Supplementary Materials

Rational design of MgF$_2$ catalysts with long-term stability for the
dehydrofluorination of 1,1-difluoroethane (HFC-152a)

List of figures:

**Figure S1.** Conversion rate as a function of time on stream for three MgF$_2$ catalysts including MgF$_2$-S, MgF$_2$-T, and MgF$_2$-P at 350 °C.

**Figure S2.** XRD patterns of the MgF$_2$ catalysts synthesized from precipitation, sol-gel and hard-template methods after calcination at 200, 300 and 350 °C.

**Figure S3.** An example GC spectrum of contents in gas stream after dehydrofluorination of HFC-152a demonstrating the product/reactant distribution. Note that, the peak at 0.907 min represents N$_2$; the peak at 2.815 min represents the product PVF; the peak at 5.848 min represents the reactant HFC-152a.
