*Piper crocatum* Ruiz & Pav. (*P. crocatum*), a traditional medicinal plant, has been shown to possess various pharmacological activities, including anticancer activity, antioxidant activity, antibacterial activity, anti-hyperglycemic activity, anti-allergic inflammatory activity and others. To identify the potential anti-allergic inflammatory effective constituents of *P. crocatum*, 13 single compounds were isolated from the methanol extract of *P. crocatum* leaves, and their structures were identified by contrasting their NMR spectroscopic data and previously published papers. First, the anti-allergic inflammatory activities of these single compounds were examined by accessing immune function related biomarkers such as nitric oxide (NO) and β-hexosaminidase. We found that the methanol extract and catechaldehyde (compound 1) potently suppressed the production of NO by reducing inducible nitric oxide synthase (iNOS) expression in lipopolysaccharide (LPS)-induced RAW264.7 macrophages. Consistent with these observations, *P. crocatum* methanol extract and compound 1 suppressed the production of NO by reducing inducible nitric oxide synthase (iNOS) expression in lipopolysaccharide (LPS)-induced RAW264.7 macrophages. Consistent with these observations, *P. crocatum* methanol extract and compound 1 remarkably decreased β-hexosaminidase release from RBL-2H3 cells stimulated with 2,4-dinitrophenylated bovine serum albumin (DNP-BSA)-specific immunoglobulin E (IgE) antibodies. Furthermore, 3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium (MTS) assay indicated that *P. crocatum* methanol extract and compound 1 exhibited no cytotoxicity to RAW264.7 and RBL-2H3 cells. Based on these findings, compound 1 is suggested as an active anti-allergic inflammatory component of *P. crocatum*.

**Key words** allergic inflammation; *Piper crocatum* Ruiz & Pav.; catechaldehyde; nitric oxide; inducible nitric oxide synthase; β-hexosaminidase

INTRODUCTION

*Piper crocatum* Ruiz & Pav. (*P. crocatum*) is one of medicinal plants commonly found in Indonesian rainforest. For a long time, *P. crocatum* has served as a folk medicine to treat various diseases based on experience. Some pharmacological activities of *P. crocatum* have been reported, such as cytotoxic effect and antimigration activity on metastatic breast cancer,¹ antibiotic activity,²,³ anti-hyperglycemic activity⁴ and others.⁵

Previous studies have demonstrated the inhibitory effect of *P. crocatum* ethanol and butanol extracts on proinflammatory cytokines production, such as tumour necrosis factor alpha (TNF-α), interleukin 1 beta (IL-1β), nitric oxide (NO), and interleukin 6 (IL-6).⁶ In addition, *P. crocatum* methanol extract was examined on the anti-allergic inflammatory effect by carrageenan-induced rat oedema test.⁷ These studies make it pretty clear that *P. crocatum* has a potent anti-allergic inflammatory effect. However, the active anti-allergic inflammatory constituents of *P. crocatum* remain to be investigated.

In the present study, 13 single compounds were isolated from the methanol extract of *P. crocatum* leaves. To screen the active anti-allergic inflammatory constituents, we performed NO and β-hexosaminidase assays.

The dried leaves of *P. crocatum* (2.6 kg) were refluxing extracted with MeOH (8 L) for 3 times. The total extraction (400.0 g) of MeOH was suspended in deionized water and partitioned with *n*-hexane, and water fraction. Then the water fraction was sequentially partitioned with EtOAc and *n*-BuOH, yielding EtOAc (1A, 16.1 g), *n*-BuOH (1B, 65.0 g) fractions. The EtOAc fraction was subjected to a silica gel column chromatography with a gradient of CHCl₃–MeOH–H₂O (10 : 1 : 0, 9 : 1 : 0, 8 : 1 : 0, 6 : 1 : 0, 5 : 1 : 0, 4 : 1 : 0, 3 : 1 : 0, 2 : 1 : 0, MeOH 2.0 L for each step) to give 11 fractions (Frs. 1A-1–11). Fractions 5 and 6 were combined and isolated with a gradient of MeOH–H₂O (1 : 2, 1 : 1 and 100% MeOH) by medium-pressure liquid chromatography (MPLC) using a C₁₈ column to give 8 fractions (Frs. 2A-1–8). The fraction 2A-2 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 1 (20.0 mg). Fractions 7 and 8 were combined and isolated with a gradient of MeOH–H₂O (1 : 2, 1 : 1 and 100% MeOH) by MPLC using a C₁₈ column to give 8 fractions (Frs. 2B-1–8). Subfraction 2B-2 was separated using a silica gel column chromatography with a gradient of CHCl₃–MeOH–H₂O (10 : 1 : 0, 9 : 1 : 0, 8 : 1 : 0, 6 : 1 : 0, 5 : 1 : 0, 4 : 1 : 0, 3 : 1 : 0, 2 : 1 : 0, MeOH 5.0 L for each step) to give 11 fractions (Fr. 2C-1–11). Fractions 2C-2 and -3 were combined and isolated with a gradient of MeOH–H₂O (10 : 1 : 0, 9 : 1 : 0, 8 : 1 : 0, 6 : 1 : 0, 5 : 1 : 0, 4 : 1 : 0, 3 : 1 : 0, 2 : 1 : 0, MeOH 5.0 L for each step) to give 11 fractions (Fr. 2C-11). Fractions 2C-2 and -3 were combined and isolated with a gradient of MeOH–H₂O (1 : 2, 1 : 1 and 100% MeOH) by MPLC using a C₁₈ column to give 12 fractions (Frs. 1D-1–12). The fraction 1D-3 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 3 (3.0 mg). The n-BuOH fraction was subjected to a silica gel column chromatography with a gradient of CHCl₃–MeOH–H₂O (10 : 1 : 0, 9 : 1 : 0, 8 : 1 : 0, 6 : 1 : 0, 5 : 1 : 0, 4 : 1 : 0, 3 : 1 : 0, 2 : 1 : 0, MeOH 5.0 L for each step) to give 11 fractions (Fr. 2C-1–11). Fractions 2C-2 and -3 were combined and isolated with a gradient of MeOH–H₂O (1 : 2, 1 : 1 and 100% MeOH) by MPLC using a C₁₈ column to give 12 fractions (Frs. 1D-1–12). The fraction 1D-3 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 3 (3.0 mg). The fraction 1D-7 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 4 (4.9 mg). The fraction 1D-8 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 5 (3.6 mg). Fractions 2C-4 and -5 were combined and isolated with a gradient of MeOH–H₂O (1 : 2, 1 : 1 and 100% MeOH) by MPLC using a C₁₈ column to give 13 fractions (Frs. 1E-1–13). The fraction 1E-2 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 6 (15.0 mg). The fraction 1E-6 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 7 (3.0 mg). The fraction 1F-5 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 8 (3.0 mg). The fraction 1F-7 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 9 (3.0 mg). The fraction 1F-8 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 10 (15.0 mg). The fraction 1E-6 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 11 (2.0 mg), and 7 (3.0 mg). The fraction 1F-5 was separated by a Sephadex LH-20 column and eluted by MeOH and its subfraction was isolated by prep-HPLC to give compound 12 (31.2 mg).

The TLC analysis of compounds 1–13 and extracts are shown in Supplementary Fig. 1.

**Cell Culture and Reagents** RBL-2H3 cells were obtained from Korea Cell Bank (Seoul, South Korea). RAW264.7 and IGEL b4 cells were purchased from American Type Culture Collection (ATCC, Manassas, VA, U.S.A.). RAW264.7 and IGEL b4 cells were maintained in Dulbecco's modified Eagle's medium (DMEM) containing 10% fetal bovine serum (FBS) and 1% penicillin–streptomycin. RBL-2H3 cells were maintained in minimum essential medium (MEM) containing 10% FBS and 1% penicillin–streptomycin. The cells were cultured in a humidified 37°C incubator with 5% CO₂, DMEM and FBS were obtained from Welgene (Gyeongsan-si, Gyeongsangbuk-do, South Korea) and MEM was purchased from Gibco (Scotland, U.K.). Quercetin and grief reagent were provided by Sigma-Aldrich (St. Louis, MO, U.S.A.). We purchased 2,4-dinitrophenylated bovine serum albumin (DNP-BSA) from Invitrogen by Thermo Fisher Scientific (Eugene, OR, U.S.A.) and 3-(4,5-dimethylthiazol-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium (MTS) from Promega (Madison, WI, U.S.A.), respectively.

**Nitric Oxide Assay** RAW264.7 cells were seeded (1 × 10⁶ cells/well) in 48-well plates overnight. After treatment with drugs for 1 h, the cells were exposed to lipopolysaccharide (LPS) (500 ng/mL) for 24 h. The generation of NO in the supernatants was determined with Griess reagent [1% sulfanilamide in 5% H₃PO₄, 0.1% N-(1-naphthyl)-ethylenediamine dihydrochloride] for 30 min at room temperature. The absorbance was measured at 570 nm utilizing an enzyme-linked immunosorbent assay (ELISA) microplate reader (BioTek, Winooski, VT, U.S.A.).

**Western Blot Analysis** To evaluate whether the decreased NO production was mediated by inducible nitric oxide synthase (iNOS) regulation, Western blotting was performed. RAW264.7 cells were seeded in 6-well plates (1 × 10⁵ cells/well) in DMEM with 10% FBS at 37°C overnight. After treatment with *P. crocatum* methanol extract or compound 1 for 2 h, the cells were lysed by an ice-cold cell culture lysis reagent (Promega) in the presence of the protease inhibitor cocktail (1 : 1000, Sigma-Aldrich). The protein concentration in the lysates was quantified with the Bradford reagent (Bio-Rad Laboratories, CA, U.S.A.). The denatured samples (20 µg) were size-separated by 10% sodium dodecyl sulfate-polyacrylamide gel electrophoresis (SDS-PAGE) gels and transferred to polyvinylidene fluoride (PVDF) membranes (Millipore, Bedford, MA, U.S.A.). After blocking with 5% skim milk in Tris-buffered saline containing 0.05% Tween 20 (TBS/T) at room temperature for 2 h, membranes were incubated with primary antibodies specific to iNOS (1 : 1000, Santa Cruz, CA, U.S.A.) or glyceraldehyde-3-phosphate dehydrogenase (GAPDH) (1 : 1000, Santa Cruz, CA, U.S.A.) overnight at 4°C. Thereafter, membranes were washed three times with TBS/T and incubated with the secondary antibodies for 1 h at room temperature. Immunoreactive bands were visualized by an ECL Western blot detection system (Advansa, Menlo Park, CA, U.S.A.).
β-Hexosaminidase Assay  RBL-2H3 cells were seeded in 48-well plates (3×10⁵ cells/mL) in MEM with 10% FBS and immunoglobulin E (IgE) at 37°C overnight. After washing twice with siraganian buffer (pH 7.2, 119 mM NaCl, 5 mM KCl, 0.4 mM MgCl₂·6H₂O, 25 mM PIPES, 40 mM NaOH), the cells were incubated in SBC buffer (siraganian buffer supplemented with 5.6 mM glucose, 1 mM CaCl₂, and 0.1% BSA). After treatment with methanol extract (30, 60 µg/mL), compound 1 (10, 20 µM) or the positive control quercetin (20 µM) separately, the cells were stimulated with DNP-BSA (1 µg/mL) (Thermo Fisher Scientific) for 30 min at 37°C. The cell supernatants (25 µL) were collected and transferred to another 96-well plate. To determine the amount of released β-hexosaminidase, 25 µL of the cell supernatants in the plate were incubated with 25 µL of 1 mM 4-nitrophenyl-N-acetyl-β-D-glucosaminide (Sigma-Aldrich) in 0.1 M sodium citrate (pH 4.5) at 37°C for 1 h. The reactions were stopped with 200 µL/well of carbonate buffer (0.1 M Na₂CO₃ and 0.1 M NaHCO₃, pH 10), and the absorbance was detected at 405 nm by using a microplate reader (BioTek).

MTS Assay  RBL-2H3 and RAW264.7 cells were cultured in the 96-well plates (SPL life Sciences Co., Pocheon, Korea) (1×10⁴ cells/well) overnight and then exposed to several concentrations of P. crocatum methanol extract or compound 1 for 24 h. MTS solution was added to each well for another 1 h following manufacturer’s instructions. The absorbance was detected at 490 nm with an ELISA microplate reader (BioTek).

Statistical Assay  All data are expressed as mean ± standard error of the mean (S.E.M.) of at least three independent experiments. The statistical differences were analyzed by one-way ANOVA followed by the Tukey test or Student’s t-test. p < 0.05 was considered statistically significant using GraphPad Prism 5 (GraphPad Software Inc., San Diego, CA, U.S.A.).

RESULTS

Identification of the Single Compounds Isolated from Methanol Extract of P. crocatum Leaves  Thirteen components were isolated from methanol extract of P. crocatum leaves, and their structures were identified as catechaldehyde (1),8) gentisic acid (2),9) benzyl β-D-glucoside (3),10) methyl salicylate 2-O-β-D-glucopyranoside (4),11) β-phenylethyl β-D-glucoside (5),12) cimidahurinin (6),13) hydroxytyrosol-1-glucopyranoside (7),14) erigeside II (8),15) syringin (9),16) 3-[(1E)-3-hydroxy-1-propen-1-yl]-2,5-dimethoxyphenyl β-D-glucopyranoside (10),17) 4-hydroxybenzoic acid β-D-glucosyl ester (11),18) phenylmethyl 6-O-α-L-arabinofuranosyl-β-D-glucopyranoside (12),19) and icariside D1 (13)20) by comparing their NMR spectroscopic data with previously published papers (Fig. 1).

Effect of Methanol Extract and Single Compounds of P. crocatum on NO Production in RAW264.7 Cells  NO is generally regarded as one of the most important roles during the immune response.21) Therefore, we examined NO production in LPS-induced RAW264.7 cells after the treatment of P. crocatum methanol extract to confirm its anti-allergic inflammatory activity. The results indicated that the methanol extract of P. crocatum potently suppressed NO production (Fig. 2A). Furthermore, to ensure the effective anti-allergic inflammatory constituents, 13 single compounds were isolated from methanol extract of P. crocatum leaves and their abilities to decay the NO production were detected. As appeared in Fig. 2B, only compound 1 significantly restrained NO production (Fig. 2A). Moreover, to ensure the effective anti-allergic inflammatory constituents, 13 single compounds were isolated from methanol extract of P. crocatum leaves and their abilities to decay the NO production were detected. As appeared in Fig. 2B, only compound 1 significantly restrained NO production (Fig. 2A). Additionally, the inhibitory impact of compound 1 on NO production was in a dose-dependent manner (Fig. 2C). A large deal of NO is synthesized from
Accordingly, we further investigated the expression level of iNOS by Western blot analysis. The results revealed that the methanol extract of *P. crocatum* and compound 1 significantly decreased iNOS expression (Fig. 3), which indicated that the downregulation of NO was caused by the decreased expression level of iNOS.

**Effect of Methanol Extract and Compound 1 of *P. crocatum* on β-Hexosaminidase Release in RBL-2H3 Cells**

β-Hexosaminidase, which is secreted from mast cells and basophils stimulated by antigens or degranulation inducers, is frequently considered as an indicator of anaphylactic reactions. To investigate whether methanol extract of *P. crocatum* or compound 1 affects mast cell degranulation, we measured the amount of released β-hexosaminidase in the supernatants of RBL-2H3 cells stimulated by IgE-antigen complex. With the treatment of methanol extract or compound 1, the released β-hexosaminidase from RBL-2H3 cells was obviously reduced, and quercetin was used as a reference compound (Fig. 4).

**Effect of Methanol Extract and Compound 1 of *P. crocatum* on Cell Viability**

To ensure that the decreased levels of NO and β-hexosaminidase in RAW264.7 and RBL-2H3 cells were not caused by cell death in each condition, the cell viability was measured by MTS assay. The results showed that methanol extract and compound 1 did not have any cytotoxicity to RAW264.7 cells and RBL-2H3 cells (Figs. 5A, B). In addition, an increased cell growth was observed in 30 µg/mL of *P. crocatum* methanol extract-treated RAW264.7 cells (Fig. 5A).
DISCUSSION

Currently, more and more researchers focus on screening active constituents from medicinal plants. One of the potential medicinal plants is P. crocatum. Several studies have reported that P. crocatum exerts its anti-inflammatory effect by the inhibition of several proinflammatory cytokines. However, the effective constituents of P. crocatum remain to be determined.

In order to ascertain the active anti-allergic inflammatory constituents of P. crocatum, we isolated 13 single compounds from its methanol extract and identified their structures (Fig. 1). First, we confirmed that methanol extract of P. crocatum was effective in suppressing LPS-induced NO production (Fig. 2A), which was consistent with previously reported paper.5) NO is known as an important biomarker during immune response.25) Inhibition of NO production is considered to be one of the mechanisms of drugs for the treatment of allergic inflammatory diseases. Therefore, we screened these single compounds by measuring the NO amount in the supernatants of LPS-induced RAW264.7 macrophages. Results implied that LPS-induced NO production was only apparently decreased with the treatment of compound 1 (Fig. 2B). The other compounds did not show inhibitory effect on the assay system. There is some structure difference between compound 1 and others. It may be a reason why only compound 1 showed significant inhibitory effect on both NO production and β-hexosaminidase release. More research is needed later to reveal structure–activity relationship. NO is synthesized from L-arginine, which was catalyzed by nitric oxide synthase (NOS). Three types of NOS have been identified in mammals and among them, iNOS is mainly responsible for the generation of NO during host defense response.26) Consequently, we measured the effect of P. crocatum methanol extract and compound 1 on iNOS expression by Western blotting. The result suggested that methanol extract and compound 1 inhibited NO production through the inhibition of iNOS (Fig. 3).

β-Hexosaminidase is known as a component of mast cell granules.27) To further confirm the anti-allergic inflammatory effect of P. crocatum methanol extract and compound 1, we measured the amount of β-hexosaminidase released from IgE-antigen complex-stimulated RBL-2H3 cells. Similarily, result showed that methanol extract and compound 1 suppressed β-hexosaminidase release (Fig. 4), which was not caused by cell cytotoxicity (Figs. 5A, B).

Upon these findings, we consider that compound 1 (catechaldehyde) is an active constituent of P. crocatum to exert anti-allergic inflammatory effect. However, it should be noted that this study has isolated and examined only 13 single compounds. There may exist other effective compounds in P. crocatum. More research should be carried on to reveal the anti-allergic inflammatory mechanism of compound 1. Catechaldehyde (also known as protocatechuic aldehyde), a natural compound in some medicinal plants, possesses multiple biological activities such as neuroprotective effect,28) cardioprotective effect,29) antioxidant stress effect. Previous researchers have determined the protective effect of catechaldehyde on renal inflammation.30) However, the anti-allergic inflammatory mechanisms of catechaldehyde remain to be elucidated. Catechaldehyde was extracted from P. crocatum for the first time in this study.
and deemed to be an active anti-allergic inflammatory component of *P. crocatum*, which provided a valuable addition to the knowledge of the anti-allergic inflammatory mechanisms of *P. crocatum*.
