New Approach to Intuitionistic Fuzzy Rough Sets

Sang Min Yun and Seok Jong Lee

Abstract

The properties of the intuitionistic fuzzy rough sets are very complicated and inadequate in the sense of the extension of intuitionistic properties. In order to overcome this unnaturalness, we introduce a new definition of intuitionistic fuzzy rough sets and investigate important properties about the image and inverse image of an intuitionistic rough sets under a mapping. All the results obtained from this new definition are different from the results in other papers, and will be proven useful in expanding the related theory.

Keywords: Intuitionistic fuzzy topology, Intuitionistic fuzzy rough sets

1. Introduction

The notion of fuzzy sets was first introduced by Zadeh [1]. After that, many studies attempted to generalize the fuzzy set by using various approaches. Pawlak [2] introduced the concept of rough sets, Nanda and Majumda [3] and Coker [4] proposed the idea of fuzzy rough sets. Atanassov [5] introduced the idea of intuitionistic fuzzy sets. All these concepts provide useful means of expressing vagueness in real environments.

Combining the concepts of fuzzy rough sets and intuitionistic fuzzy sets, Samanta and Mondal [6] proposed the idea of intuitionistic fuzzy rough sets. By introducing further generalization, the authors [7][8] also conducted a study on the intuitionistic fuzzy bitopology and intuitionistic smooth bitopology. Moreover, the categorical properties of the intuitionistic fuzzy topological spaces were studied by the same research group [9][11].

Many attempts at combining fuzziness and roughness have been made. In [12], the measure of fuzziness in rough sets is provided and studied. In [13] a general framework for the study of fuzzy rough sets is presented, in which both constructive and axiomatic approaches are made. Lower and upper approximations of intuitionistic fuzzy sets with respect to an intuitionistic fuzzy approximation space are first defined by Zhou et al. [14][15]. Several important properties of intuitionistic fuzzy approximation operators are examined by many researchers including us [16][19].

However, the properties of the intuitionistic fuzzy rough sets are very complicated and inadequate in the sense of the extension of intuitionistic properties. This is because of the unnaturalness of the definition of fuzzy rough sets. For example, the double complement of a fuzzy rough set is different from itself. The property that the double complement of a set becomes the set itself is one of the essential properties of Boolean algebra. Hence this flaw is critical in expanding the related theory. In order to overcome this unnaturalness, we need a new approach to intuitionistic fuzzy rough sets.
In this paper, we introduce a new definition of intuitionistic fuzzy rough sets and investigate important properties about the image and inverse image of an intuitionistic rough sets under a mapping. This new approach enables us to manipulate fuzzy rough sets more simply and easily. All the results obtained from this new definition are different from the results in other papers, and will be proven useful in expanding the related theory.

2. Fuzzy Rough Sets

In [3], the definition of fuzzy rough sets has been introduced. The paper said:

“We shall consider \((\mathcal{V}, \mathfrak{B})\) to be a rough universe where \(\mathcal{V}\) is a nonempty set and \(\mathfrak{B}\) is a Boolean algebra of the Boolean algebra of all subsets of \(\mathcal{V}\). Also consider a rough set \(X = (X_L, X_U) \in \mathfrak{B}^2\) with \(X_L \subseteq X_U\). A fuzzy rough set in \(X\) is an object of the form

\[
A = (A_L, A_U),
\]

where \(A_L\) and \(A_U\) are characterized by a pair of maps \(A_L : X_L \rightarrow L\) and \(A_U : X_U \rightarrow L\) with \(A_L(x) \leq A_U(x)\) for all \(x \in X_L\), where \((L, \leq)\) is a fuzzy lattice.”

Furthermore, the complement \(\overline{A}\) of a fuzzy rough set \(A = (A_L, A_U)\) is defined by \((\overline{A})_L = (A_U)'(x), \forall x \in X_L\) and \((\overline{A})_U = (A_L)'(x), \forall x \in X_U\), where \((A_U)'(x) = A_U(x), \forall x \in X_L\) and

\[
A_{L<U}(x) = \begin{cases} A_L(x), & \text{if } x \in X_L, \\ \{A_L(x) | x \in X_L\}, & \text{if } x \in X_U-X_L. \end{cases}
\]

Unfortunately, the double complement of a fuzzy rough set \(A\) is different from \(A\), because \(X_L\) and \(X_U\) are different, i.e., \(X_L \leq X_U\). The property that double complement of a set becomes the set itself is one of the essential properties of Boolean algebra. Hence this flaw is critical in expanding the related theory. Thus we are going to introduce the new definition of a fuzzy rough set by weakening the condition of the old definition. Then the properties we obtain in this paper are different from the results in the above paper.

Definition 2.1. Let \(X\) be an underlying set and \((L, \leq)\) a fuzzy lattice. A fuzzy rough set in \(X\) is an object of the form

\[
A = (A_L, A_U),
\]

where \(A_L\) and \(A_U\) are defined by a pair of maps \(A_L : X \rightarrow L\) and \(A_U : X \rightarrow L\) with \(A_L(x) \leq A_U(x)\), for all \(x \in X\). Furthermore \(\emptyset = (\emptyset_L, \emptyset_U)\) the null fuzzy rough set and \(\mathbf{1} = (\mathbf{1}_L, \mathbf{1}_U)\) the whole fuzzy rough set in \(X\).

Definition 2.2. For any two fuzzy rough sets \(A = (A_L, A_U)\) and \(B = (B_L, B_U)\) of \(X\), we define the following:

1. \(A \subseteq B\) iff \(A_L(x) \leq B_L(x)\) and \(A_U(x) \leq B_U(x)\) for all \(x \in X\).
2. \(A = B\) iff \(A \subseteq B\) and \(B \subseteq A\).

If \(\{A_i | i \in J\}\) is a family of fuzzy rough sets in \(X\), with \(A_i = ((A_i)_L, (A_i)_U)\), then we define the following:

1. \((\bigcup_i A_i)_L(x) = \bigvee(A_i)_L(x)\) and \((\bigcup_i A_i)_U(x) = \bigvee(A_i)_U(x)\) for all \(x \in X\).
2. \((\bigcap_i A_i)_L(x) = \bigwedge(A_i)_L(x)\) and \((\bigcap_i A_i)_U(x) = \bigwedge(A_i)_U(x)\) for all \(x \in X\).

Definition 2.3. The complement \(\overline{A} = ((\overline{A})_L, (\overline{A})_U)\) of a fuzzy rough set \(A = (A_L, A_U)\) in \(X\) is defined by \((\overline{A})_L(x) = (A_U(x))'\) and \((\overline{A})_U(x) = (A_L(x))'\) for all \(x \in X\).

For any fuzzy rough set \(A = (A_L, A_U)\) and for any \(x \in X\),

\[
(A_L(x))' \leq (A_U(x))' = (\overline{A}_U(x)).
\]

So, \(\overline{A}\) is again a fuzzy rough set. Furthermore, for any fuzzy rough set \(A = (A_L, A_U)\), we have the double complement property, i.e., \((\overline{\overline{A}}) = A\).

Theorem 2.4. Let \(A\) be any fuzzy rough set in \(X\), then we have the following properties:

1. \(\emptyset \subseteq A \subseteq \mathbf{1}\).
2. \((\emptyset) = \mathbf{1}, (\mathbf{1}) = \emptyset\).

Theorem 2.5. If \(A, B, C, D\) and \(B_i, i \in J\) are fuzzy rough sets in \(X\), then we have the following properties:

1. \(A \subseteq B\) and \(C \subseteq D\) implies \(A \cup C \subseteq B \cup D\) and \(A \cap C \subseteq B \cap D\).
2. \(A \subseteq B\) and \(B \subseteq C\) implies \(A \subseteq C\).
3. \(A \cap B \subseteq A, B \subseteq A \cup B\).
4. \(A \cup (\bigcap_i B_i) = \bigcap_i (A \cup B_i), A \cap (\bigcup_i B_i) = \bigcup_i (A \cap B_i)\).
5. \(A \subseteq B\) implies \(\overline{B} \subseteq \overline{A}\).
6. \(\bigcap_i B_i = \bigcup_i \overline{B_i}, \bigcup_i B_i = \bigcap_i \overline{B_i}\).
Theorem 2.7. If \( f : X \rightarrow Y \) is a mapping, then for any fuzzy rough sets \( A \) and \( B \) in \( X \), we have the following:

1. \( A \subseteq B \) implies \( f(A) \subseteq f(B) \).
2. If \( f \) is surjective, then \( f(\overline{A}) \supseteq \overline{f(A)} \).
3. \( f(\bigcup_{i \in I} A_i) = \bigcup_{i \in I} f(A_i) \).
4. \( f(\bigcap_{i \in I} A_i) \subseteq \bigcap_{i \in I} f(A_i) \).

Proof. (1) The proof is clear.

(2) Let \( f \) be surjective.

\[
\begin{align*}
(f(\overline{A}))_L(y) &= f(f(\overline{A})_L(y) \\
&= \bigvee \{f(\overline{A}_x) \mid x \in f^{-1}(y)\} \\
&= \bigvee \{(A_U(x))' \mid x \in f^{-1}(y)\} \\
&\supseteq \bigwedge \{(A_U(x))' \mid x \in f^{-1}(y)\}
\end{align*}
\]

The proof of the upper part is similar.

(3) 
\[
\begin{align*}
(f(\bigcup_{i \in J} A_i))_L(y) &= f((\bigcup_{i \in J} A_i)_L(y) \\
&= \bigvee \{(\bigcup_{i \in J} A_i)_L(x) \mid x \in f^{-1}(y)\} \\
&= \bigvee \big\{ \bigvee_{i \in J} (A_i)_L(x) \mid x \in f^{-1}(y)\} \\
&= \bigvee \big\{ f((A_i)_L(y)) \mid i \in J\} \\
&= \bigcup_{i \in J} (f(A_i))_L(y)
\end{align*}
\]

The proof of the upper part is similar.

(4) 
\[
\begin{align*}
(f(\bigcap_{i \in J} A_i))_L(y) &= f((\bigcap_{i \in J} A_i)_L(y) \\
&= \bigvee \{(\bigcap_{i \in J} A_i)_L(x) \mid x \in f^{-1}(y)\} \\
&= \bigvee \big\{ \bigwedge_{i \in J} (A_i)_L(x) \mid x \in f^{-1}(y)\} \\
&= \bigwedge \big\{ f((A_i)_L(y)) \mid i \in J\} \\
&= \bigcap_{i \in J} (f(A_i))_L(y)
\end{align*}
\]

The proof of the upper part is similar.

The surjectiveness is essential in (2) of the above theorem. It can be shown by the following example.

Example 2.8. Let \( X = \{1, 2, 3\} \), \( Y = \{a, b, c\} \). Let \( f : X \rightarrow Y \) be a mapping with \( f(1) = a, f(2) = f(3) = c \). Then \( f \) is not surjective. Consider a fuzzy rough set

\[
A = \{\{1/0.4, 2/0.3\}, \{1/0.4, 2/0.4\}\}.
\]

Then

\[
\overline{A} = \{\{1/0.6, 2/0.6\}, \{1/0.6, 2/0.7\}\}.
\]

So
\( f(\overline{A}) = \{a/0.6, b/0, c/0.6\}, \{a/0.6, b/0, c/0.7\} \).

But
\( f(A) = \{a/0.4, b/0, c/0.3\}, \{a/0.4, b/0, c/0.4\} \),
and so
\[ f(\overline{A}) = \{a/0.6, b/1, c/0.6\}, \{a/0.6, b/1, c/0.7\} \].

Hence \( f(\overline{A}) \subseteq f(\overline{A}) \).

**Remark 2.9.** If \( f : X \rightarrow Y \) and \( g : Y \rightarrow Z \) are mappings, then for any fuzzy rough set \( C \) in \( Z \), the inverse image of \( C \) under \( g \circ f \) is defined by \( (g \circ f)^{-1}(C) = f^{-1}(g^{-1}(C)) \) where \( g \circ f \) is the composition of \( g \) and \( f \).

**Theorem 2.10.** If \( f : X \rightarrow Y \) is a mapping, then for all fuzzy rough sets \( A, B, i \in J \) in \( Y \), we have the following:

1. \( f^{-1}(\overline{B}) = \overline{f^{-1}(B)} \).
2. \( B \subseteq C \) implies \( f^{-1}(B) \subseteq f^{-1}(C) \).
3. \( f^{-1}(\bigcap_i B_i) = \bigcap_i f^{-1}(B_i) \).
4. \( f^{-1}(\bigcup_i B_i) = \bigcup_i f^{-1}(B_i) \).

**Proof.** (1) \( f^{-1}(\overline{B}) = \overline{f^{-1}(B)} \).

(2) Since \( B \subseteq C \), \( B_L(y) \leq C_L(y) \) for all \( y \in Y \). \( f^{-1}(B)(x) = f^{-1}(B_L)(x) = B_L(f(x)) = f^{-1}(B_U)(x) = f^{-1}(B)(x) = f^{-1}(C)(x) \). The proof of upper part is similar. Hence \( f^{-1}(\overline{B}) = \overline{f^{-1}(B)} \).

(3) \( f^{-1}(\bigcap_i B_i)(x) = \bigcap_i f^{-1}(B_i) \).

(4) \( f^{-1}(\bigcup_i B_i)(x) = \bigcup_i f^{-1}(B_i) \).

(4) Similarly.

**Theorem 2.11.** If \( f : X \rightarrow Y \) is a mapping, then for any fuzzy rough set \( A \) in \( X \) and \( B \) in \( Y \), we have the following:

1. \( B \supseteq f(f^{-1}(B)) \).
2. \( A \subseteq f^{-1}(f(A)) \).

**3. Intuitionistic Fuzzy Rough Sets**

**Definition 3.1.** If \( A = (A_L, A_U) \) and \( B = (B_L, B_U) \) are two fuzzy rough sets in \( X \) with \( B \subseteq A \), then the ordered pair \( (A, B) \) is called an intuitionistic fuzzy rough set (briefly IF rough set) in \( X \). The condition \( B \subseteq A \) is called the intuitionistic condition (briefly IC).

**Remark 3.2.** In [6], the IC is that \( B \subseteq A \) and \( A \subseteq B \). But by the definition of IF rough set in this paper, we get the followings. If \( B \subseteq A \), then \( B_L(x) \leq (A_L(x))^\prime \), i.e. \( B_L(x) \leq (A_U(x))^\prime \). So \( A_U(x) \leq A_L(x) \). Moreover, the converse is clear. Therefore \( B \subseteq A \) if \( A \subseteq B \).

**Definition 3.3.** \( 0^* = (0, 1) \) and \( 1^* = (1, 0) \) are called the null IF rough set and the whole IF rough set in \( X \), respectively. Clearly \( 0^* \subseteq 1^* \).

We denote by IFRS(X) the collection of all IF rough sets in \( X \). Usually we shall use letters \( X, Y, Z, \ldots \) to denote sets, letters \( A, B, C, \ldots \) to denote fuzzy rough sets, and letters \( P, Q, R, \ldots \) to denote IF rough sets.

**Definition 3.4.** Let \( P = (A, B) = ((A_L, A_U), (B_L, B_U)) \) and \( Q = (C, D) = ((C_L, C_U), (D_L, D_U)) \) be two IF rough sets in \( X \). We define the following:

1. \( P \subseteq Q \) iff \( A \subseteq C \) and \( B \supseteq D \).
2. \( P \supset Q \) iff \( P \subseteq Q \) and \( P \supseteq Q \).
3. \( P = Q \) iff \( P \subseteq Q \) and \( Q \subseteq P \).
4. \( P = Q \) iff \( P \subseteq Q \) and \( Q \subseteq P \).

(3) The complement \( \overline{P} \) of \( P = (A, B) \) in \( X \), is defined by \( \overline{P} = (B, A) \).

(4) For IF rough sets \( P_i = (A_i, B_i) \) in \( X, i \in J \), we define
\[ \bigcup_{i \in J} P_i = \bigcup_{i \in J} \left( \bigcap_{i \in J} A_i, \bigcup_{i \in J} B_i \right) \]
\[ \bigcap_{i \in J} P_i = \bigcap_{i \in J} \left( \bigcup_{i \in J} A_i, \bigcap_{i \in J} B_i \right) \].

**Remark 3.5.** Let \( P_i = (A_i, B_i) \) be an IF rough set for all \( i \in \Delta \), then \( A_i \subseteq B_i \) for all \( i \in \Delta \). For any \( k \in \Delta \), we have
\[ A_k \subseteq B_k \subseteq \bigcap_{i \in \Delta} B_i \subseteq \bigcup_{i \in \Delta} B_i \].

Thus \( \bigcup_{i \in \Delta} A_i \subseteq \bigcap_{i \in \Delta} B_i \). Hence \( \bigcup_{i \in \Delta} P_i = \bigcup_{i \in \Delta} A_i, \bigcap_{i \in \Delta} B_i \) is also an IF rough set.
Similarly, for any \( k \in \Delta \), \( \bigcap_i A_i \subseteq A_k \subseteq \overline{B_k} \). So \( \bigcap_i A_i \subseteq \bigcap_i B_i \). Hence \( \bigcap_i P_i = (\bigcap_i A_i, \bigcap_i B_i) \) is also an IF rough set.

**Theorem 3.6.** Let \( P = (A, B), Q = (C, D), R = (E, F) \) and \( P_i = (A_i, B_i), i \in J \) be IF rough sets in \( X \), then we have the following:

1. \( P \cap P = P \cup P \).
2. \( P \cap Q = Q \cap P, P \cup Q = Q \cup P \).
3. \( (P \cap Q) \cap R = P \cap (Q \cap R), (P \cup Q) \cup R = P \cup (Q \cup R) \).
4. \( P \cap Q \subseteq P, Q \subseteq P \cup Q \).
5. \( P \subseteq Q \) and \( Q \subseteq R \) implies \( P \subseteq R \).
6. \( P_i \subseteq Q, \forall i \in J \) implies \( \bigcup_i P_i \subseteq Q \).
7. \( Q \subseteq P_i, \forall i \in J \) implies \( Q \subseteq \bigcap_i P_i \).
8. \( Q \cup (\bigcap_i P_i) = \bigcap_i (Q \cup P_i) \).
9. \( Q \cap (\bigcup_i P_i) = \bigcup_i (Q \cap P_i) \).
10. \( (P) = P \).
11. \( P \subseteq Q \) iff \( \overline{Q} \subseteq \overline{P} \).
12. \( \bigcup_i P_i = \bigcap_i \overline{P_i}, \bigcap_i P_i = \bigcup_i \overline{P_i} \).

**Proof.**

\[
\begin{align*}
&f((\overline{B})_L)(y) = \bigvee \{ (\overline{B})_L(x) \mid x \in f^{-1}(y) \} \\
&= \bigvee \{ (B_U(x))' \mid x \in f^{-1}(y) \} \\
&= \bigwedge \{ (B_U(x)) \mid x \in f^{-1}(y) \}',
\end{align*}
\]

So, \( f(\overline{B})(y) = \big((\bigwedge \{ (B_U(x)) \mid x \in f^{-1}(y) \})', (\bigwedge \{ (B_L(x)) \mid x \in f^{-1}(y) \})' \big) \big) \). Thus, \( f(\overline{B})(y) = (\big\{ (B_U(x)) \mid x \in f^{-1}(y) \}, \big\{ (B_L(x)) \mid x \in f^{-1}(y) \}) \). \( \square \)

**Remark 3.9.** We will prove that the image of any IF rough set \( P = (A, B) \) satisfies the IC.

\[
\begin{align*}
(f(A))_L(y) &= f(A)_L(y) \\
&= \bigvee \{ A_L(x) \mid x \in f^{-1}(y) \} \\
&\leq \bigvee \{ (B_U(x))' \mid x \in f^{-1}(y) \} \\
&= \bigwedge \{ (B_U(x)) \mid x \in f^{-1}(y) \}' \\
&= \bigwedge \{ (f(\overline{B}))_L(y) \}' \\
&= \bigwedge \{ (f(\overline{B}))_U(y) \}' \\
&= \big( (f(\overline{B}))_U(y) \big)' \\
&= (f(\overline{B}))(y).
\end{align*}
\]

The proof of the upper part is similar. So, if \( P = (A, B) \) be an IF rough set in \( X \), then \( f(P) = (f(A), f(\overline{B})) \) is also an IF rough set in \( Y \).

**Remark 3.10.** By the above theorem, we have the following conclusion:

For any IF rough set \( P = (A, B) \) in \( X \) and any map \( f : X \rightarrow Y \), the image \( f(P) = (f(A), f(B)) \) of \( P \) under \( f \) is actually expressed as follows:

For any \( y \in Y \)

\[
\begin{align*}
f(P)(y) &= \big( \bigvee \{ A(x) \mid x \in f^{-1}(y) \}, \bigwedge \{ B(x) \mid x \in f^{-1}(y) \} \big),
\end{align*}
\]

where

\[
\begin{align*}
\bigvee \{ A(x) \mid x \in f^{-1}(y) \} &= \begin{cases} 0, & \text{if } f^{-1}(y) = \emptyset, \\ \big( \bigvee \{ A_L(x) \mid x \in f^{-1}(y) \}, \bigwedge \{ A_U(x) \mid x \in f^{-1}(y) \} \big), & \text{if } f^{-1}(y) \neq \emptyset, \end{cases}
\end{align*}
\]

\[
\bigwedge \{ B(x) \mid x \in f^{-1}(y) \} = \begin{cases} \emptyset, & \text{if } f^{-1}(y) = \emptyset, \\ \big( \bigwedge \{ B_L(x) \mid x \in f^{-1}(y) \}, \bigvee \{ B_U(x) \mid x \in f^{-1}(y) \} \big), & \text{if } f^{-1}(y) \neq \emptyset, \end{cases}
\]

\[
\bigwedge \{ B_U(x) \mid x \in f^{-1}(y) \} \big) \).
\]

International Journal of Fuzzy Logic and Intelligent Systems, vol. 20, no. 2, June 2020
\[ \bigwedge \{ B(x) \mid x \in f^{-1}(y) \} \]
\[
\begin{cases}
1, & \text{if } f^{-1}(y) = \emptyset, \\
\bigwedge \{ B_L(x) \mid x \in f^{-1}(y) \}, \bigwedge \{ B_U(x) \mid x \in f^{-1}(y) \}, & \text{if } f^{-1}(y) \neq \emptyset.
\end{cases}
\]

**Definition 3.11.** Let \( f : X \to Y \) be a mapping and \( Q = (C, D) = ((C_L, C_U), (D_L, D_U)) \) an IF rough set in \( Y \). Then we define an inverse image of \( Q \) under \( f \) by
\[
f^{-1}(Q) = (f^{-1}(C), f^{-1}(D)),
\]
where \( f^{-1}(C) = (f^{-1}(C)_L, f^{-1}(C)_U) = (f^{-1}(C_L), f^{-1}(C_U)) \) and \( f^{-1}(D) = (f^{-1}(D)_L, f^{-1}(D)_U) = (f^{-1}(D_L), f^{-1}(D_U)) \).

**Remark 3.12.** \( f^{-1}(C_L)(x) = C_L(f(x), x) \leq (D)_L(f(x)) = f^{-1}((D)_L)(x) = (f^{-1}(D_L))(x) \). The upper part is also hold. Hence, the inverse image of an IF rough set under \( f \) is also an IF rough set.

**Theorem 3.13.** Let \( f : X \to Y \) be a mapping. For any IF rough set \( P \) and \( Q \) on \( X \), we have the following:

1. \( P \subseteq Q \) implies \( f(P) \subseteq f(Q) \).
2. If \( f \) is surjective, then \( f(\mathcal{P}) \supseteq \mathcal{P} \).

**Proof.** (1) It is clear.

(2) Let \( P = (A, B) \) be an IF rough set. Then \( f(\mathcal{P}) = (f(A), f(B)) = (f((A, B)) = (f(A), f(B)) = (f(A), f(B), f(A)). \)
Consider \( f(B)L)(y) = \bigwedge \{ B_L(x) \mid x \in f^{-1}(y) \} \geq \bigwedge \{ B_L(x) \mid x \in f^{-1}(y) \} = \bigwedge \{(f^{-1}(B_L))(y) \). And the proof of the upper part is similar. Thus \( f(B) \supseteq f(B) \). Similarly, \( f(A) \supseteq f(A) \). Therefore \( f(\mathcal{P}) = (f(B), f(A)) \supseteq (f(B), f(A)) = (f(\mathcal{P}) \). \)

**Definition 3.14.** If \( f : X \to Y \) and \( g : Y \to Z \) are mappings, then the inverse image of IF rough set \( W \in Z \) under \( (g \circ f) \) is defined by \( (g \circ f)^{-1}(W) = f^{-1}(g^{-1}(W)) \) where \( g \circ f \) is the composition of \( g \) and \( f \).

**Theorem 3.15.** Let \( f : X \to Y \) be a mapping. For any IF rough set \( R, S \) and \( R_i, i \in J \) in \( Y \), we have the following:

1. \( f^{-1}(R) = f^{-1}(R) \).
2. \( R \subseteq S \) implies \( f^{-1}(R) \subseteq f^{-1}(S) \).
3. \( f^{-1}(\bigcup_i R_i) = \bigcup_i f^{-1}(R_i) \).
4. \( f^{-1}(\bigcap_i R_i) = \bigcap_i f^{-1}(R_i) \).

**Proof.** (1) Let \( R = (A, B) \), then \( R = (B, A). f^{-1}(R) = (f^{-1}(B), f^{-1}(A)) = (f^{-1}(A), f^{-1}(B)) = f^{-1}(R) \).
(2) Let \( R_i = (A_i, B_i) \), \( \bigcup_i R_i = \bigcup_i (A_i, B_i) = (\bigcup_i A_i, \bigcup_i B_i) \).
(3) \( f^{-1}(\bigcup_i R_i) = f^{-1}(\bigcup_i (A_i, B_i)) = f^{-1}(\bigcup_i A_i, \bigcup_i B_i) = f^{-1}(A_i, \bigcup_i B_i) = \bigcup_i f^{-1}(A_i, f^{-1}(B_i)) = f^{-1}(R_i) \).

**Theorem 3.16.** Let \( f : X \to Y \) be a mapping. For any IF rough set \( P \) in \( X \) and \( R \) in \( Y \), we have the following:

1. \( R \supseteq f^{-1}(R) \).
2. \( P \subseteq f^{-1}(f(P)) \).

**Proof.** (1) Let \( R = (C, D) \) be an IF rough set for some fuzzy rough sets \( C, D \). Then \( f^{-1}(R) = (f^{-1}(C), f^{-1}(D)) \). We have
\[
f^{-1}(R)(y) = \left\{ \begin{array}{ll}
(0, 1), & \text{if } f^{-1}(y) = \emptyset, \\
\bigwedge \{ C(f(x)) \}, \bigwedge \{ D(f(x)) \} & \text{for all } x \in f^{-1}(y), \\
\end{array} \right.
\]
\[
\leq (C(y), D(y)) = R(y).
\]

**Example 3.17.** Let \( X = \{1, 2, 3\}, Y = \{a, b, c\} \). And let \( f : X \to Y \) be a mapping with \( f(1) = a, f(2) = f(3) = c \). Consider an IF rough set \( R = (C, D) = ((\{a/0.4, b/0.3\}, \{a/0.4, b/0.4\}), (\{a/0.2, b/0.4\}, \{a/0.3, b/0.4\})) \). Then we have \( R(b) = ((0.3, 0.4), (0.4, 0.4)) \). But \( f^{-1}(R)(b) = ((0, 1), (1, 0)) \). Thus \( R \neq f^{-1}(R) \).

New Approach to Intuitionistic Fuzzy Rough Sets | 134
Example 3.18. Let $X = \{1, 2, 3\}, Y = \{a, b, c\}$. And let $f : X \to Y$ be a mapping with $f(1) = a, f(2) = f(3) = c$. Consider an IF rough set $P = (A, B) = (((1/0.4, 2/0.3), (1/0.4, 2/0.4)), ((1/0.2, 2/0.4), (1/0.3, 2/0.4)))$. Then we have $P(3) = ((0.1), (1, 0))$. But $f^{-1}(f(P))(3) = ((0.3, 0.4), (0.4, 0.4))$. Thus $P \neq f^{-1}(f(P))$.

Theorem 3.19. Let $f : X \to Y$ be a mapping. For any IF rough sets $P, Q$ in $X$, we have $f(P \cup Q) = f(P) \cup f(Q)$.

**Proof.** Let $P = (A, B), Q = (C, D)$ be two IF rough sets.

\[
f(P \cup Q)(y) = f((A \cup B) \cup (C, D))(y) = f(A \cup C, B \cap D)(y) = \bigvee \{ \{A \cup C(x)\}, \bigwedge \{B \cap D(x)\} \} \text{ for all } x \in f^{-1}(y)
\]

\[
= \bigvee \{A(x) \cup C(x)\}, \bigwedge \{B(x) \cap D(x)\} \} \text{ for all } x \in f^{-1}(y)
\]

\[
= \left( \bigwedge \{B(x) \mid x \in f^{-1}(y)\} \right) \cup \left( \bigvee \{C(x) \mid x \in f^{-1}(y)\} \right)
\]

\[
f(P)(y) \vee f(Q)(y) = (f(P) \cup f(Q))(y).
\]

Hence $f(P \cap Q) \subseteq f(P) \cap f(Q)$.

Corollary 3.22. If $f : X \to Y$ is one-one, then clearly $f(P \cap Q) = f(P) \cap f(Q)$.

But in general $f(P \cap Q) \neq f(P) \cap f(Q)$, which can be shown by the following example.

Example 3.23. Let $X = \{x, y\}$ and $Y = \{a\}$ and a mapping $f : X \to Y$ be defined by $f(x) = f(y) = a$. Let $P = (((x/0.4, y/0.3), (x/0.4, y/0.4)), ((x/0.2, y/0.4), \{x/0.3, y/0.4\})), Q = (((x/0.3, y/0.4), \{x/0.3, y/0.4\}, (x/0.3, y/0.3))).$ Clearly $P, Q$ are IF rough sets in $X$. And $P \cap Q = (((x/0.3, y/0.3), \{x/0.3, y/0.4\}, \{x/0.3, y/0.4\})).$

Thus

\[
f(P \cap Q) = ((\{a/0.3\}, \{a/0.4\}, \{a/0.3\}), \{a/0.4\}, \{a/0.3\})
\]

\[
f(P) = ((\{a/0.4\}, \{a/0.4\}, \{a/0.2\}, \{a/0.3\}), \{a/0.4\}, \{a/0.3\})
\]

\[
f(Q) = ((\{a/0.4\}, \{a/0.4\}, \{a/0.2\}, \{a/0.3\})
\]

So $f(P) \cap f(Q) = ((\{a/0.4\}, \{a/0.4\}, \{a/0.2\}, \{a/0.3\})$. Hence $f(P \cap Q) \neq f(P) \cap f(Q)$.

Theorem 3.24. Let $f : X \to Y$ be a mapping. For any IF rough set $P_i, i \in J$, we have the following:

(1) $f(\bigcup_{i \in J} P_i) = \bigcup_{i \in J} (P_i)$.

(2) $f(\bigcap_{i \in J} P_i) \subseteq \bigcap_{i \in J} (P_i)$.

**Proof.** (1) Let $P_i = (A_i, B_i)$ where $A_i, B_i$ are fuzzy rough sets for all $i \in J$. Then

\[
f(\bigcup_{i \in J} P_i)(y)
\]

\[
= f(\bigcup_{i \in J} A_i, \bigcap_{i \in J} B_i)(y) = (f(\bigcup_{i \in J} A_i)(y), f(\bigcap_{i \in J} B_i)(y))
\]

\[
= \left( \bigvee \{A_i(x) \}, \bigwedge \{B_i(x) \} \right) \text{ for all } x \in f^{-1}(y)
\]

\[
= \left( \bigvee \{A_i(x) \}, \bigwedge \{B_i(x) \} \right) \text{ for all } x \in f^{-1}(y)
\]

\[
= \bigcup \{A_i(x), \bigcap \{B_i(x) \} \} \text{ for all } x \in f^{-1}(y)
\]

\[
= \bigcup \{f(A_i)(y), f(B_i)(y) \} = \bigcup_{i \in J} (f(P_i))(y).
\]
(2) Let \( P_i = (A_i, B_i) \) where \( A_i, B_i \) are fuzzy rough sets for all \( i \in J \). Then

\[
f\left(\bigcap_{i \in J} P_i\right)(y) = f\left(\bigcap_{i \in J} A_i \cup B_i\right)(y) = \left(f\left(\bigcap_{i \in J} A_i\right)(y), \frac{1}{f\left(\bigcup_{i \in J} B_i\right)(y)}\right) = \left(\bigwedge_{i \in J} \{\bigwedge_{i \in J} A_i(x)\}, \bigwedge_{i \in J} \{B_i(x)\}\right) \quad \text{for all } x \in f^{-1}(y)
\]

\[
\leq \left(\bigwedge_{i \in J} \bigvee_{i \in J} \{A_i(x)\}, \bigvee_{i \in J} \{B_i(x)\}\right) \quad \text{for all } x \in f^{-1}(y)
\]

\[
= \left(\bigcap_{i \in J} \{A_i(x)\}, \bigvee_{i \in J} \{B_i(x)\}\right) \quad \text{for all } x \in f^{-1}(y)
\]

\[
= \bigcap_{i \in J} \left(f(A_i)(y), f(B_i)(y)\right) = \bigcap_{i \in J} \left(f(P_i)(y)\right).
\]

\[ \square \]

4. Conclusion

The properties of the intuitionistic fuzzy rough sets are very complicated and inadequate in the sense of the extension of intuitionistic properties. This is because of the unnaturalness of the definition of fuzzy rough sets. Hence this flaw is critical in expanding the related theory. In order to overcome this unnaturalness, we introduce a new definition of intuitionistic fuzzy rough sets and investigate important properties about the image and inverse image of an intuitionistic rough sets under a mapping. This new approach enables us to manipulate fuzzy rough sets more simply and easily. All the results obtained from this new definition are different from the results in other papers, and will be proven useful in expanding the related theory.
