Data report: radiolarians from the latest Cenomanian and Turonian, Holes U1512A and U1516C, IODP Expedition 369

Jochen Erbacher

Abstract

A total of 47 samples from the Alban to Turonian at three sites from International Ocean Discovery Program (IODP) Expedition 369 were investigated for radiolarian faunas. With a few exceptions, the preservation of radiolarian tests did not allow for a taxonomically sophisticated and proper determination. Consequently, radiolarian assemblages from only three samples from the uppermost Cenomanian in Hole U1516C, the lower Turonian in Hole U1516C, and the upper Turonian in Hole U1512A are described and illustrated here. The three faunas described include faunal elements reported from time equivalent successions in the Tethys as well as the western Pacific.

Introduction

International Ocean Discovery Program (IODP) Expedition 369 recovered sediments from the Great Australian Bight and Mentelle Basin in the southeast Indian Ocean (Figure F1). One of the main reasons for drilling the Expedition 369 sites was their high paleolatitude (60°–62°S) position, which allowed the sampling of high-latitude successions that are important for a reconstruction of the dynamics of the Cretaceous greenhouse climate system (Huber et al., 2019). Cenomanian to Turonian radiolarians from this part of the Cretaceous world have only been described in a single study so far that documented some specimens from Deep Sea Drilling Project (DSDP) Site 258 (Riedel and Sanfilippo, 1974). For this reason, documentation of new radiolarian records from Expedition 369 sediments is warranted. Note that because of their moderate to poor preservation, the three assemblages described here do not represent the entire taxonomic spectrum of radiolarians from this stratigraphic interval and area.
Material and methods

All samples were crushed into small pieces (approximately 1 cm in diameter), dried, and gently disaggregated using a 90% water and 10% hydrochloric acid solution. After soaking and reacting, the samples were washed with warm water over a 40 μm mesh sieve and dried at 50°C. The fraction >40 μm was then dry-sieved into fractions >125 μm and >63 μm. From each fraction, radiolarians were picked in slides. Scanning electron microscope (SEM) images were acquired at the laboratories of the Federal Institute for Geosciences and Natural Resources (BGR) in Hannover (Germany) using an FEI Sirion 200.

Results

The estimated abundance and preservation of the samples investigated is documented in Table T1. With very few exceptions, radiolarians are rare in the Turonian in Hole U1512A. The abundance, preservation, and species diversity increase upsection. No radiolarians were found in samples from Hole U1513A. The residue, however, consists of siliceous chalks and some faint ghost structures of organisms. The latter might have been radiolarian tests leaving the impression that the absence of radiolarians is not caused by ecological but diagenetic reasons. The diagenetic overprint of the samples investigated from the Cenomanian/Turonian Boundary interval in Hole U1516C is less severe, resulting in comparably well-preserved faunas. The number of species in each sample listed here correlates with the preservation of faunas; the higher the species diversity, the better the preservation:

Sample 369-U1512A-44R-6, 70–74 cm: Crucella irwini, Dactyliosphaera silvae, Dactyliosphaera maximax, Dicacthacapsa ovidea, Dictyomitra formosa, Hexapyramid pante nellii, Novixitus mclaughlini, Pessagnobrachia sp., and Stichomitra stocki.
Sample 369-U1516C-28R-4, 26–30 cm: Alievum praegallowayi, Cavaspungia tricornis, Conocaryomma universa, Dactyliosphaera maximax, Dictyomitra formosa, Dicacthacapsa ovidea, Dictyomitra montisserei, Dictyomitra multicoostata, Distylocapsa squama, Distylocapsa veneta, Paranaella communis, Pessagnobrachia clavata, Pseudautolophac sp. aff. vielseitigus, Pyramispungia glascockensis, Sciadoci capsua eu ganea, Stichomitra stocki, Stichomitra conicus, Xitus clava, and Xitus spicularis.
Sample 369-U1516C-33R-4, 56–60 cm: Dictyomitra montis sereli, Holocryptocanium barbui, Novixitus mclaughlini, Or biculiforma aff. O. multangula, Patellula verteronensis, Stichomitra stocki, Thanarla conica, and Thanarla pulchra.

Table T1. List of samples investigated including estimated abundance of radiolarians in residues and their preservation, Holes U1512A and U1516C. Download table in CSV format.

Stratigraphic implications

The reported stratigraphic ranges of some of the radiolarian species identified allow for summary age estimates of the two samples from Hole U1516C. A. praegallowayi, D. squama, P. clavata, S. conicus, and P. vielseitigus described here from Sample 369-U1516C-28R-4, 26–30 cm, are species typical in younger Late Cre taceous strata. They have not been reported from successions older than early Turonian in age. In contrast, H. barbui and T. pulchra, which are both present in Sample 33R-4, 56–60 cm, have not been reported from strata younger than latest Cenomanian in age. This confirms the presence of the Cenomanian–Turonian transition in Hole U1516C. Another species that hasn’t been described in sediments younger than latest Cenomanian in age is N. mclaughlini. In this study, however, it is documented in the late Turonian in Hole U1512A with a little doubt because the preservation is rather poor.

Acknowledgments

This research used samples and/or data provided by the International Ocean Discovery Program (IODP). I would like to thank IODP for making the samples available. Thanks also to Brian Huber and Maria Rose Petrizzo for making me aware of the presence of radiolarians in the Cenomanian and Turonian at the IODP Expedition 369 sites and thus making me enter a kind of time warp resulting in my first (and probably last) involvement in radiolarian research in 20 y; Gabriele Grützner and Sabine Stäger, both at BGR, are thanked for SEM imaging, sample preparation, and production of plates. Finally, I thank Chris Hollis for his constructive review, which greatly improved this manuscript.

Appendix

Taxonomic notes

These brief notes explain the taxonomic concept applied in this report. Younger, post-mid-nineties studies are cited if they are based on western Pacific locations (i.e., in relative proximity to the Expedition 369 sites).

*Aliievum praegallowayi* Pessagno

(*Plate P1*, figures 18–20)

*Aliievum praegallowayi*, Bragina, 2012, pl. 1, fig. 4; Koyasu et al., 2019, pl. 3, fig. 15.

Remarks: This species has been reported from the Tethys, central Atlantic, western Pacific, and eastern Pacific.

*Cavaspongia tricornis* O’Dogherty

(*Plate P1*, figure 1)

*Cavaspongia tricornis*, O’Dogherty, 1994, p. 313–314, pl. 57, figs. 24–28.

*Pseudoaulophacus sculptus* (Squinabol), Asis and Jasin, 2012, pl. 3, fig. 5.

Remarks: This species has been reported from the Tethys and Malaysia.

*Crucella messinae* Pessagno

(*Plate P1*, figure 1)

*Crucella messinae*, Pessagno, 1971, p. 56, pl. 6, figs. 1–3; Ellis, 1993, p. 960, pl. 2, figs. 1–4; O’Dogherty, 1994, p. 368, pl. 72, figs. 21–24, pl. 71, figs. 1–6; Erbacher, 1998, p. 369, pl. 2, fig. 26; Asis and Jasin, 2012, pl. 3, fig. 19.

Remarks: This species has been reported from the Tethys and central Atlantic, western Pacific, and eastern Pacific.

*Conocaryomma universa* (Pessagno)

(*Plate P2*, figure 2)

*Conocaryomma universa*, Erbacher, 1994, p. 95, pl. 17, fig. 10.

Remarks: This species has been reported from the Tethys, central Atlantic, western Pacific, and eastern Pacific.

*Dactyliosphaera maxima* (Pessagno)

(*Plate P1*, figure 2; *Plate P2*, figure 4)

*Orbiculiforma maxima*, Pessagno, 1976, pp. 34–35, pl. 1, figs. 14, 16; Erbacher, 1998, p. 370, pl. 1, fig. 25.

*Dactyliosphaera maxima* (Pessagno), O’Dogherty, 1994, pp. 338–339, pl. 63, figs. 5–8; Asis and Jasin, 2012, pl. 3, fig. 14.

Remarks: This species has been reported from the Tethys, central Atlantic, Malaysia, and eastern Pacific.

*Dactyliosphaera silvae* (Pessagno)

(*Plate P1*, figure 6)

*Pseudoaulophacus* ? sp. D, Thurow, 1988, p. 404, pl. 5, fig. 14; Erbacher, 1994, p. 109, pl. 12, fig. 13, pl. 16, fig. 14.

*Dactyliosphaera silvae* (Squinabol), O’Dogherty, 1994, p. 341, pl. 63, figs. 22–26; Erbacher, 1998, p. 370, pl. 1, fig. 27.

Remarks: This species has been reported from the Tethys, central Atlantic, and eastern Pacific.

*Diacanthocapsa ovoidea* Dumitrica

(*Plate P2*, figure 5)

*Diacanthocapsa ovoidea*, O’Dogherty, 1994, p. 220–221, pl. 37, figs. 1–6; Hashimoto et al., 2015.

Remarks: This species has been reported from the Tethys and western Pacific.

*Dictyomitra formosa* Squinabol

(*Plate P1*, figure 8; *Plate P2*, figures 6, 7)

*Dictyomitra formosa*, Thurow, 1988, p. 398, pl. 3, fig. 9; Erbacher, 1998, p. 368, pl. 1, fig. 11; Koyasu et al., 2019, pl. 2, fig. 9.

*Dictyomitra sliteri*, Ellis, 1993, pl. 5, fig. 15.

*Dictyomitra montisserei* (Squinabol), O’Dogherty, 1994, p. 77, pl. 3, figs. 1–29.

Remarks: This species has been reported from the Tethys, central Atlantic, western Pacific, eastern Pacific, and Australia.

*Distylocapsa squama* O’Dogherty

(*Plate P2*, figure 8)

*Distylocapsa squama*, O’Dogherty, 1994, p. 189, pl. 28, figs. 16–21.

Remarks: This species has been reported from the Tethys.

*Distylocapsa veneta* (Squinabol)

(*Plate P2*, figure 9)

*Distylocapsa veneta*, O’Dogherty, 1994, p. 189, pl. 28, figs. 10–15.

Remarks: This species has been reported from the Tethys and western Pacific.

*Hexapyramis pantanellii* Squinabol

(*Plate P1*, figure 7)

*Hexapyramis pantanellii*, O’Dogherty, 1994, p. 283, pl. 50, figs. 3–7; Erbacher, 1994, p. 101, pl. 5, figs. 2–3.

Remarks: This species has been reported from the Tethys and central Atlantic.

*Holocryptocanium barbui* Dumitrica

(*Plate P1*, figure 9)

*Holocryptocanium barbui*, Ellis, 1993, p. 963, pl. 4, fig. 24; Erbacher, 1994, p. 101, pl. 5, fig. 8, pl. 13, fig. 11; Koyasu et al., 2019, pl. 1, fig. 18.

Remarks: This species has been reported from the Tethys, central Atlantic, western Pacific, and Australia.
**Novixitus mclaughlini** Pessagno
(Plate P1, figures 3, 16)

*Novixitus mclaughlini*, Pessagno, 1977, p. 54, pl. 9, fig. 17; Erbacher, 1994, p. 104, pl. 6, fig. 4, pl. 7, figs. 13–14; Erbacher, 1998, p. 370, pl. 2, fig. 6; Koyasu et al., 2019, pl. 2, fig. 4.

*Xitus mclaughlini*, O’Dogherty, 1994, p. 130–131, pl. 12, figs. 14–21; Asis and Jasin, 2012, pl. 1, fig. 14.

Remarks: This species has been reported from the Tethys, central Atlantic, western Pacific, Malaysia, and eastern Pacific.

**Orbiculiforma aff. O. multangular** Pessagno
(Plate P1, figure 10)

*Orbiculiforma multangular*, Pessagno, Vishnevskaya and Kopaevich, 2020, p. 172, fig. 6.

Remarks: This species resembles *O. multangular* but the preservation is too poor to clearly determine it as such. *O. multangular* has been described from the Aptian and Albian of the central Atlantic, Tethys, and eastern Pacific.

**Paronaella communis** (Squinabol)
(Plate P2, figure 10)

*Paronaella communis*, O’Dogherty, 1994, pp. 353–354, pl. 66, figs. 9–16.

Remarks: This species has been reported from the Tethys and western Pacific.

**Patellula verteroensis** (Pessagno)
(Plate P1, figure 11)

*Patellula verteroensis*, Erbacher, 1994, p. 106, pl. 19, figs. 1–2; O’Dogherty, 1994, pp. 328–329, pl. 60, figs. 25–26; Erbacher, 1998, p. 370, pl. 1, fig. 24.

Remarks: This species has been reported from the Tethys, central Atlantic, western Pacific, and eastern Pacific.

**Pessagnobrachia clavata** (Squinabol)
(Plate P2, figure 11)

*Paronaella* sp. EJ1, Erbacher, 1994, p. 106, pl. 17, figs. 16–17. *Pessagnobrachia clavata*, O’Dogherty, 1994, pp. 362–363, pl. 68, figs. 21–26.

Remarks: This species has been reported from the western Tethys.

**Pseudoaulophacus sp. aff. vielseitigus**
(Plate P2, figure 21)

Remarks: Pseudoaulophacids are a very diverse group as has been shown by Urquhart (1995). The specimen illustrated herein differs from *P. vielseitigus* (Empson-Morin) by having 8 instead of 5 to 7 sides.

**Pyramispongia glascockensis** Pessagno
(Plate P2, figure 12)

*Pyramispongia glascockensis*, O’Dogherty, 1994, pp. 184–185, pl. 27, figs. 9–13.

Remarks: This species has been reported from the Tethys, central Atlantic, western Pacific, and eastern Pacific.
Plate P1. Radiolarians, Holes U1512A and U1516C. Scale bars = 100 μm. 1. *Crucella messinae* (369-U1512A-44R-6, 70–74 cm). 2. *Dactyliosphaera maxima* (44R-6, 70–74 cm). 3. *Novixitus mclaughlini* (44R-6, 70–74 cm). 4. *Pessagnobrachia* sp. (44R-6, 70–74 cm). 5. *Stichomitra stocki* (44R-6, 70–74 cm). 6. *Dactyliosphaera silviae* (44R-6, 70–74 cm). 7. *Hexapyramis pantanelli* (44R-6, 70–74 cm). 8. *Dictyomitra montisserei* (369-U1516C-33R-4, 56–60 cm). 9. *Holocryptocanium barbui* (33R-4, 56–60 cm). 10. *Orbiculiforma* aff. *O. multangula* (33R-4, 56–60 cm). 11. *Patellula verteroensis* (33R-4, 56–60 cm). 12, 13, 17. *Stichomitra stocki* (33R-4, 56–60 cm). 14. *Thanarla pulchra* (33R-4, 56–60 cm). 15. *Thanarla conica* (33R-4, 56–60 cm). 16. *Novixitus mclaughlini* (33R-4, 56–60 cm). 18, 19, 20. *Alievum praegallowsayi* (28R-4, 26–30 cm).
Plate P2. Radiolarians, Sample 369-U1516C-28R-4, 26–30 cm. Scale bars = 100 μm. 1. Cavaspongia tricornis. 2. Conocaryomma universa. 3. Dictyomitra formosa. 4. Dactylosphaera maxima. 5. Diacanthocapsa ovoidea. 6, 7. Dictyomitra montisserei. 8. Distylocapsa squama. 9. Distylocapsa veneta. 10. Paronaella communis. 11. Pessagnobrachia clavata. 12. Pyramispongia glascockensis. 13, 14, 16. Stichomitra stocki. 15. Stichomitra (Amphipyndax) conicus. 17. Xitus clava. 18–20. Xitus spicularius. 21. Pseudoaulophagus aff. vielseitigus. 22. Stichomitra conicus.
