2 \, dx \leq C\|\Lambda_1^\Gamma - \Lambda_2^\Gamma\|_{H^1(\Omega)} \|G_1\|_{H^1(\Omega)} \|G_2\|_{H^1(\Omega)}.
\tag{3.9}
\end{equation}

The next step involves picking $x^0 \in \Gamma_0$ such that $|\alpha_1(x^0_0) - \alpha_2(x^0_0)| = \|\alpha_1 - \alpha_2\|_{L^\infty(-L, L)}$. We may actually assume without loss of generality that $|\alpha_1(x^0_0) - \alpha_2(x^0_0)| = \alpha_1(x^0_0) - \alpha_2(x^0_0)$. In view of (3.8) and [AG2] (Formula (4.2)), the main term in the left hand side of (3.9) has the following expression

\[ \int_{B(z_r, \rho) \cap \Omega} \left[ \frac{A^{-1}((x^0)'(x^0)', t_0) - A^{-1}(x(x)^0)', s_0)}{P_0(x - z_r) \cdot (x - z_r)} \right]^{3/2} \left[ Q_0(x - z_r) \cdot (x - z_r) \right]^{3/2} \, dx, \]

with $t_0 = \alpha_1(x^0_0), \ s_0 = \alpha_2(x^0_0), \ P_0 = A^{-1}(x^0_0, t_0)$ and $Q_0 = A^{-1}(x^0_0, 0)$, where we recall that $z_r = x^0 + \tau \nu$ for some $\tau \in \mathbb{R}^*_+$. The main ingredient in the analysis developed in [AG2] is the ellipticity condition [AG2] (Formula (2.5)) imposed on $\partial A(x', t)$, implying

\begin{equation}
\int_{B(z_r, \rho) \cap \Omega} \left[ \frac{A^{-1}((x^0)'(x^0)', t_0) - A^{-1}(x(x)^0)', s_0)}{P_0(x - z_r) \cdot (x - z_r)} \right]^{3/2} \left[ Q_0(x - z_r) \cdot (x - z_r) \right]^{3/2} \, dx \geq C\tau(t_0 - s_0),
\tag{3.10}
\end{equation}

for some constant $C > 0$, which leads ultimately to the desired result.
Unfortunately, this condition is not fulfilled by $\partial_t A(x', t)$ in this framework. This can be seen from the following explicit expression

$$
\begin{align*}
\lambda_1 &= 0, \\
\lambda_2 &= |x'|^2 t - \sqrt{|x'|^4 t^2 + |x'|^2}, \\
\lambda_3 &= |x'|^2 t + \sqrt{|x'|^4 t^2 + |x'|^2},
\end{align*}
$$

of the eigenvalues of $\partial_t A(x', t)$, showing that the spectrum of $\partial_t A(x', t)$ has a negative component for $x' \in \partial \omega$. Moreover, due to the occurrence of this negative eigenvalue, the weak monotonicity assumption $[AG1]$ (Formula (5.7)) is not satisfied by the conductivity matrix under consideration either. Therefore, the approach developed in $[AG2]$ does not apply to the inverse problem of determining $\alpha$ from the knowledge of $\Lambda_{\alpha}$, which remains open in the general case.

Nevertheless, we will see in section 4 that this is not the case for constant unknown functions anymore. But, prior to examining this peculiar framework, we will now deduce from the above reasoning, upon substituting a suitable matrix $A^\bullet$ for $A$, that unknown functions $\alpha$ which are close to some a priori fixed constant value may well be identified from the associated DN map.

The case of unknown functions close to a constant value. Put

$$
A^\bullet(x', t) = t \begin{pmatrix} 1 + x_2^2 & -x_2 x_1 & -x_2 \\ -x_2 x_1 & 1 + x_1^2 & x_1 \\ -x_2 & x_1 & 1 \end{pmatrix}, \quad x' \in \omega, \ t \in \mathbb{R},
$$

and denote by $\Lambda_{\alpha}^\bullet$ the DN map $\Lambda_{\alpha}$ where $A^\bullet(x', \alpha(x_3))$ is substituted for $A(x', \alpha(x_3))$. Then, by arguing as in the derivation of (2.12), we obtain that

$$
(\Lambda_{\alpha}^\bullet - \Lambda_{\alpha}^\bullet) u, u^\bullet = \int_\Omega (A(x', \alpha(x_3)) - A^\bullet(x', \alpha(x_3)) \nabla u \cdot \nabla u^\bullet dx,
$$

for all $u, u^\bullet \in H^1(\Omega)$ satisfying $\text{div}(A'(x', \alpha(x_3))) \nabla u = \text{div}(A^\bullet(x', \alpha(x_3)) \nabla u^\bullet) = 0$ in the weak sense in $\Omega$. For $f$ (resp. $g$) in $\tilde{H}^{1/2}(\partial \Omega)$ let $u$ (resp. $u^\bullet$) be the solution to (3.3) (resp. (3.3)) where $(A^\bullet, g)$ is substituted to $(A, f)$. Thus, applying (3.11) we get that $|\langle (\Lambda_{\alpha}^\bullet - \Lambda_{\alpha}^\bullet) f, g \rangle| \leq \|\alpha - 1\|_\infty \|u\|_{H^1(\Omega)} \|u^\bullet\|_{H^1(\Omega)}$. This entails $|\langle (\Lambda_{\alpha} - \Lambda_{\alpha}^\bullet) f, g \rangle| \leq C\|\alpha - 1\|_\infty \|f\|_{\tilde{H}^{1/2}(\partial \Omega)} \|g\|_{\tilde{H}^{1/2}(\partial \Omega)}$, by (2.6), where $C = C(\omega)$ is some positive constant. As a consequence we have

$$
\|\alpha_{\alpha} - \alpha_{\alpha}^\bullet\|_{L^2(\tilde{H}^{1/2}(\partial \Omega), \tilde{H}^{-1/2}(\partial \Omega))} \leq C\|\alpha - 1\|_\infty,
$$

showing that $\Lambda_{\alpha}^\bullet$ is a suitable approximation of $\Lambda_{\alpha}$ provided $\alpha$ is sufficiently close to 1.

Actually, the main benefit of dealing with $\Lambda_{\alpha}^\bullet$ instead of $\Lambda_{\alpha}$ in the inverse problem of determining $\alpha$ from $\Lambda_{\alpha}$, boils down to the following identity

$$
\partial_t A_{\alpha}^\bullet(x', t) = A^\bullet(x', 1) = A(x', 1), \quad \text{for all } x' \in \omega \text{ and } t \in \mathbb{R},
$$

ensuring that the ellipticity condition $[AG2]$ (Formula (2.5)) required by the method presented in $[AG2]$, is verified by $A^\bullet$. Now, in light of the reasoning developed in the first part of this section, arguing as in the proof of $[AC2]$ [Theorem 2.2] we derive the:

**Theorem 3.1.** Let $L > 0$ and $M > 0$. Assume that $\alpha_i \in W^{1,\infty}(\mathbb{R})$, $i = 1, 2$, obey (3.3) and are such that

$$
\|\alpha_i\|_{W^{1,\infty}(\mathbb{R})} \leq M.
$$

Then there exists a constant $C > 0$ depending only on $\omega$, $M$ and $L$, such that we have

$$
\|\alpha_1 - \alpha_2\|_{L^\infty(\mathbb{R})} \leq C(A_{\alpha_1}^\bullet) - (A_{\alpha_2}^\bullet)\|_{L^2(\tilde{H}^{1/2}(\partial \Omega), \tilde{H}^{-1/2}(\partial \Omega))},
$$

where $(A_{\alpha_i}^\bullet) = (A_{\alpha_i})_{|\tilde{H}^{1/2}(\partial \Omega)}$ for $i = 1, 2$, the space $\tilde{H}^{1/2}(\partial \Omega)$ being the same as in (3.1).

\footnote{Note that 1 can be replaced by any constant $\mu$ by only substituting $\mu A^\bullet$ for the matrix $A^\bullet$ in the above reasoning.}
4. The case of constant unknown functions

In this section we address the case of affine twisting functions \( \theta \), that is constant functions \( \alpha \), by means of the partial Fourier transform \( \mathcal{F}_{x_3} \) with respect to the variable \( x_3 \). This is suggested by the translational invariance of the system under consideration in the infinite direction \( x_3 \), arising from the fact that the matrix \( A(x', \alpha(x_3)) \) appearing in (13) does not depend on \( x_3 \) in this peculiar case.

In the sequel, we note \( \xi \) the Fourier variable associated to \( x_3 \) and we write \( \hat{w} \) instead of \( \mathcal{F}_{x_3} w \) for every function \( w = w(x', x_3) \):

\[
\hat{w}(x', \xi) = (\mathcal{F}_{x_3} w)(x', \xi), \quad x' \in \omega, \ \xi \in \mathbb{R}.
\]

The first step of the method is to re-express the system (13) in the Fourier plane \( \{(x', \xi), \ x' \in \omega, \xi \in \mathbb{R}\} \).

Rewriting the BVP in the Fourier variables. We start with two useful technical lemmas.

**Lemma 4.1.** For every \( w \in H^1(\Omega) \) the identity \( \hat{\partial_{x_j} w} = \partial_{x_j} \hat{w} \) holds for \( j = 1, 2 \).

**Proof.** Fix \( j = 1, 2 \). For every \( \varphi \in C_0^\infty(\omega) \) and \( \psi \in \mathcal{S}(\mathbb{R}) \), we have

\[
\int_\omega \varphi(x') \left( \int_{\mathbb{R}} \partial_{x_j} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx' = \int_\omega \hat{\psi}(x_3) \left( \int_{\mathbb{R}} \partial_{x_j} w(x', x_3) \varphi(x') dx' \right) dx_3,
\]

from Fubini’s theorem. By integrating by parts in the last integral, we obtain

\[
\int_\omega \partial_{x_j} w(x', x_3) \varphi(x') dx' = - \int_\omega w(x', x_3) \partial_{x_j} \varphi(x') dx', \text{ a.e. } x_3 \in \mathbb{R},
\]

so we get

\[
\int_\omega \varphi(x') \left( \int_{\mathbb{R}} \partial_{x_j} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx' = - \int_\omega \hat{\psi}(x_3) \left( \int_{\mathbb{R}} w(x', x_3) \partial_{x_j} \varphi(x') dx' \right) dx_3 = - \int_\omega \partial_{x_j} \varphi(x') \left( \int_{\mathbb{R}} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx'.
\]

Further, the operator \( \mathcal{F}_{x_3} \) being self-adjoint in \( L^2(\mathbb{R}) \), it is true that

\[
\int_{\mathbb{R}} w(x', x_3) \hat{\psi}(x_3) dx_3 = \int_{\mathbb{R}} \hat{\psi}(x_3) \varphi(x') dx' = \int_{\mathbb{R}} \hat{w}(x', \xi) \psi(\xi) d\xi, \text{ a.e. } x' \in \omega,
\]

whence

\[
\int_\omega \varphi(x') \left( \int_{\mathbb{R}} \partial_{x_j} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx' = - \int_\omega \partial_{x_j} \varphi(x') \left( \int_{\mathbb{R}} \hat{w}(x', \xi) \psi(\xi) d\xi \right) dx' = - \int_\omega \varphi(x') \left( \int_{\mathbb{R}} \partial_{x_j} \hat{w}(x', \xi) \psi(\xi) d\xi \right) dx',
\]

by integrating by parts. From the density of \( C_0^\infty(\omega) \) in \( L^2(\omega) \), the above identity entails that

\[
\int_{\mathbb{R}} \partial_{x_j} w(x', x_3) \hat{\psi}(x_3) dx_3 = \int_{\mathbb{R}} \partial_{x_j} \hat{w}(x', \xi) \psi(\xi) d\xi, \text{ a.e. } x' \in \omega,
\]

for every \( \psi \in \mathcal{S}(\mathbb{R}) \). From this, the self-adjointness of \( \mathcal{F}_{x_3} \) and the density of \( \mathcal{S}(\mathbb{R}) \) in \( L^2(\mathbb{R}) \), then follows that \( \hat{\partial_{x_j} w} = \partial_{x_j} \hat{w} \).

**Lemma 4.2.** Let \( C = (C_{kl})_{1 \leq k, l \leq 3} \in W^{1,\infty}(\omega)^{3 \times 3} \) be such that \( (C_{kl}(x'))_{1 \leq k, l \leq 3} \) is symmetric for all \( x' \in \omega \). Then every \( w \in H^1(\Omega) \) obeying

\[
(4.1) \quad \int_{\Omega} C \nabla w \cdot \nabla v dx = 0 \quad \text{for all } v \in H_0^1(\Omega),
\]

satisfies the equation

\[
(4.2) \quad - \operatorname{div}_{x'}(C(x') \nabla_{x'} \hat{w}) + P(x', \xi) \cdot \nabla_{x'} \hat{w} + q(x', \xi) \hat{w} = 0 \quad \text{in } D'(\Omega),
\]
Proof. Choose $v = \varphi \otimes \hat{\psi}$ in (4.1), with $\varphi \in C_0^\infty(\omega)$ and $\psi \in \mathcal{S}(\mathbb{R})$, so we have:

$$\sum_{k,l=1,2,3} \int_\Omega C_{kl}(x') \partial_{x_k} w(x', x_3) \partial_{x_l} (\varphi \otimes \hat{\psi})(x', x_3) dx' dx_3 = 0. \quad (4.3)$$

For $1 \leq k, l \leq 2$, we notice that

$$\int_\Omega C_{kl}(x') \partial_{x_k} w(x', x_3) \partial_{x_l} (\varphi \otimes \hat{\psi})(x', x_3) dx' dx_3 = \int_\omega C_{kl}(x') \partial_{x_k} \varphi(x') \left( \int_\mathbb{R} \partial_{x_l} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx'$$

$$= \int_\Omega C_{kl}(x') \partial_{x_l} \tilde{w}(x', x_3) \partial_{x_k} (\varphi \otimes \psi)(x', x_3) dx' dx_3. \quad (4.4)$$

directly from Lemma 4.1. Further, the identity

$$\int_\Omega C_{l3}(x') \partial_{x_l} w(x', x_3) \partial_{x_3} (\varphi \otimes \hat{\psi})(x', x_3) dx' dx_3 = \int_\omega C_{l3}(x') \varphi(x') \left( \int_\mathbb{R} \partial_{x_3} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx'$$

$$= \int_\Omega C_{l3}(x') \varphi(x') \left( \int_\mathbb{R} \partial_{x_3} w(x', x_3) (-i\xi) \psi(x_3) dx_3 \right) dx',$$

holds for $l = 1, 2$, so we have

$$\int_\Omega C_{l3}(x') \partial_{x_l} w(x', x_3) \partial_{x_3} (\varphi \otimes \hat{\psi})(x', x_3) dx' dx_3 = \int_\Omega C_{l3}(x') (-i\xi) \partial_{x_l} \tilde{w}(x', x_3) (\varphi \otimes \psi)(x', x_3) dx' dx_3. \quad (4.5)$$

Next, since

$$\int_\Omega C_{k3}(x') \partial_{x_k} w(x', x_3) \partial_{x_k} (\varphi \otimes \hat{\psi})(x', x_3) dx' dx_3 = \int_\omega C_{k3}(x') \partial_{x_k} \varphi(x') \left( \int_\mathbb{R} \partial_{x_k} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx'$$

$$= -\int_\omega C_{k3}(x') \partial_{x_k} \varphi(x') \left( \int_\mathbb{R} w(x', x_3) \hat{\psi}(x_3) dx_3 \right) dx'$$

for each $k = 1, 2$, with

$$\int_\mathbb{R} w(x', x_3) \hat{\psi}(x_3) dx_3 = -\int_\mathbb{R} w(x', x_3)(i\xi) \psi(x_3) dx_3 = -\int_\mathbb{R} (i\xi) \tilde{w}(x', x_3) \psi(x_3) dx_3,$$

then

$$\int_\Omega C_{k3}(x') \partial_{x_k} w(x', x_3) \partial_{x_k} (\varphi \otimes \hat{\psi})(x', x_3) dx' dx_3 = \int_\Omega C_{k3}(x') (i\xi) \partial_{x_k} \tilde{w}(x', x_3) (\varphi \otimes \psi)(x', x_3) dx' dx_3. \quad (4.6)$$

Integrating by parts in the right hand side of the above identity we get

$$\int_\Omega C_{k3}(x') \partial_{x_k} w(x', x_3) \partial_{x_k} (\varphi \otimes \hat{\psi})(x', x_3) dx' dx_3 = \int_\Omega C_{k3}(x') (-i\xi) \partial_{x_k} \tilde{w}(x', x_3) (\varphi \otimes \psi)(x', x_3) dx' dx_3$$

$$+ \int_\Omega \partial_{x_k} C_{k3}(x')(i\xi) \tilde{w}(x', x_3) (\varphi \otimes \psi)(x', x_3) dx' dx_3.$$

Further, bearing in mind that $\partial_{x_k} (\varphi \otimes \hat{\psi}) = \varphi \otimes (-i\xi) \psi$ and noticing that

$$\int_\mathbb{R} \partial_{x_k} w(x', x_3)(-i\xi) \psi(x_3) dx_3 = -\int_\mathbb{R} w(x', x_3)(-i\xi)^2 \psi(x_3) dx_3 = -\int_\mathbb{R} \tilde{w}(x', x_3)(-i\xi)^2 \psi(x_3) dx_3,$$
we find out that
\[(4.7) \quad \int_{\Omega} C_{33}(x')\partial_{x_3} w(x', x_3)\partial_{x_3} (\varphi \otimes \tilde{\psi})(x', x_3)dx'dx_3 = \int_{\Omega} C_{33}(x')(\xi)^2\tilde{w}(x', \xi)\tilde{w}(x', \xi)dx'd\xi.\]

Finally, putting (4.6) and (4.7) together, we end up getting that
\[\langle -\text{div}_{x'}(C(x')\nabla_x'\tilde{w}) + P(x', \xi)\cdot \nabla_{x'}\tilde{w} + q(x', \xi)\tilde{w}, \Phi \rangle = 0, \quad \Phi \in C_0^\infty(\omega) \otimes C_0^\infty(\mathbb{R}),\]
where \(\langle \cdot, \cdot \rangle\) denotes the duality pairing between \(C_0^\infty(\Omega)\) and \(\mathcal{D}'(\Omega)\). From this and the density of \(C_0^\infty(\omega) \otimes C_0^\infty(\mathbb{R})\) in \(C_0^\infty(\Omega)\) then follows that
\[-\text{div}_{x'}(C(x')\nabla_x'\tilde{w}) + P(x', \xi)\cdot \nabla_{x'}\tilde{w} + q(x', \xi)\tilde{w} = 0 \text{ in } \mathcal{D}'(\Omega),\]
which completes the proof. \(\Box\)

Let \(a \in \mathbb{R}\) be fixed. We assume in the remaining of this section that \(a(x_3) = a\) for all \(x_3 \in \mathbb{R}\). For notational simplicity we write \(A_a(x')\) instead of \(A(x', \alpha(x_3))\). With the help of Lemma 4.2 we will first re-express (1.3) in the Fourier plane.

For \(g \in H^1(\mathbb{R}) \cap L^1(\mathbb{R})\) such that \(\int_{\mathbb{R}} g(x_3)dx_3 = 1\) and for \(h \in H^{1/2}(\partial\omega)\), we consider the \(H^1(\Omega)\)-solution \(u\) to (1.3), with
\[f(x', x_3) = g(x_3)h(x'), \quad x' \in \partial\omega, \quad x_3 \in \mathbb{R}.\]

Since \(u\) is solution to (1.3) with \(C = A_a \in W^{1,\infty}(\omega)^{3 \times 3}\), we deduce from Lemma 4.2 that \(\tilde{u} \in L^2(\mathbb{R}; H^1(\omega))\) is solution to the system
\[(4.8) \quad \begin{cases} -\text{div}_{x'}(\tilde{A}_a(x')\nabla_x'\tilde{u}(x', \xi)) - 2ia\xi x' \cdot \nabla_x'\tilde{u} + \xi^2\tilde{u} = 0 \quad \text{in } \mathcal{D}'(\Omega), \\
\tilde{u}(-, \xi) = \tilde{g}(\xi)f \quad \text{on } \partial\omega, \quad \text{for all } \xi \in \mathbb{R},\end{cases}\]
where
\[x' = (-x_2, x_1) \text{ and } \tilde{A}_a(x') = \begin{pmatrix} 1 + x_2^2a^2 & -x_2x_1a^2 \\ -x_2x_1a^2 & 1 + x_1^2a^2 \end{pmatrix} \text{.}\]

We turn now to examining (4.8).

**Analysis of the variational problem associated to (1.8).** Let us consider the bilinear form
\[A_\xi[(v, w), (\varphi, \psi)] = \int_{\omega} \tilde{A}_a \nabla v \cdot \nabla \varphi dx' - 2a\xi \int_{\omega} x' \cdot \nabla \varphi \psi dx' + \xi^2 \int_{\omega} \psi \varphi dx' + \int_{\omega} \tilde{A}_a \nabla w \cdot \nabla \psi dx' + 2a\xi \int_{\omega} x' \cdot \nabla \psi dx' - \xi^2 \int_{\omega} \psi \psi dx', \quad (v, w), (\varphi, \psi) \in \mathcal{H},\]
defined on the Hilbert space \(\mathcal{H} = H^1_0(\omega) \times H^1_0(\omega)\) endowed with the norm
\[\|(v, w)\|_\mathcal{H} = (\|\nabla v\|^2_{L^2(\omega)} + \|\nabla w\|^2_{L^2(\omega)})^{1/2}.\]

Taking into account that
\[\tilde{A}_a(x')\xi \cdot \xi \geq |\xi|^2, \quad \text{for all } \xi \in \mathbb{R}^2 \text{ and } x' \in \omega,\]
and that
\[2a|\xi| \int_{\omega} |x' \cdot \nabla v| dx' \leq a^2 \delta^2 \int_{\omega} |\nabla v|^2 dx' + \xi^2 \int_{\omega} w^2 dx', \quad (v, w) \in \mathcal{H},\]
where \(\delta = \max_{x' \in \omega} |x'| < \infty\), it is easy to see that
\[(4.9) \quad A_\xi[(v, w), (v, w)] \geq (h^2 - a^2 \delta^2)\|(v, w)\|^2_\mathcal{H}.\]

Let us fix \(a_0 > 0\) so small that \(\alpha = 1 - a_0^2 \delta^2 > 0\). In light of the above estimate, the bilinear form \(A_\xi\) is \(\alpha\)-elliptic for every \(\xi \in \mathbb{R}\), provided we have \(|a| \leq a_0\). For each \(\Phi \in C(\mathbb{R}; \mathcal{H}')\) and every \(\xi \in \mathbb{R}\), there is thus a unique \((v(\xi), w(\xi)) \in \mathcal{H}\) satisfying
\[(4.10) \quad A_\xi[(v(\xi), w(\xi)), (\varphi, \psi)] = \langle \Phi(\xi), (\varphi, \psi) \rangle \quad \text{for all } (\varphi, \psi) \in \mathcal{H},\]
by Lax-Milgram’s lemma. From this then follows that
\[
A_{\xi+\eta}[(v(\xi + \eta) - v(\xi), w(\xi + \eta) - w(\xi)), (\varphi, \psi)]
\]
\[
= A_{\xi}[(v(\xi), w(\xi)), (\varphi, \psi)] - A_{\xi+\eta}[(v(\xi), w(\xi)), (\varphi, \psi)] + (\Phi(\xi + \eta) - \Phi(\xi), (\varphi, \psi)),
\]
for each $\xi, \eta \in \mathbb{R}$ and $(\varphi, \psi) \in H$. Further, by noticing through elementary computations that
\[
A_{\xi+\eta}[(v, w), (\varphi, \psi)] = A_{\xi+\eta}[(v, w), (\varphi, \psi)] - 2a\eta \int_\omega x' \cdot (\varphi \nabla_x w - \psi \nabla_x v)dx' + \eta(2\xi + \eta) \int_\omega (v\varphi + w\psi)dx',
\]
for every $(v, w), (\varphi, \psi) \in H$, we deduce from (4.11) and Poincaré’s inequality that there exists a constant $C = C(\xi, \omega, a_0) > 0$ satisfying
\[
A_{\xi}[(v(\xi), w(\xi)), (v(\xi + \eta) - v(\xi), w(\xi + \eta) - w(\xi))] - A_{\xi+\eta}[(v(\xi), w(\xi)), (v(\xi + \eta) - v(\xi), w(\xi + \eta) - w(\xi))] \leq C|\eta||v(\xi), w(\xi)||_H + ||\Phi(\xi + \eta) - \Phi(\xi)||_{H^\prime}.
\]
This proves that $(v, w) \in C(\mathbb{R}; H)$. Moreover, we obtain
\[
\|(v(\xi), w(\xi))||_H \leq (1/\alpha)||\Phi(\xi)||_{H^\prime}, \xi \in \mathbb{R},
\]
directly from (3.10), (4.11). Further, it is easy to check for $\Phi \in C^1(\mathbb{R}; H^\prime)$ that $(v'(\xi), w'(\xi)) \in C(\mathbb{R}, H)$ is the solution to the variational problem
\[
A_{\xi}[(v'(\xi), w'(\xi)), (\varphi, \psi)] = (\Phi_0(\xi), (\varphi, \psi)) + (\Phi'(\xi), (\varphi, \psi)) \quad \text{for all} \quad (\varphi, \psi) \in H,
\]
where
\[
(\Phi_0(\xi), (\varphi, \psi)) = 2a \int_\omega x' \cdot (\varphi \nabla_x w(\xi) - \psi \nabla_x v(\xi))dx' + 2\xi \int_\omega (v(\xi)\varphi + w(\xi)\psi)dx'.
\]
Using (4.12) and noting $(\xi) = (1 + |\xi|^2)^{1/2}$, we deduce from the above estimate that
\[
\|(v'(\xi), w'(\xi))||_H \leq C((\xi)^2||\Phi(\xi)||_{H^\prime} + ||\Phi'(\xi)||_{H^\prime}), \quad \xi \in \mathbb{R},
\]
for some constant $C = C(a_0, \omega) > 0$. Similarly, if $\Phi \in C^2(\mathbb{R}; H^\prime)$ then the same reasoning shows that $(v, w) \in C^2(\mathbb{R}, H)$ verifies
\[
\|(v''(\xi), w''(\xi))||_H \leq C((\xi)^2||\Phi(\xi)||_{H^\prime} + (\xi)||\Phi'(\xi)||_{H^\prime} + ||\Phi''(\xi)||_{H^\prime}), \quad \xi \in \mathbb{R}.
\]
Summing up we obtain the:

**Proposition 4.1.** Let $a_0 \in (0, (\max_{x' \in \omega} |x'|)^{-1/2})$, pick $a \in [-a_0, a_0]$ and assume that $\alpha(x_3) = a$ for all $x_3 \in \mathbb{R}$. Then for every $\Phi \in H^2(\mathbb{R}, H^\prime)$ such that $(\xi)^{2-j}\Phi^{(j)} \in L^2(\mathbb{R}, H^\prime)$, $j = 0, 1$, the variational problem (4.10) admits a unique solution $(v, w) \in H^2(\mathbb{R}; H)$ satisfying
\[
\|(v, w)||_{H^2(\mathbb{R}; H)} \leq C\left(\sum_{j=0}^{2} \|\xi^{2-j}\Phi^{(j)}\|_{L^2(\mathbb{R}; H^\prime)}\right),
\]
for some constant $C = C(\omega, a_0) > 0$. The above assumptions on $\Phi$ are actually satisfied whenever $\Phi = \widehat{\Psi}$ for some $\Psi \in H^2(\mathbb{R}; H^\prime)$ such that $x_3 \Psi \in H^1(\mathbb{R}; H^\prime)$ and $x_3^2 \Psi \in L^2(\mathbb{R}; H^\prime)$. Moreover, the estimate (4.13) reads
\[
\|(v, w)||_{H^2(\mathbb{R}; H)} \leq C\left(\sum_{j=0}^{2} \|x_3^2 \Psi\|_{H^{2-j}(\mathbb{R}; H^\prime)}\right),
\]
in this case.
Armed with Proposition 4.1, we may now tackle the analysis of the solution to (4.8).

**Some useful properties of the solution to (4.8).** Pick \( F \in H^1(\omega) \) such that \( F = f \) on \( \partial \omega \) and \( \| F \|_{H^1(\omega)} \leq C(\omega)^2 \| f \|_{H^{1/2}(\partial \omega)} \). Let \( \tilde{u} \) (resp. \( \hat{u} \)) denote the real (resp. imaginary) part of \( u = \tilde{u} - \hat{g}(\xi)F = \tilde{u} + i\hat{g} \). Since the Fourier transform \( \hat{u} \) of the \( H^1(\Omega) \)-solution \( u \) to (4.3) is actually solution to (4.8), we get by direct calculation that \( (\tilde{u}, \hat{u}) \) is solution to the variational problem (4.10), with

\[
(\Phi(\xi), (\varphi, \psi)) = -\mathcal{A}_c[(\tilde{g}'F, \hat{g}'F), (\varphi, \psi)],
\]

and where \( \tilde{g}' \) (resp. \( \hat{g}' \)) stands for the real (resp. imaginary) part of \( \hat{g} \). In light of (4.16) we check out using elementary computations that

\[
\begin{align*}
\| \Phi(\xi) \|_{H^1} &\leq C(\xi)^2 \| \hat{g}(\xi) \|_{H^{1/2}(\partial \omega)} \| f \|_{H^{1/2}(\partial \omega)} \|, \\
\| \Phi'(\xi) \|_{H^1} &\leq C(\xi)^2 \| \hat{g}'(\xi) + (\xi) \|_{H^{1/2}(\partial \omega)} \| f \|_{H^{1/2}(\partial \omega)} \|, \\
\| \Phi''(\xi) \|_{H^1} &\leq C(\xi)^2 \| \hat{g}''(\xi) + (\xi) \|_{H^{1/2}(\partial \omega)} \| f \|_{H^{1/2}(\partial \omega)} \|,
\end{align*}
\]

for some constant \( C = C(a_0, \omega) > 0 \). Therefore we have \( \langle \xi \rangle^j \Phi^{(2-j)} \in L^2(\mathbb{R}) \) for \( j = 0, 1, 2 \), provided \( \langle \xi \rangle^{4-j} \hat{g}' \in L^2(\mathbb{R}) \), which is actually the case if \( x^2g \in H^{4-j}(\mathbb{R}) \). From this and Proposition 4.1, then follows the:

**Corollary 4.1.** Let \( a, \alpha, \beta \) be as in Proposition 4.1 and assume that \( g \in H^3(\mathbb{R}) \) verifies \( x_3g \in H^5(\mathbb{R}) \), \( x^2g \in H^2(\mathbb{R}) \) and \( \int_{\mathbb{R}} g(x_3) dx_3 = 1 \). Then we have \( \tilde{u} \in H^2(\mathbb{R}; H^1(\omega)) \), \( u \in L^1(\mathbb{R}; H^1(\omega)) \) and

\[
\begin{align*}
\{ \text{div}_x(\tilde{A}_n \nabla_x U) &= 0 \quad \text{in } \omega, \\
U &= f \quad \text{on } \partial \omega.
\end{align*}
\]

In view of (4.8) and (4.10), we deduce from (4.17)-(4.19) that

\[
\begin{align*}
\| \text{div}_x(\tilde{A}_n \nabla_x \tilde{u}(\cdot, \xi)) \|_{L^2(\omega)} &\leq C(\xi)^4 \| \hat{g}(\xi) \|_{H^{1/2}(\partial \omega)} \| f \|_{H^{1/2}(\partial \omega)}, \\
\| \partial_\xi \text{div}_x(\tilde{A}_n \nabla_x \tilde{u}(\cdot, \xi)) \|_{L^2(\omega)} &\leq C(\xi)^4 \| \hat{g}'(\xi) + (\xi) \|_{H^{1/2}(\partial \omega)} \| f \|_{H^{1/2}(\partial \omega)} \|, \\
\| \partial_\xi^2 \text{div}_x(\tilde{A}_n \nabla_x \tilde{u}(\cdot, \xi)) \|_{L^2(\omega)} &\leq C(\xi)^5 \| \hat{g}'(\xi) + (\xi)^2 \|_{H^{1/2}(\partial \omega)} \| f \|_{H^{1/2}(\partial \omega)},
\end{align*}
\]

for some positive constant \( C \) depending only on \( a_0 \) and \( \omega \). This combined with Corollary 4.1 yields the:

**Proposition 4.2.** Let \( a, \alpha, \beta \) be as in Proposition 4.1. Let \( g \in H^6(\mathbb{R}) \) verify \( x_3g \in H^5(\mathbb{R}) \), \( x^2g \in H^4(\mathbb{R}) \) and \( \int_{\mathbb{R}} g(x_3) dx_3 = 1 \). Then we have \( \tilde{A}_n \nabla_x \tilde{u} \in H^2(\mathbb{R}; H^{-1/2}(\partial \omega)) \) and thus \( \tilde{A}_n \nabla u \cdot \nu(x) \in L^1(\mathbb{R}; H^{-1/2}(\partial \omega)) \) with

\[
\tilde{A}_n \nabla_x U \cdot \nu(x') = \tilde{A}_n \nabla_x \tilde{u}(\cdot, 0) \cdot \nu(x') = \int_{\mathbb{R}} \tilde{A}_n \nabla u(\cdot, x_3) \cdot \nu(x') dx_3 \in H^{-1/2}(\partial \omega).
\]

In light of Proposition 4.2 it is natural to define the two following DN maps:

\[
\tilde{\Lambda}_n : f \in H^{1/2}(\partial \omega) \mapsto \tilde{A}_n \nabla u(\cdot, x_3) \cdot \nu(x) \in L^1(\mathbb{R}; H^{-1/2}(\partial \omega))
\]

\[
\tilde{\Lambda}_n : f \in H^{1/2}(\partial \omega) \mapsto \tilde{A}_n \nabla_x U \cdot \nu(x') \in H^{-1/2}(\partial \omega).
\]

These two operators are bounded, and they satisfy the estimate

\[
\| \tilde{\Lambda}_1 - \tilde{\Lambda}_2 \|_{L^1(H^{1/2}(\partial \omega), H^{-1/2}(\partial \omega))} \leq \| \Lambda_1 - \Lambda_2 \|_{L^1(H^{1/2}(\partial \omega), L^1(\mathbb{R}; H^{-1/2}(\partial \omega)))},
\]

where, for simplicity, we write \( \Lambda_j \) (resp. \( \tilde{\Lambda}_j \)) for \( \Lambda_{a_j} \) (resp. \( \tilde{\Lambda}_{a_j} \)), \( j = 1, 2 \).

Finally, since the matrix \( \partial_\xi A(x', a) \) has two eigenvalues \( \lambda_0 = 0 \) and \( \lambda_1 = |x'|^2 \), we derive the following result by mimicking the proof of [AG1] [CLAIM, page 169].
Theorem 4.1. Let $a_0$ be the same as in Proposition 4.1; let $a_j \in \mathbb{R}$, $j = 1, 2$, and assume that $a_j(x_3) = a_j$ for all $x_3 \in \mathbb{R}$. Then there exists a constant $C > 0$, depending only on $a_0$ and $\omega$, such that the following stability estimate
\[ |a_1 - a_2| \leq C\|A_1 - A_2\|_{L^2(\mathbb{R}; H^{-1/2}(\partial\omega))}^2, \]
holds true whenever $|a_1|, |a_2| \leq a_0$.

5. APPENDIX: MORE ON $\Lambda_\alpha$

Appendix 1: Restriction to $\tilde{H}^{3/2}(\partial\Omega)$. In this subsection we exhibit sufficient conditions on $\omega$ and $\alpha$ ensuring that the restriction of $\Lambda_\alpha$ to $\tilde{H}^{3/2}(\partial\Omega)$ is a bounded operator into $L^2(\mathbb{R}; H^{1/2}(\partial\omega))$. We assume for this purpose that $\Omega = \omega \times (-1, 1)$ has $H^2$-regularity property. That is, for every $F \in L^2(\Omega)$ and any matrix-valued function $C = (C_{ij}(x))_{1 \leq i,j \leq 3}$ with coefficients in $W^{1,\infty}(\Omega)$ verifying the ellipticity condition
\[ \exists \alpha > 0, \; C(x)\xi \cdot \xi \geq \alpha|\xi|^2, \text{ for all } \xi \in \mathbb{C}^3, x \in \Omega, \]
the following BVP
\[
\begin{align*}
\text{div}(C\nabla w) &= F & \text{in } \Omega, \\
w &= 0 & \text{on } \partial\Omega,
\end{align*}
\]
has a unique solution $w \in H^2(\Omega)$ obeying
\[ \|w\|_{H^2(\Omega)} \leq C(\alpha, M)\|F\|_{L^2(\Omega)}, \]
for some constant $C(\alpha, M) > 0$ depending only on $\alpha, M = \max_{1 \leq i,j \leq 3} \|C_{ij}\|_{W^{1,\infty}(\Omega)}$ and $\omega$.

Notice that $\Omega_1$ has $H^2$-regularity property if and only if this is the case for $\Omega = \omega \times (-a, a)$ and some $a > 0$. Moreover we recall from [Gr] that $\Omega_1$ has $H^2$-regularity property provided $\omega$ is convex.

We turn now to establishing the following result, which is our main tool for the analysis of the restriction of $\Lambda_\alpha$ to $\tilde{H}^{3/2}(\partial\Omega)$.

Theorem 5.1. Assume that $\alpha \in C^{0,1}(\mathbb{R})$ and that $\Omega_1$ has $H^2$-regularity property. Then for any $f \in \tilde{H}^{3/2}(\partial\Omega)$, the BVP (1.3) admits a unique solution $u \in H^2(\Omega)$. Moreover there is a constant $C > 0$, depending only on $\|\alpha\|_{C^{0,1}(\mathbb{R})}$ and $\omega$, such that we have:
\[ \|u\|_{H^2(\Omega)} \leq C\|f\|_{\tilde{H}^{3/2}(\partial\Omega)}. \]

Proof. Since $f \in \tilde{H}^{3/2}(\partial\Omega)$ we may choose $F \in H^2(\Omega)$ in accordance with Lemma 2.1 so that $F = f$ on $\partial\Omega$ and
\[ \|F\|_{H^2(\Omega)} \leq 2\|f\|_{\tilde{H}^{3/2}(\partial\Omega)}. \]
Putting $\Psi = \text{div}(A\nabla F)$ we next refer to [24] and define the unique vector $u_0 \in H^1_0(\Omega)$ satisfying simultaneously
\[ \int_\Omega A\nabla u_0 \cdot \nabla v dx = \int_\Omega \Psi v dx, \text{ for all } v \in H^1_0(\Omega), \]
and
\[ \|u_0\|_{H^1(\Omega)} \leq C_0\|\Psi\|_{L^2(\Omega)}, \]
for some constant $C_0 > 0$ depending on $\omega$ and $M = \|\alpha\|_{C^{0,1}(\mathbb{R})}$.

Further, for all $n \geq 1$, we consider $\xi_n \in C_0^\infty(-n+1,n+1)$ such that $\xi_n = 1$ in $[-n, n]$, $\|\xi_n^\prime\|_{\infty} \leq 1/2$ and $\|\xi_n^\prime\|_{\infty} \leq 1/2$. For every $v \in H^1_0(\Omega)$, we get
\[
\int_\Omega A\nabla(\xi_n u_0) \cdot \nabla v dx = \int_\Omega A\nabla u_0 \cdot \nabla (\xi_n v) dx - \int_\Omega (A\nabla u_0 \cdot \nabla \xi_n) v dx + \int_\Omega (A\nabla \xi_n \cdot \nabla v) u_0 dx,
\]
by direct calculation. An integration by parts in the last term of this identity provides
\[
\int_\Omega (A\nabla \xi_n \cdot \nabla v) u_0 dx = - \int_\Omega (A\nabla \xi_n \cdot \nabla u_0) v dx - \int_\Omega \text{div}(A\nabla \xi_n) u_0 v dx,
\]
we find out that
\[
\int_{\Omega} A \nabla (\xi_n u_0) \cdot \nabla v dx = \int_{\Omega} A \nabla u_0 \cdot \nabla (\xi_n v) dx - \int_{\Omega} (A \nabla u_0 \cdot \nabla \xi_n) v dx - \int_{\Omega} (A \nabla \xi_n \cdot \nabla u_0) v dx - \int_{\Omega} \text{div}(A \nabla \xi_n) u_0 v dx.
\]
Since \( A \) is symmetric, it follows from this and (5.3) that
\[
\int_{\Omega} A \nabla (\xi_n u_0) \cdot \nabla v dx = \int_{\Omega} \Psi \xi_n v dx - 2 \int_{\Omega} (A \nabla \xi_n \cdot \nabla u_0) v dx - \int_{\Omega} \text{div}(A \nabla \xi_n) u_0 v dx, \text{ for all } v \in H_0^1(\Omega).
\]
Therefore, bearing in mind that \( \Omega_\alpha = \omega \times (-a, a) \) for any \( a > 0 \), the \( \xi_n u_0 \in H_0^1(\Omega_{\alpha+1}) \) is thus solution to the variational problem

(5.5) \[
\int_{\Omega_{\alpha+1}} A \nabla (\xi_n u_0) \cdot \nabla v dx = \int_{\Omega_{\alpha+1}} \tilde{\Psi} v dx, \text{ for all } v \in H_0^1(\Omega_{\alpha+1}),
\]
with
\[
\tilde{\Psi} = \Psi \xi_n - 2 A \nabla \xi_n \cdot \nabla u_0 - \text{div}(A \nabla \xi_n) u_0.
\]
The next step of the proof is to make the change of variables \((x', x_3) \in \Omega_{\alpha+1} \mapsto (x', y_3) = (x', 1/(n+1)x_3) \in \Omega_1 \) in (5.3). Putting
\[
J_n = \begin{pmatrix}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1/n
\end{pmatrix}, \quad n \geq 1,
\]
and
\[
A(x', y_3) = 1/(n+1)J_{n+1} A(x', (n+1)y_3) J_{n+1},
\]
\[
\xi(y_3) = \xi_n((n+1)y_3),
\]
\[
u(x', y_3) = u_0(x', (n+1)y_3),
\]
\[
w_n(x', y_3) = \xi_n((n+1)y_3) u_0(x', (n+1)y_3),
\]
\[
\text{div}(P(x', y_3)) = \partial_{x_1} P_1(x', y_3) + \partial_{x_2} P_2(x', y_3) + 1/(n+1) \partial_{y_3} P_3(x', y_3),
\]
\[
\Psi(x', y_3) = 1/(n+1) \left[ \Psi(x', (n+1)y_3) - 2 J_{n+1} A(x', (n+1)y_3) J_{n+1} \nabla \xi(y_3) \cdot \nabla \nu(x', y_3) \right.
\]
\[
\left. - \text{div}(A(x', (n+1)y_3) J_{n+1} \nabla \xi(y_3)) \nu(x', y_3) \right],
\]
for \((x', y_3) \in \Omega_1\), we find out by direct computations that \(w_n \in H_0^1(\Omega_1)\) is solution to
\[
\int_{\Omega_1} A \nabla w_n \cdot \nabla v dx = \int_{\Omega_1} \Psi v dx, \text{ for all } v \in H_0^1(\Omega_1).
\]
Since \( \|\Psi\|_{L^2(\Omega_1)} \leq (n+1)^{-3/2} C(\omega, M) \|\Psi\|_{L^2(\Omega)} \) by (3.4), where \( C = C(\omega, M) \) denotes some generic positive constant depending only on \( \omega \) and \( M \), it holds true that \( \|w_n\|_{H^2(\Omega_1)} \leq (n+1)^{-3/2} C(\omega, M) \|\Psi\|_{L^2(\Omega)} \). Here we used the estimate \( \|w_n\|_{H^2(\Omega_1)} \leq C(\omega, M) \|\Psi\|_{L^2(\Omega_1)} \), arising from the \( H^2 \)-regularity property imposed on \( \Omega_1 \). As a consequence we have

(5.6) \[
\|\xi_n u_0\|_{H^2(\Omega)} \leq C(\omega, M) \|\Psi\|_{L^2(\Omega)}.
\]
Therefore, upon eventually extracting a subsequence of \((\xi_n u_0)_n\), we may assume that it converges weakly to \( \tilde{u} \) in \( H^2(\Omega) \). On the other hand since \((\xi_n u_0)_n\) converges to \( u_0 \) in \( L^2(\Omega) \) it is true that \( u_0 \in H^2(\Omega) \) so \((\xi_n u_0)_n\) converges weakly to \( u_0 \) in \( H^2(\Omega) \). Further, the norm \(|\cdot|_{H^2(\Omega)}\) being lower semi-continuous, we have

(5.7) \[
|u_0|_{H^2(\Omega)} \leq \liminf_n \|\xi_n u_0\|_{H^2(\Omega)} \leq C(\omega, M) \|\Psi\|_{L^2(\Omega)},
\]
by (5.6). Bearing in mind that \( \|\Psi\|_{L^2(\Omega)} \leq C(\omega, M) |F|_{H^2(\Omega)} \) and \( |F|_{H^2(\Omega)} \leq 2 \|f\|_{H^{1/2}(\partial\Omega)} \) by (5.2) and (5.7) then yield
\[
|u_0|_{H^2(\Omega)} \leq C(\omega, M) \|f\|_{H^{1/2}(\partial\Omega)}.
\]
Now the desired result follows from this by taking into account that \( u = u_0 + F \in H^2(\Omega) \) is the unique solution to
\[
\square
\]
For all $\Omega$ and $\alpha$ fulfilling the assumptions of Theorem 5.1, the mapping

$$\Lambda_\alpha : f \in \tilde{H}^{3/2}(\partial \Omega) \mapsto \partial_\nu u \in L^2(\mathbb{R}; H^{1/2}(\partial \omega)),$$

where $u$ denotes the unique $H^2(\Omega)$-solution to (1.3), is well defined by Theorem 5.1. Further, since $C_0^\infty(\mathbb{R}; H^2(\omega))$ is dense in $H^2(\Omega)$, then the trace operator

$$\tilde{\tau} : w \in H^2(\Omega) \mapsto \partial_\nu w \in L^2(\mathbb{R}; H^{1/2}(\partial \omega)),$$

is easily seen to be bounded. From this and (5.1) then follows that $\|\Lambda_\alpha\| \leq C$ as a linear bounded operator from $\tilde{H}^{3/2}(\partial \Omega)$ into $L^2(\mathbb{R}; H^{1/2}(\partial \omega))$, where the constant $C > 0$ depends only on $\omega$ and $\|\alpha\|_{C^{0,1}(\mathbb{R})}$.

**Appendix 2: Linking $\Lambda_\alpha$ to the DN map associated with $\Omega_\theta$.** In this subsection we define the DN map $\Lambda_\theta$ associated to the BVP (1.2), which is stated on the twisted domain $\Omega_\theta$, and establish the link between $\Lambda_\theta$ and $\Lambda_\alpha$, where we recall that $\alpha = \theta'$. Of course, it turns out that $\Lambda_\theta$ is not directly relevant for the analysis of the inverse problem under consideration in this text, but since the BVP (1.3) was derived from (1.2), it is plainly natural to link the operator $\Lambda_\alpha$ we used in the preceding sections to $\Lambda_\theta$.

We start by defining the trace space for functions in $H^1(\Omega_\theta)$. We set for all $L > 0$,

$$\Omega^L_\theta = \{(x_0(x), x_3) : x' = (x_1, x_2) \in \omega, x_3 \in (-L, L)\} = \{x \in \Omega_\theta, |x_3| < L\}$$

and

$$\Gamma^L_\theta = \{(x_0(x), x_3) : x' = (x_1, x_2) \in \partial \omega, x_3 \in [-L, L]\} = \{x \in \partial \Omega_\theta, |x_3| < L\}.$$

Let $L > 0$ be fixed. For every $u \in H^1(\Omega_\theta)$ we have $u|_{\partial \Omega^L_\theta} \in H^1(\Omega^L_\theta)$ hence $u|_{\partial \Omega^L_\theta} \in H^{1/2}(\partial \Omega^L_\theta)$. Thus, putting

$$H^{1/2}(\Gamma^L_\theta) = \{h = g|_{\Gamma^L_\theta} \in L^2(\Gamma^L_\theta) : g \in H^{1/2}(\partial \Omega^L_\theta)\},$$

it holds true that $u|_{\partial \Omega^L_\theta} \in H^{1/2}(\Gamma^L_\theta)$. Here the space $H^{1/2}(\Gamma^L_\theta)$ is equipped with its natural quotient norm

$$\|h\|_{H^{1/2}(\Gamma^L_\theta)} = \inf\{\|g\|_{H^{1/2}(\partial \Omega^L_\theta)} : g|_{\Gamma^L_\theta} = h\}.$$

Further we define

$$H^{1/2}_{loc}(\partial \Omega_\theta) = \{h \in L^2_{loc}(\partial \Omega_\theta) : h|_{\Gamma^L_\theta} \in H^{1/2}(\Gamma^L_\theta) \text{ for all } L > 0\},$$

and then introduce the following subspace $\tilde{H}^{1/2}(\partial \Omega_\theta) = \{h \in H^{1/2}_{loc}(\partial \Omega_\theta) : \text{there exists } v \in H^1(\Omega_\theta) \text{ such that } v|_{\partial \Omega_\theta} = h\}$ of $H^{1/2}_{loc}(\partial \Omega_\theta)$. Here and henceforth $v|_{\partial \Omega_\theta} = h$ means that the identity $v|_{\Gamma^L_\theta} = h|_{\Gamma^L_\theta}$ holds in the trace sense for every $L > 0$. It is not hard to see that $\tilde{H}^{1/2}(\partial \Omega_\theta)$ is a Banach space for the quotient norm:

$$\|h\|_{\tilde{H}^{1/2}(\partial \Omega_\theta)} = \inf\{\|v\|_{H^1(\Omega_\theta)} : v|_{\partial \Omega_\theta} = h\}.$$

We introduce the mapping

$$I_\theta : C^1_0(\partial \Omega_\theta) \rightarrow C^1_0(\partial \Omega),$$

$$g \mapsto f = g \circ \varphi_\theta,$$

where, for shortness sake, we note $\varphi_\theta(x) = T_\theta(x_3)(x', x_3)$ for $x \in \overline{\Omega}$. Pick $g \in C^1_0(\partial \Omega_\theta)$ and choose $v \in C^1_0(\mathbb{R}^3)$ such that $v|_{\partial \Omega_\theta} = g$. Since $v|_{\partial \Omega_\theta} \in H^1(\Omega_\theta)$ we get that $g \in \tilde{H}^{1/2}(\partial \Omega_\theta)$. Moreover for all $v \in H^1(\Omega_\theta)$ obeying $v|_{\partial \Omega_\theta} = g$ the function $u = v|_{\partial \Omega_\theta} \circ \varphi_\theta$ belongs to $H^1(\Omega)$ by [Br62, Proposition 9.6], and

$$\|I_\theta g\|_{\tilde{H}^{1/2}(\partial \Omega_\theta)} \leq \|u\|_{H^1(\Omega)} \leq C(\omega, \theta)\|v\|_{H^1(\Omega_\theta)}.$$
For all \( n \geq 1 \), put \( f_n = I_0 g_n = g_n \circ \varphi_\theta \) and \( u_n = v_n \circ \varphi_\theta \). Since \( f_n = u_n|_{\partial \Omega} \), we see that
\[
\|f_n - f_m\|_{\tilde{H}^{1/2}(\partial \Omega)} \leq \|u_n - u_m\|_{H^1(\Omega)} \leq C(\omega, \theta)\|v_n - v_m\|_{H^1(\Omega_0)}.
\]

Therefore \( (f_n)_n \) is a Cauchy sequence in \( \tilde{H}^{1/2}(\partial \Omega) \) and \( f = \lim_n f_n \in \tilde{H}^{1/2}(\partial \Omega) \). Set \( f = I_0 g \). Then, in view of (5.8), \( I_0 \) extends to a bounded operator, still denoted by \( I_0 \), from \( \tilde{H}^{1/2}(\partial \Omega_0) \) into \( \tilde{H}^{1/2}(\partial \Omega) \).

Arguing as above, we thus find out that the mapping
\[
J_\theta : C^1_0(\partial \Omega) \rightarrow C^1_0(\partial \Omega_0)
\]
\[
f \mapsto \tilde{v} = f \circ \psi_\theta,
\]
where \( \psi_\theta = \varphi_\theta^{-1} \), extends to a bounded operator, which is still called \( J_\theta \), from \( \tilde{H}^{1/2}(\partial \Omega) \) into \( \tilde{H}^{1/2}(\partial \Omega_0) \).

Evidently, \( I_0 J_\theta f = f \) for all \( f \in C^1_0(\partial \Omega) \) and \( J_\theta I_0 g = g \) for all \( g \in C^1_0(\partial \Omega_0) \). Therefore we have \( J_\theta = I_0^{-1} \) from the density of \( C^1_0(\partial \Omega) \) (resp. \( C^1_0(\partial \Omega_0) \)) in \( \tilde{H}^{1/2}(\partial \Omega) \) (resp. \( \tilde{H}^{1/2}(\partial \Omega_0) \)).

Next, by reasoning in the same way as in the derivation of (1.2), we prove with the help of the Lax-Milgram lemma that the BVP (1.2) has a unique solution \( \tilde{v} \in H^1(\Omega_0) \) for every \( g \in \tilde{H}^{1/2}(\partial \Omega_0) \). Moreover the operator
\[
\tilde{\Lambda}_\theta : g \mapsto \tilde{v}
\]
is well defined as a bounded operator from \( \tilde{H}^{1/2}(\partial \Omega_0) \) into its dual space \( \tilde{H}^{-1/2}(\partial \Omega_0) \). Similarly to \( \Lambda_\theta \), it can be checked that \( \tilde{\Lambda}_\theta \) is characterized by the following identity
\[
\langle \tilde{\Lambda}_\theta g, h \rangle = \int_{\Omega_0} \nabla \tilde{v} \cdot \nabla H dy,
\]
which holds true for all \( h \in \tilde{H}^{1/2}(\partial \Omega_0) \) and all \( H \in H^1(\Omega_0) \) such that \( H|_{\partial \Omega_0} = h \). By performing the change of variable \( y = \varphi_\theta(x) \) in the last integral, we thus get that
\[
\langle \tilde{\Lambda}_\theta g, h \rangle = \int_{\Omega_0} A\nabla u \cdot \nabla (H \circ \varphi_\theta) dx,
\]
where \( u \) denotes the solution to the BVP (1.2) with \( f = I_0 g \). Therefore we have
\[
\langle \tilde{\Lambda}_\theta g, h \rangle = \langle \Lambda_{\theta'} I_0^* g, I_0 h \rangle,
\]
which means that \( \tilde{\Lambda}_\theta = I_0^* \Lambda_{\theta'} I_0 \), or equivalently that \( \Lambda_{\theta'} = J_\theta^* \tilde{\Lambda}_\theta J_\theta \), where \( \Lambda_{\theta'} \) stands for \( \Lambda_{\theta'} \).
