This paper established some new Hermite–Hadamard type inequalities for \(\psi\)-Riemann–Liouville fractional integrals via convex functions. As applications, we applied the inequalities to special means of real numbers and constructed inequalities for the beta function.

1. Introduction

Hermite–Hadamard integral inequality provides the estimate for the integral average of any convex function defined on a compact interval. In recent years, many mathematicians extended it to \(s\)-convex functions, quasi-convex functions, \(\psi\)-Riemann–Liouville integral inequalities, \(\eta\)-convex functions, \(r\)-convex functions, \((a,m)\)-convex functions, and Lipschitzian functions, see [1–7]. The most famous are trapezoid inequality and midpoint inequality [8, 9]: suppose that \(f: [a,b] \rightarrow \mathbb{R}\) is a differentiable function on \((a,b)\) with \(a < b\). If \(|f'|\) is convex on \([a,b]\), then

\[
\left| \frac{f(a) + f(b)}{2} - \frac{1}{b-a} \int_a^b f(x)dx \right| \leq \frac{b-a}{8} \left( |f'(a)| + |f'(b)| \right).
\]

\[
\left| \frac{1}{b-a} \int_a^b f(x)dx - f\left( \frac{a+b}{2} \right) \right| \leq \frac{b-a}{8} \left( |f'(a)| + |f'(b)| \right).
\]  

(1)

In [10], Mehrez and Agarwal extended the interval of \(f'\) and established the following result: let \(f: [a,b] \rightarrow \mathbb{R}\) be a differentiable function on \((a,b)\), and \(f': ([3a-b)/2], ((3b-a)/2) \rightarrow \mathbb{R}\) be a continuous function on \([((3a-b)/2), ((3b-a)/2)]\). \(q \geq 1\). If \(|f'|^q\) is convex on \([((3a-b)/2), ((3b-a)/2)]\), then the following inequality holds:

\[
\left| \frac{1}{b-a} \int_a^b f(x)dx - f\left( \frac{a+b}{2} \right) \right| \leq \frac{b-a}{8} \left( |f'(3a-b)/2|^q + |f'(3b-a)/2|^q \right)^{1/q}.
\]

(2)

The classical integro-differential equation has been studied deeply, and a rigorous and systematic theoretical system has been established. In recent decades, the theoretical research of fractional integro-differential equation has been constantly improved. Many theoretical achievements have been obtained [2–4, 7, 11–15]. The research of Hermite–Hadamard type inequalities for fractional integrals has also been deepened.

In [3], Liu et al. established the Hermite–Hadamard type inequalities for \(\psi\)-Riemann–Liouville fractional integrals via convex functions: let \(g: [a,b] \rightarrow \mathbb{R}\) be a positive convex integrable function, \(0 \leq a < b\). \(\psi(x)\) is an increasing positive monotone function and have continuous derivation on \((a,b)\), and \(x \in (0,1)\). Then, the following inequality holds:
\[
g\left(\frac{a+b}{2}\right) \leq \frac{\Gamma(a+1)}{2(b-a)^{\alpha}} \left[ I_{\psi^{-1}(a)}^{\alpha} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)-}^{\alpha} (g \circ \psi)(\psi^{-1}(a)) \right] + \frac{g(a) + g(b)}{2}
\]

(3)

Let \( g : [a, b] \rightarrow \mathbb{R} \) be a differentiable mapping on \((a, b), a < b, |g'| \) is convex on \([a, b], \psi(x) \) is an increasing positive monotone function on \( (a, b) \) and have continuous derivation on \((a, b), \) and \( \alpha \in (0, 1). \) Then, the following inequalities hold:

\[
g(a) + g(b) = \frac{\Gamma(a+1)}{2(b-a)^{\alpha}} \left[ I_{\psi^{-1}(a)}^{\alpha} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)-}^{\alpha} (g \circ \psi)(\psi^{-1}(a)) \right] \leq \frac{g(a) + g(b)}{2}
\]

(4)

\[
g(a) + g(b) = \frac{\Gamma(a+1)}{2(b-a)^{\alpha}} \left[ I_{\psi^{-1}(a)}^{\alpha} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)-}^{\alpha} (g \circ \psi)(\psi^{-1}(a)) \right] - g\left(\frac{a+b}{2}\right)
\]

(5)

where \( I_{\psi^{-1}(a)}^{\alpha} \) and \( I_{\psi^{-1}(b)-}^{\alpha} \) are the left-sided and right-sided \( \psi \)-Riemann–Liouville fractional integral operators of order \( \alpha \), which are listed in Section 2.

The aim of this paper is to extend the range of argument of the function \( g \) and establish some new Hermite–Hadamard type inequalities for \( \psi \)-Riemann–Liouville fractional integrals with convex functions on the basis of (3)–(5). Then, we apply them to special means of real numbers and construct inequalities for the beta function.

2. Preliminaries

In this section, we recall the definition of \( \psi \)-Riemann–Liouville fractional integral and some lemmas about \((\Gamma(a+1)/2(b-a)^a)[I_{\psi^{-1}(a)}^{\alpha} (f \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)-}^{\alpha} (f \circ \psi)(\psi^{-1}(a))]\).

Definition 1 (see [16]). Let \((a, b) (-\infty < a < b < \infty)\) be a finite or infinite interval of the real line \( \mathbb{R} \) and \( \alpha > 0 \). Also, let \( \psi(x) \) be an increasing and positive monotone function on \((a,b), \) having a continuous derivative \( \psi'(x) \) on \((a,b). \) The left-sided and right-sided \( \psi \)-Riemann–Liouville fractional integrals of order \( \alpha \) for function \( f \) with respect to another function \( \psi \) on \([a,b]\) are defined by

\[
I_{\psi^{-1}(a)}^{\alpha} f(x) = \frac{1}{\Gamma(a)} \int_{a}^{x} \psi'(t) (\psi(x) - \psi(t))^{a-1} f(t) dt, \quad (x > a),
\]

\[
I_{\psi^{-1}(b)-}^{\alpha} f(x) = \frac{1}{\Gamma(a)} \int_{b}^{x} \psi'(t) (\psi(t) - \psi(x))^{a-1} f(t) dt, \quad (x < b),
\]

respectively. Here, \( \Gamma(a) \) is the gamma function.

Lemma 1 (see [3]). Let \( f : [a, b] \rightarrow \mathbb{R} \) be a differentiable mapping on \((a, b), \) suppose that \( g' \in L[a, b], \psi(x) \) is an increasing and positive monotone function on \((a, b), \) having a continuous derivative \( \psi'(x) \) on \((a,b), \) and \( \alpha \in (0,1). \) Then, we have

\[
\frac{g(a) + g(b)}{2} = \frac{\Gamma(a+1)}{2(b-a)^{\alpha}} \left[ I_{\psi^{-1}(a)}^{\alpha} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)-}^{\alpha} (g \circ \psi)(\psi^{-1}(a)) \right]
\]

(7)

Lemma 2 (see [3]). Under the assumptions of Lemma 1, we have

\[
\frac{\Gamma(a+1)}{2(b-a)^{\alpha}} \left[ I_{\psi^{-1}(a)}^{\alpha} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)-}^{\alpha} (g \circ \psi)(\psi^{-1}(a)) \right] - g\left(\frac{a+b}{2}\right)
\]

(8)

\[
= \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} k(g' \circ \psi) (t) \psi'(t) dt + \frac{1}{2(b-a)^{\alpha}} \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} [ (b - \psi(t))^{a} - (\psi(t) - a)^{a} ] (g' \circ \psi) (t) \psi'(t) dt,
\]
where
\[
\begin{align*}
    k &= \frac{1}{2} \psi^{-1} \left( \frac{a + b}{2} \right) \leq t \leq \psi^{-1} \left( b \right), \\
    \frac{1}{2} \psi^{-1} \left( a \right) &< t < \psi^{-1} \left( \frac{a + b}{2} \right).
\end{align*}
\]

Lemma 3 (see [17]). Assume that \( a \geq 0, p \geq q \geq 0 \) and \( p \neq 0 \). Then,
\[
    a^{(q/p)} \leq \frac{q}{p} K^{((q-p)/p)} a + \frac{p-q}{p} K^{(q/p)},
\]
for any \( K > 0 \).

3. Main Results

First, we give an estimate for \((\Gamma(a + 1)/2(b - a)^a)[I_{\psi^{-1}(a)} a \psi \psi \left( \psi^{-1}(b) \right) + I_{\psi^{-1}(b)} a \psi \psi \left( \psi^{-1}(a) \right)]\).

Lemma 4. Let \( g: [a, b] \rightarrow \mathbb{R} \) be a positive function, \( g \in L_1 [a, b] \), \( \psi(x) \) is an increasing and positive monotone function on \([a, b]\), with a continuous derivative \( \psi'(x) \) on \((a, b)\), \( 0 \leq a < b \), and \( a \in (0, 1) \). If \( g \) is a convex function on \([a, b]\), then the following inequalities hold:

\[
    g \left( \frac{a + b}{2} \right) \leq \frac{\Gamma(a + 1)}{2(b - a)^a} \left[ I_{\psi^{-1}(a)} \psi'(\psi^{-1}(b)) + I_{\psi^{-1}(b)} \psi'(\psi^{-1}(a)) \right] \leq \frac{g((3a - b)/2) + g((3b - a)/2) + 2g((a + b)/2)}{4}.
\]

Proof. From the left side of (3), we can directly get the left side of (11). Then, we prove the right side of (11).

\[
    \frac{\Gamma(a + 1)}{2(b - a)^a} \left[ I_{\psi^{-1}(a)} \psi'(\psi^{-1}(b)) + I_{\psi^{-1}(b)} \psi'(\psi^{-1}(a)) \right] = \frac{\alpha}{2(b - a)^a} \left[ \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} \psi'(\nu) (b - \nu) \psi(x) d\nu + \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} \psi'(\nu) (\nu - a) \psi(x) d\nu \right]
\]
\[
    = \frac{3a}{8(b - a)^a} \left[ \int_{(3b - a)/3}^{(3b - a)/3} \left( \frac{3b - a}{4} - \frac{3}{4} t \right)^{a-1} g \left( \frac{3}{4} t + \frac{a + b}{4} \right) dt + \int_{(3b - a)/3}^{(3b - a)/3} \left( \frac{3b - a}{4} + \frac{3}{4} t \right)^{a-1} g \left( \frac{3}{4} t + \frac{a + b}{4} \right) dt \right]
\]
\[
    \leq \frac{3a}{8(b - a)^a} \left[ \int_{(3b - a)/3}^{(3b - a)/3} \left( \frac{3b - a}{4} - \frac{3}{4} t \right)^{a-1} \left( \frac{1}{2} g \left( \frac{3}{2} t \right) + \frac{1}{2} g \left( \frac{a + b}{2} \right) \right) dt \right]
\]
\[
    + \int_{(3b - a)/3}^{(3b - a)/3} \left( \frac{3b - a}{4} + \frac{3}{4} t \right)^{a-1} \left( \frac{1}{2} g \left( \frac{3}{2} t \right) + \frac{1}{2} g \left( \frac{a + b}{2} \right) \right) dt \right]
\]
\[
    = \frac{3a}{16(b - a)^a} \left[ \int_{(3b - a)/3}^{(3b - a)/3} \left( \frac{3b - a}{4} - \frac{3}{4} t \right)^{a-1} \left( \frac{1}{2} g \left( \frac{3}{2} t \right) + \frac{1}{2} g \left( \frac{a + b}{2} \right) \right) dt \right]
\]
\[
    + \int_{(3b - a)/3}^{(3b - a)/3} \left( \frac{3b - a}{4} + \frac{3}{4} t \right)^{a-1} \left( \frac{1}{2} g \left( \frac{3}{2} t \right) + \frac{1}{2} g \left( \frac{a + b}{2} \right) \right) dt \right].
\]
Let

\[ N_1 = \int_{(3a-b)/3}^{(3b-a)/3} \left( \frac{3b-a}{4} - \frac{3}{2} t \right)^{a-1} + \left( \frac{b-3a}{4} + \frac{3}{4} t \right)^{a-1} g\left( \frac{3}{2} t \right) dt, \]

\[ N_2 = \int_{(3a-b)/3}^{(3b-a)/3} \left( \frac{3b-a}{4} - \frac{3}{2} t \right)^{a-1} + \left( \frac{b-3a}{4} + \frac{3}{4} t \right)^{a-1} g\left( \frac{a+b}{2} \right) dt, \]

we have

\[ N_1 = \frac{1}{2a-3} \int_{(3a-b)/3}^{(3b-a)/3} \left( \frac{3b-a}{2} - \frac{3}{2} t \right)^{a-1} + \left( \frac{b-3a}{2} + \frac{3}{2} t \right)^{a-1} g\left( \frac{3}{2} t \right) dt \]

\[ \left( \text{let } \psi(v) = \frac{3}{2} t \right) \]

\[ = \frac{1}{2a-3} \int_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}((3b-a)/2)} \left( \frac{3b-a}{2} - \psi(v) \right)^{a-1} + \left( \psi(v) - \frac{3a-b}{2} \right)^{a-1} (g \circ \psi)(v)\psi'(v) dv \]

\[ = \frac{\Gamma(a)}{2a-3} \left[ I_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}((3b-a)/2)} (g \circ \psi)^{\left( \psi^{-1}(3b-a)/2 \right)} + I_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}(3a-b)/2} (g \circ \psi)^{\left( \psi^{-1}(3a-b)/2 \right)} \right], \]

\[ N_2 = g\left( \frac{a+b}{2} \right) \int_{(3a-b)/3}^{(3b-a)/3} \left( \frac{3b-a}{4} - \frac{3}{4} t \right)^{a-1} + \left( \frac{b-3a}{4} + \frac{3}{4} t \right)^{a-1} dt \]

\[ = \frac{4}{3} g\left( \frac{a+b}{2} \right) \int_{(3a-b)/4}^{(3b-a)/4} \left( \frac{3b-a}{4} - x \right)^{a-1} + \left( \frac{b-3a}{4} + x \right)^{a-1} dx \]

\[ = \frac{8}{3} (b-a)^a g\left( \frac{a+b}{2} \right). \]

From (12)–(15), we have the inequality

\[ \frac{\Gamma(a+1)}{2(b-a)^a} \left[ I_{\psi^{-1}(3a-b)/2}^{\psi^{-1}(3b-a)/2} (g \circ \psi)^{\left( \psi^{-1}(3b-a)/2 \right)} + I_{\psi^{-1}(3a-b)/2}^{\psi^{-1}(3a-b)/2} (g \circ \psi)^{\left( \psi^{-1}(3a-b)/2 \right)} \right] \leq \frac{3a}{16(b-a)^a} \left( N_1 + N_2 \right) \]

\[ = \frac{\Gamma(a+1)}{2a+2} (b-a)^a \left[ I_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}((3b-a)/2)} (g \circ \psi)^{\left( \psi^{-1}(3b-a)/2 \right)} + I_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}(3a-b)/2} (g \circ \psi)^{\left( \psi^{-1}(3a-b)/2 \right)} \right] + \frac{1}{2} g\left( \frac{a+b}{2} \right). \]  

(16)

From (3), we have

\[ 0 \leq \frac{\Gamma(a+1)}{2^{a+2} (b-a)^a} \left[ I_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}((3b-a)/2)} (g \circ \psi)^{\left( \psi^{-1}(3b-a)/2 \right)} + I_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}(3a-b)/2} (g \circ \psi)^{\left( \psi^{-1}(3a-b)/2 \right)} \right] \]

\[ \leq g((3a-b)/2) + g((3b-a)/2) \]

(17)
From (16) and (17), we obtain the right-hand side of inequality (11). This completes the proof.

\[
\frac{\Gamma (\alpha + 1)}{2(b - a)^\alpha} \left[ I_{\psi^{-1} (a)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} (b) \right) + I_{\psi^{-1} (b)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} (a) \right) \right] + \frac{g \left( \frac{a + b}{2} \right)}{2} \leq \frac{\Gamma (\alpha + 1)}{2^n (b - a)^\alpha} \left[ I_{\psi^{-1} \left( \left( \frac{3a - b}{2} \right) \right)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} \left( \frac{3a - b}{2} \right) \right) + I_{\psi^{-1} \left( \frac{3b - a}{2} \right)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} \left( \frac{3b - a}{2} \right) \right) \right].
\]

From (17) and (18), we obtain a new inequality

\[
0 < \frac{\Gamma (\alpha + 1)}{2(b - a)^\alpha} \left[ I_{\psi^{-1} (a)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} (b) \right) + I_{\psi^{-1} (b)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} (a) \right) \right] - \frac{g \left( \frac{a + b}{2} \right)}{2} \leq \frac{g \left( \frac{(3a - b)}{2} \right) + g \left( \frac{(3b - a)}{2} \right)}{4}.
\]

**Theorem 1.** Let \( g : [a, b] \rightarrow \mathbb{R} \) be a differentiable mapping on \((a, b)\) with \(0 \leq a < b\), \( \psi(x) \) is an increasing and positive monotone function on \([a, b]\), having a continuous derivative \( \psi'(x) \) on \((a, b)\), and \( \alpha \in (0, 1) \). \( g' : \left( \frac{(3a - b)}{2} \right) \rightarrow \mathbb{R} \) is a continuous function on \(\left( \frac{(3a - b)}{2} \right)\). If \(|g'|^q\) is a convex function on \(\left( \frac{(3a - b)}{2} \right), \left( \frac{(3b - a)}{2} \right)\), then the following inequalities hold:

\[
\frac{\Gamma (\alpha + 1)}{2(n + 1)^\alpha} \left[ I_{\psi^{-1} \left( \frac{(3a - b)}{2} \right)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} \left( \frac{3b - a}{2} \right) \right) + I_{\psi^{-1} \left( \frac{3b - a}{2} \right)}^{\alpha \psi} (g \circ \psi) \left( \psi^{-1} \left( \frac{3a - b}{2} \right) \right) \right] = \frac{g \left( \frac{a + b}{2} \right)}{2} \int_{\psi^{-1} \left( \frac{(a + b)}{2} \right)} \left( g' \circ \psi \right) (v) \psi'(v) dv + \int_{\psi^{-1} \left( \frac{(3a - b)}{2} \right)} g \circ \psi \left( \psi^{-1} \left( \frac{3a - b}{2} \right) \right) \frac{1}{2} \left( \psi'(v) \right)^2 dv + \int_{\psi^{-1} \left( \frac{(3b - a)}{2} \right)} g \circ \psi \left( \psi^{-1} \left( \frac{3b - a}{2} \right) \right) \frac{1}{2} \left( \psi'(v) \right)^2 dv.
\]
From (16) and (21), we have

\[
\frac{\Gamma(a+1)}{2(b-a)^a} \left[ \int_{\psi^{-1}(a)^+}^{\psi^{-1}(b)^+} (g \circ \psi)(\psi^{-1}(b)) + \int_{\psi^{-1}(b)^-}^{\psi^{-1}(a)^-} (g \circ \psi)(\psi^{-1}(a)) \right] - g\left(\frac{a+b}{2}\right) \\
\leq \frac{\Gamma(a+1)}{2^{a+1}(b-a)^a} \left[ \int_{\psi^{-1}((3a-b)/2)^+}^{\psi^{-1}(b)^+} (g \circ \psi)(\psi^{-1}(b)) + \int_{\psi^{-1}((3b-a)/2)^-}^{\psi^{-1}(a)^-} (g \circ \psi)(\psi^{-1}(a)) \right] - \frac{1}{2} g\left(\frac{a+b}{2}\right) \\
= \frac{1}{2} \int_{\psi^{-1}((3a-b)/2)^+}^{\psi^{-1}(b)^+} \frac{1}{2} (g' \circ \psi)(v)\psi'(v)dv + \int_{\psi^{-1}((3b-a)/2)^-}^{\psi^{-1}(a)^-} \frac{1}{2} (g' \circ \psi)(v)\psi'(v)dv \\
+ \frac{1}{2^{a+1}(b-a)^a} \int_{\psi^{-1}((3a-b)/2)^+}^{\psi^{-1}(b)^+} \left[ \left(\frac{3b-a}{2} - \psi(v)\right)^{\alpha} - \left(\psi(v) - \frac{3a-b}{2}\right)^{\alpha} \right] (g' \circ \psi)(v)\psi'(v)dv \\
\leq \int_{\psi^{-1}((3a-b)/2)^+}^{\psi^{-1}(b)^+} \frac{1}{4} (g' \circ \psi)(v)\psi'(v)dv + \int_{\psi^{-1}((3b-a)/2)^-}^{\psi^{-1}(a)^-} \frac{1}{4} (g' \circ \psi)(v)\psi'(v)dv \\
+ \frac{1}{2^{a+2}(b-a)^a} \int_{\psi^{-1}((3a-b)/2)^+}^{\psi^{-1}(b)^+} \left[ \left(\frac{3b-a}{2} - \psi(v)\right)^{\alpha} - \left(\psi(v) - \frac{3a-b}{2}\right)^{\alpha} \right] (g' \circ \psi)(v)\psi'(v)dv \\
\leq \int_{\psi^{-1}((3a-b)/2)^+}^{\psi^{-1}(b)^+} \frac{1}{4} (g' \circ \psi)(v)\psi'(v)dv + \frac{1}{2^{a+2}(b-a)^a} \left[ \int_{\psi^{-1}((3a-b)/2)^+}^{\psi^{-1}(b)^+} \left(\frac{3b-a}{2} - \psi(v)\right)^{\alpha} \right] (g' \circ \psi)(v)\psi'(v)dv \\
+ \int_{\psi^{-1}((3b-a)/2)^-}^{\psi^{-1}(a)^-} \left(\psi(v) - \frac{3a-b}{2}\right)^{\alpha} (g' \circ \psi)(v)\psi'(v)dv \\
\left(\text{let } \psi(v) = \frac{3b-a}{2} - 2t(b-a)\right) \\
\leq \frac{b-a}{2} \int_0^1 \left| g'\left(\frac{3b-a}{2}(1-t) + \frac{3a-b}{2} t\right) \right| dt + \frac{b-a}{2} \int_0^1 \left| g'\left(\frac{3b-a}{2}(1-t) + \frac{3a-b}{2} t\right) \right| dt \\
+ \frac{b-a}{2} \int_0^1 (1-t)^{\alpha} \left| g'\left(\frac{3b-a}{2}(1-t) + \frac{3a-b}{2} t\right) \right| dt.
\]

If \( q = 1 \) and the function \(|g'|\) is a convex function on \(((3a-b)/2), ((3b-a)/2))\), then we have

\[
\left| g'\left(\frac{3a-b}{2} + (1-t)\left(\frac{3b-a}{2}\right) \right) \right| \leq \left| g'\left(\frac{3a-b}{2}\right) \right| + |1-t| \left| g'\left(\frac{3b-a}{2}\right) \right|, \tag{23}
\]

\]
for any \( t \in [0, 1] \).

Therefore, we obtain

\[
\int_0^1 g' \left( \frac{t}{2} - \frac{3a - b}{2} + (1 - t) \frac{3b - a}{2} \right) dt \leq \int_0^1 g' \left( \frac{3a - b}{2} \right) dt + \int_0^1 (1 - t) g' \left( \frac{3b - a}{2} \right) dt
\]

\[
= \frac{\left| g' \left( \frac{(3a - b)/2}{2} \right) \right| + \left| g' \left( \frac{(3b - a)/2}{2} \right) \right|}{2},
\]

\[
\int_0^1 (1 - t)^q \left| g' \left( \frac{3a - b}{2} \right) \right| \left( 1 - t \right) dt + \int_0^1 t^q \left| g' \left( \frac{3b - a}{2} \right) \right| \left( 1 - t \right) dt
\]

\[
\leq \int_0^1 (1 - t)^q \left| g' \left( \frac{3a - b}{2} \right) \right| dt + \int_0^1 t^q \left| g' \left( \frac{3b - a}{2} \right) \right| dt
\]

\[
= \frac{1}{\alpha + 1} \left| g' \left( \frac{3a - b}{2} \right) \right| + \frac{1}{\alpha + 1} \left| g' \left( \frac{3b - a}{2} \right) \right|
\]

\[
= \frac{1}{\alpha + 1} \left[ \left| g' \left( \frac{3a - b}{2} \right) \right| + \left| g' \left( \frac{3b - a}{2} \right) \right| \right].
\]

From (22), (24), and (25), if \( q = 1 \), we have

\[
\frac{\Gamma(\alpha + 1)}{2(b - a)^{\alpha}} \left[ \int_{\psi^{-1}(a)}^{\psi(b)} (g \circ \psi)\left( \psi^{-1}(b) \right) + t^{\alpha \psi}(\psi^{-1}(a)) \right] - g\left( \frac{a + b}{2} \right)
\]

\[
\leq \frac{b - a}{2} \cdot \frac{\alpha + 3}{2\alpha + 2} \left[ \left| g' \left( \frac{3a - b}{2} \right) \right| + \left| g' \left( \frac{3b - a}{2} \right) \right| \right].
\]

Suppose that \( q > 1 \), \( |g'|^q \) is convex on \([((3a - b)/2), ((3b - a)/2)]\); using Hölder’s inequality \((q > 1, p = (q/(q - 1)))\) and Jensen inequality, we have

\[
\int_0^1 g' \left( \frac{t}{2} - \frac{3a - b}{2} + (1 - t) \frac{3b - a}{2} \right) dt
\]

\[
\leq \left( \int_0^1 (q(q - 1)) \right)^1 \left( \int_0^1 g' \left( \frac{t}{2} - \frac{3a - b}{2} + (1 - t) \frac{3b - a}{2} \right) \right)^q dt \cdot \left( \int_0^1 (q(q - 1)) \right)^{1/q} \leq \left( \int_0^1 g' \left( \frac{3a - b}{2} \right) \right)^q + \left( 1 - t \right) g' \left( \frac{3b - a}{2} \right) \right)^q dt \cdot \left( \int_0^1 (q(q - 1)) \right)^{1/q}
\]

\[
= \frac{\left| g' \left( \frac{(3a - b)/2}{2} \right) \right| + \left| g' \left( \frac{(3b - a)/2}{2} \right) \right|}{2} \left( \int_0^1 (q(q - 1)) \right)^{1/q}
\]

\[
\leq \frac{1}{2} \left[ \left| g' \left( \frac{3a - b}{2} \right) \right| + \left| g' \left( \frac{3b - a}{2} \right) \right| \right].
\]
\[
\int_0^1 t^a g' \left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) dt = \int_0^1 (t^a)^{1-(1/q)(q)} \left[ (t^a)^{1/q} g' \left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right] dt \\
\leq \left( \int_0^1 t^a dt \right)^{1-(1/q)(q)} \left( \int_0^1 t^a \left| g' \left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right|^q dt \right)^{(1/q)} \\
\leq \left( \frac{1}{\alpha + 1} \right)^{1-(1/q)(q)} \left( \int_0^1 (1-t)^a \left| g' \left( \frac{3a-b}{2} \right) \right|^q dt \right)^{(1/q)} \\
= \left( \frac{1}{\alpha + 1} \right)^{1-(1/q)(q)} \left( \frac{1}{\alpha + 2} \left| g' \left( \frac{3a-b}{2} \right) \right|^q + B(\alpha + 1, 2) \left| g' \left( \frac{3b-a}{2} \right) \right|^q \right)^{(1/q)} 
\]

where \( B \) is the beta function.

From (27)–(29), using Jensen inequality, we have

\[
\int_0^1 \left| g' \left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right| dt + \int_0^1 t^a \left| g' \left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right| dt \\
+ \int_0^1 (1-t)^a \left| g' \left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right| dt \\
\leq \frac{1}{2} \left( \left| g' \left( \frac{3a-b}{2} \right) \right| + \left| g' \left( \frac{3b-a}{2} \right) \right| \right) \\
+ \left( \frac{1}{\alpha + 1} \right)^{1-(1/q)(q)} \left( \frac{1}{\alpha + 2} \left| B(\alpha + 1, 2) \right| \left( \left| g' \left( \frac{3b-a}{2} \right) \right|^q + \left| g' \left( \frac{3a-b}{2} \right) \right|^q \right) \right)^{(1/q)} \\
\leq \frac{1}{2} \left( \left| g' \left( \frac{3a-b}{2} \right) \right| + \left| g' \left( \frac{3b-a}{2} \right) \right| \right) \\
+ \left( \frac{1}{\alpha + 1} \right)^{1-(1/q)(q)} \left( \frac{1}{\alpha + 2} \left( \left| B(\alpha + 1, 2) \right| \left( \left| g' \left( \frac{3b-a}{2} \right) \right|^q + \left| g' \left( \frac{3a-b}{2} \right) \right|^q \right) \right) \right)^{(1/q)} \\
= \left[ \left( \frac{1}{\alpha + 1} \right)^{1-(1/q)(q)} \left( \frac{1}{\alpha + 2} + B(\alpha + 1, 2) \right)^{(1/q)-1} \left( \left| g' \left( \frac{3b-a}{2} \right) \right| + \left| g' \left( \frac{3a-b}{2} \right) \right| \right) \right] \\
= \left[ \left( \frac{1}{\alpha + 1} \right)^{1-(1/q)(q)} \left( \frac{1}{\alpha + 2} \right)^{(1/q)} + \frac{1}{2} \left( \left| g' \left( \frac{3b-a}{2} \right) \right| + \left| g' \left( \frac{3a-b}{2} \right) \right| \right) \right] \\
= \left[ \frac{1}{\alpha + 1} + \frac{1}{2} \left( \left| g' \left( \frac{3b-a}{2} \right) \right| + \left| g' \left( \frac{3a-b}{2} \right) \right| \right) \right].
\]
Proof. By Hölder’s inequality \(((1/p) + (1/q) = 1, p = (q/(q-1)))\) and Jensen inequality, we have

\[
\int_0^1 t^q \left| g\left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right| dt
\]

\[
\leq \left( \int_0^1 \left( t^q \right)^{1-\{1/q\}} \, dt \right)^{1-\{1/q\}} \left( \int_0^1 \left| g\left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right|^q \, dt \right)^{1/q}
\]

\[
\leq \left( 1 + \frac{aq}{q-1} \right)^{1-\{1/q\}} \left( \int_0^1 \left| g\left( \frac{3a-b}{2} \right) \right|^q \, dt \right)^{1/q}
\]

\[
= \left( 1 + \frac{aq}{q-1} \right)^{1-\{1/q\}} \left( \frac{1}{2} \left| g\left( \frac{3a-b}{2} \right) \right|^q + \frac{1}{2} \left| g\left( \frac{3b-a}{2} \right) \right|^q \right)^{1/q}
\]

\[
\int_0^1 (1-t)^p \left| g\left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right| dt
\]

\[
\leq \left( \int_0^1 \left( (1-t)^p \right)^{1-\{1/q\}} \, dt \right)^{1-\{1/q\}} \left( \int_0^1 \left| g\left( \frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t \right) \right|^q \, dt \right)^{1/q}
\]

\[
\leq \left( 1 + \frac{aq}{q-1} \right)^{1-\{1/q\}} \left( \int_0^1 \left| g\left( \frac{3a-b}{2} \right) \right|^q \, dt \right)^{1/q}
\]

\[
= \left( 1 + \frac{aq}{q-1} \right)^{1-\{1/q\}} \left( \frac{1}{2} \left| g\left( \frac{3a-b}{2} \right) \right|^q + \frac{1}{2} \left| g\left( \frac{3b-a}{2} \right) \right|^q \right)^{1/q}
\]
From (27), (34), and (35), using Jensen inequality, we have

\[
\int_0^1 g'(\frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t) dt + \int_0^1 t^\alpha g'(\frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t) dt
\]

\[
+ \int_0^1 (1-t)\alpha g'(\frac{3b-a}{2} (1-t) + \frac{3a-b}{2} t) dt
\]

\[
\leq \left[ \left(1 + \frac{aq}{q-1}\right)^{1/(q)} + \frac{1}{2}\right]\left( g\left(\frac{3b-a}{2}\right) + |g'|\left(\frac{3a-b}{2}\right) \right).
\]

From (22) and (36), we have

\[
\Gamma(\alpha+1)\frac{\Gamma(\alpha+1)}{2(b-a)^\alpha}\left[ I_\psi^{\alpha\psi}(g \circ \psi)(\psi^{-1}(b)) + I_\psi^{\alpha\psi}(g \circ \psi)(\psi^{-1}(a)) \right] - g\left(\frac{a+b}{2}\right)
\]

\[
\leq \frac{b-a}{2}\left[ \left(1 + \frac{aq}{q-1}\right)^{1/(q)} + \frac{1}{2}\right]\left( g\left(\frac{3b-a}{2}\right) + |g'|\left(\frac{3a-b}{2}\right) \right).
\]

The proof is complete. \(\square\)

**Corollary 1.** From Theorems 1-2, we get the following inequalities for \(q > 1:\)

\[
\Gamma(\alpha+1)\frac{\Gamma(\alpha+1)}{2(b-a)^\alpha}\left[ I_\psi^{\alpha\psi}(g \circ \psi)(\psi^{-1}(b)) + I_\psi^{\alpha\psi}(g \circ \psi)(\psi^{-1}(a)) \right] - g\left(\frac{a+b}{2}\right)
\]

\[
\leq \frac{b-a}{2}\min\{N_1, N_2\}\left( |g\left(\frac{3b-a}{2}\right)| + |g'|\left(\frac{3a-b}{2}\right) \right).
\]

where \(N_1 = (1/(\alpha+1)) + (1/2)\) and \(N_2 = (1 + (aq/(q-1)))^{1-1/q} + (1/2).\)

Now, we get the estimation for

\[
\Gamma(\alpha+1)\frac{\Gamma(\alpha+1)}{2(b-a)^\alpha}\left[ I_\psi^{\alpha\psi}(g \circ \psi)(\psi^{-1}(b)) + I_\psi^{\alpha\psi}(g \circ \psi)(\psi^{-1}(a)) \right] - g\left(\frac{(3a-b)/2) + g((3b-a)/2) + 2g((a+b)/2)\right)
\]

\[
\leq \frac{b-a}{2}\left( |g\left(\frac{3a-b}{2}\right)| + |g'|\left(\frac{3b-a}{2}\right) \right).
\]

\[
(39)
\]

**Theorem 3.** Under the assumptions of Theorem 1, if \(|g'|\) is a convex function on \([(3a-b)/2), ((3b-a)/2)], q \geq 1,\) then the following inequalities hold:

**Proof.** By Lemma 1, substituting \((3a-b)/2\) for \(a\) and \((3b-a)/2\) for \(b\), we have
\[
\frac{\Gamma(a + 1)}{2^{a+1} (b - a)^a} \left[ I_{\psi^{-1}((3a-b)/2)^+}^a (g \circ \psi) \left( \psi^{-1} \left( \frac{3b-a}{2} \right) \right) + I_{\psi^{-1}((3b-a)/2)^+}^a (g \circ \psi) \left( \psi^{-1} \left( \frac{3a-b}{2} \right) \right) \right] \\
= \frac{g((3a-b)/2) + g((3b-a)/2)}{2} - \frac{1}{2^{a+1} (b - a)^a} \int_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}((3b-a)/2)} \left( \psi(v) - \frac{3b-a}{2} \right) - \left( \frac{3b-a}{2} - \psi(v) \right)^a \frac{(g' \circ \psi)(v) \psi'(v)}{dv}. \tag{41}
\]

From (16) and (41), we have

\[
\frac{\Gamma(a + 1)}{2^{a+2} (b - a)^a} \left[ I_{\psi^{-1}(a)^+}^a (g \circ \psi) \left( \psi^{-1} (b) \right) + I_{\psi^{-1}((3a-b)/2)^+}^a (g \circ \psi) \left( \psi^{-1} (a) \right) \right] - \frac{g((3a-b)/2) + g((3b-a)/2) + 2g((a+b)/2)}{4} \\
\leq \frac{\Gamma(a + 1)}{2^{a+2} (b - a)^a} \left[ I_{\psi^{-1}((3a-b)/2)^+}^a (g \circ \psi) \left( \psi^{-1} \left( \frac{3b-a}{2} \right) \right) + I_{\psi^{-1}((3b-a)/2)^+}^a (g \circ \psi) \left( \psi^{-1} \left( \frac{3a-b}{2} \right) \right) \right] \\
- \frac{g((3a-b)/2) + g((3b-a)/2)}{4} \\
= -\frac{1}{2^{a+1} (b - a)^a} \int_{\psi^{-1}((3a-b)/2)}^{\psi^{-1}((3b-a)/2)} \left[ \left( \psi(v) - \frac{3a-b}{2} \right)^a - \left( \frac{3b-a}{2} - \psi(v) \right)^a \right] \frac{(g' \circ \psi)(v) \psi'(v)}{dv} \tag{42}
\]

\begin{align*}
\left( \text{let } \psi(v) = \frac{3a-b}{2} + 2t(b-a) \right) \\
= \frac{b-a}{2} \left[ \int_0^1 t^a (1-t)^a g' \left( \frac{3a-b}{2} (1-t) + \frac{3b-a}{2} t \right) dt \right] \\
\leq \frac{b-a}{2} \left[ \int_0^1 t^a \left( \frac{3a-b}{2} (1-t) + \frac{3b-a}{2} t \right) dt + \int_0^1 (1-t)^a \left( \frac{3a-b}{2} (1-t) + \frac{3b-a}{2} t \right) dt \right].
\end{align*}

Suppose that \( q = 1 \); the function \( |g'| \) is a convex function on \( ([3a-b)/2], ((3b-a)/2) \), so we have

\[
\frac{\Gamma(a + 1)}{2^{a+1} (b - a)^a} \left[ I_{\psi^{-1}(a)^+}^a (g \circ \psi) \left( \psi^{-1} (b) \right) + I_{\psi^{-1}((3a-b)/2)^+}^a (g \circ \psi) \left( \psi^{-1} (a) \right) \right] - \frac{g((3a-b)/2) + g((3b-a)/2) + 2g((a+b)/2)}{4} \\
\leq \frac{b-a}{2} \left[ \int_0^1 t^a \left( \frac{3a-b}{2} (1-t) + \frac{3b-a}{2} t \right) dt + \int_0^1 (1-t)^a \left( \frac{3a-b}{2} (1-t) + \frac{3b-a}{2} t \right) dt \right] \\
+ \int_0^1 (1-t)^a \left( \frac{3a-b}{2} (1-t) + \frac{3b-a}{2} t \right) dt + \int_0^1 (1-t)^a \left( \frac{3a-b}{2} (1-t) + \frac{3b-a}{2} t \right) dt \\
= \frac{b-a}{2} \left( B(2, a + 1) + \frac{1}{a+2} \left( \left| g' \left( \frac{3a-b}{2} \right) \right| + \left| g' \left( \frac{3b-a}{2} \right) \right| \right) \right). \tag{43}
\]
Then, we suppose that $q > 1$; the function $|g'|^q$ is a convex function on $[((3a - b)/2), ((3b - a)/2)]$, so we have

\[
\int_0^1 t^a |g'(\frac{3a-b}{2} - t + \frac{3b-a}{2})| dt \\
\leq \int_0^1 (t^n)^{1-(1/q)} \left[ (t^n)^{1/q} \left| g'\left(\frac{3a-b}{2} - t + \frac{3b-a}{2}\right)\right| \right] dt \\
\leq \left( \int_0^1 t^a dt \right)^{1-(1/q)} \left( \int_0^1 t^a \left| g'\left(\frac{3a-b}{2} - t + \frac{3b-a}{2}\right)\right|^q dt \right) \tag{44} \\
\leq \left( \int_0^1 (1-t)^n dt \right)^{1-(1/q)} \left( \int_0^1 (1-t)^a \left| g'\left(\frac{3a-b}{2} - t + \frac{3b-a}{2}\right)\right|^q dt \right) \tag{45} \\
\leq \left( \int_0^1 (1-t)^a dt \right)^{1-(1/q)} \left( \int_0^1 (1-t)^a \left| g'\left(\frac{3a-b}{2} - t + \frac{3b-a}{2}\right)\right|^q dt \right)
\]

From (42), (44), and (45), using Jensen inequality, for $q > 1$, we have

\[
\frac{\Gamma(\alpha+1)}{2(b-a)^\alpha} \left[ I_{\psi}^{\alpha\psi} \left( \psi^{-1} (b) \right) + I_{\psi}^{\alpha\psi} \left( \psi^{-1} (a) \right) \right] - \frac{g((3a-b)/2) + g((3b-a)/2) + 2g((a+b)/2)}{4} \\
\leq \left( \frac{1}{2} \right)^{(1/q)} (b-a) \left( \frac{1}{\alpha+1} + B(2, \alpha+1) \right) \left( \left| g'\left(\frac{3a-b}{2} \right)\right|^q + \left| g'\left(\frac{3b-a}{2} \right)\right|^q \right) \tag{46}
\]

In conclusion, we get (40). The proof is complete.

Based on Theorem 3, we give Theorems 4 and 5.

**Theorem 4.** Under the assumptions of Theorem 1, if $|g'|^q$ is a convex function on $[((3a-b)/2), ((3b-a)/2)]$, $q > 1$, then the following inequalities hold:

\[
\int_0^1 t^a |g'(\frac{3a-b}{2} - t + \frac{3b-a}{2})| dt \\
\leq \left( \int_0^1 \left| g'\left(\frac{3a-b}{2} - t + \frac{3b-a}{2}\right)\right| dt \right)^{1-(1/q)} \left( \int_0^1 \left( t^a \right)^{1/q} \left| g'\left(\frac{3a-b}{2} - t + \frac{3b-a}{2}\right)\right|^q dt \right) \tag{47}
\]

\[
\leq \left( \int_0^1 \left( t^a + (1-t)^a \right) dt \right)^{1-(1/q)} \left( \int_0^1 \left( t^a \right)^{1/q} \left| g'\left(\frac{3a-b}{2} - t + \frac{3b-a}{2}\right)\right|^q dt \right) \tag{48}
\]

\[
\leq B(2, \alpha+1) \left( \left| g'\left(\frac{3a-b}{2} \right)\right|^q + \left| g'\left(\frac{3b-a}{2} \right)\right|^q \right) \tag{49}
\]
\[
\frac{\Gamma (\alpha + 1)}{2(b - a)^{\alpha}} \left[ I_{\psi^{-1}(b)}^{\alpha \psi} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(a)}^{\alpha \psi} (g \circ \psi)(\psi^{-1}(a)) \right] - \frac{g((3a - b)/2) + g((3b - a)/2) + 2g((a + b)/2)}{4} \\
\leq \frac{b - a}{2} \left( 1 + \frac{\alpha q}{q - 1} \right)^{1 - (1/q)} \left( \left| g' \left( \frac{3b - a}{2} \right) \right| + \left| g' \left( \frac{3a - b}{2} \right) \right| \right).
\]

(47)

**Proof.** From the convex function of \( |g'|^q \) and Hölder inequality, we have

\[
\int_0^1 t^\alpha \left| g' \left( \frac{3a - b}{2} (1 - t) + \frac{3b - a}{2} t \right) \right| dt \\
\leq \left( \int_0^1 (t^\alpha)^{\left( q/(q - 1) \right)} dt \right)^{1/(1/q)} \left( \int_0^1 \left| g' \left( t \left( \frac{3b - a}{2} \right) + (1 - t) \left( \frac{3a - b}{2} \right) \right) \right|^q dt \right)^{1/q}
\leq \left( 1 + \frac{\alpha q}{q - 1} \right)^{1 - (1/q)} \left( \int_0^1 \left| g' \left( \frac{3b - a}{2} \right) \right|^q + (1 - t) \left| g' \left( \frac{3a - b}{2} \right) \right|^q dt \right)^{1/(1/q)}
\leq \left( 1 + \frac{\alpha q}{q - 1} \right)^{1 - (1/q)} \left( \frac{1}{2} \left| g' \left( \frac{3b - a}{2} \right) \right|^q + \frac{1}{2} \left| g' \left( \frac{3a - b}{2} \right) \right|^q \right)^{1/(1/q)}
\leq \left( 1 + \frac{\alpha q}{q - 1} \right)^{1 - (1/q)} \left( \frac{1}{2} \left| g' \left( \frac{3b - a}{2} \right) \right|^q + \frac{1}{2} \left| g' \left( \frac{3a - b}{2} \right) \right|^q \right)^{1/(1/q)}
\]

From (42), (47), and (49), using Jensen inequality, we have

\[
\frac{\Gamma (\alpha + 1)}{2(b - a)^{\alpha}} \left[ I_{\psi^{-1}(b)}^{\alpha \psi} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(a)}^{\alpha \psi} (g \circ \psi)(\psi^{-1}(a)) \right] - \frac{g((3a - b)/2) + g((3b - a)/2) + 2g((a + b)/2)}{4} \\
\leq \frac{b - a}{2} \left( 1 + \frac{\alpha q}{q - 1} \right)^{1 - (1/q)} \left( \left| g' \left( \frac{3b - a}{2} \right) \right|^q + \left| g' \left( \frac{3a - b}{2} \right) \right|^q \right)^{1/(1/q)}
\leq \frac{b - a}{2} \left( 1 + \frac{\alpha q}{q - 1} \right)^{1 - (1/q)} \left( \left| g' \left( \frac{3b - a}{2} \right) \right| + \left| g' \left( \frac{3a - b}{2} \right) \right| \right).
\]

(50)

The proof is complete. \(\square\)
Theorem 5. Under the assumptions of Theorem 1, if $|g'|^p$ is a convex function on $\{(3a - b)/2, (3b - a)/2\}$, $q > 1$, then the following inequalities hold:

$$
\frac{\Gamma(a + 1)}{2(b - a)^a} \left[ \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} (g \circ \psi)(\psi^{-1}(b)) + \int_{\psi^{-1}(b)}^{\psi^{-1}(a)} (g \circ \psi)(\psi^{-1}(a)) \right] - \frac{g((3a - b)/2) + g((3b - a)/2) + 2g((a + b)/2)}{4}
\leq \frac{b - a}{4} \left( \frac{2p}{a + 1} + (1 - p) \right) \left( \left| g' \left( \frac{3b - a}{2} \right) \right| + \left| g' \left( \frac{3a - b}{2} \right) \right| \right),
$$

where $(1/p) + (1/q) = 1$. 

Proof. By (42), using Holder inequality, Jensen inequality, and Lemma 3 (let $K = 1$, $(q/p) = p$), we have

$$
\frac{\Gamma(a + 1)}{2(b - a)^a} \left[ \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} (g \circ \psi)(\psi^{-1}(b)) + \int_{\psi^{-1}(b)}^{\psi^{-1}(a)} (g \circ \psi)(\psi^{-1}(a)) \right] - \frac{g((3a - b)/2) + g((3b - a)/2) + 2g((a + b)/2)}{4}
\leq \frac{b - a}{2} \left[ \int_{0}^{1} \left| t^a - (1 - t)^a \right| g' \left( \frac{3a - b}{2} (1 - t) + \frac{3b - a}{2} t \right) dt \right]
\leq \frac{b - a}{2} \left[ \int_{0}^{1} \left| t^a - (1 - t)^a \right| \left| \int_{0}^{1} g' \left( \frac{3a - b}{2} (1 - t) + \frac{3b - a}{2} t \right) dt \right| \right]^{1/q}
\leq \frac{b - a}{2} \left[ \int_{0}^{1} \left| t^a + (1 - t)^a \right|^p dt \right]^{1/p} \left[ \int_{0}^{1} \left| g' \left( \frac{3a - b}{2} (1 - t) + \frac{3b - a}{2} t \right) \right| dt \right]^{1/q}
\leq \frac{b - a}{2} \left[ \int_{0}^{1} p(1 - t)^a + pt^a + (1 - p) dt \right]^{1/p} \left[ \int_{0}^{1} \left| g' \left( \frac{3a - b}{2} \right) \right|^q + \left| g' \left( \frac{3b - a}{2} \right) \right|^q dt \right]^{1/q}
\leq \frac{b - a}{4} \left( \frac{2p}{a + 1} + (1 - p) \right) \left( \left| g' \left( \frac{3b - a}{2} \right) \right| + \left| g' \left( \frac{3a - b}{2} \right) \right| \right).
$$

The proof is complete.

Corollary 2. From Theorems 3–5, we get the following inequality for $q > 1$:

$$
\frac{\Gamma(a + 1)}{2(b - a)^a} \left[ \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} (g \circ \psi)(\psi^{-1}(b)) + \int_{\psi^{-1}(b)}^{\psi^{-1}(a)} (g \circ \psi)(\psi^{-1}(a)) \right] - \frac{g((3a - b)/2) + g((3b - a)/2) + 2g((a + b)/2)}{4}
\leq \min\{N_3, N_4, N_5\} \left( \left| g' \left( \frac{3b - a}{2} \right) \right| + \left| g' \left( \frac{3a - b}{2} \right) \right| \right).
$$
where $N_3 = ((b-a)/(2a+2))$, $N_4 = ((b-a)/2)(1 + (aq/(q-1)))^{1-(1/q)}$, $N_5 = ((b-a)/(4)((2p/(a+1)) + (1-p))^{1/p}$.

4. Applications

Example 1. We consider the following the arithmetic means, geometric means, logarithmic means, and generalized logarithmic means for positive real numbers $a, b$, and $a \neq b$:

$$A(a,b) = \frac{a+b}{2}, \ a, b \in \mathbb{R},$$

$$G(a,b) = \sqrt{ab}, \ a, b \in \mathbb{R},$$

$$L(a,b) = \frac{b-a}{\ln|b| - \ln|a|}, \ |a| \neq |b|, \ ab \neq 0,$$

$$L_n(a,b) = \frac{b^n - a^{n+1}}{(n+1)(b-a)}, \ n \in \mathbb{Z}\setminus\{-1,0\}, \ a,b \in \mathbb{R}, \ a \neq b.$$  \hspace{1cm} (54)

Now, using the results of Section 3, we have some conclusions to the special means of real numbers.

(1) Let $a, b \in \mathbb{R}$, $0 < a < b$, then we have

$$L^{-1}(a,b) - A^{-1}(a,b) \leq (b-a)\min\{N_1, N_2\}$$

$$\cdot A\left(\left|\frac{3b-a}{2}\right|^2 + \left|\frac{3a-b}{2}\right|^2\right).$$

(2) Let $a, b \in \mathbb{R}$, $0 < a < b$, then we have

$$|L_n(a,b) - A^n(a,b)| \leq n(b-a)\min\{N_1, N_2\}$$

$$\cdot A\left(\left|\frac{3b-a}{2}\right|^n + \left|\frac{3a-b}{2}\right|^n\right).$$

where $N_1 = 1$, $N_2 = (1 + (q/(q-1)))^{1-(1/q)} + (1/2)$.

In fact, applying Corollary 1 with $g(x) = (1/x)$, $\psi(x) = x$, and $\alpha = 1$, we have

$$L^{-1}(a,b) - A^{-1}(a,b) \leq (b-a)\min\{N_1, N_2\}$$

$$\cdot A\left(\left|\frac{3b-a}{2}\right| + \left|\frac{3a-b}{2}\right|^2\right).$$

(3) Let $a, b \in \mathbb{R}$, $0 < a < b$, then we have

$$|L_n(a,b) - A^n(a,b)| \leq n(b-a)\min\{N_1, N_2\}$$

$$\cdot A\left(\left|\frac{3b-a}{2}\right|^n + \left|\frac{3a-b}{2}\right|^n\right).$$
\[ G^{-2}(a, b) - A^{-2}(a, b) \leq 2(b-a)\min\{N_1, N_2\} \]

\[ \cdot A\left(\frac{3b-a}{2}, \frac{3a-b}{2} \right)^{-3}, \tag{58} \]

where \( N_1 = 1 \), and \( N_2 = (1 + (q/(q-1)))^{1-(1/q)} + (1/2) \).

Applying Corollary 1 with \( g(x) = (1/x^2), \psi(x) = x, \alpha = 1 \), by similar calculation, we obtain the result.

From Corollary 2, we get the estimate for \( B(a, \rho) \).

Example 2. Let \( a > 0, a = 0, b = 1, g(x) = x^{\alpha-1} \quad (x \in [0, 1], \rho \geq 3), \psi(x) = x, \Gamma(a) \) is the gamma function, and \( B(a, \rho) \) is the beta function. Then, \( |g'| \) is convex on \([-1/2), (3/2)\). So, we have

\[ \Gamma(a+1) \left\{ \int_0^1 x^{\alpha-1} dx = \frac{\alpha}{2} B(a, \rho) \right\}. \tag{59} \]

\[ = \int_0^1 (1-x)^{\alpha-1} x^{\alpha-1} dx = \frac{\alpha}{2} B(a, \rho), \]

\[ = \int_0^1 x^{\alpha-1} dx = \frac{\alpha}{2} \frac{1}{2(a+\rho-1)}. \]

From Corollary 2, the following inequality holds:

\[ B(a, \rho) + \frac{1}{(a+\rho-1) - \frac{1}{2} \cdot \frac{1}{2}} \leq \frac{2}{a(\rho-1) - \frac{1}{2} \cdot \frac{1}{2}} \min\{N_3, N_4, N_5\} \left( \frac{1}{2} \right)^{\alpha-2} + \left( \frac{3}{2} \right)^{\alpha-2}. \tag{60} \]

where \( N_3 = 1/(2a+2), N_4 = (1/2)(1 + (a/2)q - 1)) \left( \frac{1}{2} \right)^{\alpha-1} \), and \( N_5 = (1/4)((2p/(a+1)) + (1 - \rho))^{(1/p)} \). \( (ZR2019MA034). \)

5. Conclusion

This paper extends the range of argument of the function \( g' \) and establishes some new Hermite–Hadamard type inequalities for \( \psi \)-Riemann–Liouville fractional integrals via convex functions. If \( g \) is a convex function on \([a, b]\), we obtain an estimate for

\[ \frac{\Gamma(a+1)}{2(b-a)^a} \left[ \int_{\psi^{-1}(a)}^{\psi^{-1}(b)} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)}^{\psi^{-1}(a)} (g \circ \psi)(\psi^{-1}(a)) \right] - g\left( \frac{a+b}{2} \right) \]. \tag{61} \]

If \( |g'|^q \) is a convex function on \([(3a-b)/2), ((3b-a)/2)\], we obtain estimates for

\[ \frac{\Gamma(a+1)}{2(b-a)^a} \left[ I_{\psi^{-1}(a)}^{\psi^{-1}(b)} (g \circ \psi)(\psi^{-1}(b)) + I_{\psi^{-1}(b)}^{\psi^{-1}(a)} (g \circ \psi)(\psi^{-1}(a)) \right] - g\left( \frac{3a-b}{2} \right) + g\left( \frac{3b-a}{2} \right) + 2g\left( \frac{a+b}{2} \right) \]. \tag{62} \]

Conflicts of Interest

The authors declare that there are no conflicts of interest regarding the publication of this paper.

Authors’ Contributions

YS carried out the main results and completed the corresponding proof. RX participated in the proof and helped to complete Section 4. All authors read and approved the final manuscript.
