INTRODUCTION

The World Health Organization reported that ascariasis is commonly parasitic infection disease of human with highest cases occur in tropical and subtropical countries. It is estimated around 60,000 people deaths by severe ascariasis infections, mainly in children [1]. Ascariasis also remains a health problem in Indonesia with the frequency cases about 75%. Because of chronic ascariasis, children experience impaired growth and development due to decreased food intake [2]. Arizono et al. have studied that human ascariasis is a result of infection with pig-derived ascariasis such as Ascaris lumbricoides, Ascaris suum, and Ascaridia galli [3].

The emergence of helminthes resistance to currently available anthelmintic agents leads to an increasing of natural anthelmintic demand [4].

Curanga fel-terrae (Lour.) Merr. which is known as Poguntan tanoh or poguntano by Indonesian people belongs to family Linderniaceae [5,6]. The leaf of plant is traditionally used for helminthiasis treatment [7]. Preliminary study indicated that the leaf ethanol extract of C. fel-terrae has potential anthelmintic activity against an earthworm, Pheretima phostuma. This effect may due to the presence of phytochemical compounds such as flavonoids, saponins, tannins, glycosides, and terpenoids/steroids [8]. However, anthelmintic effects of the leaf ethanol extract of Indonesian C. fel-terrae on human parasitic worms have not been studied.

This work was to study the anthelmintic effects of the leaf ethanol extract of C. fel-terrae against A. galli. Although A. galli is the common helminth parasites in fowls [9], but this worm has similarity with A. lumbricoides in morphological and physiological properties [10]. Because of this reason, A. galli is used as animal model in our experiment.

MATERIALS AND METHODS

Plant materials

Leaves of C. fel-terrae were collected from Dairi District, North Sumatra Province, Indonesia. The species was authenticated and deposited by the Herbarium Department of Indonesian Institute of Sciences.

Chemicals

Chemical used in this study namely 96% ethanol, saline, and sodium carboxymethyl cellulose (Na-CMC) were purchased from Merck, UK. Standard albendazole was obtained from Indofarma Pharmaceutical Industry, Indonesia.

Preparation of plant extract

The cleaned leaves of C. fel-terrae were dried on oven with air circulation at 40°C and then powdered with electrical grounder. The dried leaf powder was extracted by percolating with 96% ethanol at room temperature. Filtrate was then concentrated in a rotary evaporator at 40°C to obtain the crude extract of plant leaves.

Phytochemical screening

Phytochemical screening method from Tiwari et al. was adopted to identify chemical compounds of the ethanol extract of C. fel-terrae leaves, such as alkaloids, flavonoids, glycosides, saponins, tannins, and terpenoids/steroids [11].

Evaluation of anthelmintic effects

A. galli were obtained from a local slaughterhouse in Medan, Indonesia. The worms were identified by the Zoology Department of Universitas Sumatera Utara. Before experiment, A. galli were acclimated in saline at room temperature for 1 hr. To investigate anthelmintic effects, the worms were divided into six groups in which each group contain three worms. Group I was exposed to saline (negative control), Group II was

ABSTRACT

Objective: This study was to investigate the anthelmintic effects of ethanol extract of Curanga fel-terrae leaves on Ascaridia galli.

Methods: Extract of C. fel-terrae was prepared by percolating the dried powder of the plant leaves. To observe anthelmintic effects, A. galli was exposed to the plant extract solutions in different concentrations at room temperature for 72 hrs. Sodium chloride 0.9%, sodium carboxymethyl cellulose 0.5%, and albendazole 0.1% were served as negative control, solvent control, and positive control, respectively. The anthelmintic effects were determined by observing the time taken for paralysis and the time taken for death of A. galli during experiment.

Results: The results demonstrated that there were no different effects between negative and solvent controls. However, the ethanol extract of C. fel-terrae leaves exhibited significantly paralysis and death effects toward A. galli. The plant extracts at the concentration of 100 mg/ml showed similar anthelmintic effects with albendazole 0.1%. This study also indicated that the paralysis and death effects of plant extract were shorter when the worms exposed with the concentration above of 100 mg/ml.

Conclusion: This study indicated that the ethanol extract of C. fel-terrae leaves has potential anthelmintic effects on A. galli.

Keywords: Curanga fel-terrae, Ascaridia galli, Anthelmintic, Helminthiasis, Ascariasis.
exposed to Na-CMC 0.5% in saline (solvent control), and Group III was exposed to albendazole 0.1% (positive control). Groups IV-VI were separately exposed to the ethanol extract of C. fel-terrae leaves at the different doses (100, 200, and 300 mg/ml). The anthelmintic effects were evaluated by observing the time taken for paralysis, and the time taken for death of the worms at room temperature for 72 hrs.

**Statistical analysis**

All data were expressed as mean±SD. The data of each group were statistically analyzed using analysis of variance followed by post hoc test Tukey honest significant difference multiple comparison tests. Values were classified as significantly different if p<0.05.

**RESULTS**

**Phytochemical compounds**

The results of phytochemical test indicated that the leaf ethanol extract of *C. fel-terrae* contain flavonoids, glycosides, saponins, tannins, and steroids.

**Anthelmintic effects**

As shown in Table 1, there were no different effects on *A. galli* between saline (negative control) and Na-CMC 0.5% (solvent control). During observation, the ethanol extract of *C. fel-terrae* leaves significantly produced paralysis and death effects toward *A. galli* compared with these controls. The plant extract at the concentration of 100 mg/ml have similar anthelmintic effects with albendazole 0.1%. In addition, the paralysis and death times were shorter when on *A. galli* exposed to the plant extract at concentrations of 200 mg/ml and 300 mg/ml. The results also indicated that the time taken for paralysis is and the time taken for death on the worms declined with the increasing concentrations of the plant extract.

**DISCUSSION**

This study identified the presence of flavonoids, glycosides, saponins, tannins, and steroids in the leaf ethanol extract of *C. fel-terrae*. Few compounds of this plant leaves such as flavonoid glucoronesides [12], dehydrobryogenin glycoside, cucurbitacin [13,14], triterpenoid saponins [15], and β-sitosterol [16] also isolated by other researchers. The *C. fel-terrae* also contain acid compounds mainly heptadecanoic acid, butanedioic acid, docosanoic acid, and hydroxycinnamic acid [17]. The saponins [15], and β-sitosterol [16] also isolated by other researchers. 

The effects also involve the change of phosphatase enzymes in the tegument of parasites [39]. However, so far, action of mechanism of the anthelmintic effects of ethanol extract of *C. fel-terrae* on *A. galli* are weaker than the such plant extracts, but further studies are still needed to discovery its bioactive compounds.

**CONCLUSION**

This study indicates the potential anthelmintic effects of leaf ethanol extract of *C. fel-terrae* on *A. galli*.
