Parent-Adolescent Communication Quality and Life Satisfaction: The Mediating Roles of Autonomy and Future Orientation

Background: Previous studies have suggested that family communication quality is an important factor that can influence adolescents’ life satisfaction. However, relatively few studies have examined this relationship in the Chinese cultural context or explored the potential mechanisms underlying this relationship. Therefore, the purpose of this study was to investigate whether family communication quality is closely linked to Chinese adolescents’ life satisfaction and whether this link was mediated by autonomy and future orientation.

Methods: This study recruited 442 Chinese college students (67.19% girls) as participants. Based on a longitudinal design, the participants reported family communication quality at Time 1 and reported autonomy, future orientation, and life satisfaction at Time 2.

Results: The results of correlation analysis showed the existence of a positive correlation between family communication quality, autonomy, future orientation, and life satisfaction. The mediation models showed family communication quality predicted adolescents’ life satisfaction through the mediating effects of autonomy and future orientation. Furthermore, autonomy and future orientation not only independently mediated the relationship between family communication quality and life satisfaction but sequentially mediated this relationship.

Conclusion: Autonomy and future orientation mediated the relationship between family communication quality and life satisfaction. The findings of the present study highlight the significance of elevating family communication quality and promoting adolescents’ development of autonomy and future orientation to enhance their life satisfaction.

Keywords: family communication, life satisfaction, autonomy, future orientation, adolescence

Introduction

With the development of positive psychology, researchers have paid much attention to life satisfaction and actively studied this research area from clinical, developmental, and neuroscientific perspectives. Life satisfaction is defined as individuals’ subjective evaluation of the quality of their lives. Numerous empirical studies have found that individuals’ higher level of satisfaction with life is beneficial for their development in multiple domains, such as keeping in good health, having more adaptive coping behaviors and fewer problem behaviors, and attaining educational and occupational success. Given the beneficial role of life satisfaction, it is critical to investigate the influential factors of life satisfaction.
and explore the underlying mechanisms. The present study focused on the effect of parent-adolescent communication quality on adolescents’ life satisfaction. As an extension of previous research, we further investigated the mediating effects of autonomy and future orientation on this relationship.

**Parent-Adolescent Communication Quality and Life Satisfaction**

As a pivotal factor in the family system, family communication plays an important role in affecting children’s development. Especially in the period of adolescence, family communication becomes more critical because parents and adolescents need to adapt to the rapid development of adolescents’ psychology and renegotiate their power boundaries. The quality of communication between parents and adolescents can influence multiple domains of adolescent developmental outcomes, including life satisfaction. Previous research has found that adolescents would perceive more life satisfaction when they communicate openly with parents, whereas adolescents were less likely to perceive satisfaction with life when they encounter obstacles in the process of communicating with parents. Furthermore, the positive relationship between parent-adolescent communication quality and life satisfaction remains significant even after controlling for other factors, such as perceived schoolwork pressure and bullying victimization. Open communication between parents and adolescents may create a positive family atmosphere and facilitate the operation of family function, which may promote adolescents’ satisfaction with life. In contrast, problems in family communication (eg, the hesitation to disclose personal feelings and avoidance of talking about some topics) may lead to misunderstandings and conflicts between parents and adolescents, which may decrease adolescents’ life satisfaction.

The findings of previous research suggest that the positive effect of family communication quality on life satisfaction is well established; however, the mechanisms underlying this relationship have not been adequately studied. Although some research has examined the mediating factors among this relationship, including emotional intelligence, self-esteem, classroom environment, and feelings of loneliness, it is still far from comprehensively understanding how parent-adolescent communication quality is associated with adolescents’ life satisfaction. The current study focused on examining the mediating roles of autonomy and future orientation to unravel the mechanisms underlying this relationship in the Chinese cultural context.

**Mediating Effect of Autonomy**

According to the findings of empirical studies and self-determination theory (SDT), autonomy may be a promising mediator between family communication quality and adolescents’ life satisfaction. Autonomy means regulation by the self, rather than by external forces. The development of adolescents’ autonomy is influenced by multiple familial factors, such as parenting styles, parenting practices, and parental beliefs. In addition to these factors, researchers also have explored the influence of family communication quality on autonomy and found that high quality of family communication (eg, more open communication and fewer problems in the communication) is conducive to the satisfaction of autonomy. Open communication creates a positive family environment in which adolescents have more opportunities to develop their autonomy, such as freely expressing feelings and perspectives, independently making decisions, and engaging in autonomous behaviors instead of being influenced by external forces.

In turn, adolescents’ development of autonomy plays an influential role in life satisfaction. SDT provides a framework for understanding this relationship. According to SDT, the satisfaction of the psychological needs for autonomy is critical for individuals’ optimal functioning and well-being. Empirical evidence supported this theory and indicated that adolescents’ perception of autonomy is positively associated with life satisfaction. When adolescents achieve adequate autonomy, their psychological need for autonomy can be fulfilled, which results in a higher level of life satisfaction.

**Mediating Effect of Future Orientation**

Another possible mediator between parent-adolescent communication quality and life satisfaction is adolescents’ future orientation. Future orientation is defined as consciously representing and self-constructing images of the future. Theoretical and empirical evidence indicate that communication quality between parents and adolescents is closely associated with adolescents’ future orientation. According to evolutionary life history theory, individuals in positive developmental environments (eg, supportive interpersonal relations and high quality of family communication) are more likely to adopt long-term strategies and
orient towards the future. In contrast, those in negative developmental environments (eg, unsafe environments and negative family interactions) tend to discount the importance of future orientation and adopt short-term strategies. As one of the most important interpersonal interactions, communication between parents and adolescents creates a developmental environment that plays a vital role in affecting adolescents’ future orientation. Empirical research supported this theory and found that open communication with parents promoted individuals to endorse future time perspective, whereas problematic family communication hindered them from developing future time perspective.

Adolescents’ future orientation, in turn, can impact their perception of life satisfaction. Generally, individuals’ orientation towards the future promoted them to perceive higher levels of life satisfaction. And this relationship was discovered in various samples, including samples from both Western and Eastern cultural backgrounds. When individuals envision and plan for the future, take actions to pursue future goals, and anticipate the consequence of their actions, they may have feelings of control over their lives. And life satisfaction may generate from these feelings.

**Autonomy and Future Orientation**

Based on theoretical and empirical evidence mentioned above, we hypothesized that autonomy and future orientation independently mediated the relationship between family communication quality and life satisfaction. Besides, we expected that autonomy and future orientation would sequentially mediate this relationship. Previous research has found that autonomy was positively related to future orientation. The development of adolescents’ future orientation requires the opportunity to explore their interests, values, and goals, and the freedom to make choices. When adolescents achieve adequate autonomy, they can plan for the future, devote themselves to achieving their future goals, and weigh the future paths based on their interests and values instead of social pressures or external expectations. In other words, adolescents’ autonomy may be a psychological resource that is beneficial for the development of future orientation. Considering the relationships between these variables mentioned above, we hypothesized that family communication quality may influence adolescents’ achievement of autonomy, which may affect the development of future orientation and in turn, contributes to adolescents’ life satisfaction.

**The Chinese Cultural Context**

Although theories and empirical evidence have confirmed the close relationships between family communication quality, autonomy, future orientation, and life satisfaction, previous research was mainly conducted in Western cultural contexts. There are some unique characteristics of traditional Chinese culture which may influence the effects of family communication quality and autonomy. For instance, traditional Chinese culture emphasizes non-confrontational and implicit communication, encourages submission to authority, and devalues autonomy. However, with the social change, Chinese culture is changing towards individualism which emphasizes autonomy and the self and discourages reserved communication style.

**Objective**

The overall purpose of this study was to examine the relationships between parent-adolescent communication quality and life satisfaction and to explore the inner mechanism among Chinese adolescents by using a longitudinal design. Specifically, the first aim of this study was to investigate whether parent-adolescent communication quality is associated with adolescents’ life satisfaction in the Chinese cultural background. The second aim of this study was to examine the mediating effects of autonomy and future orientation on the relationship between parent-adolescent communication quality and life satisfaction. In the mediation model, we tried to explore the independent and sequential mediating effects of autonomy and future orientation.

Based on self-determination theory, evolutionary life history theory, and empirical evidence, we proposed two specific hypotheses. First, high quality of parent-adolescent communication (eg, more open communication
and fewer problems in communication) would elevate adolescents’ life satisfaction in the contemporary Chinese cultural context. Second, adolescents’ autonomy and future orientation would independently and sequentially mediate the relationship between parent-adolescent communication quality and life satisfaction.

Method
Participants
The present study used a one-year longitudinal design to collect data. The open-source statistical language R was used to determine the minimum size of the research sample with power = 0.80 options. The result showed that the minimum sample size was determined to be 127. By using cluster sampling, 550 adolescents were recruited from 2 colleges in the urban areas of Jinan, the capital city of Shandong Province in China (65.01% girls; age range: 16.10–24.09 years; $M_{\text{age}} = 18.97 \pm 0.89$ years). At Time 2, 108 students either withdrew from the study or did not complete the questionnaires. Finally, 442 college students who accomplished two-wave assessments were retained in the data set (67.19% girls). In the final data set, the educational accomplishment of mothers and fathers, respectively, were as follows: 61.54% and 50.00% had completed junior high school or less, 29.86% and 37.78% got senior high school degree, and 7.92% and 11.54% were college graduates. For the parents’ occupational statuses, 48.42% of mothers and 29.64% of fathers were peasant or jobless, and 50.22% of mothers and 7.92% and 11.54% were college graduates. For the parents’ accomplishment of mothers and fathers, respectively, were as follows: 61.54% and 50.00% had completed junior high school or less, 29.86% and 37.78% got senior high school degree, and 7.92% and 11.54% were college graduates. For the parents’ occupational statuses, 48.42% of mothers and 29.64% of fathers were peasant or jobless, and 50.22% of mothers and 7.92% and 11.54% were college graduates.

Procedure
Before collecting data, participants were informed about the purposes and procedures of this study. Then, all participants completed written informed consent, which acknowledged that they understood and agreed to the terms of this study, including its voluntary and confidential nature. The participants’ parents also provided informed consent for their child to participate. During the process of collecting data, the participants rated their communication quality with parents at Time 1, and they rated autonomy, future orientation, and life satisfaction at Time 2. At each time point, the participants were instructed to complete self-reported questionnaires in classrooms. It took about 30 minutes to complete the questionnaires. This study was conducted in accordance with the Declaration of Helsinki and received ethical approval from the ethics review board of Shandong Women’s University.

Measures
Family Communication Quality
The Parent-Adolescent Communication Scale was used to measure youths’ perceptions of communication quality with their mothers and fathers, respectively. This measure consists of two subscales. The open family communication subscale measures the perception of freely exchanging information and opinions in the process of communicating with parents (10 items; eg, “I find it easy to discuss problems with my mother/father”). The problems in the family communication subscale measures obstacles in parent-adolescent communication, such as the negative feelings in communicating with parents and the reluctance to disclose opinions and feelings (10 items; eg, “I am sometimes afraid to ask my mother/father for what I want”). The items were rated by adolescents on a 5-point scale ranging from 1 (strongly disagree) to 5 (strongly agree). To generate a latent construct, the responses of items in the problems in the family communication subscale were reverse-coded. Higher scores indicate that there are fewer problems in parent-adolescent communication. In the present study, the total scale had good reliability (father: $\alpha = 0.87$; mother: $\alpha = 0.87$). Confirmatory factor analyses (CFA) indicated that the items fitted well to the two-factor model for both parents (father: RMSEA = 0.051, CFI = 0.93, TLI = 0.92; mother: RMSEA = 0.052, CFI = 0.92, TLI = 0.91).

Autonomy
The Worthington Autonomy Scale (WAS) was used to assess autonomy. Three dimensions of this scale were used in the present study: the behavioral autonomy (10 items; eg, “I apologize for my part of an argument even if the other person doesn’t”), the emotional autonomy (10 items; eg, “I can be close to someone and give them space at the same time”), and the value autonomy (10 items; eg, “I would hold to my religious beliefs even if my family and friends did not approve”). Participants reported their endorsement of each item on a 4-point scale ranging from 1 (strongly disagree) to 4 (strongly agree). Higher scores indicated higher levels of autonomy. In this study, the Cronbach’s alpha coefficient was 0.80 for this scale. The results of CFA showed that the present data fitted well to the structure of this scale (RMSEA = 0.065, CFI = 0.96, TLI = 0.92).

Future Orientation
Future orientation was assessed by the Chinese version of Questionnaire for Teenagers’ Future Orientation which was
partly derived from the future temporal perspective subscale of Zimbardo’s Time Perspective Inventory. This scale measures the extension of future orientation (3 items; eg, “I can imagine my life in ten years”), the density of future-oriented thoughts (6 items; eg, “I often think about my future”), optimistic beliefs about future (5 items; eg, “I believe I have the ability to create a better future”), planning for the future (12 items; eg, “I believe that a person’s day should be planned ahead each morning”) and taking action to achieve future goals (5 items; eg, “I am able to resist temptations when I know that there is work to be done”). Participants assessed the items on a 5-point scale ranging from 1 (completely false) to 5 (completely true). The Cronbach’s alpha coefficient was 0.91 in the current study. CFA indicated that the present data fitted well to the structure of this scale (RMSEA = 0.054, CFI = 0.92, TLI = 0.91).

Life Satisfaction

Life satisfaction was assessed by the Multidimensional Students’ Life Satisfaction Scale (MSLSS). The Chinese version of this scale was developed and eventually, a 36-item version was produced (Zhang et al, 2004). This scale measures the satisfaction with specific domains of life, such as family, friends, study, freedom, school, and living environment. Participants responded to each item on a 7-point scale ranging from 1 (completely false) to 7 (completely true). In the current study, the Cronbach’s alpha coefficient was 0.93 for this scale. As indicated by CFA, the present data fitted the six-factor structure well (RMSEA = 0.053, CFI = 0.91, TLI = 0.90).

Analysis Plan

In the present study, SPSS 22.0 was used to conduct descriptive statistics among the variables. Mplus 7.4 was used to perform structural equation modeling. In the total effect model, the relations between parent-adolescent communication quality and adolescents’ life satisfaction was examined. In the mediation model, the independent and sequential mediating effects of autonomy and future orientation on this relationship were examined. All these variables were modeled as latent variables based on the dimensions of each scale (see Figure 1). Overall model fit was acceptable when root mean square error of approximation (RMSEA) < 0.08, comparative fit index (CFI) > 0.90, and Tucker-Lewis index (TLI) > 0.90. The significance of direct and indirect effects was tested using 95% bias-corrected bootstrap. A 95% confidence interval (95% CI) that excluded zero indicated significant effect. Missing values were replaced with the series mean method in SPSS 22.0.

Results

Descriptive Statistics

The values of mean, standard deviation, and correlation among parent-adolescent communication quality, autonomy, future orientation, and life satisfaction are presented.
Mediating Effect of Autonomy and Future Orientation

The fitting indexes of the total effect model were acceptable (RMSEA = 0.075, CFI = 0.97, TLI = 0.96). The total effect of parent-adolescent communication quality on life satisfaction was positive (β = 0.51, 95% CI [0.40, 0.61]). Then we examined the indirect effects of parent-adolescent communication quality on adolescents’ life satisfaction through the mediation of autonomy and future orientation by using bias-corrected bootstrapping. The fitting indexes of the mediation model also were acceptable (RMSEA = 0.073, CFI = 0.94, TLI = 0.92). As displayed in Table 2, the total indirect effect of parent-adolescent communication quality on adolescents’ life satisfaction was significant. Specifically, autonomy and future orientation independently mediated the relationship between parent-adolescent communication quality and life satisfaction. In addition, autonomy and future orientation also sequentially mediated this relationship.

As shown in Figure 1, parent-adolescent communication quality positively predicted adolescents’ autonomy (β = 0.44, 95% CI [0.34, 0.53]) and future orientation (β = 0.17, 95% CI [0.04, 0.29]). In turn, adolescents’ autonomy and future orientation positively predicted life satisfaction (autonomy: β = 0.42, 95% CI [0.29, 0.57]; future orientation: β = 0.40, 95% CI [0.24, 0.55]). Besides, adolescents’ autonomy was positively linked to future orientation (β = 0.52, 95% CI [0.40, 0.64]).

Discussion

The present study aimed to examine whether parent-adolescent communication quality was associated with adolescents’ life satisfaction in the contemporary Chinese cultural context and what were the underlying mechanisms in this relationship. We used a longitudinal research design to unravel the link between parent-adolescent communication quality and adolescents’ life satisfaction and to examine the mediating roles of autonomy and future orientation in the link.

Parent-Adolescent Communication Quality and Life Satisfaction

Consistent with previous research,12–14 our findings indicated that high quality of family communication enhanced adolescents’ life satisfaction. This may be explained by the fact that adolescents who openly communicate with parents and have fewer problems in communication with parents are more likely to perceive parental support, trust, and closeness. In this process, adolescents’ psychological need for relatedness would be fulfilled, and family function would be smoothly implemented.10 Therefore, high quality of family communication may be conducing to the achievement of life satisfaction.10,13,51 Although traditional Chinese culture encourages nonconfrontational and implicit communication,21,37 contemporary Chinese culture places more importance on freedom in expression because of the influence of individualism.38 In this situation, open communication matches with the broad cultural context and plays a positive role in promoting adolescents’ well-being.

Mediation of Autonomy and Future Orientation

The present study found that autonomy independently mediated the relationship between family communication quality and adolescents’ life satisfaction. High quality of

### Table 1 Descriptive Statistics of the Variables

| Variables               | M  | SD  | I  | 2  | 3  | 4  |
|-------------------------|----|-----|----|----|----|----|
| 1 Communication quality | 3.43| 0.59|    |    |    |    |
| 2 Autonomy              | 3.01| 0.26| 0.32*** |    |    |    |
| 3 Future orientation    | 3.53| 0.51| 0.28*** | 0.48*** |    |    |
| 4 Life satisfaction     | 5.05| 0.73| 0.39*** | 0.56*** | 0.57*** |    |

Note: ***p < 0.001.

In Table 1, Parent-adolescent communication quality was positively associated with autonomy, future orientation, and life satisfaction. Autonomy and future orientation were positively correlated with life satisfaction, and they were also positively linked to each other.

### Table 2 Standardized Estimates and 95% CIs for Direct and Indirect Effects

| Path                  | Standardized Estimate | 95% CI       |
|-----------------------|-----------------------|--------------|
| Direct effect         |                        |              |
| CQ → LS               | 0.15 *                 | [0.04, 0.27] |
| Total indirect effect |                        |              |
| CQ → LS               | 0.34 *                 | [0.27, 0.43] |
| Specific indirect effect |                   |              |
| CQ → AU → LS          | 0.19 *                 | [0.12, 0.28] |
| CQ → FO → LS          | 0.07 *                 | [0.02, 0.13] |
| CQ → AU → FO → LS     | 0.09 *                 | [0.05, 0.15] |

Note: Empirical 95% confidence interval does not include zero.

Abbreviations: CQ, communication quality; AU, autonomy; FO, future orientation; LS, life satisfaction.
family communication was a supportive family resource that can help adolescents to develop autonomy.\textsuperscript{21} In the process of openly communicating with parents, adolescents have more opportunities to express themselves and make decisions according to their own volition rather than external forces. In turn, the acquisition of autonomy promoted adolescents to perceive life satisfaction.\textsuperscript{23,24} This finding is concordant with previous studies and provides empirical verification for self-determination theory which proposes that the fulfillment of adolescents’ basic psychological need for autonomy promotes their optimal development, including the achievement of life satisfaction.\textsuperscript{22} More importantly, this study extends previous findings to the Chinese cultural context. Traditional Chinese culture emphasizes conformity to norms and authority.\textsuperscript{36} With the social change, Chinese culture is exchanging, fusing, and colliding with Western cultures and contemporary Chinese culture is changing towards individualism.\textsuperscript{39} Contemporary Chinese adolescents tend to place more value on acquiring autonomy, which results in the positive effects of autonomy on their life satisfaction.

In addition to autonomy, future orientation also independently mediated the relationship between family communication quality and adolescents’ life satisfaction. This result was consistent with previous research and supported evolutionary life history theory. According to this theory, high quality of family communication provides adolescents with a positive developmental environment which promotes them to adopt long-term strategies and orient towards the future.\textsuperscript{26} Adolescents who experience a high quality of communication with parents would perceive more support from parents; then they would devote more time to envisioning and exploring the future instead of dealing with negative interactions with parents in the present.\textsuperscript{27} In turn, future-oriented adolescents would achieve more gratification from planning for the future and performing goal-oriented tasks, which leads to a high level of life satisfaction.\textsuperscript{30,52,53}

The present study also found that family communication quality could account for Chinese adolescents’ life satisfaction through the sequential mediating effect of autonomy and future orientation. In other words, Chinese adolescents who experience a high quality of family communication are more likely to have adequate autonomy, which may contribute to the development of future orientation and in turn, result in higher levels of life satisfaction. This finding may be due to that adolescents’ development of future orientation needs adequate autonomy.\textsuperscript{35} When adolescents achieve adequate autonomy (eg, making decisions volitionally and taking autonomous actions), they would have more opportunities to orient towards the future (eg, exploring the possibilities of the future).

**Contributions and Limitations**

There are some important contributions of this study. First, by using a longitudinal design, the present study enriches the literature on the relationships between family communication quality and life satisfaction among Chinese adolescents. Second, the findings extend our insights into the underlying mechanism of this relationship by demonstrating that in addition to the mediators discovered in previous research (eg, emotional intelligence, self-esteem, classroom environment, and feelings of loneliness), adolescents’ autonomy and future orientation can play important mediating roles in the links between family communication quality and adolescents’ life satisfaction. Furthermore, by including both mediators in the model, the current study examined the independent and sequential mediating effects of these mediators. Third, these findings may provide practical implications for how to enhance adolescents’ life satisfaction. For instance, parents should communicate openly with their children and create positive family environment. In addition, parents should adopt effective strategies to promote adolescents’ development of autonomy and future orientation, which may contribute to adolescents’ well-being. Additionally, psychologist professionals also should commit to increasing adolescents’ life satisfaction, such as providing interventions for families with communication problems, guiding parents to fulfill adolescents’ psychological need for autonomy, and developing programs to direct adolescents towards their future.

Despite the above-mentioned contributions, some limitations of this study should be mentioned. First, this study was conducted among Chinese college students in urban areas, which limits the generalization of the findings to other age groups or cultural contexts. Second, we used the self-reporting method to collect data, which may increase the risk of common method bias. Future research should use multiple appraisal methods to reduce such bias. Third, this study found that the relationship between family communication quality and Chinese adolescents’ life satisfaction was partially mediated, suggesting that a further understanding of this relationship requires information on other mediators.
Conclusions
The present study makes the first attempt to simultaneously examine the mediating effects of autonomy and future orientation in one study to unravel the association between family communication quality and life satisfaction and provides support for self-determination theory and evolutionary life history theory. Results indicated that high quality of family communication is conducive to adolescents’ life satisfaction in the contemporary Chinese cultural context. In addition, adolescents’ autonomy and future orientation can independently and sequentially mediate the relationship between family communication quality and adolescents’ life satisfaction. The findings of this study highlight the importance of enhancing the quality of family communication and promoting the development of adolescents’ autonomy and future orientation to increase adolescents’ life satisfaction.
