Abstract
We describe gradings by finite abelian groups on the associative algebras of infinite matrices with finitely many nonzero entries, over an algebraically closed field of characteristic zero.

Keywords and phrases: matrix algebras, graded algebras, automorphisms
Mathematics Subject Index 2000: 17B20, 17B40, 16W10, 16W50

1 Introduction
This paper is devoted to the extension of the results of [1,2,3] about the group gradings on finite-dimensional matrix algebras to the case of infinite-
dimensional simple algebras of finitary linear transformations. After reminding the main results in the case of finite dimensions, we describe the $G$-graded embeddings of one finite dimensional graded matrix algebra into another (Theorem 3), with $G$ a finite abelian group. Our next result says that if a simple algebra with minimal one-sided ideals is graded by $G$ as above then it can be presented as the direct limit of finite-dimensional $G$-graded matrix algebras (Theorem 4). This allows us to describe in Theorem 5 the gradings on the simple algebra of finitary matrices that is, the algebra of infinite matrices such that each matrix has only finitely many nonzero entries. Finally, in Theorem 6, we give a necessary and sufficient condition for the equivalence of elementary gradings on the above algebra of infinite matrices.

2 Some notation and simple facts

Let $F$ be an arbitrary field, $R$ a not necessarily associative algebra over an $F$ and $G$ a group. We say that $R$ is a $G$-graded algebra, if there is a vector space sum decomposition

$$R = \bigoplus_{g \in G} R^{(g)},$$

such that

$$R^{(g)}R^{(h)} \subset R^{(gh)}$$

for all $g, h \in G$. (1)

Two $G$-gradings

$$R = \bigoplus_{g \in G} R^{(g)}, \text{ and } R = \bigoplus_{g \in G} (R')^{(g)}$$

are called isomorphic if there is an automorphism $\varphi$ of $R$ such that $\varphi(R^{(g)}) = (R')^{(g)}$, for all $g \in G$. (2)

A subspace $V \subset R$ is called graded (or homogeneous) if $V = \bigoplus_{g \in G} (V \cap R^{(g)})$. An element $a \in R$ is called homogeneous of degree $g$ if $a \in R^{(g)}$. We also write $\deg a = g$. The support of the $G$-grading is a subset

$$\text{Supp } R = \{g \in G | R^{(g)} \neq 0\}.$$ (3)

3 Reminder: Group gradings on matrix algebras

Below we briefly recall the results of [123], where the full description of a finite group gradings on the full matrix algebra has been given.
A grading $R = \bigoplus_{g \in G} R^{(g)}$ on the matrix algebra $R = M_n(F)$ is called elementary if there exists an $n$-tuple $(g_1, \ldots, g_n) \in G^n$, such that the matrix units $E_{ij}, 1 \leq i, j \leq n$ are homogeneous and $E_{ij} \in R^{(g)} \iff g = g_i^{-1}g_j$. If $R$ is a matrix algebra with an elementary $G$-grading defined by a tuple $(g_1, \ldots, g_n) \in G^n$ and $B$ an algebra with a $G$-grading then the tensor product $R = A \otimes B$ will be given a grading if, given a homogeneous element $x$ of degree $h$, we set $E_{ij} \otimes x \in R^{(g)}$ provided that $g = g_i^{-1}hg_j$, for any $1 \leq i, j \leq n$. This grading of the tensor product is called induced.

A grading is called fine if $\dim R^{(g)} = 1$ for any $g \in \text{Supp } R$. In this case $T = \text{Supp } R$ is always a subgroup of $G$ [3]. In this case if $V$ is a natural $R$-module then $V$ is the space of a faithful irreducible representation of $T$ (see [2]). If we denote by $X_t$ the image of $t$ in $R$ corresponding to this representation then $X_t$ is a basis of $R_t$ and there is a 2-cocycle $\alpha : G \times G \rightarrow F^*$ such that $X_tX_s = \alpha(t, s)X_{ts}$, for any $t, s \in T$. This makes $R$ isomorphic to a twisted group algebra $F^\alpha G$.

The main result of [1, Theorem 6] can be formulated as follow.

**Theorem 1** Let $G$ be a group of order $d$, $F$ an algebraically closed field and $R = M_n(F)$. Then, as a $G$-graded algebra, $R$ is isomorphic to the tensor product with induced grading $R \cong A \otimes B$ where $A = M_k(F)$ has an elementary $G$-grading, with support $S$, $B = M_l(F)$ has a fine grading, with support $T$, and $S \cap T = \{e\}$.

A particular case of the fine gradings is a so-called $\varepsilon$-grading where $\varepsilon$ is an $n^{th}$ primitive root of 1. Let $G = \langle a \rangle_n \times \langle b \rangle_n$ be the direct product of two cyclic groups of order $n$ and

$$X_a = \begin{pmatrix}
\varepsilon^{n-1} & 0 & \cdots & 0 \\
0 & \varepsilon^{n-2} & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 1
\end{pmatrix}, \quad X_b = \begin{pmatrix}
0 & 1 & \cdots & 0 \\
\cdots & \cdots & \ddots & \cdots \\
0 & 0 & \cdots & 1 \\
1 & 0 & \cdots & 0
\end{pmatrix}.$$  \quad (4)

Then

$$X_aX_bX_a^{-1} = \varepsilon X_b, \quad X_a^n = X_b^n = I$$ \quad (5)

and all $X_i^aX_j^b, 1 \leq i, j \leq n$, are linearly independent. Clearly, the elements $X_i^aX_j^b, i, j = 1, \ldots, n$, form a basis of $R$ and all the products of these basis elements are uniquely defined by [3].
Now for any \( g \in G, g = a^i b^j \), we set \( X_g = X_a^i X_b^j \) and denote by \( R^{(g)} \) a one-dimensional subspace
\[
R^{(g)} = \langle X_a^i X_b^j \rangle.
\] (6)

Then from (5) it follows that \( R = \bigoplus_{g \in G} R^{(g)} \) is a \( G \)-grading on \( M_n(F) \) which is called an \( \varepsilon \)-grading.

Now let \( R = M_n(F) \) be the full matrix algebra over \( F \) graded by an abelian group \( G \). The following result has been proved in [3, Section 4, Theorems 5, 6] and [1, Subsection 2.2, Theorem 6, Subsection 2.3, Theorem 8].

**Theorem 2** Let \( F \) be an algebraically closed field of characteristic zero. Then as a \( G \)-graded algebra \( R \) is isomorphic to the tensor product
\[
R_0 \otimes R_1 \otimes \cdots \otimes R_k
\]
where \( R_0 = M_{n_0}(F) \) has an elementary \( G \)-grading, \( \text{Supp } R_0 = S \) is a finite subset of \( G \), \( R_i = M_{n_i}(F) \) has the \( \varepsilon_i \)-grading, \( \varepsilon_i \) being a primitive \( n_i \)th root of 1, \( \text{Supp } R_i = H_i \cong \mathbb{Z}_{n_i} \times \mathbb{Z}_{n_i}, i = 1, \ldots, k \). Also \( H = H_1 \cdots H_k \cong H_1 \times \cdots \times H_k \) and \( S \cap H = \{ e \} \) in \( G \).

4 Embeddings of graded matrix algebras

To describe the gradings on the algebra of finitary matrices we will need to consider the embedding of one \( G \)-graded finite-dimensional simple algebra into another. We recall that if \( R \cong M_n(F) \) is \( G \)-graded then, as a graded algebra, \( R \) is isomorphic to a tensor product \( C \otimes D \) where \( C = M_p(F), D = M_q(F), n = pq, M_p(F) \) is a matrix algebra with elementary \( G \)-grading, \( M_q(F) \) a matrix algebra with a fine \( T \)-grading where \( T = \text{Supp } D \) is a subgroup in \( G \) such that \( T \cap \text{Supp } C = \{1\} \) where 1 is the identity element of \( G \). Thus we may think that \( R = CD \cong C \otimes D \). Let us notice that the subalgebra \( D \) is not defined uniquely and once \( D \) has been fixed, \( C \) is uniquely defined as the centralizer of \( D \) in \( R \).

**Theorem 3** Let \( R_1 \cong M_k(F) \) and \( R_2 \cong M_n(F) \) be two \( G \)-graded matrix algebras with identity elements \( e_1 \) and \( e_2 \), respectively, \( R_1 = C_1 D_1, R_2 = C_2 D_2 \) their decompositions in which \( C_1, C_2 \) have elementary grading while \( D_1, D_2 \) have fine grading. Let also \( D_1 \cong D_2 \) as graded algebras and \( \varphi : R_1 \to R_2 \) be an injective homomorphism of graded algebras. Then there exists a decomposition \( R_2 = C_2 \tilde{D}_2 \cong C_2 \otimes \tilde{D}_2 \) such that \( C_2 \) is a matrix algebra with elementary grading, \( \tilde{D}_2 \) is a matrix algebra with fine grading, \( \tilde{D}_2 \cong D_2 \) as graded algebras and
ϕ(C_1) \subset \tilde{C}_2. If \varphi(e_1)R_2\varphi(e_1) = \varphi(R_1) then also \varphi(e_1)\tilde{C}_2\varphi(e_1) = \varphi(C_1). Besides, there is an isomorphism \psi : D_1 \to \tilde{D}_2 such that \varphi(a)\varphi(d) = \varphi(a)\psi(d), for any a \in R_1, d \in D_1.

**Proof.** Since \(
\begin{align*}
D_1 \cong D_2,
\end{align*}
\) in particular, \(
\text{Supp } D_1 \cong \text{Supp } D_2.
\) We denote \(T = \text{Supp } D_1\). Then for any \(t \in T\) there exist invertible matrices \(X_t \in R_1\) and \(X'_t \in R_2\) such that
\[
D_1 = \text{Span } \{X_t \mid t \in T\}, \quad D_2 = \text{Span } \{X'_t \mid t \in T\}.
\]
In addition, for any \(t, s \in T\) there is \(\alpha(t, s) \in F\) such that
\[
X_tX_s = \alpha(t, s)X_{ts}, \quad X'_tX'_s = \alpha(t, s)X'_{ts},
\]
following because \(D_1\) and \(D_2\) are isomorphic. One may also assume that \(X_1\) and \(X'_1\) are the identity elements of \(R_1\) and \(R_2\), respectively.

Since \(T \cap \text{Supp } C_2 = \{1\}\) it follows that \(\varphi(X_t) = A_tX'_t\) for some matrix \(A_t \in C_2\), \(\deg A_t = 1\) in the \(G\)-grading. We then set
\[
A'_t = A_t\varphi(e_1) + e_2 - \varphi(e_1) \quad \text{and} \quad X''_t = A'_tX'_t,
\]
where \(e_2\) is the identity of \(R_2\).

We will first show that
\[
\tilde{D}_2 = \text{Span } \{X''_t \mid t \in T\}
\]
is a graded subalgebra in \(R_2\) isomorphic to \(D_1\) (or \(D_2\)). Now since
\[
\varphi(e_1)A_tX'_t = \varphi(e_1)\varphi(X_t) = \varphi(X_t) = A_tX'_t
\]
and \(X'_t\) is nondegenerate, it follows that \(\varphi(e_1)A_t = A_t\). Since \(A_t\) and \(X'_t\) commute in \(R_2\), it follows that
\[
X'_tA_t\varphi(e_1) = \varphi(X_t)\varphi(e_1) = \varphi(X_t) = X'_tA_t,
\]
and so
\[
\varphi(e_1)A_t = A_t\varphi(e_1) = A_t.
\]
In particular, \((e_2 - \varphi(e_1))A_t = 0\).

Now let us recall that \(\varphi(e_1) = \varphi(X_1) = A_1X'_1 = A_1 \in C_{R_2}(D_2)\) and so
\[
\varphi(e_1)X'_t = X'_t\varphi(e_1) \quad \text{for any } t \in T.
\]
If we use (7), (8), and (9) we will obtain the following.

\[
X''_tX''_s = (A_t + e_2 - \varphi(e_1))X'_t(A_s + e_2 - \varphi(e_1))X'_s \\
= A_tX'_tA_sX'_s + (e_2 - \varphi(e_1))X'_tX'_s \\
= \varphi(X_t)\varphi(X_s) + (e_2 - \varphi(e_1))X'_tX'_s \\
= \varphi(X_tX_s) + (e_2 - \varphi(e_1))X'_tX'_s \\
= \varphi(\alpha(t,s)X_{ts}) + (e_2 - \varphi(e_1))\alpha(t,s)X'_{ts} \\
= \alpha(t,s)A_{ts}X'_{ts} + \alpha(t,s)(e_2 - \varphi(e_1))X'_{ts} \\
= \alpha(t,s)X''_{ts}.
\]

Since the elements \(X''_t, t \in T\) are linearly independent, it follows that the mapping \(X_t \mapsto X''_t\) is a (graded) isomorphism of algebras \(D_1\) and \(\tilde{D}_2\).

Now we denote by \(\tilde{C}_2\) the centralizer \(C_{R_2}(\tilde{D}_2)\) of \(\tilde{D}_2\) in \(R_2\). Then \(\tilde{C}_2\) is a graded subalgebra of \(R_2\). The identity element \(e_2\) of \(R_2\) is in \(\tilde{D}_2\) since \(X_1 = e_1\) and

\[
X''_1 = \varphi(X_1) + e_2 - \varphi(e_1) = \varphi(e_1) + e_2 - \varphi(e_1) = e_2.
\]

In this case \(R_2 = \tilde{C}_2\tilde{D}_2 \cong \tilde{C}_2 \otimes \tilde{D}_2\) (see, for instance, [3]).

Now we would like to show that \(\tilde{C}_2\) is an algebra with elementary \(G\)-grading. Since \(\tilde{C}_2\) is a central simple \(F\)-algebra, by the main result of [3] \(\tilde{C}_2 = \tilde{C}_0\tilde{D}_0 \cong \tilde{C}_0 \otimes \tilde{D}_0\) where the grading on \(\tilde{C}_0\) is elementary while on \(\tilde{D}_0\) fine. We set \(T_0 = \text{Supp } \tilde{D}_0\). Then \(T_0\) is a subgroup in \(G\) such that \(T_0 \cap T = \{1\}\). It follows that \(\tilde{D}_0\tilde{D}_2 \cong \tilde{D}_0 \otimes \tilde{D}_2\) is a graded subalgebra in \(R_2\) with fine grading such that \(\text{Supp } \tilde{D}_0\tilde{D}_2 = T_0T \cong T_0 \times T\). Besides, \(R_2 \cong \tilde{C}_0 \otimes (\tilde{D}_0 \otimes \tilde{D}_2)\) is another decomposition of \(R_2\) as the tensor product of algebras with elementary and fine grading. From the proof of [3] Theorem 6] it follows that the factor \(\tilde{D}_2\) in the decomposition \(R_2 = \tilde{C}_2\tilde{D}_2\) is defined uniquely up to an isomorphism of graded algebras and so \(T = \text{Supp } \tilde{D}_2 = \text{Supp } \tilde{D}_0\tilde{D}_2 = T_0T\). Then \(T_0 = \{1\}\) implying that \(\tilde{C}_2 = \tilde{C}_0\) is an algebra with elementary grading.

Now we need to show that \(\varphi(C_1) \subset \tilde{C}_2 = C_{R_2}(\tilde{D}_2)\). Let \(a \in C_1 = C_{R_1}(D_1)\). Then \(aX_t = X_t a\) for any \(t \in T\). Then we have the following.

\[
\varphi(a)X''_t = \varphi(a)(\varphi(X_t) + e_2 - \varphi(e_1)) \\
= \varphi(a)\varphi(X_t) + \varphi(a)\varphi(e_1)(e_2 - \varphi(e_1)) = \varphi(aX_t) \\
= \varphi(X_t a) = (\varphi(X_t) + e_2 - \varphi(e_1))\varphi(a) \\
= X''_t\varphi(a),
\]

proving that \(\varphi(a) \in C_{R_2}(\tilde{D}_2)\), that is, \(\varphi(C_1) \subset \tilde{C}_2\).
Finally, let us assume $\varphi(e_1)R_2\varphi(e_1) = \varphi(R_1)$. Since $\varphi(C_1) \subset \tilde{C}_2$ the containment $\varphi(C_1) \subset \varphi(e_1)\tilde{C}_2\varphi(e_1)$ is obvious. To prove the converse, we notice that

$$\varphi(R_1) \cap \tilde{C}_2 = \varphi(e_1)\tilde{C}_2\varphi(e_1).$$

Now $C_1 = C_{R_1}(D_1)$ and so $b \in R_1$ satisfies $\varphi(b) \in C_{R_2}(\tilde{D}_2)$ if and only if $b \in C_1$, that is, $\varphi(R_1) \cap \tilde{C}_2 = \varphi(C_1)$ which now implies $\varphi(C_1) = \varphi(e_1)\tilde{C}_2\varphi(e_1)$.

It remains to look at the homomorphism $\psi : D_1 \to \tilde{D}_2$ given by $\psi(X_i) = X_i''$. We have the following.

$$\varphi(e_1)X_i'' = \varphi(e_1)A_iX_i' + \varphi(e_1)(e_2 - \varphi(e_1))X_i'$$

$$= \varphi(e_1)A_iX_i' = \varphi(e_1)\varphi(X_i')$$

so that $\varphi(e_1)\psi(d) = \varphi(e_1)\varphi(d)$ for any $d \in D_1$ and thus

$$\varphi(a)\psi(d) = \varphi(a)\varphi(e_1)\varphi(d) = \varphi(a)\varphi(d).$$

Now the proof is complete. □

To describe the elementary gradings on infinite-dimensional simple algebras we first consider the case of one finite-dimensional matrix algebra embedded in another, both having elementary gradings. Notice that in the claims to follow the grading group $G$ may be infinite and nonabelian.

To start with we notice that if $R = M_n(F)$ is an algebra with an elementary grading given by a tuple $(h_1 \ldots, h_n)$, $n = km + r$ for some $k, m \geq 1$, $r \geq 0$ and $h_1, \ldots, h_n$ satisfy the conditions

$$h_{i+1}^{-1}h_{i+2} = h_{i+k+1}^{-1}h_{i+k+2} = \cdots = h_{i+(m-1)k+1}^{-1}h_{i+(m-1)k+2} \text{ for } 1 \leq i \leq k-2$$

\hspace{1cm} (10)

then the subalgebra $C$ consisting of all block-diagonal matrices of the form $\text{diag} \{X, \ldots, X, 0\}$ where $X$ is an arbitrary $k \times k$-matrix repeated $m$ times on the diagonal is $G$-graded and isomorphic to a matrix algebra $M_k(F)$ with an elementary grading given by the tuple $(h_1, \ldots, h_k)$. This easily follows because by (10) all matrix units $E_{a+ik,b+ik}$, $i = 0, 1, \ldots, m-1$, have the same degree for fixed $1 \leq a, b \leq k$. We would like now to prove that any embedding of simple algebras with elementary gradings amounts to this construction.

Let us recall that if $V = \bigoplus_{g \in G} V_g$ is a $G$-graded space then $R = \text{End } V$ canonically becomes $G$-graded if, given a $G$-graded basis $\{v_1, \ldots, v_n\}$ of $V$ with $\deg v_i = g_i^{-1}$, $1 \leq i \leq n$, one gives the matrix unit $E_{ij}$ the degree equal $g_i^{-1}g_j$. Thus the grading of $M_n(F)$ induced from $V$ is elementary.
Lemma 1 Let \( V \) be an \( n \)-dimensional \( G \)-graded space over a field \( F \) and \( \text{End} \, V = R = \bigoplus_{g \in G} R(g) \) the algebra of all linear transformations of \( V \) with induced elementary grading. Let \( C \) be a graded subalgebra in \( R \) which is isomorphic to the matrix algebra \( M_k(F) \) with an elementary grading given by the tuple \( (g_1, \ldots, g_k) \). Then \( V \) splits as the sum of \( C \)-invariant subspaces

\[ V = V_1 \oplus \cdots \oplus V_m \oplus V_0 \tag{11} \]

where \( \dim V_1 = \cdots = \dim V_m = k \), \( V_1, \ldots, V_m \) are faithful irreducible \( C \)-modules while \( CV_0 = \{0\} \). Besides, there is a homogeneous basis of \( V \) in which all matrices of the transformations in \( C \) have the block-diagonal form \( \text{diag} \{X, \ldots, X, 0\} \) where \( X \) is a \( k \times k \)-matrix and the tuple \( (h_1, \ldots, h_n) \) giving the induced elementary grading on \( R = M_n(F) \) satisfies (10).

**Proof.** Since the grading on \( C \cong M_k(F) \) is elementary, any subspace spanned by a set of matrix units is graded. In particular, this is true for any minimal left ideal spanned by all matrix units in a fixed column. Let \( L \) be one of such minimal ideals, corresponding to the last, \( k \)-th column of \( C \). If we fix any \( v \in V \) then the left \( C \)-module \( Lv \) is either irreducible or equal zero. Moreover, if \( v \) is homogeneous then the \( C \)-submodule \( Lv \) is also \( G \)-graded. These remarks are sufficient to prove the existence of the decomposition (11).

Now let \( E_{ij}, 1 \leq i, j \leq k \) be the set of all matrix units of \( C \). Since \( V_1 \) in (11) is a faithful \( C \)-module, there exists a homogeneous element \( v \in V \) such that \( E_{1k}v \neq 0 \). In this case the vectors \( v_i = E_{ik}v = E_{i,i+1} \cdots E_{k-1,k}v, i = 1, \ldots, k-1, v_k = v \), form a homogeneous basis of \( V_1 \) and the elementary grading on \( C \) induced from this grading is given by the tuple \( (g_1, \ldots, g_k) \). Indeed, if \( \text{deg} \, v = h \) then \( \text{deg} \, v_i = g_i^{-1}g_i h \), \( \text{deg} \, v_j = g_j^{-1}g_j h \) and so \( \text{deg} \, E_{ij} = g_i^{-1}g_j \) and still \( E_{ij}v = v_i \). If we choose the bases in other \( V_2, \ldots, V_m \) and an arbitrary homogeneous basis in \( V_0 \) then we obtain a realization of \( C \) by the the block-diagonal matrices of the form \( \text{diag} \{X, \ldots, X, 0\} \).

It remains to consider the tuple \( (h_1, \ldots, h_n) \) which defines the elementary grading on \( R = M_n(F) \) induced from the graded basis of \( V \) just constructed. If we denote by \( \tilde{E}_{st}, 1 \leq s, t \leq n \), the matrix units of \( R \) corresponding to this basis, then, as usual, \( \text{deg} \, \tilde{E}_{st} = g_s^{-1}g_t \). Also, for any \( 1 \leq i, j \leq k \) we will have

\[ E_{ij} = \tilde{E}_{ij} + \tilde{E}_{i+i,j+k} + \cdots + \tilde{E}_{i+(m-1)k,j+(m-1)k} \]

in \( R \) and \( \text{deg} \, E_{ij} = g_i^{-1}g_j \) in \( C \), hence in \( R \), since the embedding of \( C \) in \( R \) is graded. Now all \( \tilde{E}_{st} \) are homogeneous and so the conditions (10) must be satisfied. Now the proof is complete. \( \square \)
Example 1 The condition of \( C \) having an elementary grading is essential. For example, suppose \( C \cong M_n(F) \) with a fine grading. Let \( V \) be \( C \) itself as a graded vector space and let us assume that \( C \) acts on itself by multiplication on the left. Then \( R = \text{End} V \) is an algebra with elementary grading induced from \( V \) and \( C \) a graded subalgebra. So, \( C \) is a graded matrix subalgebra of a matrix algebra with an elementary grading but the grading of \( C \) is not elementary. So the conclusion of the previous lemma cannot hold for \( C \).

Lemma \( \text{II} \) enables one to describe the gradings on all possible direct limits of matrix algebras with elementary gradings. Here we will need a special case where \( C = \bigcup_{i \geq 1} C_i \) where \( C_1 \subset C_2 \subset \cdots \) is an ascending chain of matrix algebras and \( C_i = e_i C_j e_i \) for any \( 1 \leq i \leq j \), where \( e_i \) is the identity element of \( C_i \). To start with we generalize the notion of the elementary grading to the case of finitary matrices.

**Definition 1** Let \( R \) be the algebra of finitary matrices and \( g = (g_1, g_2, \ldots) \) a sequence of elements in a group \( G \). Then a grading \( R = \bigoplus g \in G R(g) \) is called elementary defined by \( g \) if \( R(g) = \text{Span} \{ E_{ij} \mid g_{i-1} g_j = g \} \).

**Lemma 2** Let \( C = \bigoplus_{g \in G} C(g) \) be a \( G \)-graded algebra over a field \( F \) which is the union \( C = \bigcup_{i \geq 1} C_i \) of an ascending chain of graded matrix subalgebras of orders \( n_1, n_2, \ldots \), with identity elements \( e_1, e_2, \ldots \). Suppose all the gradings on the subalgebras \( C_1, C_2, \ldots \) are elementary and \( C_i = e_i C_j e_i \) for all \( i, j \) with \( 1 \leq i \leq j \). Then \( C \) is isomorphic to the algebra \( R \) of finitary matrices with elementary grading given by a sequence \( g = (g_1, g_2, \ldots) \) of elements of \( G \) in which every \( C_i \) is embedded as a graded subalgebra of all matrices with zero entries in all rows and columns whose numbers are greater than \( n_i \), \( i = 1, 2, \ldots \). The \( G \)-grading on \( C_i \) is elementary given by an \( n \)-tuple \( (g_1, \ldots, g_n) \).

**Proof.** By Lemma \( \text{II} \), we may adjust our graded embeddings in the sequence \( C_1 \subset C_2 \subset \cdots \) in such a way that each \( C_i \) can be viewed as a graded subalgebra of \( C_{i+1} \) consisting of all \( n_i \times n_i \) matrices in the left upper corner. These adjustments do not change the isomorphism class of the limit since this depend only on the module structure of \( C_{i+1} \) over \( C_i \), for each \( i \) (see \( \text{III} \)). But then the set of all matrices \( L_i \) in \( C_i \) with zeros outside the first column is a graded subspace of the similar subspace \( L_{i+1} \) in \( C_{i+1} \). If \( \{ e = g_1^{-1}, g_2^{-1}, \ldots, g_n^{-1} \} \) is the set of degrees of the matrix units spanning \( L_i \) then the elementary grading of \( C_i \) is defined by the tuple \( (g_1, \ldots, g_n) \). Then the set of degrees of the matrix units in \( L = \bigcup_{i=1}^\infty \) is the desired sequence of elements of \( G \) defining the elementary grading on the algebra of finitary matrices \( C \). \( \square \)
5 Gradings on simple algebras with minimal one sided ideals

In this section we consider the gradings by finite abelian groups on simple algebras with minimal one sided ideals. Suppose that $R$ is such an algebra. According to the Structure Theorem in [8, Chapter 4, Section 9], there exists a pair of mutually dual spaces $V$ and $\Pi \subset V^*$ such that $R \cong V \otimes \Pi$ with the product is given by

$$(v_1 \otimes \pi_1)(v_2 \otimes \pi_2) = \pi_1(v_1)(v_2 \otimes \pi_2)$$

where $v_1, v_2 \in V$, $\pi_1, \pi_2 \in \Pi$ and the kernel of the bilinear mapping $(v, \pi) \mapsto \pi(v)$ is trivial. If $\dim V = \dim \Pi = n < \infty$ we have $R \cong M_n(F)$, the matrix algebra of order $n$ over $F$.

The linear mapping $S : V \to V$ and $T : \Pi \to \Pi$ are called adjoint if $(T(\pi))(v) = \pi(S(v))$. Actually, $T$ is completely defined by $S$ and we write $T = S^*$. The Isomorphism Theorem [8, Chapter 4, Section 11] describes the automorphisms of $V \otimes \Pi$ with the help of the automorphisms of $V$ in the following way. If $\varphi \in \text{Aut}(V \otimes \Pi)$ then there exists a linear automorphism $S : V \to V$, for which there exists the adjoint automorphism $S^* : \Pi \to \Pi$, such that

$$\varphi(v \otimes \pi) = S^{-1}(v) \otimes S^*(\pi)$$

for any $v \in V$, $\pi \in \Pi$.

The automorphism $S$ is defined by $\varphi$ uniquely up to a nonzero scalar multiple.

The finite-dimensional subspaces $V' \subset V$ and $\Pi' \subset \Pi$ are called compatible if they are of the same dimension $n$ and the annihilator of $V'$ in $\Pi'$ is zero. As mentioned above, in this case $V' \otimes \Pi' \cong M_n(F)$. A simple remark is that $V' \otimes \Pi' \subset V'' \otimes \Pi''$ if and only if $V' \subset V''$ and $\Pi' \subset \Pi''$. It is shown in [8, Chapter 4, Section 16] that $R = V \otimes \Pi$ has a local system of matrix subalgebras of such form. It will be convenient to label the subalgebras in this local system by the elements of a directed set $I$, that is, an ordered set such that for any $\alpha, \beta \in I$ there is $\gamma \in I$ with $\alpha \prec \gamma$ and $\beta \prec \gamma$. We will have $V_\alpha \otimes \Pi_\alpha \subset V_\beta \otimes \Pi_\beta$ if and only if $V_\alpha \subset V_\beta$ and $\Pi_\alpha \subset \Pi_\beta$. The latter holds if and only if $\alpha \prec \beta$.

Our aim is to prove the following.

**Theorem 4** Let a simple algebra $R$ with minimal one sided ideals over an algebraically closed field of characteristic zero be given a grading by a finite abelian group $G$. Then $R$ has a local system of graded finite-dimensional matrix algebras.

**Proof.** According to Litoff’s Theorem [8, Chapter 4, Section 15] $R$ is locally
matrix, that is, there a local system \( \{ V_\alpha \otimes \Pi_\alpha \mid \alpha \in I \} \) of matrix subalgebras in a \( G \)-graded algebra \( R = V \otimes \Pi \). We need to prove that there is another local system whose terms are \( G \)-graded matrix subalgebras of the form \( \{ V_\alpha \otimes \Pi_\alpha \mid \alpha \in I \} \).

Now the conditions imposed on the field allow one to replace the graded subspaces by the invariant subspaces with respect to the automorphisms corresponding to the multiplicative characters \( \chi \in \hat{G} \), given by \( \chi * r = \chi(g)r \), for any \( r \in R^g \). As mentioned before, to each such \( \chi \) one can associate an automorphism \( S_\chi : V \to V \) and its adjoint \( S_\chi^* : \Pi \to \Pi \) so that \( \chi * (v \otimes \pi) = S_\chi^{-1}(v) \otimes S_\chi^*(\pi) \), for any \( v \in V \) and \( \pi \in \Pi \). Since \( S_\chi \) is defined up to scalar, the mappings \( \chi \mapsto S_\chi \) and \( \chi \mapsto S_\chi^* \) are projective representations of \( \hat{G} \) by linear transformations of \( V \) and \( \Pi \). It is obvious that given a \( \hat{G} \)-invariant subspace \( U \) in \( V \), annihilator \( U^\perp \) in \( \Pi \) is also \( \hat{G} \)-invariant. With these facts in mind, we first pick, for each \( \alpha \in I \) a subspace of finite codimension \( \Pi_\alpha^\perp \). Set

\[
U_\alpha = \bigcap_{\chi \in \hat{G}} S_\chi(\Pi_\alpha^\perp) \subset \Pi_\alpha^\perp.
\]

This is a \( \hat{G} \)-invariant subspace in \( V \) of finite codimension. Since \( \cup_{\alpha \in I} \Pi_\alpha = \Pi \) we must have \( \cap_{\alpha \in I} \Pi_\alpha^\perp = 0 \), hence \( \cap_{\alpha \in I} U_\alpha = 0 \). Note that \( U_\gamma \subset U_\beta \) as soon as \( \beta \prec \gamma \). Let us now consider a finite-dimensional \( \hat{G} \)-invariant subspace \( \hat{G}(V_\alpha) = \sum_{\chi \in \hat{G}} \chi(V_\alpha) \). Then there exists \( U_\beta \) such that \( \hat{G}(V_\alpha) \cap U_\beta = 0 \). Since \( I \) is a directed set, there is \( \gamma \in I \) such that \( \alpha, \beta \prec \gamma \) hence \( \hat{G}(V_\alpha) \cap U_\gamma = 0 \). Since the projective representation of a finite group is fully reducible there is a \( \hat{G} \)-invariant subspace \( L \) in \( V \) such that \( V = L \oplus (\hat{G}(V_\alpha) \oplus U_\gamma) = 0 \). We then set \( V_\alpha = L \oplus \hat{G}(V_\alpha) \). Also, we set \( \Pi_\alpha = U_\gamma^\perp \). Since \( U_\gamma \subset U_\alpha \subset \Pi_\alpha^\perp \), we have that \( \Pi_\alpha \subset \Pi_\alpha^\perp \). Being an orthogonal complement to a \( \hat{G} \)-invariant space, \( \Pi_\alpha \) is \( \hat{G} \)-invariant. By construction, \( \dim \Pi_\alpha = \dim V_\alpha \) and also \( \Pi_\alpha^\perp = U_\gamma \) has trivial intersection with \( V_\alpha \). This proves that \( V_\alpha \) and \( \Pi_\alpha \) are compatible invariant spaces so that \( V_\alpha \otimes \Pi_\alpha \) is a \( \hat{G} \)-invariant matrix subalgebra. Since \( V \otimes \Pi_\alpha \subset V_\alpha \otimes \Pi_\alpha \), we obtain a \( \hat{G} \)-invariant local system, hence a local system of graded matrix subalgebras. \( \square \)

6 Gradings on simple algebras of finitary matrices

Now we are ready to prove our main result.

**Theorem 5** Let \( G \) be a finite abelian group, \( R = \bigoplus_{g \in G} R^g \) be a \( G \)-graded
algebra of infinite matrices each having only finitely many nonzero entries over an algebraically closed field $F$ of characteristic zero. Then $R$ is isomorphic to a graded tensor product $C \otimes D$ where $C$ is such with an elementary grading and $D = M_n(F)$ is a matrix algebra of order $n$ with a fine grading. Additionally, we have $\text{Supp } C \cap \text{Supp } D = \{1\}$.

**Proof.** According to [8, Chapter 4, Section 15] $R$ is the same as the simple algebra with minimal one sided ideals in the case where $\dim R$ is countable. Clearly, in this case we can remove unnecessary terms from the local system provided by Theorem 4 and conclude that $R$ is the union of the ascending chain $R_1 \subset R_2 \subset \cdots$ of graded simple finite-dimensional subalgebras. Each $R_i$ decomposes as the tensor product $R_i = C_i \otimes D_i \cong C_i \otimes D_i$ of a simple subalgebra $C_i$ with an elementary grading and a simple subalgebra $D_i$ with a fine grading. The support $T_i = \text{Supp } D_i$ is a subgroup in $G$. Since the number of subgroups in $G$ is finite, by excluding unnecessary subalgebras $R_i$ we may assume that $T_1 = T_2 = \cdots$ is the same subgroup $T$ of $G$. In particular, $\dim D_i = |T|$ for all $i$ and that the $D_i$ as ungraded algebras all isomorphic to the same $M_n(F)$. Since the number of different fine gradings is also finite, we may, as before, assume that all $D_i$ are isomorphic as graded algebras.

Let $\varphi_{i+1,i}$ be the graded embedding of $R_i$ in $R_{i+1}$. We also set $\varphi_{ji} = \varphi_{j,j-1} \cdots \varphi_{i+1,i}$. If we apply Theorem 4 to each embedding $R_i \subset R_{i+1}$ then we may assume that $\varphi_{i+1,i}(C_i) \subset C_{i+1}$ and $\varphi_{i+1,i}(C_i) = \varphi_{i+1,i}(e_i)C_{i+1}\varphi_{i+1,i}(e_i)$ where $e_i$ is the identity element of $C_i$ and that there is an isomorphism $\psi_{i+1,i}(D_i) \rightarrow D_{i+1}$ such that

$$\varphi_{i+1,i}(a)\varphi_{i+1,i}(d) = \varphi_{i+1,i}(a)\psi_{i+1,i}(d) \text{ for all } a \in C_i, \ d \in D_i. \quad (12)$$

We set $\psi_1 = \text{id}_{D_1}$ and $\psi_i = \psi_{i-1} \cdots \psi_{2,1} : D_1 \rightarrow D_i$, for all $i \geq 2$. Then $\psi_j(d) = 1_{i,j}(\psi_i(d))$ for any $i, j$ with $1 \leq i \leq j$, and any $d \in D_1$. Besides, using (12), we may write

$$\varphi_{j,i}(a)\varphi_{j,i}(d) = \varphi_{i,j}(a)\psi_j(\psi_i^{-1}(d)) \text{ for all } a \in C_i, \ d \in D_i. \quad (13)$$

Let us set $C = \bigcup_{i\geq1} C_i$ and construct an isomorphism $\rho : R \rightarrow C \otimes D_1$. If $a \in C_i, \ d \in D_i$ then we set

$$\rho(ad) = a \otimes \psi_i^{-1}(d) \text{ for any } a \in C_i, \ d \in D_i. \quad (14)$$

Clearly, (14) defines an injective homomorphism of $R_i = C_iD_i$ into $C \otimes D_1$. Actually, the same formula defines an isomorphism of $R$ to $C \otimes D_1$. To prove this we only need to check that $\rho$ is well defined on $R$. Indeed, if $a \in C_i, \ d \in D_i$ and $i < j$ then $\varphi_{j,i}(ad) = \varphi_{j,i}(a)\varphi_{j,i}(d)$ in $R$ and $a = \varphi_{j,i}(a)$ in $C$ since we
identify \( a \in C_i \) with its image \( \varphi_{j,i}(a) \) in \( C_j \). But then, according to (13) we should have

\[
\rho(\varphi_{j,i}(a)\varphi_{j,i}(d)) = \rho(\varphi_{i,j}(a)\psi_j(\psi_i^{-1}(d))) = \varphi_{j,i}(a) \otimes \psi_i^{-1}(d) = a \otimes \psi_i^{-1}(d),
\]

proving that, indeed, \( \rho \) is defined correctly.

By Lemma 2 \( C \) is isomorphic to the algebra of finitary matrices with an elementary \( G \)-grading. Since \( \text{Supp} \ C = \bigcup_{i \geq 1} \text{Supp} \ C_i \) and \( T \cap \text{Supp} \ C_i = \{1\} \), for all \( i \geq 1 \), we have \( T \cap \text{Supp} \ C = \{1\} \), and the proof is complete. □

7 The uniqueness theorem for the elementary gradings of simple algebras of finitary matrices

The defining sequence \( g \) of an elementary grading is not defined uniquely. In what follows we prove a theorem that gives necessary and sufficient conditions for two sequences to define isomorphic gradings. It will be convenient to denote such sequence as a function \( \tau : I \rightarrow G \) such that \( \tau(i) = g_i \). Here \( I \) is the sequence of natural numbers or any initial segment of this. In the latter case we simply deal with \( R = M_n(F) \) for a natural number \( n \). With each such function we associate a function \( S_\tau : G \rightarrow \mathbb{N} \cup \{\infty\} \) given by \( S_\tau(g) = \text{Card}(\tau^{-1}(g)) \).

Further notice that for each elementary grading defined by a function \( \tau \) there is a graded vector space \( V \) with a basis \( \{v_i \mid i \in I\} \) such that \( \deg v_i = g_i^{-1} \). We denote the subspace spanned by all \( v_i \) with \( \tau(i) = g \) by \( V_{g^{-1}} \). In this case the algebra of finitary matrices can be identified with the set all linear transformations of \( V \) spanned by the linear transformations with matrices \( E_{ij} \) with respect to the above basis. The homogeneous component \( R^{(g)} \) is then the set of all linear transformations \( \varphi \) such that \( \varphi(V_h) \subset V_{gh} \).

**Theorem 6** Let \( G \) be a group, \( R \) and \( R' \) the algebras of finitary matrices endowed by two elementary gradings \( R = \bigoplus_{g \in G} R^{(g)} \) and \( R' = \bigoplus_{g \in G} (R')^{(g)} \) defined by the tuples \( \tau \) and \( \tau' \), respectively. Then \( R \) and \( R' \) are isomorphic as graded algebras if and only if there is an element \( g_0 \in G \) such that \( S_\tau(g) = S_{\tau'}(g_0g) \), for all \( g \in G \).

**Proof.** First we assume that the gradings defined by \( \tau \) and \( \tau' \) are isomorphic. Note that two sequences \( g = (g_1, g_2, \ldots) \) and \( h = (ag_1, ag_2, \ldots) \) defines the
same gradings on $R$ and $S_\tau(g) = S_\rho(ag)$ for all $g \in G$ where $\rho(i) = ag$. Hence we can suppose that $\rho(1) = e$ that is $g_1 = 1$ in $g$.

Let $f : R \rightarrow R'$ be the graded isomorphism of $R$ and $R'$, that is, $f(R^{(g)}) = (R')^{(g)}$, for all $g \in G$. Let us consider the identity components $R^{(e)}$ and $(R')^{(e)}$.

Each of these algebras is the sum of simple ideals $M^{(g)}$ and $(M')^{(g)}$ each defined as the linear span of the set of matrix units $E_{ij}$ or $E'_{ij}$, respectively, such that $\tau(i) = \tau(j) = \tau'(i) = \tau'(j) = g$.

Since $f(R^{(e)}) = (R')^{(e)}$ we must have $f(M^{(g)}) = (M')^{(\sigma(g))}$ for a bijective map $\sigma : \text{Supp} R \rightarrow \text{Supp} R' = \text{Supp} R$ on $G$. Let us also recall [H Corollary 2, Section 4.11] that there is a linear bijective map $\alpha : V \rightarrow V'$ such that $f(\varphi) = \alpha \varphi \alpha^{-1}$ for any $\varphi \in R$. Let us notice first that such $\alpha$ must satisfy the equation $\alpha(V_{g^{-1}}) = V'_{\sigma(g)^{-1}}$. Indeed, we have

$$M^{(g)} = \{ \varphi \in R^{(e)} \mid \varphi(V) \subset V_{g^{-1}} \} \text{ and } (M')^{(g)} = \{ \varphi \in (R')^{(e)} \mid \varphi(V') \subset V'_{g^{-1}} \}.$$

We have $\alpha M^{(g)} \alpha^{-1} = (M')^{(\sigma(g))}$ and so $\alpha M^{(g)} = (M')^{(\sigma(g))} \alpha$. Applying both sides to $V$ and having in mind the equations

$$\alpha(V) = V', \ M^{(g)}(V) = V_{g^{-1}} \text{ and } (M')^{(\sigma(g))}(V') = V'_{\sigma(g)^{-1}}$$

we obtain $\alpha(V_{g^{-1}}) = V'_{\sigma(g)^{-1}}$.

Now let us use $\alpha R^{(g)} \alpha^{-1} = (R')^{(g)}$ or $\alpha R^{(g)} = (R')^{(g)} \alpha$, for all $g \in \text{Supp} R \subset G$. Applying both sides of this equation to any $V_h, h \in \text{Supp} V \subset G$, we obtain $\alpha R^{(g)}(V_h) = (R')^{(g)} \alpha(V_h)$ and so $\alpha(V_{gh}) = (R')^{(g)}(V'_{\sigma(h)^{-1}g^{-1}})$. In other words, $V'_{\sigma(h^{-1}g^{-1})^{-1}} = V'_{\sigma(h^{-1})^{-1}g^{-1}}$

$$\sigma(h^{-1}g^{-1})^{-1} = g\sigma(h^{-1})^{-1} \tag{15}$$

for any $h \in \text{Supp} R, g \in \text{Supp} R$. Recall that $g_1 = e$ in $g$ that is $e^{-1} = e \in \text{Supp} V$. Substituting $h = e$ in (15) and setting $g_0 = \sigma(e)$, we obtain $\sigma(g^{-1}) = g_0g^{-1}$, for any $g \in \text{Supp} R$. Note that for any elementary grading $oh g^{-1} \in \text{Supp} R$ if and only if $g \in \text{Supp} R$. Hence also $\sigma(g) = g_0g$ for all $g \in \text{Supp} R$. So we have dim $V_g = \text{dim} V'_{g_0g}$. Since $S_\tau(g) = \text{dim} V_g$, we easily obtain the desired condition: there is $g_0 \in G$ such that $S_\tau(g) = S_{\tau'}(g_0g)$ for all $g \in G$.

To prove the converse, we consider two $G$-graded finitary matrix algebras $R = \oplus_{g \in G} R^{(g)}$, $R' = \oplus_{g \in G} (R')^{(g)}$ and assume that there is $g_0 \in G$ such that $S_\tau(g) = S_{\tau'}(g_0g)$, for any $g \in \text{Supp} R \subset G$. 

14
We define an isomorphism \( f : R \to R' \) in the following way. For each \( g \in G \), let the ordered subset \( I_g \) label the elements \( v_i \) of the basis of \( V \cap V_{g^{-1}} \). Let \( I'_g \) be the same thing for \( V' \). Then there is an ordered map \( \beta_g : I_g \to I'_g \). We extend it to a bijection \( \beta \) of \( I \) into itself. Then \( \beta \) satisfies the following condition. If \( g = (g_1, g_2, \ldots) \) and \( h = (h_1, h_2, \ldots) \) then
\[
h_{\beta(i)} = g_0 g_i.
\] (16)

Denote by \( f \) the linear map \( R \to R' \) such that \( f(E_{ij}) = E_{\beta(i)\beta(j)} \). Then \( f \) is an isomorphism and \( f(R^{(g)}) = (R')^{(g)} \) due to (16). \( \square \)

**Remark 1** The theorem above is no longer true if we replace the algebra of finitary matrices by the other direct limits of matrix algebras. For example, suppose an algebra \( R \) is the direct limit of the algebras \( R_i = M_{2^i}, i = 1, 2, \ldots \), where the structure mappings \( \phi_i : R_i \to R_{i+1} \) are given by \( X \mapsto \text{diag}\{X, X\} \). Then the elementary grading by \( G = \langle a \rangle_2 \) of \( R_i \) given by a tuple \( \tau \) can be extended to the grading of \( R_{i+1} \) defined by \( \tau' \) to make \( \phi_i \) graded if we either choose \( \tau' = (\tau, \tau) \) or \( \tau' = (\tau, a\tau) \). If we start wish the grading of \( R_1 \) defined by \( \tau = (e, a) \) and consider the identity component of the grading in each of the two cases then we will see the limits of semisimple algebras, each of which is the sum of two isomorphic matrix subalgebras. But the Bratteli diagrams of these limits are different and so the limits are not isomorphic. At the same time the “Steinitz numbers” \( S_\tau \) and \( S'_\tau \) are the same and both equal to \( e^\infty a^\infty \).

**Remark 2** A uniqueness theorem for the \( G \)-gradings of matrix algebras over algebraically closed field \( F \) of characteristic zero has been established by A. A. Chasov [7].
