Abstract

In this paper we describe some experiments related to a corpus derived from an authoritative historical Italian dictionary, namely the Grande dizionario della lingua italiana (‘Great Dictionary of Italian Language’, in short GDLI). Thanks to the digitization and structuring of this dictionary, we have been able to set up the first nucleus of a diachronic annotated corpus that selects—according to specific criteria, and distinguishing between prose and poetry—some of the quotations that within the entries illustrate the different definitions and sub-definitions. In fact, the GDLI presents a huge collection of quotations covering the entire history of the Italian language and thus ranging from the Middle Ages to the present day. The corpus was enriched with linguistic annotation and used to train and evaluate NLP models for POS tagging and lemmatization, with promising results.

Keywords: Diachronic Corpus, Adaptation of Annotation Tools, Historical Dictionaries

1. Introduction

Over the past decades, the number and variety of historical corpora available for different languages has been progressively growing. They represent an invaluable asset in the era of Digital Humanities, given the increasing interest in applying quantitative and computational methods to diachronic linguistics and historical text analysis.

For Italian, diachronic corpora are still few. Among them, covering a large timespan going from the origin of the Italian language to the present day, it is worth mentioning the MIDIA corpus (Gaeta et al., 2013, D’Achille and Grossmann, 2017), from which the CODIT was developed (Micheli, 2022), the Letteratura italiana Zanichelli (LIZ, later reissued as BIZ), and Bibl’1. Other corpora focus on specific periods, such as the Corpus OVI dell’Italiano antico (Squillacioti, 2021) for Old Italian, the epistolary corpus CEOD2 for 19th c. Italian, the DiaCORIS corpus (Onelli et al., 2006) and the reference corpus built for the construction of a Dynamic Vocabulary of Modern Italian (VoDIM, Marazzini and Maconi, 2018) for post-unitarian Italian. Many of these corpora have been enriched with linguistic annotation (typically, POS tagging and lemmatization), carried out (semi-)automatically or manually, and can be queried through advanced search tools. Yet, they are not distributed as linguistically annotated corpora: they were conceived as reference resources to be queried by scholars for the analysis of linguistic phenomena over the covered period of time and across the different varieties of language use testified (e.g. textual genres). Unfortunately, this feature makes them of limited use for the application of NLP-based methods with a specific view to the adaptation of linguistic annotation tools for the processing of historical varieties of language and for computational analyses focusing e.g. on semantics or style.

To the best of our knowledge, only two linguistically annotated corpora testifying historical varieties of language are available for Italian: the Voci della Grande Guerra corpus (VGG, Lenci et al., 2020) containing texts related to different varieties (both textual genres and registers) of Italian at the time of the World War I; and the corpus of the politician Alcide De Gasperi’s public documents (Tonelli et al., 2019), a multi-genre corpus spanning 50 years of European history, written or transcribed between 1901 and 1954. VGG and Alcide corpora are available as multi-level annotated corpora, with both silver and gold annotations, which are compliant to internationally recognized representation standards. In Alcide, gold annotation was used to assess the accuracy of lemmatization, POS tagging and named entity annotation which was performed with tools trained on contemporary language. In VGG, gold annotation was also used to specialize the annotation tools to deal with the challenges posed by the linguistic varieties subsumed in the corpus (De Felice et al., 2018): retrained models were then used to annotate the rest of the corpus.

In the general picture depicted above, the aim of this paper is twofold. First, it illustrates the preliminary steps towards the creation of a linguistically annotated diachronic corpus for Italian, whose time span goes from old to contemporary Italian. Second, it reports the results of experiments aimed at assessing the accuracy of linguistic annotation (lemmatization and POS tagging) carried out with specialized annotation models against a diachronically representative sample of the corpus (gathering texts both in prose and poetry, going from the 13th to the 20th century).

For the composition of the corpus, we decided to use an interesting diachronic textual collection, represented by the set of quotations in a historical dictionary of Italian, namely the Grande dizionario della lingua italiana (‘Great

1 http://www.bibliotecaitaliana.it/ 2 http://ceod.unistrasi.it/
Dictionary of Italian Language*, in short GDLI). Since quotations are seen as the “bedrock” of any historical dictionary (Hawke, 2016), we believe that they can be usefully exploited to build a wide coverage diachronic corpus. Studies carried out on quotations databases (see e.g. Hoffman, 2004; Rohdenburg, 2013) demonstrate how they can be used as a valuable information source for different typologies of studies, including quantitative ones.

The challenges of the linguistic annotation of historical texts are well known (Piotrowski, 2012). For Italian, an exploratory study on a diachronic corpus with texts (both prose and poetry) from the 13th to the 19th century focusing on morphological and morpho-syntactic annotation (Penna caviotto and Zanzotto, 2008) highlights the specific issues (mostly, graphical, phonological, and morphological variability) connected with the automatic processing of Italian historical texts. More recently, adaptation experiments have been carried out to improve the performance of the automatic analysis tools by using manually revised sub-corpora to retrain the automatic linguistic annotation tools, with promising results. This is the case of De Felice et al. (2018) for the VGG Corpus and of Favaro et al. (2020) for a subset of the VoDIM corpus.

The paper is organized as follows. Section 2 describes the GDLI source with a specific view to the huge collection of quotations. Section 3 illustrates the selection criteria and the corpus composition of the first nucleus of the diachronic corpus. Sections 4 and 5 report the results of the annotation experiments carried out on the corpus. The final section mainly highlights current directions of research.

2. The Corpus Source: GDLI

GDLI, edited by Salvatore Battaglia and later by Giorgio Barberi Squarotti, is the most important historical dictionary of the Italian language in existence. Published by UTET in 21 volumes between 1961 and 2002 (with the addition of two update volumes, published in 2004 and 2009, for a total number of over 23,000 pages), GDLI covers the entire history of the Italian language, from the Middle Ages to the present day. Born with the aim of updating the Dizionario della lingua italiana known as “Tommaseo-Bellini” (1861-1879), which in turn was a sort of update of the famous Vocabolario degli Accademici della Crusca, GDLI-like its predecessors—bases its lexicographic description of Italian words on quotations taken from mainly literary works and authors. Within the entries, each definition and sub-definition is accompanied by a rich (often very rich) set of quotations, which attempt to cover the widest possible chronological span. Like and more than its predecessors, GDLI draws its quotations from a very wide range of authors and works: within the confines of the Italian literary or par literary (treatises, letters, translations, a few statutes) written tradition, not only those who are part of the canon of the major authors, but also a huge number of minor and minimal authors and works enter among the quoted. Overall, the breadth of the range of authors and works cited is impressive: GDLI quotes 6,226 authors and 13,848 sources (cf. Biffi and Guadagnini, 2022).

Each quotation tends to preserve the syntactic autonomy of the textual passage, or rather to restore its overall sense (often beyond sentence boundaries): the GDLI entries are in fact conceived as a sort of small anthology of authorial citations, aimed at representing the uses of that particular word in the history of Italian writing (and specifically of Italian literature). These characteristics of the quotation cutting methods, combined with the very high number of authors and works consulted, make the corpus of quotations of GDLI an extremely rich textual set that can potentially be exploited as a resource in its own right.

Given the peculiar history of Italian, which is in fact a written and literary language until the twentieth century, a corpus that collects all the quotations present in the GDLI entries (henceforth, referred to as GDLI Quotations Corpus, in short GDLI-QC) can be considered as a “representative” diachronic corpus of Italian (Biffi, 2018). Provided, of course, that by “representativeness” we mean the ability, offered by this corpus, to extrapolate data regarding the use of words within the boundaries of the Italian literary tradition, as it is documented by the texts that have come down to us (possibly through the medium of previous dictionaries) (Burgassi and Guadagnini, 2017, p. 11; Kabatek, 2013). It must be kept in mind, of course, that GDLI-QC is particularly appropriate for lexical research, while it is far less reliable for investigations on other linguistic planes—namely spelling and phonology. Indeed, it should be remembered that GDLI draws virtually all of its quotations from printed texts, which are not always modern critical editions: e.g., medieval or otherwise pre-normative texts may be quoted from nineteenth-century printings, where the spelling and sometimes morphological features happen thus to be sometimes modified and modernized.

In this paper, we illustrate a case study aimed at creating the GDLI-QC. With this in mind, we have created a first nucleus of a linguistically annotated corpus (divided into two sub-corpora: Annotated GDLI-QC-prose and Annotated GDLI-QC-poetry) that is somewhat representative of the overall corpus. For the time being, linguistic annotation focused on POS tagging and lemmatization.

3. GDLI-QC Construction and Composition

3.1 GDLI Quotation Extraction

GDLI quotations were automatically extracted from the TEI XML version of the dictionary, obtained through a semi-automatic conversion process aimed at structuring the dictionary contents from the OCRred version of the dictionary. The goal of semi-automatically reaching an articulated structuring of GDLI entries has been organized into several iterative steps, each with the function of progressively refining and organizing the dictionary structure previously identified. The general approach to the extraction and structuring of GDLI contents, described in Sassolini et al. (2019), Biffi et al. (2020) and Sassolini et al. (2021), adopts a strategy substantially based on pattern matching. The specific identification criteria cover a wide range of features ranging from the layout of the page to structural information relating to the different parts of the lexical entry. The goal is focused on the conversion of the dictionary contents into macroareas structured and mapped in the XML TEI standard format.
Quotation extraction is part of this iterative process. In what follows we briefly exemplify the TEI XML conversion of the GDLI quotation macrofield, which includes author, reference and quotation text information. Figure 1 exemplifies the source GDLI entry and the automatically generated TEI XML counterpart for the lemma `abiàtico` `grandchild`. It can be seen that, for each sense, the set of quotations is annotated using the `<cit>` element which in turn contains one or more pairs of `<bibl>`/`<quote>` elements, respectively encoding a loosely-structured bibliographic citation (whose sub-components are not further structured at the moment) and the quotation text. For this case study we used only volumes I and II of GDLI, for which the manual revision of entry segmentation was completed.

### 3.2 GDLI-QC Composition

We developed two sub-corpora selected to be representative of the whole GDLI-QC. The most cited authors in the dictionary were considered (cf. Biffi and Guadagnini, 2022), choosing those who would allow to cover the widest chronological span. These writers are milestones in Italian literature and history of Italian language, such as Dante, Boccaccio, Petrarca, Ariosto and Manzoni. Their different linguistic features, determined by diachronic and stylistic factors, are very valuable to test and possibly retrain linguistic annotation tools, that, as we already observed, are usually trained on contemporary language varieties (typically, newswire texts). Moreover, we chose authors and works representative of different text typologies: texts belong to several genres, such as chronicle, literary prose, poetry, treatises. This is a first experiment carried out with a view to the future structuring of GDLI-QC in balanced sub-corpora both in diachrony and based on text belonging to different genres.

| Author                    | Century | Quotes | Tokens |
|---------------------------|---------|--------|--------|
| Dante Alighieri           | XIV     | 100    | 2839   |
| Giovanni and Matteo Villani | XIV     | 100    | 2114   |
| Giovanni Boccaccio        | XIV     | 100    | 2681   |
| Leon Battista Alberti    | XV      | 100    | 1931   |
| Baldassarre Castiglione   | XVI     | 100    | 2307   |
| Niccolò Machiavelli       | XVI     | 100    | 2102   |
| Giorgio Vasari            | XVI     | 100    | 2549   |
| Daniello Bartoli          | XVII    | 100    | 2843   |
| Giambattista Vico         | XVII-XVIII | 100  | 2149   |
| Giacomo Leopardi          | XVIII-XIX | 100  | 2089   |
| Alessandro Manzoni        | XIX     | 100    | 2327   |
| Ippolito Nievo            | XIX     | 100    | 2363   |
| Oscar Luigi Pirandello    | XIX-XX  | 100    | 1982   |
| Alberto Moravia           | XX      | 100    | 2166   |
| Vaso Pratolini            | XX      | 100    | 2294   |
| tot.                      |         | 1500   | 34736  |

Table 1: Annotated GDLI-QC_prose composition

As a result, the first nucleus of GDLI-QC are two balanced sub-corpora, concerning works written between 14th and 20th century: one collecting 1500 prose quotes (henceforth,
Annotated GDLI-QC_prose) from 15 authors (100 each), see Table 1; one gathering 500 poetry quotes (henceforth, Annotated GDLI-QC_poetry) from 10 authors (50 each), see Table 2. Annotated GDLI-QC_prose size is about 35,000 tokens, whereas Annotated GDLI-QC_poetry is about 10,000.

### 4. Linguistic Annotation

Next step was corpus annotation. First, texts were preprocessed to reach a unified text segmentation. In fact, each quote of both sub-corpora was processed as an individual sentence; furthermore, we removed slashes, used to separate lines in poetry quotes, to focus on the underlying syntactic structure while disregarding the verse unity (which potentially pertains a distinct annotation layer). We could do that also because GDLI quotations are syntactically complete. This means that, already in the dictionary, poetry quotations are considered as “normal” sentences.

Both sub-corpora were automatically annotated through Stanza (Qi et al., 2020), a state-of-art fully neural pipeline for multilingual NLP trained on Universal Dependencies treebanks (UD, De Marneffe et al. 2021). Annotation concerned tokenization, POS tagging and lemmatization (sentence splitting was not needed here due to the overlapping with the quotation).

Automatic annotation was then manually revised and whenever needed corrected to create gold standard corpora. Regarding lemmatization, we chose a low-level lemmatization strategy; in fact, we kept the same graphical core abstraction levels.

To improve the POS tagging and lemmatization accuracy on historical varieties of Italian, each gold Annotated GDLI-QC sub-corpus was split in two parts: 80% was used for retraining, and the remaining 20% for testing.

| Author              | Century | Quotes | Tokens |
|---------------------|---------|--------|--------|
| Francesco Petrarca  | XIV     | 50     | 1043   |
| Matteo Maria Boiardo| XV      | 50     | 1109   |
| Ludovico Ariosto    | XVI     | 50     | 1115   |
| Torquato Tasso      | XVI     | 50     | 1152   |
| Giovan Battista Marino| XVII    | 50     | 1111   |
| Vittorio Alfieri    | XVIII   | 50     | 1099   |
| Ugo Foscolo         | XVIII-XIX| 50 | 947   |
| Giosuè Carducci     | XIX-XX  | 50     | 937    |
| Giovanni Pascoli    | XIX-XX  | 50     | 880    |
| Eugenio Montale     | XX      | 50     | 762    |
| tot.                |         | 500    | 10115  |

Table 2. Annotated GDLI-QC_poetry composition

### 5. Evaluation of POS Tagging and Lemmatization

Tables 5 and 6 show the accuracy scores respectively obtained for POS tagging and lemmatization, with the baseline and retrained models.

| Model                           | UPOS | XPOS | UFeats |
|---------------------------------|------|------|--------|
| Baseline Model                  | 96%  | 96%  | 96%    |
| GDLI-QC prose retrained Model   | 97%  | 97%  | 96%    |
| Baseline Model                  | 92%  | 92%  | 92%    |
| GDLI-QC poetry retrained Model  | 94%  | 94%  | 93%    |

Table 5. POS tagging accuracy

As a baseline, we used the Stanza “combined” model, pretrained with a combination of available Italian UD treebanks. The retrained models for prose and poetry were obtained by using the training corpora listed in Tables 3 and 4 above. To test the performances of the different models
(baseline and retrained), we used a 5-fold cross validation. So, the results in the tables are an average of 5 training iterations and 5 test set evaluations.

Let us compare now the overall results achieved with the baseline and retrained models. Contrary to our expectations, baseline POS tagging models are still baseline and retrained models. No improvement is reported for what concerns Universal Features (UFeats), language-specific POS (XPOS). No improvement is effective in relation to GDLI-QC_prose, even in the case of older diachronic varieties (see below). Indeed, the accuracy showing the same value in both baseline and retrained iterations and 5 test set evaluations.

Let us compare now the overall results achieved with the baseline and retrained models. We also carried out an analysis of the annotation accuracy registered for single authors, detailed in Tables 7 and 8 (note that POS accuracy values refer here to the Universal POS, UPOS).

We also carried out an analysis of the annotation accuracy registered for single authors, detailed in Tables 7 and 8 (note that POS accuracy values refer here to the Universal POS, UPOS).

| Century | Baseline Model | Retrained Model |
|---------|----------------|-----------------|
|        | Baseline Model | Retrained Model |
| Dante   | XIX            | 98% 95% 95%     |
| Villani | XIX            | 98% 95% 95%     |
| Boccaccio | XIX          | 98% 95% 95%     |
| Alberti | XIX            | 98% 95% 95%     |
| Castiglione | XIX       | 98% 95% 95%     |
| Machiavelli | XIX      | 98% 95% 95%     |
| Vasari  | XIX            | 98% 95% 95%     |
| Bartoli | XIX            | 98% 95% 95%     |
| Vico    | XIX            | 98% 95% 95%     |
| Leopardi | XIX          | 98% 95% 95%     |
| Manzoni | XIX            | 98% 95% 95%     |
| Nievo   | XIX            | 98% 95% 95%     |
| Pirandello | XIX       | 98% 95% 95%     |
| Moravia | XIX            | 98% 95% 95%     |
| Pratolini | XIX         | 98% 95% 95%     |

Table 7. Authors accuracy (GDLI-QC prose)

In general, POS tagging and lemmatization results achieved with retrained models show a significant improvement with respect to the baseline. The biggest difference between baseline and retrained models is recorded for Alberti (prose), Petrarca and Alfieri (poetry). Only for Petrarca this distance could be explained in terms of diachronic factors: most part of the errors involves historical variants, such as functional words with apheresis (‘l vs il), words with single consonant instead of double (abbassare vs abbassare), verbal polimorphy (fuor vs furono), to mention only a few. These kinds of errors are fewer in the retrained model (5 vs 18 in the baseline model), but still significant since they represent 56% of the total number of errors (in the baseline model the error percentage was 67%). For Alberti and Alfieri, annotation difficulties are more likely concerned with other features of their language use. For example, Alberti adopted an Italian language graphically near to Latin, making even functional elementary words like conjunction e and’ (in Alberti et) difficult to process. In particular, we observe that et and words with similar graphical features (adrichto vs addirrito, old Italian form for diritto or dritto; adhiato vs avvitiato etc.) cover 30% of the errors in the baseline model, whereas this percentage drops to 12% in the retrained model. On the other hand, Alfieri uses in his verses a solemn style, full of classical poetic forms, both phonological—many words are contracted with apocope, e.g. cor, figliuo—and lexical (alma, nascoso, prisco etc.) variants, that correspond to 57% of errors in the baseline model, and drop to 27% in the retrained.

Besides the individual cases reported above, it is very interesting to note that retrained models reach very good results also in relation to Middle Ages authors, especially with prose quotations. For example, Villani’s (14th century) accuracy scores are very close to values reported for 19th and 20th century authors.

Stylistic features also affect POS tagging performances, due to complex and archaic syntactic constructions.
occurring in these texts. Consider, for example, the following Alfieri’s quotation from Rime (Maggini F. ed., Firenze, 1933, 83):

«Cede ei talor, ma ai tempi rei non serve; abbonito e temato da chi regna, non men che dalle schiave alme proterve» (Eng. 'Sometimes he surrenders, but in guilty times (it) doesn’t serve; calmed down and feared by those who reign, not less than by insolent slave souls')

where the sequence schiave alme proterve represents a complex syntactic structure, used mostly in poetry as a figure of speech, formed by a noun nestled between two adjectives, one on its right, one on its left. So, because of the rare syntactic construction as well as the rare used poetic words (alme and proterve), only schiave ‘slave’ was properly tagged as an adjective by the models, whereas alme ‘souls’ and proterve ‘indolent’ were erroneously annotated as verbs (instead of noun and adjective, respectively), which also lead to lemmatization errors.

These preliminary results require further investigation; however, they clearly show that diachronic factors are not the only ones contributing to the distance between the investigated authors and contemporary Italian. Underlying this distance there could be stylistic factors, or the textual genre or the linguistic register the text belongs to (see Favaro et al., 2020). The used reference editions represent another variable that will need to be carefully evaluated and managed in subsequent developments.

6. Conclusions
We presented the first steps towards the creation of a linguistically annotated diachronic corpus for Italian, including both prose and poetry and covering a wide timespan (going from the 14th to the 20th century), which is compliant with respect to the current de facto representation standard of Universal Dependencies. We focused on the design, preprocessing and composition of the corpus and on the adaptation of annotation tools to reliably process diachronic varieties of language use. The encouraging results achieved so far suggest that it will soon be possible to linguistically annotate the whole GDLI-QC with a high degree of accuracy, which however can be further improved. Current directions of research include: experiments aimed at identifying the most appropriate model for processing texts of a given author or specific variety of language use; the definition of an incremental strategy for lemmatizing texts characterized by a high degree of variability.
