**ABSTRACT**

*Rhododendron shanii* W.P. Fang 1983 (Ericaceae) is a woody plant naturally distributed in the southwest of Anhui, China. *R. shanii* is a narrowly distributed species in the Dabie Mountain, its distribution range is only limited to a long and narrow zone with an area of 110 km² in the junction district of Yuexi County, Huoshan County in Anhui Province and Yangshuang County in Hubei Province, and mainly distributes on the ridge or on the slope near the ridge at altitude over 1400 m (Zhao et al.2012). Zhao kai believes that according to their investigation results and classification standard of IUCN endangered species red list, it is determined that the endangered level of *R. shanii* should be vulnerable grade (VU) at least (Zhao et al. 2012). The plant is used as ornamental flowers, which is endemic to the southern Dabie Mountains (Zhao et al. 2010). Here, we reported the complete chloroplast (cp) genome of *R. shanii*, deposited the annotated cp genome into GenBank with the accession numbers MW374796.

Fresh leaves of *R. shanii* were collected from Duozhijian of Yuexi County (31°3’50”E 116°10’52”N), Anhui province, China. These leaves were dried with the silicone. Voucher specimens were deposited at Nanjing Institute of Environmental Sciences (http://ppbc.iplant.cn/tu/9352036, Huanxi Yu and 2280328008@qq.com), and the voucher number of the specimen is DZJ202001. The genomic DNA was extracted following the modified CTAB method from the dry and healthy leaves (Doyle and Doyle 1987). The isolated genomic was manufactured to an average 400 bp paired-end (PE) library and sequenced by Illumina genome analyzer (HiSeq PE400). Sequencing service was provided by Personal Biotechnology Co., Ltd. Shanghai, China. The filtered reads were assembled using the program NOVOPlasty (Dierckxsens et al. 2017) with the complete cp genome of *Rhododendron delavayi*, *R. griersonianum* and *R. platypodum* as the reference (GenBank accession number MN413198, MT533181, MT985162 and MN711645). The assembled cp genome was annotated using Geneious 11.0.4 and corrected manually (Kearse et al., 2012). The complete cp genome of 11 species of Ericaceae were employed to build the maximum likelihood (ML) tree using RaxML (Stamatakis 2006) with 1000 bootstrap replicates. The cp genome of *R. shanii* was 204,170 bp in length (GenBank accession number MW374796), containing a large single-copy region (LSC) of 107,189 bp, a small single-copy region (SSC) of 2615 bp, and a pair of inverted repeat regions (IR) of 47,183 bp. Genome annotation predicted 150 genes, including 95 protein-coding genes, 47 tRNA genes, and eight rRNA genes. Phylogenetic analysis with the Ericaceae reported chloroplast genomes revealed that *R. shanii* is sister to the clade comprising *R. delavayi*, *R. griersonianum* and *R. platypodum*.

With released complete cp genome of Ericaceae, the phylogenetic analysis suggested that *R. shanii* is close to *Rhododendron delavayi* Franch., *Rhododendron griersonianum* Balf. f. & Forrest and *Rhododendron platypodum* Diels (Figure 1). *Arbutus unedo* is the outgroup in the phylogenetic analysis. Our study represents the first look into the complete cp genome of *R. shanii*, with 2001 bp longer than that of *R. delavayi* (Li et al. 2020), 2297 bp shorter than that of *R. griersonianum* (Liu et al. 2020) and 3123 bp shorter than that of *R. platypodum* (Ma et al. 2021) separately. This complete cp genome can provide a genomic resource and contribute to constructing phylogenetic relationships and evolutionary studies among the subgenus *Hymenanthes* (Blume) K. Koch. and relative groups.
Acknowledgments

The authors appreciate the opened raw cp genome data in NCBI. The authors thank Xian-Lin Guo for help with the technology. The authors thank Yong Chu, Jun Chu for their help with collecting the materials.

Ethical approval

This article does not contain any studies with human participants or animals performed by any of the authors. I confirm that all the research meets ethical guidelines and adheres to the legal requirements of the study country.

Author contribution

Huan-Xi Yu and Wang-Gu Xu contributed to the study concept and design; Zhi Wang, Jian-Liang Zhang and Peng Chen contributed to the acquisition of the data; Ying-Ying Lv, Bao-Kun Xu and Chang Qu analyzed and interpreted the data; and so on All authors read and approved the final manuscript.

Disclosure statement

No potential conflict of interest was reported by the author(s).
