Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.
Short communication

Maintaining medical team communication using video conferencing during the COVID-19 lockdown

Abstract

COVID-19 is a global pandemic of unprecedented proportions. It has resulted in changes to all aspects of our lives. The impact on medicine has been significant. Clear and effective communication during these times is vital. We present an evaluation of the use of video conferencing (VC) and offer a simple format to structure meetings for their effectiveness and promotion of team communication and wellbeing.

Keywords: Covid; Video Conference; Team working; Communication

Introduction

The 2020 COVID-19 global pandemic has resulted in sweeping changes to society. With wide ranging effects on ‘everyday’ lives, there have been far-reaching implications to the working and communication of medical teams. The introduction of public health social measures, team redeployment has reduced our face-to-face (direct) contact and communication.

The use of video conferencing (VC) in medicine has been described1 in multiple situations, however, little has been published on its effectiveness for developing and maintaining communication for the medical team. With the psychological effects of this crisis now being reported,2 we should not underestimate the impact that isolation can have on morale and wellbeing. As doctors, this can affect the care we afford our patients.3

During this current period, our department has been undertaking weekly team VC meetings. From the outset, we defined the overall aims as being: to maintain clear communication, discuss up to date developments, offer support and wellbeing advice, and ‘face to face’ contact. We present our evaluation of this method and provide a simple format to structure these meetings and gain maximum benefit.

Methods

Weekly team meetings were commenced on a secure VC platform. Email invitation was sent to all members (of the medical team). In total, 20 people were invited to participate over five meetings with an identified facilitator. To evaluate this process and gain feedback, we sent out an anonymous online survey to each individual participant. All results were collected confidentially and results analysed.

Results

A total of 20 responses were received from DCT 1/2/3 and medical students (n = 12) and specialty registrar/middle grade doctors (n = 8).

Few people had regular experience of VC communication (no regular use n = 12/20). One respondent had experience >5 times. Of those who had previously experienced video conferencing, five had used it for work-based meetings and two for social reasons.

Individuals undertook their meeting at home (n = 17), with three at work. They used: 40 % phone, 15% home desktop, 35% laptop, and 10% tablet.

All twenty participants felt that the weekly meeting promoted reassurance (100%) and delivered a positive impact (n = 20) for themselves. A total of 75% (n = 15) felt the meeting was at least ‘as good as’ a face to face meeting, and four felt it to be better.

Overall, on a Likert satisfaction scale (1-10) a mean (range) score was 8.5 (6-10). A total of 85% (n = 17) believed the meeting enhanced their well-being.

During the current crisis (n = 15) wanted weekly meetings and suggested these be continued for the future.

3/ Information dissemination – all should be informed of any key issues or changes.

4/ Discussion - open questions to the whole group and address any concerns.

5/ Thank you - thank all members of the group individually, and provide all individuals with an opportunity to speak before closing the meeting.

We suggest a flattened hierarchy is critical for effectiveness and promoting an informal sharing environment.7

Whilst our results are widely positive, we appreciate there are some negatives with VC including difficulty with time lag, and the variability in communications technology. Consideration of confidentiality issues should also be considered.

In conclusion, this evaluation suggests that VC provides the medical team with an effective tool to maintain communication, provides opportunities for discussion, and promotes wellbeing.

Conflict of interest

We have no conflicts of interest.
