dedicated to the 70th birthday of Professor Li Ta-tsien

Abstract. We consider an elastic bi-dimensional body whose reference configuration is a shallow shell. We establish a Carleman estimate for the linear shallow shell equation and apply it to prove a conditional stability for an inverse problem of determining external source terms by observations of displacement in a neighbourhood of the boundary over a time interval.

§1. Introduction.

The problems of controllability or observability for thin bi-dimensional bodies as membranes or plates have been discussed for many years and we refer to Lagnese and Lions [17], Lions [22], Russell [25] as early works. Here we do not intend a complete list of works and we list some of important papers on the controllability for shell and related problems; Cagnol, Lasiecka, Lebiedzik and Zolésio [3], Geymonat, Loreti and Valente [6], [7], Komornik [16], Lasiecka [18], Lasiecka and Marchand [19], Lasiecka, Triggiani and Valente [20], Telega and Bielski [26], Valente [27]. In

Key words and phrases. shallow shell, Carleman estimate, inverse source problem, conditional stability.

Typeset by AMS-TEX
this paper we consider the case of an elastic body that occupies a two-dimensional
domain slightly curved and we establish a Carleman estimate. A Carleman estimate
yields observability inequalities by an argument in Cheng, Isakov, Yamamoto and
Zhou [4], Kazemi and Klibanov [14]. From a geometrical point of view, this is of
great interest because a general shell can be approximated through a juxtaposition
of shallow shells. From a theoretical point of view, the approach retained here which
is based on Carleman estimates, is powerful, while by the multipliers technique,
we were not able to obtain the controllability of a Koiter shell by a boundary
action without a “shallowness” restriction (Miara and Valente [23]). In the static
case, let us now briefly recall the equilibrium equations of a shallow shell with
middle surface $S$, thickness $2\varepsilon$ and curvature $\varepsilon \theta$ (this expression of the curvature
has been rigorously justified in Ciarlet and Miara [5]). More precisely, let $\Omega \subset \mathbb{R}^2$
be a bounded connected domain with Lipschitz boundary $\partial \Omega$, and let a point in
$\Omega$ be denoted by $x = (x_1, x_2)$, let $\theta: \overline{\Omega} \to \mathbb{R}$, $\theta \in C^3(\overline{\Omega})$. Let $\partial_j = \frac{\partial}{\partial x_j}$ and
$\partial_{ij} = \partial_i \partial_j = \frac{\partial^2}{\partial x_i \partial x_j}$. Then the middle surface of the shell is therefore given by the
set $S = \{(x_1, x_2, \varepsilon \theta(x_1, x_2)); (x_1, x_2) \in \overline{\Omega}\}$ and the shell with thickness $2\varepsilon$ occupies
the domain $\{(x_1, x_2, \varepsilon \theta(x_1, x_2)) + x_3 \mathbf{a}(x_1, x_2); (x_1, x_2) \in \overline{\Omega}, -\varepsilon \leq x_3 \leq \varepsilon\}$, where
$\mathbf{a}(x_1, x_2)$ is the unit outward normal vector to the middle surface $S$ at the point
$(x_1, x_2)$. Hence, if we denote by $\Theta^\varepsilon$ the mapping

$$
\Theta^\varepsilon(x_1, x_2, x_3) = (x_1, x_2, \varepsilon \theta(x_1, x_2)) + x_3 \mathbf{a}(x_1, x_2), \quad (x_1, x_2) \in \overline{\Omega}, -\varepsilon \leq x_3 \leq \varepsilon,
$$

then the reference configuration of the shell is $\Theta^\varepsilon(\Omega \times (-\varepsilon, \varepsilon))$. Subjected to applied
volume forces $\mathbf{F} = (F_1, F_2, F_3) \in \{L^2(\Omega)\}^3$ (for simplicity, no surface forces are
taken into account in this presentation), a shell which is clamped on its lateral
surface, undergoes a scaled Kirchhoff-Love displacement field of the form $u_1 -$
$x_3\partial_1 u_3, u_2 - x_3\partial_2 u_3, u_3).$ For the precise meaning of the scaling, see Ciarlet and Miara [5]. In this section, Latin exponents and indices take their values in the set \{1, 2, 3\}, Greek indices take their values in the set \{1, 2\}, the Einstein convention for repeated exponents and indices is used. These notations are used especially for the compatibility with the notations in Ciarlet and Miara [5], Miara and Valente [23], [24]. Throughout this paper, bold face letters represent vectors.

The three-dimensional vector–valued function $u = (u_1, u_2, u_3) : \overline{\Omega} \rightarrow \mathbb{R}^3$ describes the displacement of the middle surface of the shell and solves a boundary value problem for shallow shell equations: Find $u = (u_1, u_2, u_3) \in \{H^1_0(\Omega)\}^2 \times H^2_0(\Omega)$ such that

$$
\begin{align*}
- \int_\Omega m_{\alpha\beta}(u_3)\partial_\alpha v_3 d\Omega + \int_\Omega n^\theta_{\alpha\beta}(u)(\partial_\alpha \theta)\partial_\beta v_3 d\Omega &= \int_\Omega v_3 \left( \int_{-1}^1 (f_3 + y_3 \partial_\alpha f_\alpha)dy_3 \right) d\Omega, \\
\forall v_3 \in H^2_0(\Omega), \\
\int_\Omega n^\theta_{\alpha\beta}(u)\partial_\beta v_\alpha d\Omega &= \int_\Omega v_\alpha \left( \int_{-1}^1 f_\alpha dy_3 \right) d\Omega, \quad \forall v_\alpha \in H^1_0(\Omega).
\end{align*}
$$

(1.1)

For a Saint Venant-Kirchhoff isotropic material with Lamé coefficients $\tilde{\lambda}$ and $\tilde{\mu}$, the constitutive law reads:

$$
\begin{align*}
m_{\alpha\beta}(u_3) := & -\left( \frac{4\tilde{\lambda}\tilde{\mu}}{3(\tilde{\lambda} + 2\tilde{\mu})} (\Delta u_3)\delta_{\alpha\beta} + \frac{4}{3}\tilde{\mu}\partial_\alpha u_3 \right), \\
n^\theta_{\alpha\beta}(u) = & \frac{4\tilde{\lambda}\tilde{\mu}}{\tilde{\lambda} + 2\tilde{\mu}} e^\theta_{\rho\rho}(u)\delta_{\alpha\beta} + 4\tilde{\mu} e^\theta_{\alpha\beta}(u), \\
e^\theta_{\alpha\beta}(u) = & \frac{1}{2}(\partial_\alpha u_\beta + \partial_\beta u_\alpha) + \frac{1}{2}((\partial_\alpha \theta)\partial_\beta u_3 + (\partial_\beta \theta)\partial_\alpha u_3).
\end{align*}
$$

(1.2)

The outline of the contents of the paper is as follows: In the next section we rewrite the shallow shell equations in a more appropriate form to deal with the evolution problem, in section 3 we establish a Carleman estimate for the evolution problem and finally in section 4 we solve the inverse problem.

§2. The evolution problem of the shallow shell equation.
Let \( \Omega \subset \mathbb{R}^2 \) be a bounded domain with smooth boundary \( \partial \Omega \), \( x = (x_1, x_2) \), 
\[ \partial_j = \frac{\partial}{\partial x_j}, \quad \partial_t = \frac{\partial}{\partial t}, \quad \partial_{jk} = \partial_j \partial_k = \frac{\partial^2}{\partial x_j \partial x_k}, \] 
and let \( \theta : \overline{\Omega} \to \mathbb{R} \) be given and sufficiently smooth,

\[
\mathbf{u}(x_1, x_2, t) = (u_1(x, t), u_2(x, t), u_3(x, t)),
\]

\[
\bar{\mathbf{u}}(x_1, x_2, t) = (u_1(x, t), u_2(x, t)) : \overline{\Omega} \to \mathbb{R}^2.
\]

Then, considering the force of inertia in (1.1) and (1.2), we can describe an evolution problem for shallow shell equation:

\[
\rho \partial_t^2 \bar{\mathbf{u}} - \mu \Delta \bar{\mathbf{u}} - (\lambda + \mu) \nabla \text{div} \bar{\mathbf{u}} - (\text{div} \bar{\mathbf{u}}) \nabla \lambda - (\nabla \bar{\mathbf{u}} + (\nabla \bar{\mathbf{u}})^T) \nabla \mu
\]

\[
- \mathcal{G}(D^2 u_3, \nabla u_3) = \bar{\mathbf{F}},
\]  

(2.1)

and

\[
\rho \partial_t^2 u_3 + \frac{\lambda + 2\mu}{3} \Delta^2 u_3 + \left( \frac{4}{3} \nabla \mu + \frac{2}{3} \nabla \lambda \right) \cdot \nabla (\Delta u_3)
\]

\[
+ (\mu \Delta \bar{\mathbf{u}} + (\lambda + \mu) \nabla \text{div} \bar{\mathbf{u}}) \cdot \nabla \theta + G_3(\nabla \bar{\mathbf{u}}, D^2 u_3, \nabla u_3) = F_3 \text{ in } Q \equiv \Omega \times (0, T).
\]  

(2.2)

Here

\[
\mathcal{G}(D^2 u_3, \nabla u_3) = \sum_{k=1}^2 \left\{ \nabla (\lambda (\partial_k \theta)(\partial_k u_3)) + \partial_k \{\mu (\partial_k u_3)(\nabla \theta) + \mu (\partial_k \theta)(\nabla u_3)\} \right\},
\]

\[
G_3(\nabla \bar{\mathbf{u}}, D^2 u_3, \nabla u_3) = \left\{ (\text{div} \bar{\mathbf{u}}) \nabla \lambda + (\nabla \bar{\mathbf{u}} + (\nabla \bar{\mathbf{u}})^T) \nabla \mu + \mathcal{G}(D^2 u_3, \nabla u_3) \right\} \cdot \nabla \theta
\]

\[
+ \frac{1}{3} \Delta \lambda \Delta u_3 + \sum_{j,k=1}^2 \frac{2}{3} \partial_{jk} \mu (\partial_{jk} u_3) + \sum_{j,k=1}^2 n_{jk}^\theta \partial_{jk} \theta,
\]

\[
\bar{\mathbf{F}} = (F_1, F_2)
\]

and

\[
\lambda = 4 \bar{\lambda} \bar{\mu} / (\bar{\lambda} + 2 \bar{\mu}), \quad \mu = 2 \bar{\mu},
\]
\[ \triangle = \partial_1^2 + \partial_2^2, \quad \nabla = (\partial_1, \partial_2), \quad \nabla_{x,t} = (\partial_1, \partial_2, \partial_t), \]
\[ \text{div} \tilde{u} = \partial_1 u_1 + \partial_2 u_2, \quad \text{rot} \tilde{u} = \partial_1 u_2 - \partial_2 u_1, \]
\[ \nabla \tilde{u} = \begin{pmatrix} \partial_1 u_1 \\ \partial_2 u_1 \\ \partial_1 u_2 \end{pmatrix}, \quad D^2 u_3 = (\partial_1^2 u_3, \partial_2^2 u_3, \partial_1 \partial_2 u_3) \]

and \((\nabla \tilde{u})^T\) is the transpose matrix of \(\nabla \tilde{u}\).

Henceforth we set
\[ L_e u = \rho \partial_t^2 u - \mu \triangle \tilde{u} - (\lambda + \mu) \nabla \text{div} \tilde{u} - (\text{div} \tilde{u}) \nabla \lambda - \left(\nabla \tilde{u} + (\nabla \tilde{u})^T\right) \nabla \mu \]
\[ - \tilde{G}(D^2 u_3, \nabla u_3) \]

and
\[ L_p u = \rho \partial_t^2 u_3 + \frac{\lambda + 2 \mu}{3} \Delta^2 u_3 + \left(\frac{4}{3} \nabla \mu + \frac{2}{3} \nabla \lambda\right) \cdot \nabla (\Delta u_3) \]
\[ + (\mu \Delta \tilde{u} + (\lambda + \mu) \nabla \text{div} \tilde{u}) \cdot \nabla \theta + G_3(\nabla \tilde{u}, D^2 u_3, \nabla u_3) \text{ in } Q. \]

§3. Carleman estimate.

In this section, we establish a Carleman estimate for the shallow shell equation.

We assume that \(\rho = \rho(x), \lambda = \lambda(x)\) and \(\mu = \mu(x)\) are in \(C^2(\overline{\Omega})\) and positive in \(\overline{\Omega}\). We set \(t_0 = T/2, \)
\[ \varphi(x, t) = e^{\gamma(|x-x_0|^2 - \nu |t-t_0|^2)}, \]
(3.1)

\( \gamma \) and \( \nu \) are positive constants, \( x_0 = (x_0^1, x_0^2) \in \mathbb{R}^2 \setminus \overline{\Omega} \). We set
\[ Lu_3 = \rho \partial_t^2 u_3 + \frac{\lambda + 2 \mu}{3} \Delta^2 u_3 + \left(\frac{4}{3} \nabla \mu + \frac{2}{3} \nabla \lambda\right) \cdot \nabla (\Delta u_3). \]

First we present

**Lemma 1.** We assume that \(\rho, \mu \) and \( \lambda \) are in \(C^2(\overline{\Omega})\) and positive on \(\overline{\Omega}\) and that
\[ \left(\nabla \log \left(\sqrt{\frac{3 \rho}{\lambda + 2 \mu}} (x) \cdot (x-x_0)\right)\right) > -2, \quad x \in \overline{\Omega}. \]
(3.2)
Let $\nu > 0$ be arbitrarily fixed in (3.1). Then there exists a number $\gamma_0 > 0$ such that for arbitrary $\gamma \geq \gamma_0$, we can choose $s_0 \geq 0$ satisfying: there exists a constant $C > 0$ such that

$$
\int_Q \left\{ s|\nabla \partial_t v|^2 + s|\nabla \Delta v|^2 + s^3|\partial_t v|^2 + s \sum_{j,k=1}^2 |\partial_j \partial_k v|^2
\right. \\
+ s^4|\nabla v|^2 + s^6|v|^2
\left. + \sum_{j,k,\ell=1}^2 |\partial_j \partial_k \partial_{\ell} v|^2 \right\} e^{2s\varphi} dx dt \leq C \int_Q |Lv|^2 e^{2s\varphi} dx dt
$$

for all $s > s_0$ and every real-valued $v \in L^2(0, T; H^1_0(\Omega)) \cap H^1(0, T; H^3_0(\Omega)) \cap H^2(0, T; H^1_0(\Omega))$ satisfying $v(\cdot, 0) = \partial_t v(\cdot, 0) = v(\cdot, T) = \partial_t v(\cdot, T) = 0$, provided that the right hand side of what is finite. The constants $s_0$ and $C$ continuously depend on $T$, $\gamma$, $\|\rho\|_{C^1(\overline{\Omega})}$, $\|\lambda\|_{C^1(\overline{\Omega})}$, $\|\mu\|_{C^1(\overline{\Omega})}$, and $\gamma_0$ continuously depends on $T$, $\|\rho\|_{C^1(\overline{\Omega})}$, $\|\lambda\|_{C^1(\overline{\Omega})}$, $\|\mu\|_{C^1(\overline{\Omega})}$.

We note that if $\lambda$ and $\mu$ are positive constants, then condition (3.2) is automatically satisfied.

**Proof of Lemma 1.** Except for the term $\sum_{j,k,\ell=1}^2 |\partial_j \partial_k \partial_{\ell} v|^2 e^{2s\varphi}$, by Yuan and Yamamoto [28], all the terms on the left hand side is proved to be estimated by the right hand side. We have to estimate $\partial_j \partial_k \partial_{\ell} v$. We have

$$
\triangle((\partial_j v)e^{s\varphi}) = \triangle(\partial_j v)e^{s\varphi} + 2s\nabla(\partial_j v) \cdot (\nabla \varphi)e^{s\varphi} + (\partial_j v)(s\Delta \varphi + s^2|\nabla \varphi|^2)e^{s\varphi},
$$

and so

$$
|\triangle((\partial_j v)e^{s\varphi})|^2 \leq C|\triangle(\partial_j v)|^2 e^{2s\varphi} + Cs^2|\nabla(\partial_j v)|^2 e^{2s\varphi} + Cs^4|\nabla v|^2 e^{2s\varphi}.
$$

(3.3)

Similarly we have

$$
|\triangle(v e^{s\varphi})|^2 \leq C|\triangle v|^2 e^{2s\varphi} + Cs^2|\nabla v|^2 e^{2s\varphi} + Cs^4|v|^2 e^{2s\varphi}.
$$
Lemma 1 yields
\[ s^2 \int_Q |\Delta (ve^{s\varphi})|^2 dx dt \leq C \int_Q |Lv|^2 e^{2s\varphi} dx dt. \]

Here the a priori estimate for the Dirichlet problem for \( \Delta \) implies
\[
\sum_{j,k=1}^2 \int_Q s^2 |\partial_j \partial_k (ve^{s\varphi})|^2 dx dt \leq C \int_Q |Lv|^2 e^{2s\varphi} dx dt.
\]

Since
\[
\partial_j \partial_k (ve^{s\varphi}) = (\partial_j \partial_k v)e^{s\varphi} + s e^{s\varphi} \{(\partial_j \varphi) \partial_k v + (\partial_k \varphi) \partial_j v\}
+ \{s(\partial_j \partial_k \varphi) + s^2(\partial_j \varphi)(\partial_k \varphi)\} ve^{2s\varphi},
\]
we have
\[
\sum_{j,k=1}^2 \int_Q s^2 |\partial_j \partial_k v|^2 e^{2s\varphi} dx dt \leq C \int_Q |Lv|^2 e^{2s\varphi} dx dt \tag{3.4}
\]
in terms of Lemma 1. Hence by (3.3) and Lemma 1, we have
\[
\int_Q |\Delta ((\partial_j v)e^{s\varphi})|^2 dx dt \\
\leq C \int_Q (|\nabla (\Delta v)|^2 + s^2 \sum_{j,k=1}^2 |\partial_j \partial_k v|^2 + s^4 |\nabla v|^2)e^{2s\varphi} dx dt \leq C \int_Q |Lv|^2 e^{2s\varphi} dx dt.
\]

Hence the a priori estimate for the Dirichlet problem for \( \Delta \) yields
\[
\sum_{j,k,\ell=1}^2 \int_Q |\partial_j \partial_k ((\partial_\ell v)e^{s\varphi})|^2 dx dt \leq C \int_Q |Lv|^2 e^{2s\varphi} dx dt,
\]
that is,
\[
\sum_{j,k,\ell=1}^2 \int_Q |\partial_j \partial_k \partial_\ell v|^2 e^{2s\varphi} dx dt \\
\leq C \int_Q |Lv|^2 e^{2s\varphi} dx dt + C \int_Q \left(s^2 \sum_{j,k} |\partial_j \partial_k v|^2 + s^4 |\nabla v|^2\right) e^{2s\varphi} dx dt.
\]
In terms of (3.4), we obtain
\[
\sum_{j,k,\ell=1}^{2} \int_{Q} |\partial_j \partial_k \partial_\ell v|^2 e^{2s\varphi} dxdt \leq C \int_{Q} |Lv|^2 e^{2s\varphi} dxdt. \tag{3.5}
\]
Thus the proof of Lemma 1 is completed.

Next we present a Carleman estimate for the two-dimensional isotropic Lamé system. We set \( \tilde{u} = (u_1, u_2) \) and
\[
L_0 \tilde{u} = \rho \partial_t^2 \tilde{u} - \mu \Delta \tilde{u} - (\lambda + \mu) \nabla \text{div} \tilde{u} - (\text{div} \tilde{u}) \nabla \lambda - (\nabla \tilde{u} + (\nabla \tilde{u})^T) \nabla \mu.
\]
Let \( x_0 \notin \overline{\Omega} \). Set
\[
D = \sqrt{\sup_{x \in \overline{\Omega}} |x - x_0|^2 - \inf_{x \in \overline{\Omega}} |x - x_0|^2}.
\]
We introduce conditions on a function \( a \):
\[
\begin{cases}
\|a\|_{C^3(\overline{\Omega})} \leq M_0, \\
a(x) \geq \theta_1 > 0, \quad \frac{(x - x_0) \cdot \nabla a(x)}{2a(x)} \leq 1 - \theta_0, \quad x \in \overline{\Omega},
\end{cases} \tag{3.6}
\]
where the constants \( M_0 > 0, 0 < \theta_0 < 1, \theta_1 > 0 \) are given. We fix a positive constant \( \nu \) such that
\[
\nu + \frac{M_0 D}{\sqrt{\theta_1}} \sqrt{\nu} \leq \theta_1 \theta_0, \quad \theta_1 \inf_{x \in \overline{\Omega}} |x - x_0|^2 - \nu \sup_{x \in \overline{\Omega}} |x - x_0|^2 > 0. \tag{3.7}
\]
Here we note that such \( \nu > 0 \) exists because \( x_0 \notin \overline{\Omega} \).

Then

**Lemma 2.** We assume that \( \rho, \lambda, \mu \in C^3(\overline{\Omega}), \rho, \lambda, \mu > 0 \) on \( \overline{\Omega} \), and that (3.2) holds and \( \frac{\lambda + 2\mu}{\rho} \) satisfy (3.6). Let \( \varphi(x,t) \) be defined by (3.1), \( \gamma > 0 \) be sufficiently large, and \( \nu > 0 \) satisfy (3.7). Then

\[
\int_{Q} (s|\nabla_{x,t} \text{rot} \tilde{u}|^2 + s|\nabla_{x,t} \text{div} \tilde{u}|^2 + s|\nabla_{x,t} \tilde{u}|^2 + s^3|\text{rot} \tilde{u}|^2 + s^3|\text{div} \tilde{u}|^2 + s^3|\tilde{u}|^2) e^{2s\varphi} dxdt
\leq C \int_{Q} (|L_0 \tilde{u}|^2 + |\nabla (L_0 \tilde{u})|^2) e^{2s\varphi} dxdt
\]
for $s \geq s_0$ and $\tilde{u} \in \{H^3_0(Q)\}$.

The proof of the lemma is found in Imanuvilov and Yamamoto [10], [11], [12] for example.

Now we proceed to the derivation of the Carleman estimate for the shallow shell equation. Since $\Delta u_1 = \partial_t (\text{div} \, \tilde{u}) - \partial_2 \text{rot} \, \tilde{u}$ and $\Delta u_2 = \partial_2 (\text{div} \, \tilde{u}) + \partial_1 \text{rot} \, \tilde{u}$, we have

$$|\Delta \tilde{u}|^2 \leq C(|\nabla (\text{div} \, \tilde{u})|^2 + |\nabla (\text{rot} \, \tilde{u})|^2).$$

Hence Lemma 2 yields

$$\int_Q s|\Delta \tilde{u}|^2 e^{2s\varphi} dxdt \leq C \int_Q (|L_0 \tilde{u}|^2 + |\nabla (L_0 \tilde{u})|^2)e^{2s\varphi} dxdt. \quad (3.8)$$

On the other hand, since

$$\partial_t^2 \tilde{u} = \frac{1}{\rho} L_0 \tilde{u} + \frac{\mu}{\rho} \Delta \tilde{u} + \frac{\lambda + \mu}{\rho} \nabla (\text{div} \, \tilde{u})$$

$$+ (\text{div} \, \tilde{u}) \frac{\nabla \lambda}{\rho} + (\nabla \tilde{u} + (\nabla \tilde{u})^T) \frac{\nabla \mu}{\rho},$$

we obtain

$$\int_Q |\partial_t^2 \tilde{u}|^2 e^{2s\varphi} dxdt \leq C \int_Q (|L_0 \tilde{u}|^2 e^{2s\varphi} dxdt$$

$$+ C \int_Q (|\Delta \tilde{u}|^2 + |\nabla (\text{div} \, \tilde{u})|^2 + |\nabla \tilde{u}|^2) e^{2s\varphi} dxdt.$$ 

Therefore by Lemma 2 and (3.8), we have

$$\int_Q |\partial_t^2 \tilde{u}|^2 e^{2s\varphi} dxdt \leq C \int_Q (|L_0 \tilde{u}|^2 + |\nabla (L_0 \tilde{u})|^2)e^{2s\varphi} dxdt. \quad (3.9)$$

Applying Lemma 2 and (3.9), we obtain

$$\int_Q (s|\nabla \text{rot} \, \tilde{u}|^2 + s|\nabla \text{div} \, \tilde{u}|^2 + s|\nabla \tilde{u}|^2 + s|\partial_t (\text{rot} \, \tilde{u})|^2 + s|\partial_t (\text{div} \, \tilde{u})|^2 + s|\partial_t \tilde{u}|^2$$

$$+ s^3|\text{rot} \, \tilde{u}|^2 + s^3|\text{div} \, \tilde{u}|^2 + s^3|\tilde{u}|^2 + s|\Delta \tilde{u}|^2 + |\partial_t^2 \tilde{u}|^2) e^{2s\varphi} dxdt$$

$$\leq C \int_Q \left\{ \sum_{|\alpha| \leq 2} |\partial_x^\alpha u_3|^2 + |\tilde{F}|^2 \right\} + \sum_{|\alpha| \leq 3} |\partial_x^\alpha u_3|^2 + |\nabla \tilde{F}|^2 \right\} e^{2s\varphi} dxdt$$

$$\leq C \int_Q \left( \sum_{|\alpha| \leq 3} |\partial_x^\alpha u_3|^2 + |\tilde{F}|^2 + |\nabla \tilde{F}|^2 \right) e^{2s\varphi} dxdt. \quad (3.10)$$
Applying Lemma 1, (3.4) and (3.5) to (2.2), we have

\[
\int_Q \left\{ s|\nabla \partial_t u_3|^2 + s|\nabla \triangle u_3|^2 + s^3|\partial_t u_3|^2 + s^3|\triangle u_3|^2 \\
+ s^2 \sum_{j,k=1}^2 |\partial_j \partial_k u_3|^2 + s^4|\nabla u_3|^2 + s^6|u_3|^2 + \sum_{|\alpha|=3} |\partial_\alpha u_3|^2 \right\} e^{2s\varphi} \, dx \, dt
\leq C \int_Q (|\triangle \tilde{u}|^2 + |\nabla \text{div} \tilde{u}|^2 + |\nabla \tilde{u}|^2 + |\tilde{u}|^2) e^{2s\varphi} \, dx \, dt + C \int_Q |F_3|^2 e^{2s\varphi} \, dx \, dt.
\] (3.11)

Here we absorbed \( \sum_{j,k=1}^2 |\partial_j \partial_k u_3|^2 \) and \( |\nabla u_3|^2 \) into the left hand side. Substitute (3.11) into the right hand side of (3.10), we obtain

\[
\int_Q \left\{ (s|\nabla \text{rot} \tilde{u}|^2 + s|\nabla \text{div} \tilde{u}|^2 + s|\nabla \tilde{u}|^2 + s|\partial_t (\text{rot} \tilde{u})|^2 + s|\partial_t (\text{div} \tilde{u})|^2 + s|\partial_t \tilde{u}|^2 \right. \\
+ s^3|\text{rot} \tilde{u}|^2 + s^3|\text{div} \tilde{u}|^2 + s^3|\tilde{u}|^2 + s|\triangle \tilde{u}|^2 + |\partial_2 \tilde{u}|^2 \right\} e^{2s\varphi} \, dx \, dt
\leq C \int_Q (|\triangle \tilde{u}|^2 + |\nabla \text{div} \tilde{u}|^2 + |\nabla \tilde{u}|^2 + |\tilde{u}|^2) e^{2s\varphi} \, dx \, dt \\
+ C \int_Q (|\tilde{F}|^2 + |\nabla \tilde{F}|^2 + |F_3|^2) e^{2s\varphi} \, dx \, dt.
\]

Absorbing the first term on the right hand side into the left hand side, we reach

\[
\int_Q \left\{ (s|\nabla \text{rot} \tilde{u}|^2 + s|\nabla \text{div} \tilde{u}|^2 + s|\nabla \tilde{u}|^2 + s|\partial_t (\text{rot} \tilde{u})|^2 + s|\partial_t (\text{div} \tilde{u})|^2 + s|\partial_t \tilde{u}|^2 \right. \\
+ s^3|\text{rot} \tilde{u}|^2 + s^3|\text{div} \tilde{u}|^2 + s^3|\tilde{u}|^2 + s|\triangle \tilde{u}|^2 + |\partial_2 \tilde{u}|^2 \right\} e^{2s\varphi} \, dx \, dt
\leq C \int_Q (|\tilde{F}|^2 + |\nabla \tilde{F}|^2 + |F_3|^2) e^{2s\varphi} \, dx \, dt.
\] (3.12)

Again the application of (3.12) in (3.11) yields

\[
\int_Q \left\{ s|\nabla \partial_t u_3|^2 + s|\nabla \triangle u_3|^2 + s^3|\partial_t u_3|^2 + s^3|\triangle u_3|^2 \\
+ s^2 \sum_{j,k=1}^2 |\partial_j \partial_k u_3|^2 + s^4|\nabla u_3|^2 + s^6|u_3|^2 + \sum_{|\alpha|=3} |\partial_\alpha u_3|^2 \right\} e^{2s\varphi} \, dx \, dt
\leq C \int_Q \left\{ \frac{1}{s} |\tilde{F}|^2 + \frac{1}{s} |\nabla \tilde{F}|^2 + |F_3|^2 \right\} e^{2s\varphi} \, dx \, dt.
\] (3.13)

Thus we proved
Theorem 1 (Carleman estimate). We assume that \( \rho, \lambda, \mu \in C^3(\Omega), \rho(x) > 0, \lambda(x) > 0, \mu(x) > 0 \) for all \( x \in \Omega \), and that (3.2) holds, \( \frac{\mu}{\rho} \) and \( \frac{\lambda + 2\mu}{\rho} \) satisfy (3.6). Let \( \varphi(x,t) \) be defined by (3.1) and \( \nu > 0 \) satisfy (3.7). Then there exists \( \gamma_0 > 0 \) such that for any \( \gamma > \gamma_0 \), we can choose \( s_0 = s_0(\gamma) > 0 \) and \( C = C(s_0, \gamma_0, M_0, 0_0, \theta_1, \nu, \Omega, T, x_0, \omega) > 0 \) such that

\[
\int_Q \left\{ s|\nabla_{x,t} \text{rot}\, \tilde{u}|^2 + s|\nabla_{x,t} \text{div}\, \tilde{u}|^2 + s|\nabla_{x,t} \tilde{u}|^2 \\
+s^3|\text{rot}\, \tilde{u}|^2 + s^3|\text{div}\, \tilde{u}|^2 + s^3|\tilde{u}|^2 + s|\Delta \tilde{u}|^2 + |\partial_t^2 \tilde{u}|^2 \right\} e^{2s\varphi} \, dx \, dt \\
+ \int_Q \left\{ s|\nabla \partial_t u_3|^2 + s|\nabla \Delta u_3|^2 + s^3|\partial_t u_3|^2 + s^3|\Delta u_3|^2 \\
+s^2 \sum_{j,k=1}^2 |\partial_j \partial_k u_3|^2 + s^4|\nabla u_3|^2 + s^6|u_3|^2 + \sum_{|\alpha|=3} |\partial_\alpha^3 u_3|^2 \right\} e^{2s\varphi} \, dx \, dt \\
\leq C \int_Q (|L_e u|^2 + |\nabla (L_e u)|^2 + |L_p u|^2) e^{2s\varphi} \, dx \, dt.
\]

for all \( s \geq s_0 \), \( \tilde{u} \in \{H^3_0(Q)\}^2 \) and \( u_3 \in H^4_0(Q) \).

This is a Carleman estimate for the linear shallow shell equation, which is novel to the authors’ best knowledge. As for Carleman estimates and applications to the observability and inverse problems for nonstationary Lamé system and a plate equation, see Cheng, Isakov, Yamamoto and Zhou [4], Imanuvilov, Isakov and Yamamoto [9], Imanuvilov and Yamamoto [10], [11], [12], Isakov [13].

§4. Inverse source problem.

We consider

\[
L_e u = \tilde{F} \quad (4.1)
\]

\[
L_p u = F_3 \quad \text{in } Q = \Omega \times (0, T), \quad (4.2)
\]

\[
u = \partial_t u = 0 \quad \text{on } \Omega \times \{t_0\}, \quad (4.3)
\]
\( u = 0 \) on \( \partial \Omega \times (0, T) \), \hspace{1cm} (4.4)

where \( t_0 = \frac{T}{2} \), \( \tilde{F} = (F_1, F_2) \), and \( \tilde{u} = (u_1, u_2) \) and \( u_3 \) depends on \((x, t) \in Q\).

**Inverse source problem.** We assume that

\[
\tilde{F}(x, t) = \left( \frac{F_1(x, t)}{F_2(x, t)} \right) = \left( \frac{f_1(x) R_1(x, t)}{f_2(x) R_2(x, t)} \right), \quad F_3(x, t) = f_3(x) R_3(x, t). \hspace{1cm} (4.5)
\]

Let an observation subdomain \( \omega \subset \Omega \) satisfy \( \partial \Omega \subset \partial \omega \) and \( T > 0 \) be suitably given. Then determine an \( x \)-dependent component \((f_1(x), f_2(x), f_3(x)) \), \( x \in \Omega \) of an exterior force \((F_1, F_2, F_3)\) from the observations of

\[
u(x, t) = (\tilde{u}(x, t), u_3(x, t)), \quad (x, t) \in Q_\omega \equiv \omega \times (0, T).
\]

The condition \( \partial \omega \supset \partial \Omega \) means that \( \omega \subset \Omega \) is a neighbourhood of \( \partial \Omega \). We can relax the condition \( \partial \omega \supset \partial \Omega \), but we cannot choose an arbitrary subdomain \( \omega \), because the equation in \( \tilde{u} \) is hyperbolic, so that we need some geometric condition on \( \omega \) (e.g., [10]). This condition is related with the pseudo-convexity which is necessary for proving a Carleman estimate (e.g., Hörmander [8]).

We are ready to state the main result for the inverse source problem.

**Theorem 2.** We assume that \( \rho, \lambda, \mu \in C^3(\overline{\Omega}), \rho(x) > 0, \lambda(x) > 0, \mu(x) > 0 \) for all \( x \in \overline{\Omega}\), and that (3.2) holds, and \( \frac{\mu}{\rho} \) and \( \frac{\lambda + 2\mu}{\rho} \) satisfy (3.6). Let \( \nu > 0 \) satisfy (3.7). Furthermore we assume that

\[
T > \frac{2D}{\sqrt{\nu}}, \hspace{1cm} (4.6)
\]

and there exist constants \( M_1, r_0 > 0 \) such that

\[
\|R_j\|_{W^{3, \infty}(Q)} \leq M_1, \quad |R_j(x, t_0)| \geq r_0, \quad x \in \overline{\Omega}, \quad j = 1, 2, 3. \hspace{1cm} (4.7)
\]
Moreover, we assume that \( \tilde{u} \in \{ W^{5,\infty}(Q) \}^2, u_3 \in W^{6,\infty}(Q), f_j \in C^1(\Omega), j = 1, 2, f_3 \in C(\Omega) \) satisfy (4.1) - (4.5) and

\[
\| \tilde{u} \|_{W^{4,\infty}(Q)}^2 \leq M_2, \quad \| u_3 \|_{W^{3,\infty}(Q)} \leq M_2. \tag{4.8}
\]

Then there exist constants \( \kappa = \kappa(M_0, M_1, M_2, \theta_0, \theta_1, \Omega, T, x_0, \rho, \lambda, \mu) \in (0, 1) \) and \( C_0 = C_0(M_0, M_1, M_2, \theta_0, \theta_1, \Omega, T, x_0, \rho, \lambda, \mu) > 0 \) such that

\[
\| f_1 \|_{H^1(\Omega)} + \| f_2 \|_{H^1(\Omega)} + \| f_3 \|_{L^2(\Omega)} \leq C_0 \left( \| \tilde{u} \|_{H^4(Q_\omega)}^2 + \| u_3 \|_{H^6(Q_\omega)} \right)^\kappa. \tag{4.9}
\]

This kind of inverse problems was considered firstly in Bukhgeim and Klibanov [2], whose method is based on Carleman estimates. See also Bellassoued and Yamamoto [1], Klibanov [15] and the references therein. Here we do not give more detailed references on inverse problems by Carleman estimates.

**Proof.** The proof is adapted from e.g., [10]. By (4.6) and the definition (3.1) of \( \varphi \), we have

\[
\varphi(x, t_0) \geq d \geq 1, \quad 0 < \varphi(x, 0) = \varphi(x, T) < d, \quad x \in \Omega, \tag{4.10}
\]

where \( d = \exp(\gamma \inf_{x \in \Omega} |x-x_0|^2) \). Therefore, for any given small \( \eta \in (0, d - \sup_{x \in \Omega} \varphi(x, T)) \), we can choose a sufficiently small \( \delta = \delta(\eta) > 0 \), such that

\[
0 < \varphi(x, t) \leq d - \eta, \quad (x, t) \in \Omega \times ([0, 2\delta] \cup [T - 2\delta, T]). \tag{4.11}
\]

In order to apply Theorem 1, we introduce two cut-off functions \( \chi_1 \) and \( \chi_2 \) satisfying \( \chi_1 \in C^\infty(\mathbb{R}), \chi_2 \in C^\infty(\Omega), 0 \leq \chi_1(t) \leq 1 \) for \( t \in \mathbb{R}, 0 \leq \chi_2(x) \leq 1 \) for \( x \in \Omega \),

\[
\chi_1(t) = \begin{cases} 
0, & t \in [0, \delta] \cup [T - \delta, T], \\
1, & t \in [2\delta, T - 2\delta],
\end{cases} \tag{4.12}
\]

and \( \chi_2(x) = 1 \) for \( x \in \Omega \setminus \omega \).
We set \( w = (\tilde{w}, w_3), \tilde{w} = (w_1, w_2) = \chi_1 \partial_t^2 \tilde{u} \in \{ W^{3,\infty}(Q) \}^2 \) and \( w_3 = \chi_1 \partial_t^2 u_3 \in W^{4,\infty}(Q) \). Then, by (4.1) and (4.2), we have

\[
L_e w = \chi_1 \left( \partial_t^2 \tilde{F} \right) + 2 \rho \left( \partial_t \chi_1 \right) \left( \partial_t^3 \tilde{u} \right) + \rho \left( \partial_t^2 \chi_1 \right) \left( \partial_t^2 \tilde{u} \right), \tag{4.13}
\]

\[
L_p w = \chi_1 \left( \partial_t^2 F_3 \right) + 2 \rho \left( \partial_t \chi_1 \right) \left( \partial_t^3 u_3 \right) + \rho \left( \partial_t^2 \chi_1 \right) \left( \partial_t^2 u_3 \right) \quad \text{in } Q \tag{4.14}
\]

and

\[
w = 0, \quad \text{on } \partial \Omega \times (0, T). \tag{4.15}
\]

Moreover, we set \( v = (\tilde{v}, v_3) = \chi_2 (\tilde{w}, w_3) \). Then, by definition of \( \chi_1 \) and \( \chi_2 \), (4.13) and (4.14), we have \( \tilde{v} \in \{ H^3_0(Q) \}^2 \) and \( v_3 \in H^4_0(Q) \),

\[
L_e v = \chi_1 \left( \partial_t^2 \tilde{F} \right) + 2 \rho \left( \partial_t \chi_1 \right) \left( \partial_t^3 \tilde{u} \right) + \rho \left( \partial_t^2 \chi_1 \right) \left( \partial_t^2 \tilde{u} \right) - L_e ((1 - \chi_2) w), \tag{4.16}
\]

\[
L_p v = \chi_1 \left( \partial_t^2 F_3 \right) + 2 \rho \left( \partial_t \chi_1 \right) \left( \partial_t^3 u_3 \right) + \rho \left( \partial_t^2 \chi_1 \right) \left( \partial_t^2 u_3 \right) - L_p ((1 - \chi_2) w) \quad \text{in } Q. \tag{4.17}
\]

Here we have used

\[
\tilde{v} = \tilde{w} - (1 - \chi_2) \tilde{w}, \quad v_3 = w_3 - (1 - \chi_2) w_3 \quad \text{in } Q. \tag{4.18}
\]

Furthermore, by (4.16), we have

\[
\nabla(L_e v) = \chi_1 \nabla \left( \partial_t^2 \tilde{F} \right) + 2 \left( \partial_t \chi_1 \right) \nabla \left( \rho \left( \partial_t^3 \tilde{u} \right) \right) + \left( \partial_t^2 \chi_1 \right) \nabla \left( \rho \left( \partial_t^2 \tilde{u} \right) \right) \nonumber
\]

\[\quad - \nabla \{ L_e ((1 - \chi_2) w) \} \quad \text{in } Q. \tag{4.19}
\]

Applying Theorem 1, we obtain

\[\int_Q \left( s^3 |\tilde{v}|^2 + s |\nabla_{x,t} \tilde{v}|^2 + s |\Delta \tilde{v}|^2 + s^6 |v_3|^2 + s^3 |\nabla_{x,t} v_3|^2 \right) e^{2s\phi} dxdt \tag{4.20}
\]

\[\leq C_1 \int_Q (|L_e v|^2 + |\nabla(L_e v)|^2 + |L_p v|^2) e^{2s\phi} dxdt \]
for all large $s > 0$. Here and henceforth, $C_k$ denote generic positive constants which may depend on $s_0$, $s_1$, $s_2$, $\gamma$, $M_0$, $M_1$, $M_2$, $\theta_0$, $\theta_1$, $D$, $d$, $\Omega$, $T$, $\omega$, $\chi_1$, $\chi_2$, $\delta$, $\eta$, but are independent of $s$. By the definition of $\chi_1$ and $\chi_2$, we have

$$ (1 - \chi_2(x)) \bar{w}(x, t) = 0, \quad (1 - \chi_2(x)) w_3(x, t) = 0 \quad \text{for} \quad (x, t) \in (\Omega \setminus \omega) \times (0, T) \quad (4.21) $$

and $(\partial_t \chi_2) (t) = (\partial^2_t \chi_2) (t) = 0$ for $t \in (0, \delta) \cup (2\delta, T - 2\delta) \cup (T - \delta, T)$. Therefore, by (4.5), (4.7), (4.8), (4.11) and (4.16), we have

$$
\begin{align*}
\int_Q |L_e \nu|^2 e^{2s\varphi} dxdt &\leq C_2 \int_Q |\chi_1 \partial_t^2 \bar{\mu}|^2 e^{2s\varphi} dxdt + C_3 \int_{Q_\omega} |L_e((1 - \chi_2) \nu)|^2 e^{2s\varphi} dxdt \\
&+ C_4 \left( \int_{2\delta}^{T - \delta} \int_{\Omega} \left( |2\rho(\partial_t \chi_1)(\partial^2_t \bar{u})|^2 + |\rho(\partial^2_t \chi_1)(\partial_t \bar{u})|^2 \right) e^{2s\varphi} dxdt \right) \\
&\leq C_5 \left\{ \int_Q (|f_1|^2 + |f_2|^2) e^{2s\varphi} dxdt + e^{2s(d - \eta)} + e^{2s \Phi} \right\}
\end{align*}
$$

for all $s > 0$, where $\Phi = \sup_{(x,t) \in \Omega_\omega} \varphi(x,t) \geq 1$ and

$$
\Theta = \|\bar{u}\|_{H^4(Q_\omega)}^2 + \|u_3\|_{H^6(Q_\omega)}^2.
$$

Similarly, by (4.5), (4.7), (4.8), (4.11), (4.17) and (4.19), we have

$$
\begin{align*}
\int_Q (|L_e \nu|^2 + |\nabla (L_e \nu)|^2) e^{2s\varphi} dxdt &\leq C_6 \left\{ \int_Q \left( \sum_{k=1}^2 (|f_k|^2 + |\nabla f_k|^2) + |f_3|^2 \right) e^{2s\varphi} dxdt + e^{2s(d - \eta)} + e^{2s \Phi} \right\}
\end{align*}
$$

for all $s > 0$. Therefore, by (4.18), (4.20) and (4.21), we arrive at

$$
\begin{align*}
\int_Q (s|\bar{w}|^2 + s|\nabla_{x,t} \bar{w}|^2 + |\Delta \bar{w}|^2 + s|w_3|^2 + |\nabla_{x,t} w_3|^2) e^{2s\varphi} dxdt \\
&\leq C_7 \int_Q (s|\bar{v}|^2 + s|\nabla_{x,t} \bar{v}|^2 + |\Delta \bar{v}|^2 + s|v_3|^2 + |\nabla_{x,t} v_3|^2) e^{2s\varphi} dxdt \\
&+ C_8 s e^{2s \Phi} \left( \|(1 - \chi_2) \bar{w}\|_{H^2(Q_\omega)}^2 + \|(1 - \chi_2) w_3\|_{H^1(Q_\omega)}^2 \right) \\
&\leq C_9 \left\{ \int_Q \left( \sum_{k=1}^2 (|f_k|^2 + |\nabla f_k|^2) + |f_3|^2 \right) e^{2s\varphi} dxdt + e^{2s(d - \eta)} + s e^{2s \Phi} \right\}
\end{align*}
$$

(4.23)
for all large $s > 0$.

On the other hand, by integral by parts, we have

$$
\frac{1}{2} \int_\Omega |\nabla \tilde{w}(x,t_0)|^2 e^{2s\varphi(x,t_0)} \, dx = \frac{1}{2} \int_0^{t_0} \partial_t \left( \int_\Omega \frac{2}{2} \sum_{j=1}^2 |\nabla w_j(x,t)|^2 e^{2s\varphi(x,t)} \, dx \right) dt
$$

$$
= \int_0^{t_0} \int_\Omega \left( \sum_{j,k=1}^2 (\partial_k w_j)(\partial_k \partial_t w_j) + s(\partial_t \varphi)|\nabla \tilde{w}|^2 \right) e^{2s\varphi} \, dx \, dt
$$

$$
= \int_0^{t_0} \int_\Omega \left( s(\partial_t \varphi)|\nabla \tilde{w}|^2 - \sum_{j=1}^2 \partial_t w_j \left( \triangle w_j + 2s \sum_{k=1}^2 (\partial_k w_j)(\partial_k \varphi) \right) \right) e^{2s\varphi} \, dx \, dt
$$

$$\leq C_{10} \int_Q \left( |\triangle \tilde{w}|^2 + s|\nabla x, t \tilde{w}|^2 \right) e^{2s\varphi} \, dx \, dt$$

for all $s > 0$. Here we have used (4.15) and $\tilde{w}(\cdot,0) = 0$ by (4.12). Furthermore we have

$$
\frac{1}{2} \int_\Omega |\tilde{w}(x,t_0)|^2 e^{2s\varphi(x,t_0)} \, dx = \frac{1}{2} \int_0^{t_0} \partial_t \left( \int_\Omega \frac{2}{2} \sum_{j=1}^2 |w_j(x,t)|^2 e^{2s\varphi(x,t)} \, dx \right) dt
$$

$$
= \int_0^{t_0} \int_\Omega \left( \sum_{j=1}^2 w_j(\partial_t w_j) + s(\partial_t \varphi)|\tilde{w}|^2 \right) e^{2s\varphi} \, dx \, dt
$$

$$\leq C_{11} \int_Q \left( s|\tilde{w}|^2 + |\partial_t \tilde{w}|^2 \right) e^{2s\varphi} \, dx \, dt$$

and

$$
\frac{1}{2} \int_\Omega |w_3(x,t_0)|^2 e^{2s\varphi(x,t_0)} \, dx \leq C_{12} \int_Q \left( s|w_3|^2 + |\partial_t w_3|^2 \right) e^{2s\varphi} \, dx \, dt
$$

for all $s > 0$. Therefore, we have

$$
\int_\Omega \left( |\nabla \tilde{w}(x,t_0)|^2 + |\tilde{w}(x,t_0)|^2 + |w_3(x,t_0)|^2 \right) e^{2s\varphi(x,t_0)} \, dx
$$

$$\leq C_{13} \int_Q \left( s|\tilde{w}|^2 + s|\nabla x, t \tilde{w}|^2 + |\triangle \tilde{w}|^2 + s|w_3|^2 + |\partial_t w_3|^2 \right) e^{2s\varphi} \, dx \, dt
$$

(4.24)

for all $s > 0$. Moreover, by (4.1), (4.2), (4.3) and (4.12), we have

$$
\tilde{F}(x,t_0) = \rho(x)\partial_t^2 \tilde{u}(x,t_0) = \rho(x)\tilde{w}(x,t_0),
$$
Therefore, noting (4.5) and (4.7), we have

$$f_j(x) = \frac{\rho(x)}{R_j(x, t_0)} w_j(x, t_0), \quad j = 1, 2, 3,$$

and

$$\nabla f_k(x) = w_k(x, t_0) \nabla \left\{ \frac{\rho(x)}{R_k(x, t_0)} \right\} + \frac{\rho(x)}{R_k(x, t_0)} \nabla w_k(x, t_0), \quad k = 1, 2, x \in \Omega.$$

Therefore, by (4.7), we have

$$\int_{\Omega} \left( \sum_{k=1}^{2} (|f_k|^2 + |\nabla f_k|^2 + |f_3|^2) \right) e^{2s\phi(x, t_0)} dx$$

$$\leq C_{14} \int_{\Omega} (|\nabla \tilde{w}(x, t_0)|^2 + |\tilde{w}(x, t_0)|^2 + |w_3(x, t_0)|^2) e^{2s\phi(x, t_0)} dx$$

(4.25)

for all $$s > 0$$. By (4.23), (4.24) and (4.25), we obtain

$$\int_{\Omega} \left( \sum_{k=1}^{2} (|f_k|^2 + |\nabla f_k|^2 + |f_3|^2) \right) e^{2s\phi(x, t_0)} dx$$

$$\leq C_{15} \left\{ \int_{\Omega} \left( \sum_{k=1}^{2} (|f_k|^2 + |\nabla f_k|^2 + |f_3|^2) \right) e^{2s\phi} dx dt + e^{2s(d-\eta)} + se^{2s\Phi} \right\}$$

(4.26)

for all sufficiently large $$s > 0$$.

We will estimate the first term of the right hand side of (4.26) as follows. By (3.1), we have

$$\phi(x, t) - \phi(x, t_0) = e^{\gamma(x-x_0^2 - t-t_0)^2} - e^{\gamma|x-x_0|^2}$$

$$= e^{\gamma|x-x_0|^2} \left( e^{-\gamma(t-t_0)^2} - 1 \right) \leq e^{-\gamma(t-t_0)^2} - 1 \leq 0, \quad t \in [0, T].$$

$$\int_{\Omega} \left( \sum_{k=1}^{2} (|f_k|^2 + |\nabla f_k|^2 + |f_3|^2) \right) e^{2s\phi} dx dt$$

$$= \int_{\Omega} \left( \int_{0}^{T} e^{2s(\phi(x, t) - \phi(x, t_0))} dt \right) \left( \sum_{k=1}^{2} (|f_k|^2 + |\nabla f_k|^2 + |f_3|^2) \right) e^{2s\phi(x, t_0)} dx$$

$$\leq \int_{\Omega} \left( \int_{0}^{T} e^{2s(e^{-\gamma(t-t_0)^2} - 1)} dt \right) \left( \sum_{k=1}^{2} (|f_k|^2 + |\nabla f_k|^2 + |f_3|^2) \right) e^{2s\phi(x, t_0)} dx$$

(4.27)
for all large $s > 0$. Moreover, we have $\lim_{s \to \infty} \exp\{2s(\exp(-\gamma \nu (t - t_0)^2) - 1)\} = 0$ for $t \neq t_0$ and $|\exp\{2s(\exp(-\gamma \nu (t - t_0)^2) - 1)\}| \leq 1$. Therefore, by the Lebesgue theorem, we have that there exists $s_1 > 0$ such that

$$C_{15} \int_0^T e^{2s(e^{-\gamma \nu (t - t_0)^2} - 1)} dt \leq \frac{1}{2} \text{ for all } s > s_1. \quad (4.28)$$

From (4.26), (4.27) and (4.28) it follows that there exists $s_2 > 0$ such that

$$\int_\Omega \left( \sum_{k=1}^2 \left( |f_k|^2 + |\nabla f_k|^2 \right) + |f_3|^2 \right) e^{2s\varphi(x,t_0)} dx \leq 2C_{15} \left( e^{2s(d-\eta)} + s e^{2s\Phi} \Theta \right)$$

for all $s > s_2$. Therefore, noting (4.10), we obtain that there exists $s_3 > 0$ such that

$$\int_\Omega \left( \sum_{k=1}^2 \left( |f_k|^2 + |\nabla f_k|^2 \right) + |f_3|^2 \right) dx \leq e^{2sd} \int_\Omega \left( \sum_{k=1}^2 \left( |f_k|^2 + |\nabla f_k|^2 \right) + |f_3|^2 \right) e^{2s\varphi(x,t_0)} dx \leq 2C_{15} \left( e^{-2s\eta} + e^{2s\Phi} \Theta \right)$$

for all $s > s_3$. Hence we have

$$\int_\Omega \left( \sum_{k=1}^2 \left( |f_k|^2 + |\nabla f_k|^2 \right) + |f_3|^2 \right) dx \leq C_{16} \left( e^{-2s\eta} + e^{2s\Phi} \Theta \right) \text{ for all } s > 0,$$

where $C_{16} = 2C_{15}e^{2s\Phi}$.

In order to prove (4.9), we can assume that $\Theta < 1$, so that $-(\log \Theta)(2\eta + 2\Phi) > 0$.

We take

$$s = -\frac{\log \Theta}{2\eta + 2\Phi}.$$

Then it follows that

$$e^{-2s\eta} = e^{2s\Phi} \Theta = \Theta^{\frac{\eta}{\eta + \Phi}}.$$

Therefore, by (4.29), we have

$$\int_\Omega \left( \sum_{k=1}^2 \left( |f_k|^2 + |\nabla f_k|^2 \right) + |f_3|^2 \right) dx \leq 2C_{16} \Theta^{\frac{\eta}{\eta + \Phi}}.$$

Noting (4.22), we obtain (4.9). The proof of Theorem 2 is completed. □
§5. Extensions.

Relying on this approach of Carleman estimates which have been proved successful, we are now considering the case of more general geometries to solve the inverse problems for elastic bodies whose equilibrium equations are of Koiter shells type (Li, Miara and Yamamoto [21]) and relax the condition of the shallowness introduced in [23].

The Graduate School of Mathematical Sciences was established in the University of Tokyo in April, 1992. Formerly there were two departments of mathematics in the University of Tokyo: one in the Faculty of Science and the other in the College of Arts and Sciences. All faculty members of these two departments have moved to the new graduate school, as well as several members of the Department of Pure and Applied Sciences in the College of Arts and Sciences. In January, 1993, the preprint series of the former two departments of mathematics were unified as the Preprint Series of the Graduate School of Mathematical Sciences, The University of Tokyo. For the information about the preprint series, please write to the preprint series office.
