1 Introduction and notation

Catalan words are particular growth-restricted words they represent still another combinatorial class counted by the Catalan numbers, see for instance [13] exercise 6.19.u, p. 222. This paper contributes to a recent line of research on classical pattern avoidance on words subject to some growth restrictions (for instance, ascent sequences [2, 6], inversion sequences [5, 10], restricted growth functions [4, 9]) by investigating connections between sequences on the On-line Encyclopedia of Integer Sequences [11] and Catalan words avoiding two patterns of length 3.

Through this paper we consider words over the set of non-negative integers and we denote such words by sequences (for instance $w_1w_2\ldots w_n$) or by italicized boldface letter (for instance $w$ and $u$). The word $w = w_1w_2\ldots w_n$ is called a Catalan word if

$$w_1 = 0 \text{ and } 0 \leq w_i \leq w_{i-1} + 1 \text{ for } i = 2, 3, \ldots, n.$$  

Catalan words are in bijection with maybe the most celebrated combinatorial class having the same enumerating sequence: Dyck path.\(^{10}\) Indeed, in a length $2n$ Dyck path collecting for the up steps the ordinates of their starting points we obtain a length $n$ Catalan word, and this construction is a bijection. See Figure 1 where this bijection is depicted for an example. We denote by $C_n$ the set of length $n$ Catalan words and $c_n = |C_n|$ is the $n$th Catalan number $\frac{1}{n+1}(2n)$. \(^{11}\)

A pattern is a word with the property that if $i$ occurs in it, then so does $j$, for any $j$ with $0 \leq j < i$. A pattern $\pi = \pi_1\pi_2\ldots \pi_k$ is said to be contained in the word $w = w_1w_2\ldots w_n$, $k \leq n$, if there is a sub-word of $w$, $w_{i_1}w_{i_2}\ldots w_{i_k}$, order-isomorphic with $\pi_1\pi_2\ldots \pi_k$. If $w$ does not contain $\pi$, we say that $w$ avoids $\pi$, see for instance Kitaev’s seminal book [7] on this topic.

For a pattern $\pi$, we denote by $C_n(\pi)$ the set of length $n$ Catalan words avoiding $\pi$, and $c_n(\pi) = |C_n(\pi)|$ is the cardinality of $C_n(\pi)$ and $C(\pi) = \bigcup_{n \geq 0} C_n(\pi)$. For example, $C_n(101)$ is the set of length $n$ Catalan words avoiding 101, that is, the set of words $w$ in $C_n$ such that there are no $i, j$ and $k$, $1 \leq i < j < k \leq n$, with $w_i = w_k > w_j$. So, $C_4(101) = \{0000, 0001, 0010, 0011, 0012, 0100, 0110, 0111, 0112, 0120, 0121, 0122, 0123\}$. Likewise, if $\pi$ is the set of patterns $\{\alpha, \beta, \ldots\}$, then $C_n(\pi)$ and $c_n(\pi)$ denote both the set of length $n$ Catalan words avoiding each pattern in $\pi$; and $c_n(\pi) = c_n(\alpha, \beta, \ldots)$ and $C(\pi) = \bigcup_{n \geq 0} C_n(\pi)$.

\(^{10}\) A Dyck path is a path in the first quadrant of the plane which begins at the origin, ends at $(2n, 0)$, and consists of up steps $(1, 1)$ and down steps $(1, -1)$.

\(^{11}\) See, for instance [13] or [7] for definitions.
\(C(\alpha, \beta, \ldots)\) have similar meaning as above. A descent in a word \(w = w_1w_2 \ldots w_n\) is a position \(i, 1 \leq i \leq n - 1\), with \(w_i > w_{i+1}\). The (ordinary) generating function of a set of pattern avoiding Catalan words \(\mathcal{C}(\pi)\) is the formal power series

\[
C_{\pi}(x) = \sum_{n \geq 0} c_n(\pi)x^n = \sum_{w \in \mathcal{C}(\pi)} x^{\lvert w \rvert},
\]

where \(\lvert w \rvert\) is the length of the word \(w\). In our case of generating function approach for counting classes of pattern avoiding Catalan words we consider the descent number as an additional statistic obtaining ‘for free’ the bivariate generating function

\[
C_{\pi}(x, y) = \sum_{w \in \mathcal{C}(\pi)} x^{\lvert w \rvert}y^{\text{des}(w)},
\]

where \(\text{des}(w)\) is the number of descents of \(w\). With these notations, the coefficient of \(x^n y^k\) in \(C_{\pi}(x, y)\) is the number of Catalan words of length \(n\) avoiding \(\pi\) and having \(k\) descents, and for a set \(\mathcal{S}\) of Catalan words \(S(x)\) and \(S(x, y)\) have similar meaning.

For a word \(w = w_1w_2 \ldots w_n\) and an integer \(a\), we denote by \((w + a)\) the word obtained from \(w\) by increasing by \(a\) each of its entries, that is, the word \((w_1 + a)(w_2 + a) \cdots (w_n + a)\). In our constructions we will often make use of two particular families of Catalan words: those avoiding 10 (i.e., with no descents) and we call these words weakly increasing (or \(w.i\) for short) Catalan words; and those avoiding 00 (and thus necessarily avoiding 10) and we call these words strictly increasing (or \(s.i\) for short) Catalan words. It is easy to see that for each length \(n \geq 1\) there are \(2^{n-1}\) w.i. Catalan words and one s.i. Catalan word.

The remaining of this paper is structured as follows. In the next section we characterize pattern avoiding ascent sequences which are Catalan words, establishing ties with some similar enumerative results for ascent sequences in [3]. In Section 3 we consider classes of Catalan words avoiding both a length two and a length three pattern. In the next sections we discuss Catalan words avoiding two patterns of length three, in increasing order of their complexity: obvious cases (Section 4), cases counted via recurrences (Section 5) and cases counted via generating functions (Section 6); these results are summarized in Table 2. We conclude with some remarks and further research directions.

![Figure 1](image-url): (a) A Dyck path where each up step is labeled by the ordinate of its starting point; and (b) its corresponding Catalan word 0012330121.

## 2 Catalan words vs. ascent sequences

An ascent in a word \(w = w_1w_2 \ldots w_n\) is a position \(i, 1 \leq i \leq n - 1\), with \(w_i < w_{i+1}\), and \(\text{asc}(w)\) denotes the number of ascents in \(w\). Closely related to Catalan words are ascent sequences introduced in [3] and defined as: the word \(w = w_1w_2 \ldots w_n\) is called an ascent sequence if

\[
w_1 = 0 \text{ and } 0 \leq w_i \leq \text{asc}(w_1w_2 \ldots w_{i-1}) + 1 \text{ for } i = 2, 3, \ldots, n,
\]

and \(A_n\) denotes the set of length \(n\) ascent sequences, and \(\mathcal{A} = \cup_{n \geq 0} A_n\). Similarly as for Catalan words, if \(\pi\) is a pattern, then \(A_{\pi}(\pi)\) is the set of length \(n\) ascent sequences avoiding \(\pi\), and \(\mathcal{A}(\pi) = \cup_{n \geq 0} A_{\pi}(\pi)\).

Clearly, \(C_n = A_n\) for \(n \leq 3\), and \(C_n \subseteq A_n\) for \(n \geq 4\), and this inclusion is strict, for instance 0102 ∈ \(A_4 \setminus C_4\). It turns out that, for particular patterns \(\pi\), \(A_{\pi}(\pi)\) collapses to \(C_{\pi}(\pi)\) for any \(n\), and this behaviour where the pattern 0102 plays a critical role is discussed below.

**Proposition 1.** If \(w \in \mathcal{A} \setminus \mathcal{C}\), then \(w\) contains the pattern 0102.
Proof: If \( w = w_1 w_2 \ldots w_n \) is an ascent sequence which is not a Catalan word, then there is an \( i \) such that \( w_i \geq w_{i-1} + 2 \), and let \( k \) be the smallest such \( i \). It follows that \( w_i \leq w_{i-1} + 1 \) for any \( i, 2 \leq i \leq k - 1 \), or equivalently \( w_1 w_2 \ldots w_k-1 \) is a Catalan word. Thus, if \( w_1 > 0, 2 \leq i \leq k - 1 \), then each symbol less than \( w_i \) occurs in the prefix \( w_1 w_2 \ldots w_{i-1} \). We distinguish two cases: (i) \( w_{k-1} \) is not the maximal symbol of the prefix \( w_1 w_2 \ldots w_{k-1} \), and (ii) otherwise.

(i) In this case there exist \( i \) and \( j, 1 \leq i < j < k - 1 \), such that \( w_j = w_{k-1} + 1 \) and \( w_i = w_{k-1} \). It follows that \( w_j w_{j+1} \) is an occurrence of 0102.

(ii) In this case the prefix \( w_1 w_2 \ldots w_{k-1} \) has a descent (otherwise, since \( w \) is an ascent sequence, the maximal possible value for \( w_{k-1} \) is \( w_{k-1} + 1 \)), and let \( j \) be such a descent, that is \( w_j > w_{j+1}, j + 1 < k - 1 \).

As noticed above, the symbol \( w_{j+1} \) already occurs in \( w_1 w_2 \ldots w_{j-1} \), say in position \( i \). Thus, \( w_i w_{j+1} \) is an occurrence of 0102.

Proposition 2. For \( n \geq 4 \) and a pattern \( \pi \) the followings are equivalent

1. \( A_n(\pi) = C_n(\pi) \).
2. 0102 contains the pattern \( \pi \).

Proof: ‘2. \( \Rightarrow \) 1.’ We proceed by contraposition and considering \( C_n(\pi) \subseteq A_n(\pi) \). If \( w \in A_n(\pi) \setminus C_n(\pi) \), then, by Proposition 1, \( w \) contains 0102, and so 0102 does not contain \( \pi \).

‘1. \( \Rightarrow \) 2.’ Again by contraposition: if 0102 does not contain \( \pi \), then at least one of the words 01023 \( \ldots (n - 2) \) or 01020 \( \ldots \) belongs to \( A_n(\pi) \) and not to \( C_n(\pi) \), and so \( A_n(\pi) \neq C_n(\pi) \).

Since the only patterns of length three of 0102 are 001, 010, 012 and 102, we have the following consequence of Proposition 3.

Corollary 1. For \( n \geq 4 \) and a pattern \( \pi \) of length three, \( A_n(\pi) = C_n(\pi) \) if and only if \( \pi \in \{001, 010, 012, 102\} \).

Pattern avoidance in ascent sequences was initiated in [3], and in [3] ascent sequences avoiding a pair of patterns of length three are considered and exact enumeration for several such pairs are given. In light of Corollary 1 it can happen that if a pattern of the avoided pair is one of the four specified in this corollary, then the resulting ascent sequences are Catalan words as well. The pairs of avoided patterns for which ascent sequences and Catalan words coincide, and for which the enumeration has already been considered in [3] are highlighted in the summarizing Table 3. In order to keep the present article self-contained we fully consider these cases, our proofs being alternative to those in [3].

3 Avoiding a length two and a length three pattern

There are three patterns of length two, namely 00, 01, and 10, and we have:

Proposition 3. The number of Catalan words avoiding a pattern of length two and a pattern \( \pi \) of length three is given by:

\[
c_n(00, \pi) = \begin{cases} 0 & \text{if } \pi = 012 \text{ and } n \geq 3, \\ 1 & \text{elsewhere}; \end{cases} \quad c_n(01, \pi) = \begin{cases} 0 & \text{if } \pi = 000 \text{ and } n \geq 3, \\ 1 & \text{elsewhere}; \end{cases}
\]

\[
c_n(10, \pi) = \begin{cases} F_n & \text{if } \pi = 000, \\ n & \text{if } \pi \in \{001, 011, 012\}, \\ 2^{n-1} & \text{elsewhere}, \end{cases}
\]

where \( F_n \) is the \( n \)th Fibonacci number defined by \( F_0 = F_1 = 1 \) and \( F_n = F_{n-1} + F_{n-2}, n \geq 2 \).

Proof: If \( w \in C_n(00) \), then \( w = 012 \ldots (n - 1) \). Thus, \( C_n(00, \pi) = \{012 \ldots (n - 1)\} \) except when \( \pi = 012 \) and in this case \( C_n(00, \pi) = \emptyset \) for \( n \geq 3 \), and the counting relation for \( C_n(00, \pi) \) follows. Similarly, if \( w \in C_n(01) \), then \( w = 000 \ldots 0 \). Thus, \( C_n(01, \pi) = \{000 \ldots 0\} \) except when \( \pi = 000 \) and in this case \( C_n(01, \pi) = \emptyset \) for \( n \geq 3 \).

Finally, a Catalan word avoids 10 if and only if it avoids 010. It follows that \( c_n(10, \pi) = c_n(010, \pi) \), which falls in the case of avoidance of two length 3 patterns and the corresponding proofs are given in the next section, see also Table 3.
4 Trivial cases

Superfluous patterns

If the pattern \( \tau \) contains the pattern \( \sigma \), then clearly \( C_n(\sigma, \tau) = C_n(\sigma) \); but this phenomenon can occur even when \( \sigma \) and \( \tau \) are not related by containment and in this case, following \( \mathbb{4} \), we say that \( \tau \) is a superfluous pattern for \( \sigma \). For example, any word in \( C_n(012) \) is a binary word, and thus any pattern with at least three different symbols is a superfluous pattern for 012. In Table 1 are listed all pairs of superfluous patterns of length three. It is worth to mentioning that superfluousness is a transitive relation, for instance 201 is superfluous for 021 which in turn is superfluous for 011. So, a pattern can be superfluous for several other ones, for instance \( \tau = 201 \) is superfluous for each of the patterns 001, 010, 011, 012, 021, 101, 120. Also it is easy to see that if \( \tau \) is superfluous for \( \sigma \), then \( \tau \) is larger lexicographically than \( \sigma \).

Table 1: In each column, each pattern \( \tau \) is superfluous for the pattern \( \sigma \).

| \( \sigma \) | 000 | 001 | 010 | 011 | 012 | 021 | 101 | 110 | 120 |
|------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 010        | 100 | 101 | 021 | 021 | 201 | 102 | 210 | 201 | 201 |
| 021        | 101 | 102 | 101 | 102 | 210 | 201 | 210 |
| 201        | 102 | 110 | 201 | 210 |
| 120        | 201 |
| 210        |     |

Ultimately constant sequences

It can happen that the number of Catalan words avoiding a pair of length 3 patterns is constant for enough long words. The only two such cases are given below.

**Proposition 4.** \( c_n(000, 011) = \begin{cases} 1 & \text{if } n = 1, \\ 2 & \text{if } n = 2, \\ 3 & \text{if } n \geq 3; \end{cases} \) and \( c_n(000, 012) = \begin{cases} 1 & \text{if } n = 1, \\ 2 & \text{if } n = 2, \\ 3 & \text{if } n = 3 \text{ or } n = 4, \\ 0 & \text{if } n \geq 5. \end{cases} \)

**Proof:** If \( n \geq 3 \), then \( C_n(000, 011) = \{0x, x0, x(n-1)\} \) where \( x \) is the word \( 01\cdots(n-2) \), and the first point follows.
If a Catalan word avoids 012, then it is a binary word. In addition if its length is larger than 4 it necessarily contains three identical entries, and so \( C_n(000, 012) = \emptyset \) for \( n \geq 5 \). Considering the initial values of \( c_n(000, 012) \) the second point follows.

Counting sequence \( n \)

**Proposition 5.** If \( \pi \) is one of the pairs of patterns \{001, 010\}, \{001, 011\}, \{001, 012\}, \{010, 011\}, \{010, 012\} or \{011, 012\}, then \( c_n(\pi) = n \).

**Proof:** The proof is based on the easy to understand description given below for the corresponding sets of Catalan words:

\[
\begin{array}{|c|c|c|c|}
\hline
\pi & C_n(\pi) & \pi & C_n(\pi) \\
\hline
\{001, 010\} & \{012\cdots j \cdots : 0 \leq j \leq n-1\} & \{010, 011\} & \{012\cdots (n-j) : 1 \leq j \leq n\} \\
\{001, 011\} & \{012\cdots j \cdots 0 : 0 \leq j \leq n-1\} & \{010, 012\} & \{012\cdots (n-j-1) : 0 \leq j \leq n-1\} \\
\{001, 012\} & \{012\cdots j \cdots 0 : 0 \leq j \leq n-1\} & \{011, 012\} & \{0^n \cup 0^j 10^{n-j-1} : 1 \leq j \leq n-1\} \\
\hline
\end{array}
\]
5 Counting via recurrence

Counting sequence $2(n - 1)$

**Proposition 6.** If $\pi = \{011, 100\}$ or $\pi = \{011, 120\}$, then $c_n(\pi) = 2(n - 1)$ for $n \geq 2$ (Sequence A005843 in [11]).

**Proof:** If $\pi = \{011, 100\}$ and $w \in C_n(\pi)$, $n \geq 2$, then either
- $w = 0^k u$, $0 \leq k \leq n - 1$, with $u$ a s.i. Catalan word (of length at least one), or
- $w = 0^k u 0$, $0 \leq k \leq n - 3$, with $u$ a s.i. Catalan word (of length at least two).

In the first case there are $n$ possibilities for $w$ and $n - 2$ possibilities in the second case, and the result holds. If $\pi = \{011, 120\}$ and $w \in C_n(\pi)$, $n \geq 2$, then either
- $w = 0^k u$, $0 \leq k \leq n - 1$, with $u$ a s.i. Catalan word, or
- $w = 0^k 10^{n-k-1}$, $1 \leq k \leq n - 2$,
and as previously the result holds. $\square$

Sequences involving $2^n$

**Proposition 7.** If $\pi = \{000, 101\}$, then $c_n(\pi) = 2^{n-1}$ for $n \geq 1$ (Sequence A000079 in [11]).

**Proof:** If a Catalan word avoids 101, then it is unimodal (that is, it can be written not necessarily in a unique way as $u v w$ with $u$ a weakly decreasing and $v$ weakly decreasing word). In addition, if the word avoids 000, then its maximal value occurs at most twice, and when it occurs twice this happens in consecutive positions. We denote by $D_n$ the subset of words in $C_n(\pi)$ where the maximal entry occurs once and by $E_n$ that where it occurs twice, $d_n = |D_n|$, $e_n = |E_n|$, and $c_n(\pi) = d_n + e_n$. Any word $w = w_1 \cdots m m \cdots w_{n-1} \in E_n$ with its maximal value $m$ occurring twice can be extended into a word in $D_n$ by one of the transformations:
- $w \mapsto w_1 \cdots m (m+1) m \cdots w_{n-1}$, and
- $w \mapsto w_1 \cdots m m (m+1) \cdots w_{n-1}$,
and any word $w = w_1 \cdots m m \cdots w_{n-1} \in D_n$ with its maximal value $m$ occurring once can be extended into a word in $D_n$ by:
- $w \mapsto w_1 \cdots m (m+1) \cdots w_{n-1}$.

Conversely, any word in $D_n$, $n \geq 2$, can uniquely be obtained from a word in $D_{n-1}$ or in $E_{n-1}$ by reversing one of the transformations above, so

$$d_n = 2 \cdot c_{n-1} + d_{n-1},$$

for $n \geq 2$.

Reasoning in a similar way we have

$$e_n = 2 \cdot c_{n-2} + d_{n-2},$$

Thus, for $n \geq 3$, $e_n = d_{n-1}$, and finally

$$c_n(\pi) = d_n + e_n = 2 \cdot (d_{n-1} + e_{n-1}) = 2 \cdot c_{n-1}(\pi),$$

and with the initial conditions $c_1(\pi) = 1$ and $c_2(\pi) = 2$, the result follows. $\square$

**Proposition 8.** If $\pi = \{101, 210\}$ or $\pi = \{102, 120\}$, then $c_n(\pi) = (n - 1) \cdot 2^{n-2} + 1$ for $n \geq 2$ (Sequence A005183 in [11]).

**Proof:** If $\pi = \{101, 210\}$ and $w \in C_n(\pi)$, $n \geq 3$, then either
- $w = 0 u$ with $u \in C_{n-1}(\pi)$, or
- $w = 0(u+1)$ with $u \in C_{n-1}(\pi)$, or
- $w = 0(u+1) 0^{n-k-1}$ with $u$ a w.i. Catalan word of length $k$, $1 \leq k \leq n - 2$.
The number of words in each of the first two cases is \( c_{n-1}(\pi) \). The number of length \( k \) w.i. Catalan words is \( 2^{k-1} \), so the number of words in the last case is
\[
\sum_{k=1}^{n-2} 2^{k-1} = \sum_{k=0}^{n-3} 2^k = 2^{n-2} - 1.
\]
Thus, \( c_n(\pi) = 2c_{n-1}(\pi) + 2^{n-2} - 1 \), and after calculation the result holds.

If \( \pi = \{102, 120\} \) and \( w \in \mathcal{C}_n(\pi) \), \( n \geq 3 \), then either
- \( w = 0u \) with \( u \in \mathcal{C}_{n-1}(\pi) \), or
- \( w = 0(u + 1) \) with \( u \in \mathcal{C}_{n-1}(\pi) \), or
- \( w = 01u \) with \( u \) a length \( (n-2) \) binary word other than \( 11 \cdots 1 \).

The number of words in each of the first two cases is \( c_{n-1}(\pi) \), and the number of words in the last case is \( 2^{n-2} - 1 \). So \( c_n(\pi) = 2c_{n-1}(\pi) + 2^{n-2} - 1 \), and again the result holds. \( \square \)

**Proposition 9.** If \( \pi \) is one of the pairs of patterns \( \{021, 100\} \), \( \{021, 101\} \), \( \{101, 110\} \) or \( \{101, 120\} \), then \( c_n(\pi) = 2^n - n \) for \( n \geq 1 \) \( \text{A000325} \) in [7].

**Proof:**
If \( \pi = \{021, 100\} \) and \( w \in \mathcal{C}_n(\pi) \), \( n \geq 4 \), then either
- \( w \) is a w.i. Catalan word, or
- \( w = u0 \) with \( u \) a w.i. Catalan word of length \( (n-1) \) other than \( 00 \cdots 0 \), or
- \( w = 0u0(u + 1) \) where \( w \) is w.i. binary word ending by 1 and \( u \) is a w.i. Catalan word of length \( k \), \( 1 \leq k \leq n-3 \).

In the first case the number of words \( w \) is \( 2^{n-1} \) and in the second case the number of words \( w \) is \( 2^{n-2} - 1 \).

In last case the number of words \( w \) is
\[
\sum_{k=1}^{n-3} (n - k - 2) \cdot 2^{k-1} = 2^{n-2} - (n - 1).
\]

Combining these cases and considering the initial values of \( c_n(\pi) \) the result holds.

If \( \pi = \{021, 101\} \) and \( w \in \mathcal{C}_n(\pi) \), \( n \geq 2 \), then either
- \( w = u0 \) with \( u \in \mathcal{C}_{n-1}(\pi) \), or
- \( w = 0^{n-k}(u + 1) \) with \( u \) a w.i. Catalan word of length \( k \), \( 1 \leq k \leq n-1 \).

The number of words in the first case is \( c_{n-1}(\pi) \) and the number of words in the second case is \( \sum_{k=1}^{n-1} 2^k = 2^{n-1} - 1 \). So \( c_n(\pi) = c_{n-1}(\pi) + 2^{n-1} - 1 \) and after calculation the result follows.

If \( \pi = \{101, 110\} \) and \( w \in \mathcal{C}_n(\pi) \), \( n \geq 3 \), then either
- \( w = u0 \) with \( u \in \mathcal{C}_{n-1}(\pi) \), or
- \( w = 0(u + 1) \) with \( u \in \mathcal{C}_{n-1}(\pi) \), or
- \( w = u0^{n-k} \) with \( u \) a s.i. Catalan word of length \( k \), \( 2 \leq k \leq n-1 \).

The number of words \( w \) in each of the first two cases is \( c_{n-1}(\pi) \). For the last case, for each \( k \) there is exactly one word \( w \), so their number is \( (n - 2) \) in this case. So \( c_n(\pi) = 2c_{n-1}(\pi) + n - 2 \) and after calculation the result holds.

If \( \pi = \{101, 120\} \) and \( w \in \mathcal{C}_n(\pi) \), \( n \geq 3 \), then either
- \( w = u0 \) with \( u \in \mathcal{C}_{n-1}(\pi) \), or
- \( w = 0(u + 1) \) with \( u \in \mathcal{C}_{n-1}(\pi) \), or
- \( w = 01^{k}0^{n-k-1} \), \( 1 \leq k \leq n-2 \).

So, again \( c_n(\pi) = 2c_{n-1}(\pi) + n - 2 \). \( \square \)

**Proposition 10.** If \( \pi = \{021, 120\} \), then \( c_n(\pi) = (n + 2) \cdot 2^{n-3} \) for \( n \geq 3 \) \( \text{A045623} \) in [7].

**Proof:** If \( w \in \mathcal{C}_n(\pi) \), \( n \geq 4 \), then either
- \( w = 0u0 \) with \( u \) a length \( (n-2) \) binary word, or
- \( w = 0(u + 1) \) with \( u \) a length \( (n-1) \) w.i. Catalan word, or
Catalan words avoiding pairs of length three patterns

Let $D_n$ be the set of words in $C_n(102, 110)$ having one descent and avoiding 00 before the descent. Then $|D_n| = \frac{2}{9}(n-1)(n-2)$.

Proof: A word belongs to $D_n$, $n \geq 3$, if and only if it can be written as

$$012\ldots(k-1)a(u + a),$$

with $2 \leq k \leq n-1$ ($k$ is the position of the unique descent in the word), $a \in \{0, 1, \ldots, k-2\}$, and $u$ is a length $(n-k-1)$ w.i. Catalan word over $\{0, 1\}$. For each choice of $k$, there are $k-1$ choices for $a$, and for each choice for $a$ there are $n-k$ choices for $u$. It follows that

$$|D_n| = \sum_{k=2}^{n-1} (k-1) \cdot (n-k),$$

and after calculation the statement holds.

Proposition 11. If $\pi = \{021, 102\}$ or $\pi = \{102, 110\}$, then $c_n(\pi) = 3 \cdot 2^{n-1} - \frac{1}{2}(n+1)(n+2) + n$ for $n \geq 1$ (A116702 in [7]).

Proof: If $\pi = \{021, 102\}$ and $w \in C_n(\pi)$, $n \geq 3$, then either

- $w = 0u0(v + 1)$ with $u$ a length $(n-1)$ binary word, or
- $w = 0\cdots0(u + 1)0\cdots0$ with $u$ a length $k$, $2 \leq k \leq n-1$, w.i. Catalan word other than $00\cdots0$ and $w$ beginning by at least one 0.

The number of words in the first case is $2^{n-1}$ and the number of those in the second case is

$$\sum_{k=2}^{n-1} (2^{k-1} - 1) \cdot (n-k) = 2 \cdot 2^{n-1} - \frac{1}{2}(n+1)(n+2) + n,$$

and combining the two cases the result holds.

If $\pi = \{102, 110\}$ and $w \in C_n(\pi)$, then either

- $w$ is a w.i. Catalan word, the number of such words is $2^{n-1}$, or
- $w \in D_n$, with $D_n$ defined in Lemma [3] or
- $w = u(v + m)$, where $u$ is a w.i. Catalan word of length $k$, $1 \leq k \leq n-3$, $m$ is the maximal (rightmost) entry of $u$, and $v$ is a word belonging to $D_{n-k}$.

Indeed, the first case corresponds to words with no descents, the second one to those with a descent and no occurrences of 00 before the descent, and the third one to those with both descent and occurrences of 00 before the descent (the rightmost such occurrence is in positions $k$ and $k+1$). By Lemma [3], the number of words in the third case is

$$\sum_{k=1}^{n-3} 2^{k-1} \cdot (n-k) \cdot \left(\frac{1}{6}(n-k)^2 - \frac{1}{2}(n-k) + \frac{1}{3}\right) = 2^n - \frac{1}{6}(n+1)(n^2 - n + 6).$$

Finally, combining the three previous cases the desired result holds.
**Sequences involving binomial coefficients**

In this part we use the notation 
\[ ab \cdots de \cdots f \]

to denote that the entry \( d \) is in position \( i \) in the word \( ab \cdots de \cdots f \).

**Proposition 12.** If \( \pi = \{001, 210\} \), then \( c_n(\pi) = \binom{n}{3} \) for \( n \geq 3 \).

**Proof:** If \( w \in C_n(\pi) \), then it has at most one descent.

If \( w \) has no descents, then it has the form \( w = 01 \cdots (m - 1)m \cdots m \) and there are \( n \) such words.

If \( w \) has one descent, then it has the form \( w = 01 \cdots (m - 1)m \cdots mk \cdots k \) with \( 0 \leq k < m < n - 1 \). It follows that there is a bijection between the family of 3-element subsets of \( \{0, 1, \ldots, n - 1\} \) and the words in \( C_n(\pi) \) with one descent:
\[ \{k, m, \ell\} \mapsto 0123 \cdots (m - 1)m \cdots mk \cdots k. \]

Combining the two cases we have \( c_n(\pi) = \binom{n}{3} + n \).

**Proposition 13.** If \( \pi \) is one of the pairs of patterns \( \{001, 021\}, \{001, 110\}, \{001, 120\}, \{012, 100\}, \{012, 101\} \) or \( \{012, 110\} \), then \( c_n(\pi) = \binom{n}{3} + 1 \) for \( n \geq 2 \).

**Proof:** In any of the six cases for \( \pi \), the set \( C_n(\pi) \) is in bijection with the family \( S \) of subsets of \( \{2, \ldots, n\} \) with at most two elements. We give below explicit definitions for such bijections, where the empty set is mapped to \( 0 \cdots 0 \in C_n(\pi) \) by each of them.

If \( \pi = \{001, 021\} \) and \( w \in C_n(\pi) \), then either \( w = 00 \cdots 0 \) or for some \( m \geq 1, w = 0123 \cdots (m - 1)m^s \) with \( s \geq 1 \) or \( w = 0123 \cdots (m - 1)m^t0^t \) with \( s \geq 1, t \geq 1 \), and the desired bijection \( S \to C_n(001, 021) \) is
\[
\begin{align*}
\{k\} & \mapsto 0123 \cdots (m - 1)m \cdots m; \\
\{k, j\} & \mapsto 0123 \cdots (m - 1)m \cdots m0 \cdots 0; \\
\{k, j\} & \mapsto 0123 \cdots (j - 2)(k - 2) \cdots (k - 2).
\end{align*}
\]

If \( \pi = \{001, 110\} \) and \( w \in C_n(\pi) \), then either \( w = 00 \cdots 0 \) or \( w = 0123 \cdots (m - 1)m \cdots m \) with \( m \) the maximal entry of \( w \), or \( w = 0123 \cdots (m - 1)m \ell \cdots \ell \) with \( \ell < m \), and the desired bijection \( S \to C_n(001, 110) \) is
\[
\begin{align*}
\{k\} & \mapsto 0123 \cdots (m - 1)m \cdots m; \\
\{k, j\} & \mapsto 0123 \cdots (m - 1)m \ell \cdots \ell; \\
\{k, j\} & \mapsto 0123 \cdots (m - 1)m(m - 1) \cdots (m - 1).
\end{align*}
\]

For the next three cases we need the following observation: a Catalan word avoids 012 if and only if it is a binary word (over \( \{0, 1\} \) ) beginning by a 0.

If \( \pi = \{012, 100\} \) and \( w \in C_n(\pi) \), then either \( w = 0^s1^t \) with \( s \geq 1, t \geq 0 \) or \( w = 0^s1^t0^t1^r \) with \( s, t \geq 1, r \geq 0 \), and the desired bijection \( S \to C_n(012, 100) \) is
\[
\begin{align*}
\{k\} & \mapsto 0 \cdots 01; \\
\{k, j\} & \mapsto 0 \cdots 01 \cdots 101 \cdots 1.
\end{align*}
\]

If \( \pi = \{012, 101\} \) and \( w \in C_n(\pi) \), then either \( w = 0^s1^t \) with \( s \geq 1, t \geq 0 \) or \( w = 0^s1^t0^t \) with \( s, t \geq 1, r \geq 1 \), and the desired bijection \( S \to C_n(012, 101) \) is
\[
\begin{align*}
\{k\} & \mapsto 0 \cdots 011; \\
\{k, j\} & \mapsto 0 \cdots 01 \cdots 101 \cdots 1.
\end{align*}
\]
\{k, j\} \mapsto 0 \cdots 01 \cdots 10 \cdots 0.

If \(\pi = \{012, 110\}\) and \(w \in C_n(\pi)\), then either \(w = 0^s1^t\) with \(s \geq 1, t \geq 0\) or \(w = 0^s1^t1^r\) with \(s, t, r \geq 1\), and the desired bijection \(S : C_n(012, 110) \to C_n(012, 110)\) is
\[
\begin{align*}
\{k\} & \mapsto 0 \cdots 01 \cdots 1; \\
\{k, j\} & \mapsto 0 \cdots 010 \cdots 01 \cdots 1.
\end{align*}
\]

\[\square\]

**Sequences involving Fibonacci(-like) numbers**

As in Proposition 3, we consider the sequence of Fibonacci numbers \((F_n)_{n \geq 0}\) defined as \(F_0 = 1, F_1 = 1\) and \(F_n = F_{n-1} + F_{n-2}\) for \(n \geq 2\).

**Proposition 14.** If \(\pi = \{000, 001\}\) or \(\pi = \{000, 010\}\), then \(c_n(\pi) = F_n\) for \(n \geq 0\) (A000129 in [7]).

**Proof:** For \(\pi = \{000, 001\}\) the proof is up to a certain point similar to that of Proposition 7. A word belonging to \(C_n(\pi)\) is unimodal and its maximal entry occurs once or twice in consecutive positions. Let \(D_n\) denote the subset of words in \(C_n(\pi)\) where the maximal entry occurs once and \(E_n\) denote that where it occurs twice. If \(w \in C_n(\pi)\) has its maximal entry \(m\), then the insertion of \((m + 1)\) after the leftmost occurrence of \(m\) in \(w\) produces a word in \(D_{n+1}\), and the insertion of \((m + 1)(m + 1)\) produces a word in \(E_{n+2}\). It is easy to see that these transformations induce a bijection between \(C_n(\pi)\) and \(D_{n+1}\), and between \(C_n(\pi)\) and \(E_{n+2}\), and thus between \(C_{n-2}(\pi) \cup C_{n-1}(\pi)\) and \(C_n(\pi)\). It follows that \(c_n(\pi)\) satisfies a Fibonacci-like recurrence, and by considering the initial values for \(c_n(\pi)\) the result holds.

For \(\pi = \{000, 010\}\), a word \(w \in C_n(\pi)\) is characterized by: \(w\) is w.i. and \(w\) does not have three consecutive equal entries. So \(w\) can be represented by the binary word \(b_1b_2 \ldots b_{n-1}\) with no two consecutive 1s where \(b_i = 1\) iff \(w_i = w_{i-1}\). This representation is a bijection between \(C_n(\pi)\) and the set of binary words of length \((n - 1)\) without two consecutive 1s, which cardinality is the Fibonacci number, see for instance [3].

\[\square\]

**Proposition 15.** If \(\pi = \{001, 100\}\), then \(c_n(\pi) = F_{n+1} - 1\) for \(n \geq 1\).

**Proof:** If \(w \in C_n(\pi), n \geq 3\), then either
\[
-w = 0 \cdots 0, \text{ or } \\
w = 0(u + 1) \text{ with } u \in C_{n-1}(\pi), \text{ or } \\
w = 0(u + 1)0 \text{ with } u \in C_{n-2}(\pi).
\]

So, \(c_n(\pi)\) satisfies the recurrence \(c_n(\pi) = c_{n-1}(\pi) + c_{n-2}(\pi) + 1\) for \(n \geq 3\), and solving it we have the desired result.

In the next proposition we will make use of the following relation satisfied by the even index Fibonacci numbers: \(F_{2n} = F_{2n-2} + \sum_{k=0}^{n-1} F_{2k}\) for \(n \geq 1\).

**Proposition 16.** If \(\pi = \{100, 201\}\), then \(c_n(\pi) = F_{2n-2}\) for \(n \geq 1\) (A001519 in [7]).

**Proof:** If \(w \in C_n(\pi), n \geq 3\), then either
\[
-w = 0u \text{ with } u \in C_{n-1}(\pi), \text{ or } \\
w = 0(u + 1) \text{ with } u \in C_{n-1}(\pi), \text{ or } \\
w = 0(u + 1)0 \text{ with } u \in C_{n-2}(\pi), \text{ or } \\
w = 01^{n-k}20(u + 1) \text{ with } u \in C_k(\pi) \text{ for some } k, 1 \leq k \leq n - 3.
\]

In both of the first two cases the numbers of words \(w\) is \(c_{n-1}(\pi)\) and in the third case, this number is \(c_{n-2}(\pi)\). In the last case, the number of words \(w\) is \(\sum_{k=1}^{n-3} c_k(\pi)\). So, \(c_n(\pi) = 2c_{n-1}(\pi) + c_{n-2}(\pi) + \sum_{k=1}^{n-3} c_k(\pi) = c_{n-1}(\pi) + \sum_{k=0}^{n-1} c_k(\pi)\), and with the initial conditions we have \(c_n(\pi) = F_{2n-2}\).

The sequence of Pell numbers \((p_n)_{n \geq 0}\) is defined as \(p_0 = 0, p_1 = 1\) and \(p_n = 2p_{n-1} + p_{n-2}\) for \(n \geq 2\).

**Proposition 17.** If \(\pi = \{100, 101\}\), then \(c_n(\pi)\) is the \(n\)th Pell number for \(n \geq 1\) (A001541 in [7]).

**Proof:** If \(w \in C_n(\pi), n \geq 2\), then either
In both of the first two cases the numbers of words $w$ is $c_{n-1}(\pi)$ and it is $c_{n-2}(\pi)$ in the last case. So, $c_n(\pi)$ satisfies Pell numbers recurrence and considering its initial values the statement holds.

6 Counting via generating function

Here we give bivariate generating functions $C_\pi(x, y)$ where the coefficient of $x^n y^k$ is the number of Catalan words of length $n$ having $k$ descents and avoiding $\pi$, for each of the remaining pairs $\pi$ of patterns of length 3. Plugging $y = 1$ in $C_\pi(x, y)$ we obtain $C_\pi(x) = C_\pi(x, 1)$ where the coefficient of $x^n$ is the number of Catalan words of length $n$ avoiding $\pi$. All the obtained enumerating sequences are not yet recorded in [11], except that for: $\pi = \{100, 120\}$ and for $\pi = \{110, 120\}$ (see Corollary 3) and presumably for $\pi = \{100, 210\}$ (see Corollary 13). In almost all the proofs of the next propositions the desired generating function is the solution of a functional equation satisfied by it.

Proposition 18. If $\pi = \{000, 021\}$, then

$$C_\pi(x, y) = -\frac{x^4 y + x^2 y + 1}{x^2 + x - 1}.$$ 

Proof: Here we need the generating function for the Fibonacci numbers $C_{000,010}(x) = \frac{1}{1 - x - x^2}$ for the set in Proposition [4]. Note that words in $C(000, 010)$ have no descents. Let $w$ be a non-empty word in $C(\pi)$. Then $w$ has one of the following forms:
- $w = 0(u + 1)$ where $u \in C(000, 010)$; the generating function for these words is $x \cdot \frac{1}{1 - x - x^2}$.
- $w = 00(u + 1)$ where $u \in C(000, 010)$; the generating function for these words is $x^2 \cdot \frac{1}{1 - x - x^2}$.
- $w = 0(u + 1)0$ where $u \in C(000, 010)$; the generating function for these words is $y \cdot x^2 \cdot \frac{1}{1 - x - x^2}$.
- $w = 0101(u + 2)$ where $u \in C(000, 010)$; the generating function for these words is $y \cdot x^4 \cdot \frac{1}{1 - x - x^2}$.

Combining these cases and adding 1 corresponding to the empty word we have

$$C_\pi(x, y) = 1 + x (1 + x) \cdot \frac{1}{1 - x - x^2} + y x^2 (1 + x^2) \left( \frac{1}{1 - x - x^2} \right),$$

which after calculation gives the desired result. 

Corollary 2. If $\pi = \{000, 021\}$, then

$$C_\pi(x) = -\frac{x^4 + x^2 + 1}{x^2 + x - 1} = 1 + x + 3x^2 + 4x^3 + 8x^4 + 12x^5 + 20x^6 + 32x^7 + O(x^8).$$

Proposition 19. If $\pi = \{100, 120\}$, then

$$C_\pi(x, y) = -\frac{(x - 1)^2}{x^3 y - 2x^2 + 3x - 1}.$$ 

Proof: A word $w \in C(\pi)$ is in one of the following cases:
- $w$ is a w.i. Catalan word,
- $w = u(m - 1)(v + m)$ where $u$ is a w.i. Catalan word other than $00 \cdots 0$, $m$ is the largest (last) entry of $u$ and $v \in C(\pi)$.

The generating function for the words of the first form is $\frac{1}{x^2}$ and the generating function for the words of the second form is

$$\left( \frac{1 - x}{1 - 2x} - \frac{1}{1 - x} \right) \cdot x \cdot y \cdot C_\pi(x, y).$$

Combining these cases we deduce the functional equation below which solution gives the desired result:

$$C_\pi(x, y) = \left( \frac{1 - x}{1 - 2x} - \frac{1}{1 - x} \right) \cdot x \cdot y \cdot C_\pi(x, y) + \frac{1 - x}{1 - 2x}.$$  

\[\square\]
Proposition 20. If \( \pi = \{110, 120\} \), then

\[
C_\pi(x, y) = -\frac{(x - 1)^2}{x^3y - 2x^2 + 3x - 1}.
\]

Proof: A word \( w \in \mathcal{C}(\pi) \) is in one of the following cases:

- \( w \) is a w.i. Catalan word,
- \( w = u(m + 1)v \) where \( u \) is a non-empty w.i. Catalan word, \( m \) is the largest (last) entry of \( u \) and \( v \) is a word of the form \( mm \cdots m(x + m + 1) \) with at least one \( m \) in its prefix and \( x \in \mathcal{C}(\pi) \).

The generating function for the words of the first form is \( \frac{1}{1 - x} \).

For the second form, the generating function for the words \( u \) is \( \frac{1 - x}{1 - 2x} - 1 = \frac{x}{1 - 2x} \), and the generating function for the words \( mm \cdots m(x + m + 1) \) is \( \frac{x}{1 - x} \cdot C_\pi(x, y) \). Thus, the generating function for the words of the second form is

\[
\frac{x}{1 - 2x} \cdot x \cdot y \cdot \frac{x}{1 - x} \cdot C_\pi(x, y).
\]

Combining these cases we deduce the functional equation

\[
C_\pi(x, y) = \frac{x}{1 - 2x} \cdot x \cdot y \cdot \frac{x}{1 - x} \cdot C_\pi(x, y) + \frac{1 - x}{1 - 2x}.
\]

\( \square \)

The functional equations in the proofs of Propositions 19 and 20 are different but the resulting bivariate generating functions are the same. Instantiating \( y \) by 1 in \( C_\pi(x, y) \) of these propositions we have the next corollary.

Corollary 3. If \( \pi = \{100, 120\} \) or \( \pi = \{110, 120\} \), then

\[
C_\pi(x) = -\frac{(x - 1)^2}{x^3 - 2x^2 + 3x - 1} = 1 + x + 2x^2 + 5x^3 + 12x^4 + 28x^5 + 65x^6 + 151x^7 + O(x^8),
\]

and \( e_n(\pi) \) is the sequence \( A034943 \) in [17].

Proposition 21. If \( \pi = \{021, 110\} \), then

\[
C_\pi(x, y) = -\frac{x^5y + x^4y - x^4 - x^3y + 4x^3 - 6x^2 + 4x - 1}{(2x - 1)(x - 1)^3}.
\]

Proof: A non-empty word \( w \in \mathcal{C}(\pi) \) is in one of the following cases:

- \( w = 0u \) where \( u \in \mathcal{C}(\pi) \); the generating function for these words is \( x \cdot C_\pi(x, y) \),
- \( w = 0(u + 1) \) where \( u \) is a non-empty w.i. Catalan word; the generating function for these words is \( x \cdot \frac{1}{1 - x^2} \),
- \( w = 01u \) where \( u \) is a non-empty w.i. Catalan word; the generating function for these words is \( x^2 \cdot y \cdot \frac{x}{1 - x^2} \),
- \( w = u0 \cdots 0 \) where \( u \) is a s.i. Catalan word of length at least three and \( w \) ending by at least one 0; the generating function for these words is \( y \cdot \frac{x^4}{1 - x^2} \).

Combining these cases and considering the empty word which contributes with 1 to \( C_\pi(x, y) \), we deduce the functional equation

\[
C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x \cdot \frac{x}{1 - 2x} + x^2 \cdot y \cdot \frac{x}{1 - 2x} + y \cdot \frac{x^4}{(1 - x)^2}.
\]

\( \square \)

Corollary 4. If \( \pi = \{021, 110\} \), then

\[
C_\pi(x) = -\frac{x^5 + 3x^3 - 6x^2 + 4x - 1}{(2x - 1)(x - 1)^3} = 1 + x + 2x^2 + 5x^3 + 12x^4 + 26x^5 + 53x^6 + 105x^7 + O(x^8).
\]
Proposition 22. If \( \pi = \{110, 201\} \), then
\[
C_\pi(x, y) = \frac{x^4 y - x^3 + 3x^2 - 3x + 1}{(x - 1)(x^3y - 2x^2 + 3x - 1)}.
\]

Proof: A non-empty word \( w \in C(\pi) \) is in one of the following cases:
- \( w = 0u \) where \( u \in C(\pi) \); the generating function for these words is \( x \cdot C_\pi(x, y) \).
- \( w = 0(u + 1) \) where \( u \) is a non-empty word in \( C(\pi) \); the generating function for these words is \( x \cdot (C_\pi(x, y) - 1) \).
- \( w = u0 \cdots 0 \) where \( u \) is a s.i. Catalan word of length at least 2 and \( w \) ending by at least one 0; the generating function for these words is \( y \cdot \frac{x^3}{1-x} \cdot (C_\pi(x) - 1) \).
- \( w = 010 \cdots 0(u + 1) \) where \( u \) is a non-empty word in \( C(\pi) \) and \( w \) beginning by 010; the generating function for these words is \( y \cdot x^3 \cdot \frac{1}{1-x} \cdot (C_\pi(x) - 1) \).

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation
\[
C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x \cdot (C_\pi(x, y) - 1) + y \cdot \frac{x^3}{(1-x)^2} + y \cdot x^3 \cdot \frac{1}{1-x} \cdot (C_\pi(x, y) - 1) .
\]

\( \square \)

Corollary 5. If \( \pi = \{110, 201\} \), then
\[
C_\pi(x) = \frac{x^4 - x^3 + 3x^2 - 3x + 1}{(x - 1)(x^3 - 2x^2 + 3x - 1)} = 1 + x + 2x^2 + 5x^3 + 13x^4 + 32x^5 + 76x^6 + 178x^7 + O(x^8).
\]

Proposition 23. If \( \pi = \{102, 201\} \), then
\[
C_\pi(x, y) = \frac{x^5 y + x^4 y^2 - x^5 - 5x^4 y + 5x^4 + 6x^3 y - 10x^3 - 2x^2 y + 10x^2 - 5x + 1}{(-x + 1)(x^2y - x^2 + 2x - 1)(x^2y - 2x^2 + 3x - 1)}.
\]

Proof: A non-empty word \( w \in C(\pi) \) is in one of the following cases:
- \( w = 0u \) where \( u \in C(\pi) \); the generating function for these words is \( x \cdot C_\pi(x, y) \).
- \( w = 0(u + 1) \) where \( u \) is a non-empty word in \( C(\pi) \); the generating function for these words is \( x \cdot (C_\pi(x, y) - 1) \).
- \( w = 0(v + 1)0 \cdots 0 \) where \( u \) is a non-empty word in \( C(\pi) \) and \( w \) ending by at least one 0; the generating function for these words is \( y \cdot x^2 \cdot \frac{1}{1-x} \cdot (C_\pi(x, y) - 1) \).
- \( w = 01 \cdots 1u \) where \( u \) is a binary word beginning by a 0 and different from 0 \cdots 0, or equivalently, \( u \) a word in \( C(012) \) other than 0 \cdots 0; the generating function for these words is \( x^2 \cdot \frac{1}{1-x} \cdot \left( C_{012}(x, y) - \frac{1}{1-x} \right) = \frac{x^2 y}{1-x} \cdot \left( \frac{1-2x+x^2+x^3-x^2y-x^2y+1}{1-x^2} - \frac{1}{1-x} \right) \), see Theorem 4 in [2].

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation
\[
C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x \cdot (C_\pi(x, y) - 1) + \frac{x^2 y}{1-x} \cdot \left( \frac{1-2x+x^2+x^3-x^2y-x^2y+1}{1-x^2} - \frac{1}{1-x} \right) .
\]

\( \square \)

Corollary 6. If \( \pi = \{102, 201\} \), then
\[
C_\pi(x) = \frac{x^4 - 4x^3 + 8x^2 - 5x + 1}{(x - 1)(2x - 1)(x^2 - 3x + 1)} = 1 + x + 2x^2 + 5x^3 + 14x^4 + 40x^5 + 113x^6 + 314x^7 + O(x^8).
\]

Proposition 24. If \( \pi = \{100, 110\} \), then
\[
C_\pi(x, y) = \frac{x^4 y - x^4 + 2x^3 - 2x + 1}{(x - 1)(x^3y - 2x^3 + x^2 + 2x - 1)}.
\]
Proposition 26. If $\pi \in C(\pi)$ has one of the following forms:

- $0u$ where $u \in C(\pi)$; the generating function for these words is $x \cdot C_\pi(x, y)$,
- $0(u + 1)$ where $u$ is a non-empty word in $C(\pi)$; the generating function for these words is $x \cdot (C_\pi(x, y) - 1)$,
- $u(m + 1)(m + 2)v$ where $u$ and $v$ are non-empty s.i. Catalan words, $m$ is the largest entry of $u$ and the length of $v$ is less than or equal to that of $u$; the generating function for these words is $y \cdot x^4 \cdot \frac{1}{1 - x^2}$.
- $u(m + 1)uv(v + m + 1)$ where $u$ is a non-empty s.i. Catalan word, $m$ is the largest entry of $u$ and $v \in C(\pi)$; the generating function for these words is $y \cdot x^3 \cdot \frac{1}{1 - x^2} C_\pi(x, y)$.

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation

$$C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x \cdot (C_\pi(x, y) - 1) + y \cdot x^4 \cdot \frac{(x + 1)}{(1 - x^2)} + y \cdot x^3 \cdot \frac{1}{1 - x^2} C_\pi(x, y).$$

\[\square\]

Corollary 7. If $\pi = \{100, 110\}$, then

$$C_\pi(x) = \frac{-2x^3 + 2x - 1}{(x - 1)(x^3 - x^2 - 2x + 1)} = 1 + x + 2x^2 + 5x^3 + 12x^4 + 28x^5 + 64x^6 + 145x^7 + O(x^8).$$

Proposition 25. If $\pi = \{000, 110\}$, then

$$C_\pi(x, y) = \frac{x^3y + x^3 - x^2 - x + 1}{(-x + 1)(x^3 - x^2y - x^2 - x + 1)}.$$

\[\square\]

Proof: A non-empty word in $C(\pi)$ has one of the following forms:

- $0(u + 1)$ where $u \in C(\pi)$; the generating function for these words is $x \cdot C_\pi(x, y)$,
- $uu(v + m + 1)$ where $u$ is a non-empty s.i. Catalan word, $m$ is the largest (last) entry of $u$ and $v \in C(\pi)$; the generating function for these words is $y \cdot x^3 \cdot \frac{1}{1 - x^2} C_\pi(x, y)$,
- $u(m + 1)v$ where $u$ and $v$ are as above, and $v$ is a non-empty s.i. Catalan word of length less than that of $u$; the generating function for these words is $y \cdot x^3 \cdot (1 + x) \cdot \frac{1}{(1 - x^2)^2}$.

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation

$$C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + y \cdot \frac{x^2}{1 - x^2} C_\pi(x, y) + y \cdot x^3 \cdot (1 + x) \cdot \frac{1}{(1 - x^2)^2}. $$

\[\square\]

Corollary 8. If $\pi = \{000, 110\}$, then

$$C_\pi(x) = \frac{2x^3 - x^2 - x + 1}{(-x + 1)(x^3 - 2x^2 - x + 1)} = 1 + x + 2x^2 + 4x^3 + 8x^4 + 15x^5 + 28x^6 + 51x^7 + O(x^8).$$

Proposition 26. If $\pi = \{000, 102\}$ or $\pi = \{000, 201\}$, then

$$C_\pi(x, y) = \frac{y x^2 - 1}{y x^3 + y x^2 + x^2 + x - 1}.$$

\[\square\]

Proof: If $\pi = \{000, 102\}$, then a non-empty word in $C(\pi)$ has one of the following forms:

- $0(u + 1)$ where $u \in C(\pi)$; the generating function for these words is $x \cdot C_\pi(x, y)$,
- $00u + 1)$ where $u \in C(\pi)$; the generating function for these words is $x^2 \cdot C_\pi(x, y)$,
- $0(0 + 1)0$ where $u$ is a non-empty word in $C(\pi)$; the generating function for these words is $y \cdot x^2 \cdot (C_\pi(x, y) - 1)$,
- $01(0 + 2)01$ where $u \in C(\pi)$; the generating function for these words is $y \cdot x^4 \cdot C_\pi(x, y)$.
Similarly, if $\pi = \{000, 201\}$ and $w$ is a non-empty word in $C(\pi)$, then $w$ has either one of the first three forms above, or

- $w = 0101(u + 2)$ where $u \in C(\pi)$; the generating function for these words is $y \cdot x^4 \cdot C_\pi(x, y)$.

In both cases we obtain the functional equation

$$C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x^2 \cdot C_\pi(x, y) + y \cdot x^2 \cdot (C_\pi(x, y) - 1) + y \cdot x^4 \cdot C_\pi(x, y).$$

\[\square\]

**Corollary 9.** If $\pi = \{000, 102\}$ or $\pi = \{000, 201\}$, then

$$C_\pi(x) = \frac{x^2 - 1}{x^3 + 2x^2 + x - 1} = 1 + x + 2x^2 + 4x^3 + 9x^4 + 18x^5 + 38x^6 + 78x^7 + O(x^8).$$

**Proposition 27.** If $\pi = \{000, 120\}$, then

$$C_\pi(x, y) = \frac{x^4y + x^3y + 1}{x^3y + x^2 + x - 1}.$$

**Proof:** A non-empty word in $C(\pi)$ has one of the following forms:

- $0(u + 1)$ where $u \in C(\pi)$; the generating function for these words is $x \cdot C_\pi(x, y)$,
- $00(u + 1)$ where $u \in C(\pi)$; the generating function for these words is $x^2 \cdot C_\pi(x, y)$,
- $0101(u + 2)$ where $u \in C(\pi)$; the generating function for these words is $y \cdot x^4 \cdot C_\pi(x, y)$.

Apart from these general cases, there are two other fixed length ones:

- $010$; the corresponding generating function is $y \cdot x^3$,
- $0110$; the corresponding generating function is $y \cdot x^4$.

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation

$$C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x^2 \cdot C_\pi(x, y) + y \cdot x^4 \cdot C_\pi(x, y) + y \cdot x^3 + y \cdot x^4.$$

\[\square\]

**Corollary 10.** If $\pi = \{000, 120\}$, then

$$C_\pi(x) = -\frac{x^4 + x^3 + 1}{x^3 + x^2 + x - 1} = 1 + x + 2x^2 + 4x^3 + 8x^4 + 13x^5 + 23x^6 + 40x^7 + O(x^8).$$

**Proposition 28.** If $\pi = \{201, 210\}$, then

$$C_\pi(x, y) = \frac{x^4y - 2x^4 - 3x^3y + 7x^3 + x^2y - 9x^2 + 5x - 1}{(2x - 1)(x - 1)(x^2y - 2x^2 + 3x - 1)}.$$

**Proof:** A non-empty word $w$ in $C(\pi)$ has one of the following forms:

- $0u$ where $u \in C(\pi)$; the generating function for these words is $x \cdot C_\pi(x, y)$,
- $0(u + 1)$ where $u$ is a non-empty word in $C(\pi)$; the generating function for these words is $x \cdot C_\pi(x, y) - 1$,
- $01 \cdots 1w$ where $w$ is a non-empty word in $C(\pi)$ and $01$ is a prefix of $w$; the generating function for these words is $y \cdot \frac{x^2}{1-x} \cdot (C_\pi(x, y) - 1)$,
- $0(u+1) \cdots 0$ where $u$ is a w.i. Catalan word other than $0 \cdots 0$ and $w$ ending by a 0; the generating function for these words is $y \cdot \frac{x^2}{1-x} \cdot \left(\frac{1-x}{1-2x} - \frac{1}{1-x}\right)$.

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation

$$C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x \cdot (C_\pi(x, y) - 1) + y \cdot \frac{x^2}{1-x} \cdot (C_\pi(x, y) - 1) + y \cdot \frac{x^2}{1-x} \cdot \left(\frac{1-x}{1-2x} - \frac{1}{1-x}\right).$$

\[\square\]
Corollary 11. If \( \pi = \{201, 210\} \), then
\[
C_{\pi}(x) = \frac{x^4 - 4x^3 + 8x^2 - 5x + 1}{(x - 1)(2x - 1)(x^2 - 3x + 1)} = 1 + x + 2x^2 + 5x^3 + 14x^4 + 40x^5 + 113x^6 + 314x^7 + O(x^8).
\]

Proposition 29. If \( \pi = \{102, 210\} \), then
\[
C_{\pi}(x, y) = \frac{2x^7y - 2x^7 + 13x^6 - 10x^6y - x^6y^2 - 36x^5 + 19x^5y + 55x^4 - 17x^4y - 50x^3 + 7x^3y + 27x^2 - yx^2 - 8x + 1}{(x - 1)^3(2x - 1)^2(x^2y - x^2 + 2x - 1)}.
\]

Proof: A non-empty word \( w \) in \( \mathcal{C}(\pi) \) has one of the following forms:
- \( 0u \) where \( u \in \mathcal{C}(\pi) \); the generating function for these words is \( x \cdot C_{\pi}(x, y) \),
- \( 0(u + 1) \) where \( u \) is a non-empty word in \( \mathcal{C}(\pi) \); the generating function for these words is \( x \cdot (C_{\pi}(x, y) - 1) \),
- \( 01 \cdots 1u \) where \( u \) is a non-empty word in \( \mathcal{C}(012) \), and \( w \) begins by 01; the generating function for these words is \( y \cdot \frac{x^2}{1 - x} \cdot (C_{012}(x, y) - 1) = y \cdot \frac{x^2}{1 - x} \cdot \left( \frac{1 - x + x^2 - x^2y}{1 - 2x + x^2 - x^2y} - 1 \right) \) (see Theorem 4 in [1] for the generating function of \( C_{012}(x, y) \)),
- \( 0(u + 1)v \) where \( u \) is a w.i. Catalan word of length at least 2 different from \( 0 \cdots 0 \) and \( v \) is a non-empty word in \( \mathcal{C}(010, 012) \) (see Proposition 5); the generating function for these words is \( x \cdot \frac{(1 - x - y)}{1 - 2x} \cdot y \cdot C_{010, 012}(x, y) = y \cdot x \cdot \frac{x^2}{1 - x} \cdot \left( \frac{1 - x - y}{1 - 2x} \right) \).

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation
\[
C_{\pi}(x, y) = 1 + x \cdot C_{\pi}(x, y) + x \cdot (C_{\pi}(x, y) - 1) + y \cdot \frac{x^2}{1 - x} \cdot \left( \frac{1 - x + x^2 - x^2y}{1 - 2x + x^2 - x^2y} - 1 \right) + y \cdot \frac{x^2}{(1 - x)^2} \cdot \left( \frac{1 - x}{1 - 2x} - \frac{1}{1 - x} \right).
\]

Corollary 12. If \( \pi = \{102, 210\} \), then
\[
C_{\pi}(x) = \frac{2x^6 - 17x^5 + 38x^4 - 43x^3 + 26x^2 - 8x + 1}{(x - 1)^3(2x - 1)^3} = 1 + x + 2x^2 + 5x^3 + 14x^4 + 40x^5 + 111x^6 + 295x^7 + O(x^8).
\]

Proposition 30. If \( \pi = \{100, 102\} \), then
\[
C_{\pi}(x, y) = \frac{x^5y - x^4y - x^3 + 2x^3y + 3x^2 - x^2y - 3x + 1}{(x - 1)(x^4y - x^4y - 2x^2 + x^2y + 3x - 1)}.
\]

Proof: A non-empty word in \( \mathcal{C}(\pi) \) has one of the following forms:
- \( 0u \) where \( u \in \mathcal{C}(\pi) \); the generating function for these words is \( x \cdot C_{\pi}(x, y) \),
- \( 0(u + 1) \) where \( u \) is a non-empty word in \( \mathcal{C}(\pi) \); the generating function for these words is \( x \cdot (C_{\pi}(x, y) - 1) \),
- \( 0(u + 1)0 \) where \( u \) is as above; the generating function for these words is \( y \cdot x^2 \cdot (C_{\pi}(x, y) - 1) \),
- \( 01 \cdots 1(u + 2)01 \) where \( u \) is as above; the generating function for these words is \( y \cdot \frac{x^4}{(1 - x)^2} \cdot (C_{\pi}(x, y) - 1) \),
- \( uv \) where \( u \) and \( v \) are binary words of length at least 2 of the form \( 011 \cdots 1 \); the generating function for these words is \( y \cdot \frac{x^2}{(1 - x)^2} \).
Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation

\[ C_\pi(x, y) = 1 + x \cdot C_\pi(x, y) + x \cdot (C_\pi(x, y) - 1) + y \cdot x^2 \cdot (C_\pi(x, y) - 1) + y \cdot \frac{x^4}{1 - x} (C_\pi(x, y) - 1) + y \cdot \frac{x^4}{(1 - x)^2}. \]

\[ \square \]

**Corollary 13.** If ̂π = \{100, 102\}, then

\[ C_\pi(x) = \frac{x^5 - x^4 + x^3 + 2x^2 - 3x + 1}{(x - 1)(x^4 - x^3 - x^2 + 3x - 1)} = 1 + x + 2x^2 + 5x^3 + 13x^4 + 34x^5 + 87x^6 + 220x^7 + O(x^8). \]

In the proof of the next proposition we need the following lemma where the generating functions for some particular subsets of \( C(000, 210) \) are given.

**Lemma 2.** The bivariate generating function corresponding to

1. the set \( A \) of words \( uu \) with \( u \) a non-empty s.i. Catalan word is \( A(x, y) = x^2 + yx^2 \cdot \frac{x^2}{1 - x} \) and
   \( A(x) = \frac{x^2}{1 - x} \); 
2. the set \( B \) of words \( uv \) with \( u \) and \( v \) non-empty s.i. Catalan words and the length of \( v \) is less than or equal to that of \( u \) is \( B(x, y) = y \cdot \frac{x^2}{1 - x} \cdot \frac{x^2}{1 - x} \); 
3. the set \( D \) of words \( uu \) with \( u \) and \( v \) non-empty s.i. Catalan words and the length of \( v \) is less than that of \( u \) is \( D(x, y) = y \cdot \frac{x^2}{1 - x} \cdot \frac{x^2}{1 - x} \).

**Proof:** 1. For any even \( u \) there is exactly one word of this form, so the monovariate corresponding generating function is \( \frac{x^2}{1 - x} \); and only words of length larger than two have one descent.
2. The transformation \( \{uu, x\} \rightarrow uu \cdot x \) where \( uu \in A \) and \( x \) is a s.i. Catalan word defines a bijection between pairs of such words and \( B \), and thus \( B(x, y) = y \cdot A(x) \cdot \frac{x^2}{1 - x} \).
3. Similarly as point 2. \( \square \)

**Proposition 31.** If ̂π = \{000, 210\}, then

\[ C_\pi(x, y) = -\frac{(x + 1)(x^3 + x^3 y - 2x + 1)}{(x^4 - x^4 y + x^3 - 2x^2 - x + 1)(x^2 + x - 1)}. \]

**Proof:** A non-empty word in \( C(000, 210) \) has one of the following forms:

- \( u \) with \( u \in D \) and \( D \) as in Lemma 8, the generating function for these words is \( D(x, y) = y \cdot \frac{x^2}{1 - x} \).
- \( u(m + 1)(m + 1)(x + m + 2)v \) with \( u \) and \( v \) non-empty s.i. Catalan words and the length of \( v \) is less than or equal to that of \( u \), \( m \) is the largest entry of \( u \), and \( x \in C(000, 010) \); the generating function for these words is \( B(x, y) \cdot x^2 \cdot \frac{1}{1 - x - x} = y \cdot \frac{x^2}{1 - x} \cdot \frac{x^2}{1 - x - x} \cdot \frac{1}{1 - x - x} \) (see Lemma 3 and Proposition 4).
- \( 0(u + 1) \) where \( u \in C(\pi) \); the generating function for these words is \( x \cdot C_\pi(x, y) \).
- \( uuv + m + 1 \) where \( u \) is a non-empty s.i. Catalan word, \( m \) the largest entry of \( u \) and \( v \in C(\pi) \); the generating function for these words is \( A(x, y) \cdot C_\pi(x, y) \).

Combining these cases and adding 1 corresponding to the empty word we deduce the functional equation

\[ C_\pi(x, y) = 1 + y \cdot \frac{x^2}{1 - x} \frac{x}{1 - x} + y \cdot \frac{x^4}{1 - x^2} \frac{1}{1 - x - x^2} + x \cdot C(x, y) + x \cdot C(x, y) \frac{x^4}{1 - x^2} \cdot C(x, y). \]

\[ \square \]

**Corollary 14.** If ̂π = \{000, 210\}, then

\[ C_\pi(x) = -\frac{(x + 1)(2x^3 - 2x + 1)}{(x^3 - 2x^2 - x + 1)(x^2 + x - 1)} = 1 + x + 2x^2 + 4x^3 + 9x^4 + 18x^5 + 37x^6 + 72x^7 + O(x^8). \]
In the proof of the next proposition we need the following lemma where the generating functions for two subsets of \( \mathcal{C}(100, 210) \) are given.

**Lemma 3.**

1. The generating function corresponding to the set \( \mathcal{E} \) of words \( uv \) with \( u \) a w.i. Catalan word, \( v \) a non-empty s.i. Catalan word and the largest entry of \( v \) is equal to that of \( u \) minus 1 is
   \[
   C_{\pi}(x, y) = \frac{1 - x}{1 - 2x} - \frac{x^3 y}{(2x - 1)(2x^3 - x^2 + 3x + 1)}.
   \]

2. The generating function corresponding to the set \( \mathcal{F} \) of words \( uv \) with \( u \) a w.i. Catalan word, \( v \) a non-empty s.i. Catalan word and the largest entry of \( v \) is less than that of \( u \) minus 1 is
   \[
   C_{\pi}(x, y) = \frac{x^3}{(x-1)(x^2 + x - 1)}.
   \]

**Proof:**

1. If \( \mathcal{E}_n \) is the set of words of length \( n \) in \( \mathcal{E} \), then \( \mathcal{E}_n = \emptyset \) for \( 0 \leq i \leq 2 \), \( \mathcal{E}_3 = \{010\} \) and \( \mathcal{E}_4 = \{0010, 0110\} \). With \( u \) and \( v \) as above, for any \( n \geq 3 \), the transformation
   \[
   uv \rightarrow uav, \quad \text{with} \quad a \quad \text{the maximal entry of} \quad u,
   \]
   transforms a word in \( \mathcal{E}_n \) into one in \( \mathcal{E}_{n+1} \) where the maximal entry occurs at least twice,
   \[
   uv \rightarrow u(a + 1)v(b + 1), \quad \text{with} \quad a \quad \text{and} \quad b \quad \text{the maximal entries of} \quad u \quad \text{and} \quad v \quad \text{respectively},
   \]
   transforms a word in \( \mathcal{E}_n \) into one in \( \mathcal{E}_{n+2} \) where the maximal entry occurs once.

2. Any word in \( \mathcal{E}_n \), \( n \geq 5 \), except \( 0 \cdots 010 \), can be obtained in a unique way from either a word in \( \mathcal{E}_{n-1} \) or in \( \mathcal{E}_{n-2} \) by one of these transformations. This yields the recurrence \( |\mathcal{E}_n| = 1 + |\mathcal{E}_{n-1}| + |\mathcal{E}_{n-2}| \) for \( n \geq 5 \), and the desired generating function is precisely that of the sequence \( (|\mathcal{E}_n|)_{n \geq 0} \).

3. Any pair of words \( (w, x) \) with \( w = uv \in \mathcal{E} \) (with \( u \) and \( v \) as above) and \( x \) a non-empty w.i. Catalan word can be transformed into the word \( uvxv \in \mathcal{F} \), and \( (w, x) \mapsto uvxv \) is a bijection, so the generating function for \( \mathcal{F} \) is that for \( \mathcal{E} \) multiplied by \( \frac{1}{1-x^2} \).

**Proposition 32.** If \( \pi = \{100, 210\} \), then

\[
C_{\pi}(x, y) = \frac{1 - x}{1 - 2x} - \frac{x^3 y}{(2x - 1)(2x^3 - x^2 + 3x + 1)}.
\]

**Proof:**

First we consider only words in \( \mathcal{C}(\pi) \) having at least one descent, and we denote by \( G(x, y) \) the corresponding generating function, and clearly

\[
C_{\pi}(x, y) = \frac{1}{1-x} + G(x, y).
\]

A word in \( \mathcal{C}(\pi) \) with at least one descent has one of the following forms:

- \( u(\alpha + s + 1)(v + s + t + 1) \) where \( u \) and \( v \) are both w.i. Catalan words, \( \alpha \) belongs to the set \( \mathcal{E} \) defined in Lemma 3, and \( s \) is the largest symbol of \( u \) (and for convenience \(-1\) if \( u \) is empty) and \( t \) that of \( \alpha \); the generating function for these words is
  \[
y \cdot \frac{x^3}{(x-1)(x^3 + x^2 - 1)} \cdot \left( \frac{x}{1-2x} \right)^2.
  \]

- \( u(\alpha + s + 1) \) where \( u \) and \( s \) are as above, and \( \alpha \) belongs to the set \( \mathcal{F} \) defined in Lemma 3; the generating function for these words is
  \[
y \cdot \frac{x^3}{(x-1)(x^3 + x^2 - 1)} \cdot \frac{x}{1-2x}.
  \]

- \( u(\alpha + s + 1)(v + s + t + 1) \) where \( u \) and \( s \) are as above, \( \alpha \) belongs to \( \mathcal{E} \), \( v \) is a word in \( \mathcal{C}(\pi) \) with at least one descent, and \( t \) is the largest symbol of \( \alpha \); the generating function for these words is
  \[
y \cdot \frac{x^3}{(x-1)(x^3 + x^2 - 1)} \cdot \frac{x}{1-2x} \cdot \frac{1}{1-2x} \cdot \frac{x^3}{(x-1)(x^3 + x^2 - 1)} \cdot G(x, y).
  \]

It follows that \( G(x, y) \) satisfies the functional equation

\[
G(x, y) = y \cdot \frac{x^3}{(x-1)(x^2 + x - 1)} \cdot \left( \frac{1 - x}{1 - 2x} \right)^2 + y \cdot \frac{1 - x}{1 - 2x} \cdot \frac{x^3}{(x-1)(x^2 + x - 1)} \cdot \frac{x}{1-2x} + y \cdot \frac{1 - x}{1 - 2x} \cdot \frac{x^3}{(x-1)(x^2 + x - 1)} \cdot G(x, y).
\]

Finally, solving it and adding the generating function for the Catalan words with no descents (that is, w.i. Catalan words) the statement holds.

**Corollary 15.** If \( \pi = \{100, 210\} \), then

\[
C_{\pi}(x) = \frac{x - 1}{2x - 1} - \frac{x^3}{(2x - 1)(x - 1)(x^2 + 2x - 1)} = 1 + x + 2x^2 + 5x^3 + 13x^4 + 34x^5 + 88x^6 + 225x^7 + O(x^8).
\]

Numerical evidences let us believe that \( c_n(100, 210) \) is the sequence \texttt{A267905} in [1], however we failed to prove this formally.
Table 2: Pairs \{\sigma, \tau\} where \tau is superfluous for \sigma are marked by \textit{s} and those yielding ultimately constant enumerating sequences (see Proposition 4) by \textit{u.c.}. The references are to the propositions or the corollaries where the enumerating sequences or generating functions are given. Pairs referred by the same proposition or corollary form a Wilf-equivalence class and enumerating results that are not yet recorded in [11] are italicized. Highlighted pairs are already enumerated in [2] in the context of ascent sequences, see Section 2.

7 Final remarks

Catalan words are in bijection with Dyck paths (see Figure 1) and thus pattern avoiding Catalan words correspond to restricted Dyck paths. For instance, a Catalan word avoiding 012 corresponds to a Dyck path of height at most two. In this context, it can be of interest to investigate how our results on pattern avoiding Catalan words translate to corresponding restricted Dyck paths.

Even if in this article we restrict ourselves to the avoidance of two patterns of length 3, some classes considered here can be trivially extended to larger length patterns, for instance \(C(102, 201) = C(01012, 01201)\). In this light, it can be of interest to explore Catalan words avoiding patterns of length 4 or more, triples of patterns or generalized patterns.

Acknowledgements

The authors are grateful to the anonymous referees for their careful reading of the paper and their many insightful comments and suggestions.
