CONTINUOUS FAMILIES OF PROPERLY INFINITE \( C^* \)-ALGEBRAS

ETIENNE BLANCHARD

Abstract. Any unital separable continuous \( C(X) \)-algebra with properly infinite fibres is properly infinite as soon as the compact Hausdorff space \( X \) has finite topological dimension. We study conditions under which this is still the case if the compact space \( X \) has infinite topological dimension.

1. Introduction

One of the basic \( C^* \)-algebras studied in the classification programme launched by G. Elliott ([Ell94]) of nuclear \( C^* \)-algebras through K-theoretical invariants is the Cuntz \( C^* \)-algebra \( O_\infty \) generated by infinitely many isometries with pairwise orthogonal ranges ([Cun77]). This \( C^* \)-algebra is pretty rigid in so far as it is a strongly self-absorbing \( C^* \)-algebra ([TW07]): Any separable unital continuous \( C(X) \)-algebra \( A \) the fibres of which are isomorphic to the same strongly self-absorbing \( C^* \)-algebra \( D \) is a trivial \( C(X) \)-algebra provided the compact Hausdorff base space \( X \) has finite topological dimension. Indeed, the strongly self-absorbing \( C^* \)-algebra \( D \) tensorially absorbs the Jiang-Su algebra \( Z \) ([Win09]). Hence, this \( C^* \)-algebra \( D \) is \( K_1 \)-injective ([Rør04]) and the \( C(X) \)-algebra \( A \) satisfies \( A \cong D \otimes C(X) \) ([DW08]).

But I. Hirshberg, M. Rørdam and W. Winter have built a non-trivial unital continuous \( C^* \)-bundle over the infinite dimensional compact product \( \prod_{n=0}^\infty S^2 \) such that all its fibres are isomorphic to the strongly self-absorbing UHF algebra of type \( 2^\infty \) ([HRW07, Example 4.7]). More recently, M. Dădărlat has constructed in [Dăd09, §3] for all pair \((\Gamma_0, \Gamma_1)\) of countable abelian torsion groups a unital separable continuous \( C(X) \)-algebra \( A \) such that

- the base space \( X \) is the compact Hilbert cube \( X = B_\infty \) of infinite dimension,
- all the fibres \( A_x \ (x \in B_\infty) \) are isomorphic to the strongly self-absorbing Cuntz \( C^* \)-algebra \( O_2 \) generated by two isometries \( s_1, s_2 \) satisfying \( 1_{O_2} = s_1s_1^* + s_2s_2^* \),
- \( K_i(A) \cong C(Y_0, \Gamma_i) \) for \( i = 0, 1 \), where \( Y_0 \subset [0, 1] \) is the canonical Cantor set.

These \( K \)-theoretical conditions imply that the \( C(B_\infty) \)-algebra \( A \) is not a trivial one. But these arguments do not work anymore when the strongly self-absorbing algebra \( D \) is the Cuntz algebra \( O_\infty \) ([Cun77]), in so far as \( K_0(O_\infty) = \mathbb{Z} \) is a torsion free group.

We study in this paper a more modest question: Assume that \( X \) is a second countable compact Hausdorff space, \( A \) is a separable unital continuous \( C(X) \) whose fibres all unitally contains \( O_\infty \). Is there a unital embedding of \( C^* \)-algebra \( O_\infty \hookrightarrow A \)? After fixing our notations in section 2, we show in section 3 that all separable unital continuous

\[2010 \text{ Mathematics Subject Classification. Primary: 46L80; Secondary: 46L06, 46L35.}\]

\[\text{Key words and phrases. } C^* \text{-algebra, Classification, Proper Infiniteness.}\]
C(X)-algebras with properly infinite fibres are properly infinite C*-algebras if and only if the full unital free product $\mathcal{T}_2 \ast \mathcal{T}_2$ is $K_1$-injective (Corollary 3.3). We describe the link between the different notions of proper infinite C(X)-algebras which appeared during the recent years ([KR00], [BRR08], [CEI08], [RR11]) in the following section. We eventually give in section 5 conditions under which the Pimsner-Toeplitz algebra ([Pim95]) of a Hilbert C(X)-modules with fibres of dimension greater than 2 is a properly infinite C*-algebra.

I especially thank the referee for a few inspiring remarks.

2. A few notations

We present in this section the main notations which are used in this article. We denote by $\mathbb{N} = \{0, 1, 2, \ldots\}$ the set of positive integers and we denote by $[S]$ the closed linear span of a subset $S$ in a Banach space.

Definition 2.1. ([Dix69], [Kas88], [Blan97]) Let $X$ be a compact Hausdorff space and let $C(X)$ be the C*-algebra of continuous function on $X$.

- A unital C(X)-algebra is a unital C*-algebra $A$ endowed with a unital morphism of C*-algebra from $C(X)$ to the centre of $A$.
- For all closed subset $F \subset X$ and all element $a \in A$, one denotes by $a|_F$ the image of $a$ in the quotient $A|_F := A/C_0(X \setminus F) \cdot A$. If $x$ is a point in $X$, one calls fibre at $x$ the quotient $A_x := A|_{\{x\}}$ and one writes $a_x$ for $a|_{\{x\}}$.
- The C(X)-algebra $A$ is said to be continuous if the upper semicontinuous map $x \in X \mapsto \|a_x\| \in \mathbb{R}_+$ is continuous for all $a \in A$.

Remarks 2.2. a) ([Cun81], [BRR08]) For all integer $n \geq 2$, the C*-algebra $\mathcal{T}_n := \mathcal{T}(\mathbb{C}^n)$ is the universal unital C*-algebra generated by $n$ isometries $s_1, \ldots, s_n$ satisfying the relation

$$s_1s_1^* + \ldots + s_ns_n^* \leq 1.$$  \hspace{1cm} (2.1)

b) A unital C*-algebra $A$ is said to be properly infinite if and only if one the following equivalent conditions holds true ([Cun77], [Rør03, Proposition 2.1]):

- the C*-algebra $A$ contains two isometries with mutually orthogonal range projections, i.e. $A$ unitally contains a copy of $\mathcal{T}_2$,
- the C*-algebra $A$ contains a unital copy of the simple Cuntz C*-algebra $\mathcal{O}_\infty$ generated by infinitely many isometries with pairwise orthogonal ranges.

c) If $A$ is a C*-algebra and $E$ is a Hilbert $A$-module, one denotes by $\mathcal{L}(E)$ the set of adjointable $A$-linear operators acting on $E$ and by $\mathcal{K}(E) \subset \mathcal{L}(E)$ the closed two sided ideal of compact operators generated by the rank 1 operators $\zeta \mapsto \theta_{\xi_1, \xi_2} \zeta := \xi_1 \cdot (\xi_2, \zeta)$. ([Kas88]). The C*-algebra $\mathcal{K}(\ell^2(\mathbb{N}))$ of compact operators on the Hilbert space $\ell^2(\mathbb{C})$ is often written $\mathcal{K}$.
3. Global proper infiniteness

The semiprojectivity of the $C^*$-algebra $\mathcal{T}_2$ ([Blac04, Theorem 3.2]) entails the following property of stable proper infiniteness for unital continuous $C(X)$-algebras with properly infinite fibres.

**Proposition 3.1.** Let $X$ be a second countable perfect compact Hausdorff space, i.e. without any isolated point, and let $A$ be a separable unital continuous $C(X)$-algebra with properly infinite fibres.

1) There exist:
   (a) a finite integer $n \geq 1$,
   (b) a covering $X = \overline{F_1} \cup \ldots \cup \overline{F_n}$ by the interiors of closed balls $F_1, \ldots, F_n$,
   (c) unital embeddings of $C^*$-algebra $\sigma_k : \mathcal{O}_\infty \hookrightarrow A_{|F_k}$ ($1 \leq k \leq n$).

2) The tensor product $\mathcal{M}_p(C) \otimes A$ is properly infinite for all large enough integer $p$.

**Proof.** 1) For all point $x \in X$, the semiprojectivity of the $C^*$-subalgebra $\mathcal{O}_\infty \hookrightarrow A_x$ ([Blac04, Theorem 3.2]) entails that there are a closed neighbourhood $F \subset X$ of the point $x$ and a unital embedding $\mathcal{O}_\infty \otimes C(F) \hookrightarrow A_{|F}$ of $C(F)$-algebra. The compactness of the topological space $X$ enables to conclude.

2) Proposition 2.7 of [BRR08] entails that the $C^*$-algebra $\mathcal{M}_2^{n-1}(A)$ is properly infinite. Proposition 2.1 of [Rør97] implies that $\mathcal{M}_p(A)$ for all integer $p \geq 2^{n-1}$.

**Remark 3.2.** If $X$ is a second countable compact Hausdorff space and $A$ is a separable unital continuous $C(X)$-algebra, then $\tilde{X} := X \times [0,1]$ is a perfect compact space, $\tilde{A} := A \otimes C([0,1])$ is a unital continuous $C(\tilde{X})$-algebra and every morphism of unital $C^*$-algebra $\mathcal{O}_\infty \rightarrow \tilde{A}$ induces a unital $*$-homomorphism $\mathcal{O}_\infty \rightarrow A$ by composition with the projection map $\tilde{A} \rightarrow A$ coming from the injection $x \in X \mapsto (x,0) \in \tilde{X}$.

The proper infiniteness of the tensor product $\mathcal{M}_p(C) \otimes A$ does not always imply that the $C^*$-algebra $A$ is properly infinite ([HR98]). Indeed, there exists a unital $C^*$-algebra $A$ which is not properly infinite, but such that the tensor product $\mathcal{M}_2(C) \otimes A$ is a properly infinite $C^*$-algebra ([Rør03, Proposition 4.5]). The following corollary nevertheless holds true.

**Corollary 3.3.** Let $j_0, j_1$ denote the two canonical unital embeddings of the Cuntz extension $\mathcal{T}_2$ in the full unital free product $\mathcal{T}_2 \ast_{\mathbb{C}} \mathcal{T}_2$ and let $\tilde{u} \in \mathcal{U}(\mathcal{T}_2 \ast_{\mathbb{C}} \mathcal{T}_2)$ be a $K_1$-trivial unitary such that $j_1(s_1) = j_1(s_1)j_0(s_1)^*j_0(s_1) = \tilde{u} \cdot j_0(s_1)$ ([BRR08, Lemma 2.4]).

The following assertions are equivalent:

(a) The full unital free product $\mathcal{T}_2 \ast_{\mathbb{C}} \mathcal{T}_2$ is $K_1$-injective.
(b) The unitary $\tilde{u}$ belongs to the connected component $\mathcal{U}^0(\mathcal{T}_2 \ast_{\mathbb{C}} \mathcal{T}_2)$ of $1_{\mathcal{T}_2 \ast_{\mathbb{C}} \mathcal{T}_2}$.
(c) Every separable unital continuous $C(X)$-algebra $A$ with properly infinite fibres is a properly infinite $C^*$-algebra.
Proof. (a)⇒(b) A unital C*-algebra $A$ is called $K_1$-injective if and only if all $K_1$-trivial unitaries $v \in \mathcal{U}(A)$ are homotopic to the unit $1_A$ in $\mathcal{U}(A)$ (see e.g. [Roh09]). Thus, (b) is a special case of (a) since $K_1(\mathcal{T}_2 \ast_C \mathcal{T}_2) = \{1\}$ (see e.g. [Blan10, Lemma 4.4]).

(b)⇒(c) Let $A$ be a separable unital continuous $C(X)$-algebra with properly infinite fibres. Take a finite covering $X = \tilde{F}_1 \cup \ldots \cup \tilde{F}_n$ such that there exist unital embeddings $\sigma_k : \mathcal{T}_2 \rightarrow A|\tilde{F}_k$ for all $1 \leq k \leq n$. Set $G_k := \tilde{F}_1 \cup \ldots \cup \tilde{F}_k \subseteq X$ and let us construct by induction isometries $w_k \in A|G_k$ such that the two projections $w_k w_k^*$ and $1_{G_k} - w_k w_k^*$ are properly infinite and full in the restriction $A|G_k$:

- If $k = 1$, the isometry $w_1 := \sigma_1(s_1)$ has the requested properties.

- If $k \in \{1, \ldots, n-1\}$ and the isometry $w_k \in A|G_k$ is already constructed, then Lemma 2.4 of [BRR08] implies that there exists a morphism of unital C*-algebra $\pi_k : \mathcal{T}_2 \ast_C \mathcal{T}_2 \rightarrow A|G_k \cap F_{k+1}$ satisfying

$$
- \pi_k(j_0(s_1)) = w_k|G_k \cap F_{k+1}^c,
- \pi_k(j_1(s_1)) = \sigma_{k+1}(s_1)|G_k \cap F_{k+1}^c = \pi_k(1) \cdot w_k|G_k \cap F_{k+1}^c.
$$

If the unitary $\tilde{u}$ belongs to the connected component $\mathcal{U}^0(\mathcal{T}_2 \ast_C \mathcal{T}_2)$, then $\pi_k(\tilde{u})$ is homotopic to $1_{A|G_k \cap F_{k+1}} = \pi_k(1_{\mathcal{T}_2 \ast_C \mathcal{T}_2})$ in $\mathcal{U}(A|G_k \cap F_{k+1})$, so that $\pi_k(\tilde{u})$ admits a unitary lifting $z_{k+1}$ in $\mathcal{U}^0(A|F_{k+1})$ (see e.g. [LLR00, Lemma 2.1.7]). The only isometry $w_{k+1} \in A|G_{k+1}$ satisfying the two constraints

$$
- w_{k+1}|G_k = w_k,
- w_{k+1}|F_{k+1} = (z_{k+1})^* \cdot \sigma_{k+1}(s_1)
$$

verifies that the two projections $w_{k+1}^* w_{k+1}$ and $1_{G_{k+1}} - w_{k+1}^* w_{k+1}$ are properly infinite and full in $A|G_{k+1}$.

The proper infiniteness of the projection $w_n w_n^*$ in $A|G_n = A$ implies that the unit $1_A = w_n^* w_n = w_n^* w_n w_n^* w_n$ is also a properly infinite projection in $A$, i.e. the C*-algebra $A$ is properly infinite.

(c)⇒(a) The C*-algebra $\mathcal{D} := \{ f \in C([0,1], \mathcal{T}_2 \ast_C \mathcal{T}_2) ; f(0) \in j_0(\mathcal{T}_2) \text{ and } f(1) \in j_1(\mathcal{T}_2) \}$ is a unital continuous $C([0,1])$-algebra the fibres of which are all properly infinite. Thus, condition (c) implies that the C*-algebra $\mathcal{D}$ is properly infinite, a statement which is equivalent to the $K_1$-injectivity of $\mathcal{T}_2 \ast_C \mathcal{T}_2$ ([Blan10, Proposition 4.2]).

\[ \square \]

Remark 3.4. The sum $\tilde{u} \oplus 1$ belongs to $\mathcal{U}^0(M_2(\mathcal{T}_2 \ast_C \mathcal{T}_2))$ ([Blan10]).

4. A QUESTION OF PROPER INFINITENESS

We describe in this section the different notions of proper infiniteness which have been introduced during the last decades.

The first one has been introduced by J. Cuntz in [Cun77] where he defines the properly infinite unital C*-algebras as those which unitaly contains a copy of the C*-algebra $\mathcal{T}_2$ generated by two isometries with orthogonal ranges (see Remark 2.2). E. Kirchberg extended this notion by defining what are the properly infinite positive elements in a C*-algebra (see e.g. [KR00, Proposition 3.2]). More recently, K. T. Coward, G. Elliott and C. Ivanescu defined in [CEI08] a separable Hilbert module
Let $E$ over a separable $C^*$-algebra $A$ to be properly infinite if there is an embedding of Hilbert $A$-module $\ell^2(\mathbb{N}) \otimes A \hookrightarrow E$. This is another way of speaking about strictly positive compact elements acting on a Hilbert module $E$ which are properly infinite in $\mathcal{K}(E)$. Indeed, the following holds true.

**Proposition 4.1.** Let $A$ be a separable $C^*$-algebra and let $a \in \mathcal{K} \otimes A$ be a positive compact operator. The following assertions are equivalent:

(a) $a$ is properly infinite in $\mathcal{K} \otimes A$, i.e. $a \oplus a \preceq a$ in $\mathcal{K} \otimes A$ ([KR00, definition 3.2]).
(b) There is an embedding of Hilbert $A$-module $\ell^2(\mathbb{N}) \otimes A \hookrightarrow [a,\ell^2(\mathbb{N}) \otimes A]$ ([CE108]).

**Proof.** (a) $\Rightarrow$ (b) If $\{d_i\}$ is an infinite sequence in $\mathcal{K} \otimes A$ such that $a = d_i^*d_i \geq \sum_{j \in \mathbb{N}} d_j^*d_j$ for all $i \in \mathbb{N}$, then we have an inclusion of Hilbert modules

$$[a \cdot \ell^2(\mathbb{N}) \otimes A] \supset [a \cdot \ell^2(\mathbb{N}) \otimes A].$$

(b) $\Rightarrow$ (a) One has embeddings of Hilbert $A$-modules

$$[a \cdot \ell^2(\mathbb{N}) \otimes A] \subset [a \cdot \ell^2(\mathbb{N}) \otimes A].$$

**Remark 4.2.** A separable Hilbert $A$-module $E$ is therefore properly infinite if and only if one (hence all) strictly positive operator $a \in \mathcal{K}(E)$ is properly infinite in $\mathcal{K}(E)$.

These different notions of proper infiniteness imply the following result for continuous fields of properly infinite $C^*$-algebras.

**Proposition 4.3.** Let $X$ be a second countable compact Hausdorff space, let $A$ be a separable continuous $C(X)$-algebra with non-zero fibres and let $a \in A_x$ be a strictly positive contraction. Consider the following assertions:

(a) All the operators $a_x$ are properly infinite in $A_x$ ($x \in X$).
(b) The operator $a$ is properly infinite in $A$.
(c) The multiplier $C^*$-algebra $M(A)$ is a unital properly infinite $C^*$-algebra.

Then (c) $\Rightarrow$ (b) $\Rightarrow$ (a). But (a) $\not\Rightarrow$ (b) and (b) $\not\Rightarrow$ (c).

**Proof.** (c)$\Rightarrow$ (b) If $\sigma : T_2 = C^* < s_1, s_2 > \to M(A)$ is a unital $*$-homomorphism, then the two elements $d_1 = \sigma(s_1) \cdot a^{1/2}$ and $d_2 = \sigma(s_2) \cdot a^{1/2}$ satisfy $d_i^*d_j = \delta_{i,j} \cdot a$ in $A$.

(b)$\Rightarrow$ (a) The relations $c_i^*c_j = \delta_{i,j} \cdot a$ between 3 operators $c_1, c_2, a$ in a $C(X)$-algebra $A$ entails that $(c_i)^*(c_j)_x = \delta_{i,j} \cdot a_x$ in the quotient $A_x = A/C_0(X \setminus \{x\}) \cdot A$ for all $x \in X$.

(a)$\not\Rightarrow$ (b) Let $B_3 = \{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid x_1^2 + x_2^2 + x_3^2 \leq 1\}$ be the unit ball of dimension 3, let $B_3^+, B_3^-$ be the two open semi-disks $B_3^+ = \{(x_1, x_2, x_3) \in B_3 \mid x_3 > -\frac{1}{2}\}$, $B_3^- = \{(x_1, x_2, x_3) \in B_3 \mid x_3 < \frac{1}{2}\}$ and let $S_2 = \{(x_1, x_2, x_3) \in B_3 \mid x_1^2 + x_2^2 + x_3^2 = 1\} \subset B_3$ be the unit sphere of dimension 2.

The self-adjoint operator $f \in C(B_3) \otimes M_2(\mathbb{C}) \cong C(B_3, M_2(\mathbb{C}))$ given by

$$f(x_1, x_2, x_3) = \frac{1}{2} \cdot \begin{pmatrix}
1 + x_3 & x_1 - i x_2 \\
1 + i x_2 & 1 - x_3
\end{pmatrix}$$

is a positive contraction since each self-adjoint matrix $f(x_1, x_2, x_3) \in M_2(\mathbb{C})$ satisfies

$$f(x_1, x_2, x_3)^2 = f(x_1, x_2, x_3) + \frac{1}{4} (x_1^2 + x_2^2 + x_3^2 - 1) \cdot 1_{M_2(\mathbb{C})}.$$
Remark 4.4. has the desired properties ([RR11, Example 9.13]).

The non trivial Hilbert \( C(B_3) \)-module \( F := \{ f \cdot \left( \frac{C(B_3)}{C(B_3)} \right) \} \) satisfies the two isomorphisms of Hilbert \( C(B_3) \)-module:

\[
\begin{align*}
&- F \cdot C_0(B_3^+) \cong C_0(B_3^+) \oplus C_0(B_3^+ \setminus S_2 \cap B_3^+) \\
&- F \cdot C_0(B_3^-) \cong C_0(B_3^-) \oplus C_0(B_3^- \setminus S_2 \cap B_3^-) .
\end{align*}
\]

The set \( B_\infty := \{ x \in \ell^2(\mathbb{N}) : \sum_p |x_p|^2 \leq 1 \} \) is a metric compact space called the complex Hilbert cube when equipped with the distance \( d((x_p), (y_p)) = \sum_p 2^{-p-2} |x_p - y_p| \).
Denote by \( E_{DD} \) the non-trivial Hilbert \( C(B_\infty) \)-module with fibres \( \ell^2(\mathbb{N}) \) constructed by J. Dixmier and A. Douady ([DD63, §17], [BK04a, Proposition 3.6]).

Finally, consider the product \( X := B_\infty \times B_3 \) and the Hilbert \( C(X) \)-module

\[
H := E_{DD} \otimes C(B_3) \oplus C(B_\infty) \otimes F .
\]

The two Hilbert \( C(X) \)-submodules \( H \cdot C_0(B_\infty \times B_3^+) \) and \( H \cdot C_0(B_\infty \times B_3^-) \) are properly infinite, i.e. there exist embeddings of Hilbert \( C(X) \)-module \( \ell^2(\mathbb{N}) \otimes C_0(B_\infty \times B_3^+) \hookrightarrow H \cdot C_0(B_\infty \times B_3^+) \) and \( \ell^2(\mathbb{N}) \otimes C_0(B_\infty \times B_3^-) \hookrightarrow H \cdot C_0(B_\infty \times B_3^-) \). Hence, all the fibres of the Hilbert \( C(X) \)-module \( H \) are properly infinite Hilbert spaces, i.e. \( \ell^2(\mathbb{N}) \hookrightarrow H_x \) for all point \( x \) in the compact space \( X = B_\infty \times B_3 \cup B_\infty \times B_3^- \) ([CEE08]). But the Hilbert \( C(X) \)-module \( H \) is not properly infinite i.e. \( \ell^2(\mathbb{N}) \otimes C(X) \not\hookrightarrow H \) ([RR11, Example 9.11]). The equality \( C(B_3) = C_0(B_3^+) + C_0(B_3^-) \) only implies that \( \ell^2(\mathbb{N}) \otimes C(X) \hookrightarrow H \oplus H \).

(b) \( \not\equiv \) (c) There exists a continuous field \( \tilde{H} \) of Hilbert spaces over the compact space \( Y := B_\infty \times (B_3)^\infty \) such that \( H = [a \cdot \tilde{H}] \) for some properly infinite contraction \( a \in K(H) \) and the \( C^* \)-algebra \( \mathcal{L}(\tilde{H}) \) is not properly infinite. Indeed, let \( \eta \in \ell^\infty(B_\infty, \ell^2(\mathbb{N}) \oplus \mathbb{C}) \) be the section \( x \mapsto x \oplus \sqrt{1 - \|x\|^2} \), let \( \tilde{F} \) be the closed Hilbert \( C(B_\infty) \)-module \( \tilde{F} := [C(B_\infty, \ell^2(\mathbb{N}) \oplus \mathbb{C}) \otimes \eta] \), let \( \theta_{\eta, \eta} \in \mathcal{L}(\tilde{F}) \) be the projection \( \zeta \mapsto \eta(\eta, \zeta) \) and let \( E_{DD} = (1 - \theta_{\eta, \eta}) \cdot \tilde{F} \) be the Hilbert \( C(B_\infty) \)-submodule built in [DD63]. Define also the sequence of contractions \( \tilde{f} = (\tilde{f}_n) \) in \( \ell^\infty \left( \mathbb{N}, M_2(C((\hat{B}_3)^\infty)) \right) \) by

\[
x_n = (x_{n,k}) \in (B_3)^\infty \mapsto \tilde{f}_n(x_n) := f(x_{n,k}) \in M_2(\mathbb{C}) .
\]

The Hilbert \( C(Y) \)-module

\[
\tilde{H} := C(Y) \oplus E_{DD} \otimes C((B_3)^\infty) \oplus C(B_\infty) \otimes \left[ \tilde{f} \cdot \ell^2 \left( \mathbb{N}, \left( \frac{C((B_3)^\infty)}{C(B_\infty)} \right) \right) \right]
\]

has the desired properties ([RR11, Example 9.13]).

Remark 4.5. If the strictly positive contraction \( a \in A \) in Proposition 4.3 is a projection, then \( a \) is the unit of the \( C^* \)-algebra \( A \) and so (b) \( \equiv \) (c) in that case.

Question 4.5. Is the full unital free product \( \mathcal{T}_2 \ast \mathcal{T}_2 \) a properly infinite \( C^* \)-algebra which is not \( K_1 \)-injective? (see the equivalence (a) \( \equiv \) (c) in Corollary 3.3)
5. The Pimsner-Toeplitz algebra of a Hilbert $C(X)$-module

We look in this section at the proper infiniteness question for the unital continuous $C(X)$-algebras with fibres $O_\infty$ corresponding to the Pimsner-Toeplitz $C(X)$-algebras of Hilbert $C(X)$-modules with infinite dimension fibres.

**Definition 5.1.** ([Pim95]) Let $X$ be a compact Hausdorff space and let $E$ be a full Hilbert $C(X)$-module, i.e. without any zero fibre.

a) The full Fock Hilbert $C(X)$-module $\mathcal{F}(E)$ of $E$ is the direct sum

$$\mathcal{F}(E) := \bigoplus_{m \in \mathbb{N}} E^{(\otimes_{C(X)})^m},$$

where $E^{(\otimes_{C(X)})^m} := \begin{cases} C(X) & \text{if } m = 0, \\ E \otimes_{C(X)} \ldots \otimes_{C(X)} E & (m \text{ terms}) \text{ if } m \geq 1, \end{cases}$

b) The Pimsner-Toeplitz $C(X)$-algebra $\mathcal{T}(E)$ of $E$ is the unital subalgebra of the $C(X)$-algebra $\mathcal{L}(\mathcal{F}(E))$ of adjointable $C(X)$-linear operators acting on $\mathcal{F}(E)$ generated by the creation operators $\ell(\zeta)$ ($\zeta \in E$), where

$$- \ell(\zeta) (f \cdot \hat{1}_{C(X)}) := f \cdot \zeta = \zeta \cdot f \quad \text{for } f \in C(X) \quad \text{and}$$

$$- \ell(\zeta) (\zeta_1 \otimes \ldots \otimes \zeta_k) := \zeta \otimes \zeta_1 \otimes \ldots \otimes \zeta_k \quad \text{for } \zeta_1, \ldots, \zeta_k \in E \quad \text{if } k \geq 1. \tag{5.2}$$

c) Let $(C^*(\mathbb{Z}), \Delta)$ be the abelian compact quantum group generated by a unitary $u$ with spectrum the unit circle and with coproduct $\Delta(u) = u \otimes u$. Then, there is a unique coaction $\alpha$ of the Hopf $C^*$-algebra $(C^*(\mathbb{Z}), \Delta)$ on the Pimsner-Toeplitz $C(X)$-algebra $\mathcal{T}(E)$ such that $\alpha(\ell(\zeta)) = \ell(\zeta) \otimes u$ for all $\zeta \in E$, i.e.

$$\alpha : \mathcal{T}(E) \to \mathcal{T}(E) \otimes C^*(\mathbb{Z}) = C(\mathcal{T}, \mathcal{T}(E))$$

$$\ell(\zeta) \mapsto \ell(\zeta) \otimes u = (z \mapsto \ell(z\zeta)) \tag{5.3}$$

The fixed point $C(X)$-subalgebra $\mathcal{T}(E)^{\alpha} = \{ a \in \mathcal{T}(E) ; \alpha(a) = a \otimes 1 \}$ under this coaction is the closed linear span

$$\mathcal{T}(E)^{\alpha} = \left[ C(X) \cdot 1_{\mathcal{T}(E)} + \sum_{k \geq 1} \ell(E)^k \cdot (\ell(E)^k)^* \right]. \tag{5.4}$$

Besides, the projection $P \in \mathcal{L}(\mathcal{F}(E))$ onto the submodule $E$ induces a quotient morphism of $C(X)$-algebras $a \in \mathcal{T}(E)^{\alpha} \mapsto \overline{q}(a) := P \cdot a \cdot P \in \mathcal{K}(E) + C(X) \cdot 1_{\mathcal{L}(E)} \subset \mathcal{L}(E)$.

**Proposition 5.2.** Let $X$ be a second countable compact Hausdorff perfect space and let $E$ be a separable Hilbert $C(X)$-module with infinite dimensional fibres.

1) There exist a covering $X = \tilde{F}_1 \cup \ldots \cup \tilde{F}_m$ by the interiors of closed subsets $F_1, \ldots, F_m$ and norm 1 sections $\zeta_1, \ldots, \zeta_m$ in $E$ such that $\mathcal{T}(E) = C^*<\mathcal{T}(E)^{\alpha}, \ell(\zeta_1), \ldots, \ell(\zeta_m)>,$ $(\ell(\zeta_k)\ell(\zeta_k)^*)_{|F_k}$ and $(1 - \ell(\zeta_k)\ell(\zeta_k)^*)_{|F_k}$ are properly infinite projections in $\mathcal{T}(E)|_{F_k}$ for all index $k \in \{1, \ldots, m\}$.

2) Set $G_k := F_1 \cup \ldots \cup F_k$ for all integer $k \in \{1, \ldots, m\}$ and $G_l := G_l \cap F_{l+1}$ for all integer $l \in \{1, \ldots, m-1\}$. If $\xi(l) \in E_{G_l}$ is a section such that $\|\xi(l)\|_y = 1$ for all $y \in G_l$, then there is a unitary $w_l \in \mathcal{T}(E)|_{G_l}$ such that

(a) $w_l \cdot \ell(\xi(l))|_{\tilde{G}_l} = \ell(\zeta_{l+1})|_{\tilde{G}_l}$. 

7
(b) \( w_l \oplus 1_{\hat{G}_l} \) is homotopic to \( 1_{\hat{G}_l} \oplus 1_{\hat{G}_l} \) among the unitaries in \( M_2(T(E)_{\hat{G}_l}) \).

3) If for all \( K_1 \)-trivial unitary \( w_k \in T(E)_{\hat{G}_k} \) there is a unitary \( z_{k+1} \in T(E)^y_{F_{k+1}} \) such that \( (z_{k+1})_{G_k} = w_k \) \( (1 \leq k \leq m - 1) \), then there is a section \( \xi \in E \) satisfying

\[
\forall x \in X, \quad \|\xi_x\| = 1, \tag{5.5}
\]

so that Lemma 6.1 of [Bian13] implies that the \( C^* \)-algebra \( T(E) \) is properly infinite.

Proof. 1) Given a point \( x \in X \) and a unit vector \( \zeta \in E_x \), let \( \xi_1, \xi_2, \xi_3 \) be three norm 1 sections in \( E \) such that \( (\xi_1)_x = \zeta \) and the matrix \( a := ([\xi_1, \xi_2]) \in M_3(C(X)) \) satisfies \( a_x = 1_x \in M_3(\mathbb{C}) \). Let \( F \subset X \) be a closed neighbourhood of \( x \) such that \( \|a_y - 1_x\| \leq 1/2 \) for all \( y \in F \). Define the sections \( \xi'_1, \xi'_2, \xi'_3 \) in \( E_{|F} \) by

\[
\xi'_1 \oplus \xi'_2 \oplus \xi'_3 = (\xi_1 \oplus \xi_2 \oplus \xi_3)_{|F} \cdot (a^*a)_{|F}^{-1/2}. \tag{5.6}
\]

One has \( (\xi'_1 \oplus \xi'_2 \oplus \xi'_3, \xi'_1 \oplus \xi'_2 \oplus \xi'_3)_E = (a^*_F a_F)^{-1/2} \cdot (a^*_F a_F)_{|F}^{-1/2} = 1 \) in \( M_3(C(F)) \). Hence, \( \ell(\xi'_1) \ell(\xi'_1)^* \) and \( q := 1_{|F} - \ell(\xi'_1) \ell(\xi'_1)^* \) are properly infinite projections in \( T(E)_{|F} \) since

\[
- 1_{|F} - q = \ell(\xi'_1) \ell(\xi'_1)^* \geq \ell(\xi'_1) \ell(\xi'_1)^* \ell(\xi'_1) \ell(\xi'_1)^* + \ell(\xi'_1) \ell(\xi'_1)^* \ell(\xi'_1) \ell(\xi'_1)^* = q \ell(\xi'_1) q \ell(\xi'_1)^*, \quad \ell(\xi'_1) q \ell(\xi'_1)^* \geq \ell(\xi'_1) q \ell(\xi'_1)^* + \ell(\xi'_1) q \ell(\xi'_1)^* = q \ell(\xi'_1) q \ell(\xi'_1)^*, \tag{5.7}
\]

so that there exist unital \(*\)-homomorphisms from \( T_\mathcal{A} \) to \( (1 - q) \cdot T(E)_{|F} \cdot (1 - q) \) and \( q \cdot T(E)_{|F} \cdot q \) given by \( s \mapsto \ell(\xi'_1) \ell(\xi'_1+i) \ell(\xi'_1)^* \) and \( s \mapsto \ell(\xi'_1+i) \ell(\xi'_1)^* \) for \( i = 1, 2 \).

The compactness of the space \( X \) enables to end the proof of this first assertion.

2) Let \( v_l \in T(E)_{\hat{G}_l} \) be the partial isometry \( v_l := \ell(\xi_{l+1})_{\hat{G}_l} \cdot \ell(\xi(l))_{\hat{G}_l} \). There exists by Lemma 2.4 of [BRR08] a \( K_1 \)-trivial unitary \( w_l \) in the properly infinite unital \( C^* \)-algebra \( T(E)_{\hat{G}_l} \) which has the two requested properties (a) and (b).

3) One constructs inductively the restrictions \( \xi_l \) of \( \xi_{l+1} \) in \( E_{|G_l} \). Set \( \xi_{G_l} := \xi_1 \) and assume \( \xi_{G_k} \) already constructed. As \( \ell(\xi_{G_k})_{|G_k} = z_{l+1} \cdot \ell(\xi_{k+1})_{|G_k} \), the only extension \( \xi_{G_{k+1}} \in E_{|G_{k+1}} \) such that \( (\xi_{G_{k+1}})_{|G_k} = \xi_{G_k} \) and \( (\xi_{G_{k+1}})_{|F_{k+1}} = \mathfrak{q}(z_{k+1}) \cdot (\xi_{k+1})_{|F_{k+1}} \) satisfies \( \|((\xi_{G_{k+1}})_{|G_k}) x \| = 1 \) for all point \( x \in G_{k+1} \).

Remarks 5.3. a) The non trivial separable Hilbert \( C(B_\infty) \)-module \( E_D \) constructed by J. Dixmier and A. Douady ([DD63]) has infinite dimensional fibres and every section \( \zeta \in E_D \) satisfies \( \zeta_x = 0 \) for at least one point \( x \in B_\infty \). Thus, it cannot satisfy the assumptions for the assertion 3) of Proposition 5.2. There are some \( k \in \{1, \ldots, m-1\} \) and a unitary \( a_{k+1} \in \mathcal{U}(M_2(T(E_D)_{|F_{k+1}})) \) such that

\[
(a_{k+1})_{|G_k} = w_k \oplus 1_{\hat{G}_k} \tag{5.8}
\]

and either \( a_{k+1} \notin T(E_D)_{|F_{k+1}} \oplus C(F_{k+1}) \) or \( a(a_{k+1}) \neq a_{k+1} \oplus 1 \).

a') If \( \hat{H} \) is the Hilbert \( C(Y) \)-module considered in (4.6), is the Pimsner-Toeplitz algebra \( T(H) \) properly infinite?

b) If each of the \( K_1 \)-trivial unitaries \( w_l \) introduced in assertion 2) of Proposition 5.2 satisfies \( a(w_l) = w_l \otimes 1 \) and \( w_l \sim_h 1_{\hat{G}_l} \) in \( \mathcal{U}(T(E)^{y}_{G_l}) \), then there exist by [LLR00, Lemma 2.1.7] \( m-1 \) unitaries \( z_{l+1} \in T(E)^{y}_{F_{k+1}} \) such that \( (z_{l+1})_{G_l} = w_l \), so that there exists a section \( \xi \in E \) with \( \xi_x \neq 0 \) for all \( x \in X \).
c) Let $A$ be a separable unital continuous $C(B_\infty)$-algebra with fibres isomorphic to $O_\infty$ such that $K_i(A) \cong C(Y_0, \Gamma_i)$ for $i = 0, 1$, where $(\Gamma_0, \Gamma_1)$ is a pair of countable abelian torsion groups ([Dăd09, §3]). Let $\varphi$ be a continuous field of faithful states on $A$. Then the $C(B_\infty)$-algebra $A' \subset L^2(A, \varphi)$ generated by $\pi_\varphi(A)$ and the algebra of compact operators $K(L^2(A, \varphi))$ is a continuous $C(B_\infty)$-algebra since both the ideal $K(L^2(A, \varphi))$ and the quotient $A \cong A'/K(L^2(A, \varphi))$ are continuous (see e.g. [Blan09, Lemma 4.2]). All the fibres of $A'$ are isomorphic to the Cuntz extension $\mathcal{T}_\varphi$. But $A'$ is not a trivial $C(B_\infty)$-algebra since $K_0(A') = C(Y_0, \Gamma_0) \oplus \mathbb{Z}$ and $K_1(A') = C(Y_0, \Gamma_1)$.

d) Let $\mathbb{D}$ be the unit ball $\mathbb{D} := \{z \in \mathbb{C} : |z| \leq 1\}$ and define the compact space $S^2$ by $C(S^2) := \{f \in C(\mathbb{D}) : f(z) = f(1) \text{ if } |z| = 1\}$. If $Y$ is the compact product $Y := \prod_{n=1}^{\infty} S^2$ and $Y_0 \subset [0, 1]$ is the canonical Cantor set, then the unital continuous $C(Y)$-algebra $D$ constructed by M. Dădărlat in [Dăd09, section 3] satisfies $K_0(D) = C(Y_0, \mathbb{Z})$ and all its fibres are isomorphic to the universal UHF algebra $D_0$, with $K_0(D_0) = \mathbb{Q}$. The tensor product $D \otimes O_\infty$ is a non trivial unital continuous $C(Y)$-algebra with fibres $D_0 \otimes O_\infty$ since $K_0(D \otimes O_\infty) = C(Y_0, \mathbb{Z})$ whereas $K_1(C(Y)) = \mathbb{Z}^2 \oplus 0$, $K_1(D_0) = \mathbb{Q} \oplus 0$ and so $K_0(C(Y, D_0 \otimes O_\infty)) = \mathbb{Q} \oplus \mathbb{Q}$ by the Künneth formula ([Blac98]).

Question 5.4. The Pimsner-Toeplitz algebra $\mathcal{T}(E_{DD})$ is locally purely infinite ([BK04b, Definition 1.3]) since all its simple quotients are isomorphic to the Cuntz algebra $O_\infty$ ([BK04b, Proposition 5.1]). But is $\mathcal{T}(E_{DD})$ properly infinite?
