Abstract

In this note we compute the Poincaré Series of almost stretched Gorenstein local rings. It turns out that it is rational.

1 Introduction.

Let \((R, \mathfrak{n})\) be a regular local ring and \(k = R/\mathfrak{n}\) its residue field which we assume of characteristic zero.

Given an ideal \(I \subseteq \mathfrak{n}^2\), a classical problem in Commutative Algebra is to study the Poincaré series

\[ P_A(z) := \sum_{i \geq 0} \dim_k \text{Tor}^A_i(k, k) z^i \]

of the local ring \((A = R/I, \mathfrak{m} = \mathfrak{n}/I)\). This is the generating function of the sequence of Betti numbers of a minimal free resolution of \(k\) over \(A\).

Due to the classical conjecture of Serre, the main issue is concerning the rationality of this series. We know by the example of Anick, see [2], that this series can be non rational, but there are relatively few classes of local rings for which the question has been settled. See [3] for a detailed study of these and other relevant related problems in local algebra.

Given a Cohen-Macaulay local ring \(A = R/I\), we say that \(A\) is \textit{stretched} if there exists an artinian reduction \(B\) of \(A\) such that the square of its maximal ideal is a principal ideal. Instead, if the square of the maximal ideal of an artinian reduction

is minimally generated by two elements, we say that $A$ is **almost stretched**. See [11], [9], [6] and [7] for papers concerning these notions.

In [10] J. Sally computed the Poincaré series of a stretched Cohen-Macaulay local rings and obtained, as a corollary, the rationality of the series. It follows that local Gorenstein rings of multiplicity at most five have rational Poincaré series.

In this paper we compute the Poincaré series of an almost stretched Gorenstein local ring, thus exhibiting its rationality. Using this result, we can prove the rationality of the Poincaré series of any Gorenstein local rings of multiplicity at most seven.

We are not developing new methods for the computation of the Betti numbers of the minimal $A$-free resolution of $k$; rather we show that the structure theorem we proved in [6] for Artinian almost stretched Gorenstein local rings is very much suitable to the computation of $\text{Tor}^A_i(k,k)$.

In the following, for a local ring $(A, \mathfrak{m}, k := A/\mathfrak{m})$ of dimension $d$, we denote by $h$ the embedding codimension of $A$, namely the integer $h := \dim_k(\mathfrak{m}/\mathfrak{m}^2) − d$. Recall, see [11], that the multiplicity $e$ of a Cohen-Macaulay local ring $A$ of embedding codimension $h$ satisfies the inequality $e \geq h + 1$. Further, in the extremal case $e = h + 1$, it is well known that $P_A(z)$ is rational.

The main result of this paper is the following theorem.

**Theorem 1.1.** Let $A = R/I$ be an almost stretched Gorenstein local ring of dimension $d$ and embedding codimension $h$. Then

$$P_A(z) = \frac{(1 + z)^d}{1 - hz + z^2}.$$

## 2 Proof of the Theorem

The main ingredient of the proof of our result are the following classical “change of rings” theorems. The first one, see [12], relates the Betti numbers of $A$ with those of $A/xA$ when $x$ is a non-zero divisor in the local ring $A$.

a) Let $x$ be a non-zero divisor in $A$. Then

$$P_A(z) = \begin{cases} (1 + z)P_{A/xA}(z) & x \in \mathfrak{m} \setminus \mathfrak{m}^2 \\ (1 - z^2)P_{A/xA}(z) & x \in \mathfrak{m}^2. \end{cases}$$

The second one, see [8], relates the Betti numbers of $A$ with those of $A/xA$ when $x$ is a socle element.

b) Let $x \in \mathfrak{m} \setminus \mathfrak{m}^2$ be an element in the socle $(0 :_A \mathfrak{m})$ of $A$. Then

$$P_A(z) = \frac{P_{A/xA}(z)}{1 - z P_{A/xA}(z)}.$$
The third one, see [4], relates the Betti numbers of the Artinian Gorenstein local ring $A$ with those of $A$ modulo the socle.

c) If $(A, \mathfrak{m})$ is an Artinian local Gorenstein ring, then

$$P_A(z) = \frac{P_{A/(0: \mathfrak{m})}(z)}{1 + z^2 P_{A/(0: \mathfrak{m})}(z)}.$$ 

We start now proving the Theorem. Let $J := (a_1, \ldots, a_d)$ be the ideal generated by a minimal reduction of $\mathfrak{m}$, such that $A/J$ is almost stretched and Gorenstein. Since $\{a_1, \ldots, a_d\}$ is a regular sequence on $A$, we have by a)

$$P_A(z) = (1 + z)^d P_{A/J}(z).$$

Hence we may assume that $(A = R/I, \mathfrak{m} = n/I)$ is an Artinian almost stretched Gorenstein local ring of embedding dimension $h$. In this case we proved in [6], Proposition 4.8, that we can find integers $s \geq t + 1 \geq 3$ depending on the Hilbert function of $A$, a minimal system of generators $\{x_1, \ldots, x_h\}$ of the maximal ideal $n$ of $R$ and an element $a \in R$ such that $I$ is generated by the elements:

$$\{x_1 x_j\}_{j=3, \ldots, h} \{x_i x_j\}_{2 \leq i < j \leq h} \{x_j^2 - x_1^s\}_{j=3, \ldots, h} x_2^2 - ax_1 x_2 - x_1^{a-t+1}, x_1^t x_2.$$ 

Further $x_1^t \in A = R/I$ is the generator of the socle $0 : \mathfrak{m}$ of $A$. Hence

$$A/(0 : \mathfrak{m}) \simeq R/(I + (x_1^t)) = R/K$$

where $K$ is the ideal in $R$ generated by

$$\{x_1 x_j\}_{j=3, \ldots, h} \{x_i x_j\}_{2 \leq i < j \leq h} \{x_j^2\}_{j=3, \ldots, h} x_2^2 - ax_1 x_2 - x_1^{a-t+1}, x_1^t x_2, x_1^s.$$ 

Notice that by c) we have

$$P_A(z) = \frac{P_{A/(0 : \mathfrak{m})}(z)}{1 + z^2 P_{A/(0 : \mathfrak{m})}(z)} = \frac{P_{R/K}(z)}{1 + z^2 P_{R/K}(z)}$$

so that we are left to compute the Poincaré series of $R/K$.

It is clear that $x_3, \ldots, x_h \in \mathfrak{m} \setminus \mathfrak{m}^2$ are elements in the socle of $R/K$. Hence we can use $h - 2$ times b) to get

$$P_{R/K}(z) = \frac{P_{S/L}(z)}{1 - (h - 2)z P_{S/L}(z)}$$

where $S = R/(x_3, \ldots, x_h)$ is a two dimensional regular local ring with maximal ideal $n = (x_1, x_2)$ and $L$ is the ideal

$$L := (x_2^2 - ax_1 x_2 - x_1^{a-t+1}, x_1^t x_2, x_1^s).$$
Now let $V := (x_2^2 - ax_1x_2 - x_1^{a-t+1}, x_1x_2);$ in [7], Theorem 4.7 we proved that $S/V$ is an almost stretched Artinian Gorenstein local ring with socle generated by $x_1^a$. Hence, by using c), we get
\[
\mathbb{P}_{S/V}(z) = \frac{\mathbb{P}_{S/L}(z)}{1 + z^2 \mathbb{P}_{S/L}(z)}. \tag{3}
\]

Finally, the ideal $V$ is generated by a regular sequence in $n^2$ so that, by a), we get
\[
\mathbb{P}_{S/V}(z) = \frac{(1 + z)^2}{(1 - z^2)^2} = \frac{1}{(1 - z)^2}.
\]

By using (3), this last equality gives $\mathbb{P}_{S/L}(z) = \frac{1}{1 - z}$ and thus from (2) we get $\mathbb{P}_{R/K}(z) = \frac{1}{1 - h z}$. Finally, by (1) we get
\[
\mathbb{P}_A(z) = \frac{1}{1 - h z + z^2}
\]
and the conclusion follows.

A consequence of the above Theorem is the rationality of the Poincaré series of any Gorenstein local ring of multiplicity $e \leq h + 4$.

**Corollary 2.1.** Let $A$ be a Gorenstein local ring of dimension $d$, multiplicity $e$ and embedding codimension $h$. If $e = h + 1, h + 2, h + 3, h + 4$ then $\mathbb{P}_A(z)$ is rational.

**Proof.** We need only to consider the case $h + 2 \leq e \leq h + 4$. Since any Artinian reduction $B$ of $A$ is a Gorenstein local ring with the same multiplicity and the same embedding codimension, the possible Hilbert series of $B$ are
\[
\{1, h, 1\}, \{1, h, 1, 1\}, \{1, h, 2, 1\}, \{1, h, 1, 1, 1\}.
\]
This proves that $A$ is either stretched or almost stretched. The conclusion follows by Sally’s result and the above Theorem.

**Corollary 2.2.** If $A$ is a Gorenstein local ring of multiplicity at most seven, then $\mathbb{P}_A(z)$ is rational.

**Proof.** As before the possible Hilbert series of any artinian reduction $B$ of $A$ are
\[
\{1, 5, 1\}, \{1, 4, 1, 1\}, \{1, 3, 2, 1\}, \{1, 3, 1, 1, 1\}, \{1, 2, 3, 1\}, \{1, 2, 2, 1, 1\}, \{1, 2, 1, 1, 1, 1\}, \{1, 1, 1, 1, 1, 1, 1\}.
\]
But $\{1, 2, 3, 1\}$ is not allowed because Gorenstein in codimension two implies complete intersection. In all the remaining cases $A$ is either stretched or almost stretched and we get the conclusion.
Remark 1. Bøgvad in [5] showed that there exist Artinian Gorenstein local rings of multiplicity 26 with non-rational Poincaré series.

Remark 2. The Hilbert function of an almost stretched Artinian Gorenstein local ring $A$ has the following shape

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c|c|c}
 n & 0 & 1 & 2 & \ldots & t+1 & \ldots & s+1 \\
 H_A(n) & 1 & h & 2 & \ldots & 2 & 1 & \ldots & 1 & 0 \\
\end{array}
\]

for integers $s$ and $t$ such that $s \geq t+1 \geq 3$. On the contrary the Poincaré series of $A$ is independent from $t$ and $s$.

Remark 3. The Poincaré series of stretched and almost stretched Gorenstein local rings with the same dimension and the same embedding dimension coincide, see [10] Theorem 2.
