Vladimir Oliker †

Abstract

Let $\psi$ be a given function defined on a Riemannian space. Under what conditions does there exist a compact starshaped hypersurface $M$ for which $\psi$, when evaluated on $M$, coincides with the $m$-th elementary symmetric function of principal curvatures of $M$ for a given $m$? The corresponding existence and uniqueness problems in Euclidean space have been investigated by several authors in the mid 1980’s. Recently, conditions for existence were established in elliptic space and, most recently, for hyperbolic space. However, the uniqueness problem has remained open. In this paper we investigate the problem of uniqueness in hyperbolic space and show that uniqueness (up to a geometrically trivial transformation) holds under the same conditions under which existence was established.

1 Introduction

In Euclidean space $\mathbb{R}^{n+1}$ fix a point $O$ and let $S^n$ be the unit sphere centered at $O$. Let $u$ denote a point on $S^n$ and let $(u, \rho)$ be the spherical coordinates in $\mathbb{R}^{n+1}$ with the origin at $O$. The standard metric on $S^n$ induced from $\mathbb{R}^{n+1}$ we denote by $e$. Let $I = [0, a)$, where $a = \text{const}$, $0 < a \leq \infty$, and $f(\rho)$ a positive $C^\infty$ function on $I$ such that $f(0) = 0$. Introduce in $S^n \times I$ the metric

$$ h = d\rho^2 + f(\rho)e \quad (1) $$

and consider the resulting Riemannian space. When \( a = \infty \) and \( f(\rho) = \rho^2 \) this space is the Euclidean space \( \mathbb{R}^{n+1} \equiv \mathbb{R}^{n+1}(0) \), when \( a = \infty \) and \( f(\rho) = \sinh^2 \rho \) it is the hyperbolic space \( \mathbb{R}^{n+1}(-1) \) with sectional curvature \(-1\) and when \( a = \pi/2, f(\rho) = \sin^2 \rho \), it is the elliptic space \( \mathbb{R}^{n+1}(1) \) with sectional curvature \(+1\). We use the notation \( \mathbb{R}^{n+1}(K), K = 0, \pm 1 \) for either of these spaces.

Let \( \mathcal{M} \) be a hypersurface in \( \mathbb{R}^{n+1}(K) \) and \( m, 1 \leq m \leq n \), be an integer. The \( m \)-th mean curvature, \( H_m(\lambda) \equiv H_m(\lambda_1, \ldots, \lambda_n) \), of \( \mathcal{M} \) is the normalized elementary symmetric function of order \( m \) of the principal curvatures \( \lambda_1, \ldots, \lambda_n \) of \( \mathcal{M} \), that is,

\[
H_m(\lambda) = \binom{n}{m}^{-1} \sum_{i_1 < \cdots < i_m} \lambda_{i_1} \cdots \lambda_{i_m}.
\]

The subject of this paper is the following problem. Let \( \psi(u, \rho), \ u \in S^n, \ \rho \in I, \) be a given positive function and \( m, 1 \leq m \leq n \), a given integer. Under what conditions on \( \psi \) does there exist a smooth hypersurface \( \mathcal{M} \) in \( \mathbb{R}^{n+1}(K) \) given as \( (u, z(u)) \), \( u \in S^n, \ z > 0 \), for which

\[
H_m(\lambda(z(u))) = \psi(u, z(u)) \ \forall u \in S^n?
\] (2)

In addition, if such a hypersurface exists then we wish to know conditions for uniqueness.

In analytic form this problem consists in establishing existence and uniqueness of solutions for a second order nonlinear partial differential equation on \( S^n \) expressing \( H_m \) in terms of \( z \). When \( m = 1 \) this equation is quasilinear and for \( m > 1 \) it is fully nonlinear. In particular, when \( m = n \) it is of Monge-Ampère type. In Euclidean space \( \mathbb{R}^{n+1}(0) \) this problem was investigated and conditions for existence and uniqueness were given by I. Bakelman and B. Kantor [2, 3] and A. Treibergs and S.W. Wei [12] when \( m = 1 \) (the mean curvature case), by V. Oliker [10] when \( m = n \) (the Gauss curvature case), and by L. Caffarelli, L. Nirenberg and J. Spruck [6] when \( 1 < m < n \).

In [11] V. Oliker investigated the problem for hypersurfaces in \( \mathbb{R}^{n+1}(-1) \) and \( \mathbb{R}^{n+1}(1) \) when \( m = n \) and gave conditions for existence and uniqueness. In [4] L. Barbosa, J. Lira and V. Oliker obtained \( C^0 \), \( C^1 \) and \( C^2 \) estimates for solutions of (2) for the elliptic space form \( \mathbb{R}^{n+1}(1) \) for any \( m, 1 \leq m \leq n \), and then, in [9], Y. Y. Li and V. Oliker, used these estimates and degree theory for fully nonlinear elliptic operators [8] to prove existence of solutions. In the same paper [4], the authors also obtained the \( C^0 \) and \( C^1 \) estimates for any \( m, 1 \leq m \leq n \), in the hyperbolic space \( \mathbb{R}^{n+1}(-1) \). Recently, Q. Jin and Y. Y. Li [7] obtained the \( C^2 \) estimates for \( \mathbb{R}^{n+1}(1) \) and proved existence for this case as well. The main results in [4] and [7] can be formulated together as follows.

Denote by \( \Gamma_m \) the connected component of \( \{ \lambda \in \mathbb{R}^n \mid H_m(\lambda) > 0 \} \) containing the positive cone \( \{ \lambda \in \mathbb{R}^n \mid \lambda_1, \ldots, \lambda_n > 0 \} \).
Definition 1.1. A positive function $z \in C^2(S^n)$ is $m$–admissible for the operator $H_m$ if the corresponding hypersurface $M = (u, z(u)), \ u \in S^n$, is such that at every point of $M$ the principal curvatures $(\lambda_1(z(u)), ..., \lambda_n(z(u))) \in \Gamma_m$, where the $\lambda_i$ are calculated with respect to the inner normal.

Theorem 1.2. Let $1 \leq m \leq n$, $K = \pm 1$, and $\psi(u, \rho)$ is a positive smooth function on the annulus $\bar{\Omega} \subset \mathbb{R}^{n+1}(K)$, $\bar{\Omega} : \ u \in S^n, \ \rho \in [R_1, R_2]$, where $0 < R_1 < R_2 < a$, and $a = \infty$ for $\mathbb{R}^{n+1}(1)$ and $a = \pi/2$ for $\mathbb{R}^{n+1}(1)$. Suppose $\psi$ satisfies the conditions:

If $K = -1$

$$\psi(u, R_1) \geq \coth^m R_1 \text{ for } u \in S^n,$$  \hspace{1cm} (3)

$$\psi(u, R_2) \leq \coth^m R_2 \text{ for } u \in S^n,$$  \hspace{1cm} (4)

and

$$\frac{\partial}{\partial \rho} [\psi(u, \rho) \sinh^m \rho] \leq 0 \text{ for all } u \in S^n \text{ and } \rho \in [R_1, R_2];$$  \hspace{1cm} (5)

If $K = 1$

$$\psi(u, R_1) \geq \cot^m R_1 \text{ for } u \in S^n,$$  \hspace{1cm} (6)

$$\psi(u, R_2) \leq \cot^m R_2 \text{ for } u \in S^n,$$  \hspace{1cm} (7)

and

$$\frac{\partial}{\partial \rho} [\psi(u, \rho) \cot^{-m} \rho] \leq 0 \text{ for all } u \in S^n \text{ and } \rho \in [R_1, R_2].$$  \hspace{1cm} (8)

Then there exists a closed, smooth, embedded hypersurface $M$ in $\mathbb{R}^{n+1}(K)$, $M \subset \bar{\Omega}$, which is a radial graph over $S^n$ of an $m$–admissible function $z$ and

$$H_m(\lambda(z(u))) = \psi(u, z(u)) \text{ for all } u \in S^n.$$  \hspace{1cm} (9)

Similar to the case of $\mathbb{R}^{n+1}(1)$ the proof in [7] uses degree theory. The degree theory arguments in [9] and [7] do not provide an answer to the uniqueness problem and thus for the elliptic and hyperbolic space forms this question remained open except for the case $m = n$ [11]. The purpose of this paper is to show that under the same conditions as in Theorem 1.2 we can also prove uniqueness for the hyperbolic space for all $m$, $1 \leq m \leq n$. Namely, we have the following

Theorem 1.3. Let $K = -1$. Then under condition (8) in Theorem 1.2 any two hypersurfaces defined by $m$–admissible solutions $z^1$ and $z^2$ of (9) in $\bar{\Omega}$ are related by the transformation:

$$c \tanh\left(\frac{z_1(u)}{2}\right) = \tanh\left(\frac{z_2(u)}{2}\right), \ u \in S^n,$$  \hspace{1cm} (10)

where $c$ is a positive constant. If the inequality (8) is strict then $c = 1$, that is, the hypersurface $M$ in Theorem 1.2 is unique.
For \( m = n \) the condition \( \text{III} \) is slightly less restrictive than condition c) in Theorem 1.1 in [11]. For the elliptic space the uniqueness problem is still open except for the already known case when \( m = n \). In this case condition \( \text{III} \) also implies uniqueness.

2 The Equation of the Problem

In this section we present some local formulas and lemmas valid in \( \mathbb{R}^{n+1}(K) \) where \( K = \pm 1 \). Though our main result (Theorem 1.2) applies only to the case \( K = -1 \), it seems worthwhile to record here the results which are also valid for the case \( K = +1 \) because they should be useful in future studies of similar problems. Furthermore, the presentation in this section is carried out in a unified way simultaneously for both cases.

1. The main equation. First we fix our notation. Unless explicitly stated otherwise, the range for the latin indices is \( 1, \ldots, n \). The summation convention over repeated lower and upper indices is assumed to be in effect. Denote by \((u^1, \ldots, u^n) = u\) smooth local coordinates on \( S^n \) and let \( \partial_i = \partial/\partial u^i, \ i = 1, 2, \ldots, n \), be the corresponding local frame of tangent vectors such that \( e(\partial_i, \partial_j) = e_{ij} \). The first covariant derivative of a function \( v \in C^2(S^n) \) is given by \( v_i \equiv \nabla' v = \partial_i v \). Put \( (e_{ij}) = (e_{ij})^{-1} \) and let \( \nabla' v = v_i \partial_i \), where \( v_i = e_{ij} v_j \).

For the covariant derivative of \( \nabla' v \) we have

\[
\nabla'_i \nabla' v = v_{sj} e^{ji} \partial_i + v_j \nabla'_{\partial_i} (e^{ji} \partial_i) = (v_{sj} - \Gamma'_{sj} v_i) e^{jk} \partial_k,
\]

where

\[
v_{sj} = \frac{\partial^2 v}{\partial u^s \partial u^j}
\]

and \( \Gamma'_{sj} \) are the Christoffel symbols of the second kind of the metric \( e \). The second covariant derivatives of \( v \) are defined by

\[
\nabla''_{sj} v = v_{sj} - \Gamma'_{sj} v_i.
\]

Next we recall some of the basic formulas derived in [4]. Let \( M \) be a hypersurface in \( \mathbb{R}^{n+1}(K) \) given by \( r(u) = (u, z(u)), \ u \in S^n \), where \( z \in C^2(S^n) \) and positive on \( S^n \). The metric \( g = g_{ij} du^i du^j \) induced on \( M \) from \( \mathbb{R}^{n+1}(K) \) has coefficients

\[
g_{ij} = f e_{ij} + z_i z_j \quad \text{and} \quad \det(g_{ij}) = f^{n-1} (f + |\nabla' z|^2) \det(e_{ij}).
\]

The elements of the inverse matrix \((g^{ij}) = (g_{ij})^{-1}\) are

\[
g^{ij} = \frac{1}{f} \left[ e^{ij} - \frac{z^i z^j}{f + |\nabla' z|^2} \right].
\]
With the choice of the normal on \( M \) in inward direction the second fundamental form \( b \) of \( M \) has coefficients:

\[
b_{ij} = \frac{f}{\sqrt{f^2 + f|\nabla z|^2}} \left[ -\nabla_{ij} f + \frac{\partial \ln f}{\partial \rho} z_i z_j + \frac{1}{2} \frac{\partial f}{\partial \rho} c_{ij} \right].
\]

(14)

Note that the second fundamental form of a sphere \( z = \text{const} > 0 \) is positive definite, since for \( \mathbb{R}^{n+1}(K) \) \( \partial f/\partial \rho > 0 \).

The principal curvatures of \( M \) at a point \((u, z(u))\) are the eigenvalues of the second fundamental form \( b \) relative to the metric \( g \) and are the real roots, \( \lambda_1(z(u)), ..., \lambda_n(z(u)) \), of the equation

\[
\det(b_{ij}(z(u)) - \lambda g_{ij}(z(u))) = 0
\]

or, equivalently, of

\[
\det(a^i_j(z(u)) - \lambda \delta^i_j) = 0,
\]

where

\[
a^i_j = g^{ik} b_{kj},
\]

(15)

is a self-adjoint transformation of the tangent space to \( M \) at \((u, z(u))\). The elementary symmetric function of order \( m, 1 \leq m \leq n \), of the principal curvatures is

\[
S_m(\lambda) = \sum_{i_1 < ... < i_m} \lambda_{i_1} \cdots \lambda_{i_m} \quad \text{and} \quad S_m(\lambda) = {n \choose m} H_m(\lambda) = F_m(a^i_j),
\]

(16)

where \( F_m \) is the sum of principal minors of \( (a^i_j) \) of order \( m \). Evidently,

\[
F_m(a^i_j(z(u))) \equiv F(u, z, \nabla'_1 z, ..., \nabla'_n z),
\]

(17)

and the equation (16) assumes the form

\[
S_m(\lambda(z(u))) \equiv F_m(a^i_j(z(u))) = \bar{\psi}(u, z(u)),
\]

(18)

where \( \bar{\psi} \equiv {n \choose m} \psi \).

2. The conformal model of \( \mathbb{R}^{n+1}(K) \) and a change of the function \( z \). For the function \( f(\rho), \rho \in I \), in (11) corresponding to \( \mathbb{R}^{n+1}(-1) \) or \( \mathbb{R}^{n+1}(+1) \) we put

\[
s(\rho) = \sqrt{f(\rho)}, \quad c(\rho) = \frac{ds(\rho)}{d\rho}, \quad t(\rho) = \frac{s(\rho)}{c(\rho)}.
\]

It will be convenient to make a change of the function \( z \) in (17) by setting \( v(u) = t(z(u))/2 \).\footnote{This is equivalent to re-writing (11) in the conformal model of the corresponding space form in the unit ball in Euclidean space \( \mathbb{R}^{n+1} \) centered at the origin.}

\[
q = \frac{2}{1 + Kv^2}.
\]
\[ z_i = q v_i, \quad \nabla'_{ij} z = q \nabla'_{ij} v - K q^2 v v_{ij}. \]  

(19)

Put

\[ \hat{\gamma}_{ij}(v) = v^2 e_{ij} + v_i v_j, \quad \hat{\gamma}^{ij}(v) = \frac{1}{v^2} \left( e^{ij} - \frac{v^i v^j}{W^2(v)} \right), \quad W(v) = \sqrt{v^2 + |\nabla' v|^2}. \]

A substitution into (13) gives

\[ g_{ij}(v) = \frac{1}{q^2} \hat{g}_{ij}(v) \]

and a substitution into (14) gives

\[ b_{ij}(v) = q \hat{b}_{ij}(v) - K q^2 v^2 \hat{\gamma}_{ij}(v) \frac{W(v)}{W(v)}, \]

where

\[ \hat{b}_{ij}(v) = -v \nabla'_{ij} v + 2 v_i v_j + v^2 e_{ij} \frac{W(v)}{W(v)}. \]  

(20)

Note that \( \hat{g} \) and \( \hat{b} \) are respectively the first and second fundamental forms in the Euclidean sense of the hypersurface which is a graph of \( v \) over \( \mathbb{S}^n \) in the unit ball \([10]\). Finally, we obtain

\[ a_j^i(v) = g^{ik}(v) b_{kj}(v) = \frac{\hat{a}_j^i(v)}{q} - K \frac{v^2 \delta_j^i}{W(v)}, \quad \text{where} \quad \hat{a}_j^i(v) = \hat{\gamma}^{ik}(v) \hat{b}_{kj}(v). \]

(21)

For a \( m \)-admissible function \( z \in C^2(\mathbb{S}^n) \) and \( v = t(z/2) \) consider the family of functions \( sv \), where \( s > 0 \) and such that \( sv < 1 \). Then

\[ a_j^i(sv) = \frac{1 + K s^2 v^2}{2s} \hat{a}_j^i(v) - K \frac{s v^2}{W(v)} \delta_j^i. \]

(22)

Define, as before, the eigenvalues \( \lambda_i(sv(u)), i = 1, ..., n, \) of \( b_{ij}(sv(u)) \) with respect to \( (g_{ij}(sv(u))) \) (which is positive definite) and consider the corresponding \( m \)-th elementary symmetric function \( S_m(\lambda(sv(u))) \). Clearly, since \( z \) is \( m \)-admissible, the function \( v \) is \( m \)-admissible, that is, \( \lambda(v(u)) \in \Gamma_m \).

**Lemma 2.1.** Let \( z, v \) and \( s \) be as above. Put

\[ A(sv) = \frac{1 + K s^2 v^2}{s(1 + K v^2)} , \quad B(sv) = K \frac{(1 - s^2) v^2}{s(1 + K v^2) W(v)}. \]

Then

\[ S_m(\lambda(sv)) = A^m(sv) S_m(\lambda(v)) + \sum_{j<m} c(n, m, j) A^j(sv) B^{m-j}(sv) S_j(\lambda(v)), \]

(23)
where \( c(n, m, j) \) are positive coefficients. Furthermore, if \( K = -1 \) and \( s \geq 1 \) or if \( K = +1 \) and \( s \leq 1 \), then

\[
S_m(\lambda(sv(u))) \geq A^m(sv(u))S_m(\lambda(v(u))).
\]  

(24)

In particular, \( sv \) is \( m \)-admissible for \( H_m \) in \( \mathbb{R}^{n+1}(K) \) for the corresponding choice of \( s \).

**Proof.** It follows from (21) and (22) that

\[
a_j^i(sv) = A(sv)a_j^i(v) + B(sv)\delta^i_j.
\]

Since \( v \) is \( m \)-admissible, \( S_j(v) > 0 \) for each \( j \leq m \) (see [5]) and \( A(sv) > 0 \) because \( sv < 1 \). On the other hand, \( B(sv) \geq 0 \) with each choice of \( s \) as in the statement of the lemma. Then \( S_m(\lambda(sv)) > 0 \) in both cases. Because \( sv \) is a positive multiple of \( v \in \Gamma_m \) we conclude that \( sv \in \Gamma_m \) in both cases. QED.

We complete this section with the following

**Lemma 2.2.** Let \( z \) be \( m \)-admissible for the operator \( H_m \) and \( v = t(z/2) \). Then the operator \( F_m(a_j^i(v)) \) is negatively elliptic on \( v \) on \( S^n \).

**Proof.** In order to show that \( F_m(a_j^i(v)) \) is negatively elliptic we need to show that at any point of \( S^n \) the quadratic form

\[
\frac{\partial F_m(a_j^i(v))}{\partial \nabla_i^j v} \xi^i \xi^j < 0 \quad \forall \xi \in \mathbb{R}^n, \xi \neq 0.
\]  

(25)

It follows from (21) and (20) that

\[
\frac{\partial F_m}{\partial \nabla_i^j v} = -\frac{v}{q(v)W(v)}F^j_i, \quad \text{where} \quad F^j_i = \frac{\partial F_m}{\partial a_j^i(v)}.
\]

(26)

Thus, we need to consider the matrix \((F^j_i)\).

Fix an arbitrary point \( u_0 \in S^n \) and diagonalize at that point the metric \((g_{ij}(v))\) and the second fundamental form \((b_{ij}(v))\) using the orthonormal set of principal directions as a basis. Then at \( u_0 \) we have \( g_{ij}(v) = \delta_{ij} \),

\[
b_{ij}(v) = \begin{cases} 
\lambda_i(v) & \text{when } i = j \\
0 & \text{when } i \neq j,
\end{cases}
\]

and

\[
a_j^i(v) = \begin{cases} 
\lambda_i(v) & \text{when } i = j \\
0 & \text{when } i \neq j.
\end{cases}
\]

Then at \( u_0 \) we have

\[
F^j_i = 0 \quad \text{when } i \neq j \text{ and } F^i_i = \frac{\partial S_m(\lambda_1(v), ..., \lambda_n(v))}{\partial \lambda_i(v)},
\]  

(27)
where no summation over $i$ is performed. Since $z$, and therefore $v$, are $m$–admissible for $H_m$, it follows that $S_m(\lambda_1(v), ..., \lambda_n(v)) > 0$. Then, by a well known property of elementary symmetric functions $\frac{\partial S_m}{\partial \lambda_i(v)} > 0$ for each $i = 1, 2, ..., n$; see [5]. Now, (25) follows from (27) and (26).

**QED.**

### 3 Proof of Theorem 1.3

In this section we work in the hyperbolic space $\mathbb{R}^{n+1}(-1)$.

Let $z_1$ and $z_2$ be two different $m$–admissible solutions of (9) and $M_1, M_2$ the corresponding hypersurfaces on the annulus $\bar{\Omega}$. It follows from Lemma 4.1 (see appendix) that for any $m$–admissible solution $z$ of (9) such that $R_1 \leq z(u) \leq R_2$ we have either $z(u) \equiv R_1$ or $z(u) \equiv R_2$ or $R_1 < z(u) < R_2 \forall u \in S^n$.

(28)

Assume first that

$$R_1 \leq z_k(u) < R_2 \quad \text{for } k = 1, 2 \text{ and } \forall u \in S^n.$$  

(29)

The case when $z_1$ or $z_2 \equiv R_2$ is special and will be treated separately at the end of the proof.

Let $v_k(u) = t(z_k(u)/2)$, where now $t(z_k(u)/2) = \tanh(z_k(u)/2)$. Suppose $v_1 < v_2$ somewhere on $S^n$; otherwise re-label them. Multiply $v_1$ by $s \geq 1$ such that

$$sv_1(u) < 1, \quad sv_1(u) \geq v_2(u) \forall u \in S^n \text{ and } sv_1(\bar{u}) = v_2(\bar{u}) \text{ at some } \bar{u} \in S^n.$$  

By (29) there exists some neighborhood $U \subset S^n$ of the point $\bar{u}$ such that $z^* = 2t^{-1}(sv_1)$ satisfies the inequality

$$R_1 < z^*(u) < R_2, \quad u \in U.$$  

Since $S_m(\lambda(z_1)) = \tilde{\psi}(u, z_1(u))$, it follows from Lemma 2.1 that in $U$

$$S_m(\lambda(sv_1)) - \tilde{\psi}(u, 2t^{-1}(sv_1)) \geq A^m(sv_1)\tilde{\psi}(u, 2t^{-1}(v_1)) - \tilde{\psi}(u, 2t^{-1}(sv_1)).$$  

(30)

Put $sv_1 = \tilde{v}$. Then, using the explicit expression for $A(sv_1)$ and taking into account that $K = -1$, we get

$$S_m(\lambda(\tilde{v})) - \tilde{\psi}(u, 2t^{-1}(\tilde{v})) \geq \left[ \frac{1 - \tilde{v}^2}{s(1 - \frac{\tilde{v}^2}{s^2})} \right]^m \tilde{\psi}(u, 2t^{-1}(\frac{\tilde{v}}{s})) - \tilde{\psi}(u, 2t^{-1}(\tilde{v})).$$  

(31)
Put
\[ Q(s) = \left[ \frac{1 - \tilde{v}^2}{s(1 - \frac{s^2}{\tilde{v}^2})} \right]^m \tilde{\psi}(u, 2t^{-1}(\tilde{v}^s)) - \tilde{\psi}(u, 2t^{-1}(\tilde{v}^s)). \]

Note that \( Q(1) \equiv 0 \). We have
\[
\frac{\partial Q}{\partial s} = -m \left[ \frac{1 - \tilde{v}^2}{s(1 - \frac{s^2}{\tilde{v}^2})} \right]^{m-1} \frac{(1 - \tilde{v}^2)(1 + \tilde{v}^2)}{s^2(1 - \frac{s^2}{\tilde{v}^2})^2} \tilde{\psi}(u, 2t^{-1}(\tilde{v}^s)) - \frac{2\tilde{v}^s}{s(1 - \frac{s^2}{\tilde{v}^2})} \tilde{\psi}_z(u, 2t^{-1}(\tilde{v}^s)) =
\]
\[
- \frac{1}{s^{m+1}} \left[ \frac{1 - \tilde{v}^2}{1 - \frac{s^2}{\tilde{v}^2}} \right]^m \left[ \frac{1 + \tilde{v}^2}{1 - \frac{s^2}{\tilde{v}^2}} \tilde{\psi}(u, 2t^{-1}(\tilde{v}^s)) + \frac{2\tilde{v}^s}{s(1 - \frac{s^2}{\tilde{v}^2})} \tilde{\psi}_z(u, 2t^{-1}(\tilde{v}^s)) \right] \geq 0,
\]
where \( \tilde{\psi}_z = \frac{\partial \tilde{\psi}}{\partial z} \). The last inequality on the right follows from (5).

By (31), (30) and the assumption that \( z^2 \) is an \( m \)-admissible solution of (9) we have
\[
F_m(a_j^j(\tilde{v})) = \tilde{\psi}(u, 2t^{-1}(\tilde{v}^s)) = \tilde{\psi}(u, 2t^{-1}(\tilde{v}^s)).
\]

Since \( F_m \) is negatively elliptic, \( \tilde{v} \geq v_2 \) in \( U \) and \( \tilde{v}(\bar{u}) = v_2(\bar{u}) \), we conclude from the geometric form of Aleksandrov’s maximum principle [1] that \( \tilde{v} \equiv v_2 \) in \( U \). By continuity, the set
\[
\{ u \in \mathbb{S}^n \mid \tilde{v}(u) = v_2(u) \}
\]
is open and closed on \( \mathbb{S}^n \). Hence, \( \tilde{v}(u) = v_2(u) = sv_1(u) \) everywhere on \( \mathbb{S}^n \) and the proof of uniqueness is complete in this case.

Suppose now that \( z^2 \equiv R_2 \) and \( z_1 < R_2 \forall u \in \mathbb{S}^n \). In this case we extend \( \tilde{\psi}(u, \rho) \) smoothly for \( \rho > R_2 \) satisfying conditions
\[
\psi(u, \rho) \leq \coth^m R_2 \text{ for } u \in \mathbb{S}^n,
\]
and
\[
\frac{\partial}{\partial \rho} [\psi(u, \rho) \sinh^m \rho] \leq 0 \text{ for all } u \in \mathbb{S}^n \text{ and } \rho \geq R_2;
\]
Then, again, the same arguments apply and this completes the proof of the theorem.
4 Appendix

Lemma 4.1. Assume that the conditions of the Theorem 1.2 are satisfied except for conditions (5) and (8). Then a \( m \)-admissible solution \( z \) of (9) such that \( R_1 \leq z(u) \leq R_2 \) is either \( \equiv R_1 \) or \( \equiv R_2 \), or \( R_1 < z(u) < R_2 \) \( \forall u \in S^n \).

This lemma was stated in [4] without a detailed proof. At the suggestion of the referee we provide a proof here. The proof consists in showing that the conditions of Aleksandrov’s maximum principle [1] are satisfied.

**Proof.** Suppose, on the contrary, that there exists some \( u_0 \in S^n \) such that \( z(u_0) = R_2 \) and \( z(u) \not\equiv R_2 \). (The case when \( z(u_0) = R_1, z(u) \not\equiv R_1 \), is treated similarly.) Then \( z \) attains a maximum at \( u_0 \). Consider the family of functions \( z(s) = (1 - s)z + sR_2, s \in [0,1] \).

Obviously, \( z(s) \) also attain a maximum = \( R_2 \) at \( u_0 \) for all \( s \in [0,1] \). We will need an expression for the \( m \)-th elementary symmetric function of the hypersurface \( M(s) \) defined by \( z(s) \) at \( u_0 \). We have

\[
\nabla' z(s) = 0 \quad \text{and} \quad \nabla'_{ij} z(s) = (1 - s)z_{ij} \quad \text{at} \quad u_0, \quad s \in [0,1].
\]

Put

\[
\mu = \frac{1}{2f(R_2)} \left. \frac{\partial f(z(s))}{\partial z} \right|_{z(s) = R_2}
\]

and observe that \( \mu > 0 \), since \( 0 < R_2 < a \) and \( \frac{\partial f}{\partial \rho} > 0 \) in \( \bar{\Omega} \). Using (13), (14) and (11) and noting that \( a^j_i(R_2) = \mu \delta^j_i \),

we obtain at the point \( u_0 \)

\[
a^j_i(z(s)) = \frac{e^{ik}}{f(R_2)} \left[ -(1 - s)z_{kj} + \mu e_{kj} \right] = (1 - s)a^j_i(z) + sa^j_i(R_2).
\]

Then

\[
S_m(\lambda(z(s)))|_{u_0} = \sum_{p=0}^{m} (1 - s)^p (\mu s)^{m-p} S_p(\lambda(z(s)))|_{u_0},
\]

where \( S_0 = \binom{n}{m} \). Since \( S_p(\lambda(z)) > 0 \) for all \( p \leq m \) and \( \mu > 0 \), it follows that \( S_m(\lambda(z(s)))|_{u_0} > 0 \) for all \( s \in [0,1] \). By continuity \( S_m(\lambda(z(s))) > 0 \) in some neighborhood \( U_0 \) of \( u_0 \) in \( S^n \). Then by [4] \( \frac{\partial S_m}{\partial \lambda(z(s))} > 0 \) and by shrinking \( U_0 \), if necessary, we have \( \frac{\partial S_m}{\partial \lambda(z(s))} \geq C > 0 \) for all \( u \in U_0 \) with some fixed constant \( C \). It follows now from Lemma 2.2 and the second expression in (19) that \( -F_m(a^j_i(z(s)) \) is positively elliptic in \( U_0 \) for all \( s \in [0,1] \).
The above arguments establish that the function $-F_m(a_j(z(s)) + \bar{\psi}(u, z(s)))$ satisfies the conditions (1)-(4) in [1], §1. (Note that our orientation of $M(s)$ is opposite to that in [1].) We need to check one more inequality. Namely, since $z$ satisfies (9) on $S^n$ we have

$$-F_m(a_j(z) + \bar{\psi}(u, z) = 0,$$

while, taking into account (4) for the hyperbolic space or (7) for the elliptic space, we also have

$$-F_m(a_j(R_2) + \bar{\psi}(u, R_2)) \leq 0.$$

Since, also, $z(u) \leq R_2$ on $S^n$ and $z(u_0) = R_2$ it follows from the maximum principle in [1] that $z(u) = R_2$ everywhere on $U_0$. This implies that the set $\{u \in S^n \mid z(u) = R_2\}$ is open on $S^n$. Since it is also closed, we conclude that $z(u) = R_2$ everywhere on $S^n$. QED.
