Abstract

Chromium trioxide (CrO$_3$) has many industrial applications for the manufacturing of aerospace parts, synthetic rubies, stripping agent, etc. but it is very hygroscopic, toxic and powerful oxidizing material. The objective of this study was to evaluate the influence of the Trivedi Effect®-Consciousness Energy Healing Treatment on the physicochemical and thermal properties of CrO$_3$ using modern analytical techniques. The sample was divided into two parts, one part of the test sample was considered as the control sample (no Biofield Treatment was provided), while another portion received the Biofield Treatment remotely by a renowned Biofield Energy Healer, Gopal Nayak and termed as the treated sample. The particle size values of the treated CrO$_3$ were increased by 2.39%, 4.52%, 4.42%, and 4.15% at $d_{10}$, $d_{50}$, $d_{90}$, and D(4,3), respectively compared to the control sample. Thus, the specific surface area of the treated CrO$_3$ was decreased by 4.27% compared with the control sample. The PXRD peak intensities of the treated CrO$_3$ were significantly altered ranging from -73.48% to 212.5% compared with the control sample. Similarly, the crystallite sizes of the treated sample were significantly altered ranging from -38.7% to 167.39% compared to the control sample. However, the average crystallite size of the treated sample was increased by 4.25% compared with the control sample. The latent heat of fusion of the treated sample was significantly increased by 556.45% compared with the control sample. The Trivedi Effect®-Consciousness Energy Healing Treatment might produce a new polymorphic form of CrO$_3$ which would be better powder flowability and lower solubility; hence it will show the lower absorption and toxicity on inhalation, ingestion, contact to skin and eye, chronic exposure, and aggravation of pre-existing conditions. The Biofield Energy Treated CrO$_3$ sample would be very useful for the ceramic industry manufacturing the synthetic rubies, stripping agent of anodic coatings, aerospace parts, etc.

Introduction

Chromium (VI) oxide (chromium trioxide; CrO$_3$) is an acidic anhydride of chromic acid [1]. Chromium oxide is highly hygroscopic and a powerful oxidizer. Being a powerful oxidizer, it will ignite the organic materials on contact (i.e., alcohol) [2]. It is typically applied for the chrome plating and it generates passivating chromate films by reacting with cadmium, zinc, and other metals to protect from the process of corrosion [3]. Aerospace parts, synthetic rubies, and stripping agent of anodic coatings also manufactured from chromium oxide [2,4]. Chromium oxide is highly corrosive, toxic, and carcinogenic. It causes potential damage to the health through inhalation, ingestion, contact with the eye and skin, chronic exposure, and aggravation of pre-existing conditions [5].

Characterization of the physicochemical properties is attained a strong interest in the different field of the scientific research area and is now a standard method, which is one of the key challenges developing an object with the appropriate physicochemical profile. The Trivedi Effect®-Biofield Energy Healing Treatment is an economically viable approach and also scientifically proved that it has the huge impact to alter the physicochemical properties of various non-living and living object(s) [6-9]. The Trivedi Effect® is natural and the only scientifically proven phenomenon in which a person can harness this inherently intelligent energy from the Universe and transmit it anywhere on the planet. It is believed that the Trivedi Effect® act through the possible mediation of neutrinos oscillation [10]. A unique para-dimensional electromagnetic field exists around the body of every living organism which produces due to the continuous movements of the charged particles, ions, cells, blood/lymph flow, heart function, and brain functions in the body known as the "Biofield". The Biofield based Energy Therapies (energy medicine) have been reported with significantly beneficial outcomes against various disease conditions [11].

The National Institute of Health (NIH) and the National Centre for Complementary and Alternative Medicine (NCCAM) recommend and included the Energy therapy under the Complementary
and Alternative Medicine (CAM) category along with traditional Chinese herbs and medicines, Ayurvedic medicine, naturopathy, homeopathy, yoga, acupuncture, acupressure, meditation, Tai Chi, Qi Gong, chiropractic/osteopathic manipulation, healing touch, Reiki, deep breathing, special diets, massage, progressive relaxation, relaxation techniques, guided imagery, movement therapy, hypnotherapy, pilates, Rolfing structural integration, mindfulness, cranial sacral therapy, aromatherapy, and applied prayer; which has been accepted by the most of the U.S.A. population [12,13]. In this regard, the Trivedi Effect®-Consciousness Energy Healing Treatment also significantly altered the physicochemical and thermal properties of metals, ceramics, polymers, organic compounds, pharmaceuticals, nutraceuticals [14-19], improved productivity of crops and livestock [20,21], inhibit the growth of microbes and cancer cells [22,23]. The current study was designed and evaluated the effect of the Trivedi Effect®-Consciousness Energy Healing Treatment on chromium trioxide using particle size analysis (PSA), powder X-ray diffraction (PXRD), and differential scanning calorimetry (DSC) analytical techniques.

Materials and Methods

Chemicals and reagents

The chromium (VI) oxide (CrO$_3$) powder sample was purchased from Sigma Aldrich, India. All other chemicals used during the experiments were of analytical grade also procured from India.

Consciousness energy healing treatment strategies

The CrO$_3$ powder test sample was divided into two parts. One part of the test sample was provided the Trivedi Effect®-Consciousness energy healing treatment remotely under standard laboratory conditions for 3 minutes, known as the treated sample. Biofield Energy Treatment was provided through the healer’s unique energy transmission process by a renowned Biofield Energy Healer, Gopal Nayak, India, to one of the test sample. The second part of the test item was considered as a control sample (no Biofield Energy Treatment was provided). Further, the control sample was treated with a “sham” healer for the better comparison with the results of the Biofield Energy Treated sample. In this case, the “sham” healer did not have any knowledge about the Biofield Energy Treatment. After the treatment, both the Biofield Energy Treated and untreated samples were kept in sealed conditions and characterized using PSA, PXRD, and DSC analytical techniques.

Characterization

**Particle size analysis (PSA):** The particle size analysis of CrO$_3$ powder was performed on Malvern Mastersizer 2000, from the UK with a detection range between 0.1 μm to 300μm using wet method [24,25]. The sample unit (Hydro MV) was filled with a dispersant medium (sunflower oil) and the stirrer operated at 2500 rpm. The PSA analysis of CrO$_3$ was performed to obtain the average particle size distribution. Where d (0.1) μm, d (0.5) μm, d (0.9) μm represent particle diameter corresponding to 10%, 50%, and 90% of the cumulative distribution. D (4,3) represents the average mass-volume diameter, and SSA is the specific surface area (m$^2$/g). The calculations were done by using software Mastersizer Ver. 5.54.

The percent change in particle size (d) for CrO$_3$ powder at below 10% level ($d_{(0.1)}$), 50% level ($d_{(0.5)}$), 90% level ($d_{(0.9)}$), and D (4,3) was calculated using the following equation 1:

$$\% \text{ change in particle size } = \frac{d_{\text{Treated}} - d_{\text{Control}}}{d_{\text{Control}}} \times 100 \quad (1)$$

Where $d_{\text{Treated}}$ and $d_{\text{Control}}$ are the particle sizes (μm) for at below 10% level ($d_{(0.1)}$), 50% level ($d_{(0.5)}$) and 90% level ($d_{(0.9)}$) of the control and the Biofield Energy Treated samples, respectively.

The percent change in surface area (S) was calculated using the following equation 2:

$$\% \text{ change in surface area } = \frac{S_{\text{Treated}} - S_{\text{Control}}}{S_{\text{Control}}} \times 100 \quad (2)$$

Where $S_{\text{Control}}$ and $S_{\text{Treated}}$ are the surface area of the control and the Biofield Energy Treated CrO$_3$, respectively.

**Powder X-ray diffraction (PXRD) analysis:** The PXRD analysis of CrO$_3$ was performed with the help of Rigaku Mini Flex-II Desktop X-ray diffractometer (Japan) [26,27]. The CuKα radiation source tube output voltage was used 30kV, and tube output current was 15mA. Scans were performed at room temperature. The average size of individual crystallites was calculated from PXRD data using the Scherrer’s formula (3):

$$G = \frac{\lambda \cos \theta}{\beta} \quad (3)$$

Where $k$ is the equipment constant (0.94), G is the crystallite size in nm, $\lambda$ is the radiation wavelength (0.154056 nm for Kα1 emission), $\beta$ is the half-width at half maximum (FWHM), and $\theta$ is the Bragg angle [28].

The percent change in crystallite size (G) of CrO$_3$ was calculated using the following equation 4:

$$\% \text{ change in crystallite size } = \frac{G_{\text{Treated}} - G_{\text{Control}}}{G_{\text{Control}}} \times 100 \quad (4)$$

Where $G_{\text{Control}}$ and $G_{\text{Treated}}$ are the crystallite size of the control and the Biofield Energy Treated samples, respectively.

**Differential scanning calorimetry (DSC):** The DSC analysis of CrO$_3$ was performed with the help of DSC Q200, TA instruments. The sample of ~1-3 mg was loaded to the aluminium sample pan with a heating rate of 10 °C/min from 30 °C to 350 °C [24,25]. The % change in melting point (T) was calculated using the following equation 5:

$$\% \text{ change in melting point } = \frac{T_{\text{Treated}} - T_{\text{Control}}}{T_{\text{Control}}} \times 100 \quad (5)$$

Where $T_{\text{Control}}$ and $T_{\text{Treated}}$ are the melting point of the control and treated samples, respectively.

The percent change in the latent heat of fusion ($\Delta H$) was calculated using the following equation 6:

$$\% \text{ change in the latent heat of fusion } = \frac{\Delta H_{\text{Treated}} - \Delta H_{\text{Control}}}{\Delta H_{\text{Control}}} \times 100 \quad (6)$$

Where $\Delta H_{\text{Control}}$ and $\Delta H_{\text{Treated}}$ are the latent heat of fusion of the control and the Biofield Energy Treated CrO$_3$, respectively.

Results and Discussion

**Particle size analysis (PSA):**

The particle size and surface area data of both the control and the Biofield Energy Treated CrO$_3$ powder are presented in Table 1.
The particle size values of the control sample at $d_{10}$, $d_{50}$, $d_{90}$ and $D(4,3)$ were 172.19 $\mu$m, 321.58 $\mu$m, 549.35 $\mu$m, and 341.53 $\mu$m respectively. Similarly, the particle sizes of the treated CrO$_3$ at $d_{10}$, $d_{50}$, $d_{90}$, and $D(4,3)$ were 176.31 $\mu$m, 336.12 $\mu$m, 573.63 $\mu$m, and 355.7 $\mu$m respectively. The particle size values in the treated CrO$_3$ powder was increased at $d_{10}$, $d_{50}$, $d_{90}$, and $D(4,3)$ by 2.39%, 4.52%, 4.42%, and 4.15% respectively compared to the control sample. Thus, the specific surface area (SSA) of the treated CrO$_3$ powder (0.0224 m$^2$/g) was decreased by 4.27% compared with the control sample (0.0234 m$^2$/g). The results indicated that the Biofield Energy Treatment might be responsible for reducing internal force for increasing the particle size of CrO$_3$ sample, hence decreasing the surface area significantly. Increase in the particle size of the compound may help in enhancing the appearance, shape, and powder flowability of the compound [29,30]. Hence, the Trivedi Effect$^\text{®}$-Consciousness Energy Healing Treated CrO$_3$ might improve the powder flowability, lower solubility, lower the absorption, and lower toxicity due to inhalation, ingestion, contact to skin and eye, chronic exposure, and aggravation of pre-existing conditions.

Table 1: Particle size distribution of the control and the Biofield Energy Treated CrO$_3$ powder.

| Parameter       | $d_{10}$ ($\mu$m) | $d_{50}$ ($\mu$m) | $d_{90}$ ($\mu$m) | $D(4,3)$ ($\mu$m) | SSA (m$^2$/g) |
|-----------------|-------------------|-------------------|-------------------|-------------------|---------------|
| Control         | 172.19            | 321.58            | 549.35            | 341.53            | 0.0234        |
| Biofield Treated| 176.31            | 336.12            | 573.63            | 355.7             | 0.0224        |
| Percent change* (%) | 2.39            | 4.52              | 4.42              | 4.15              | -4.27         |

$d_{10}$, $d_{50}$ and $d_{90}$: particle diameter corresponding to 10%, 50% and 90% of the cumulative distribution; $D(4,3)$: The average mass-volume diameter; SSA: the specific surface area.

Powder X-ray diffraction (PXRD) analysis

The PXRD diffractograms of both the control and the Biofield Energy Treated CrO$_3$ powder samples showed the sharp and intense peaks (Figure 1) indicating both the samples were crystalline. The control sample showed peaks at Bragg’s angle (2θ) equal to 21.35°, 25.86°, 26.1°, 26.31° and 37.46° in the chromatogram (Figure 1). Similarly, the Biofield Energy Treated sample showed peaks at Bragg’s angle (2θ) equal to 21.33°, 25.48°, 26.01°, 26.43° and 37.53° in the chromatogram (Figure 1). The highest peak intensity of both the samples was found at 2θ equal to 21.3° (Table 2). Overall, the peak intensities of the treated CrO$_3$ were significantly altered ranging from -73.48% to 212.5% compared to the control sample (Table 2). As well, the crystallite sizes of the Biofield Energy Treated
sample at 2θ were significantly altered ranging from -38.7% to 167.39% compared to the control sample (Table 2). Overall, the average crystallite size of the Trivedi Effect®-Consciousness Energy Healing Treated (672.6 nm) was increased by 4.25% compared with the control sample (645.2 nm).

Table 2: PXRD data for the control and the Biofield Energy Treated CrO$_3$ powder.

| Entry No. | Bragg angle ($2\theta$) | Peak Intensity (%) | Crystallite size (G, nm) |
|-----------|--------------------------|---------------------|--------------------------|
|           | Control                  | Treated             | Control                  | Treated | % change$^a$ | Control                  | Treated | % change$^b$ |
| 1         | 21.35                    | 21.33               | 50                       | 98      | 96           | 564                       | 393     | -30.32      |
| 2         | 25.86                    | 25.48               | 23                       | 6.1     | -73.48       | 552                       | 1476    | 167.39      |
| 3         | 26.1                     | 26.01               | 16                       | 50      | 212.5        | 832                       | 510     | -38.7       |
| 4         | 26.31                    | 26.43               | 23                       | 41      | 78.26        | 402                       | 364     | -9.45       |
| 5         | 37.46                    | 37.53               | 13.7                     | 39      | 184.67       | 876                       | 620     | -29.22      |
| 6         | Average crystallite size |                     |                           |         |              | 645.2                     | 672.6   | 4.25        |

$^a$denotes the percentage change in the peak intensity of the Biofield Energy Treated sample with respect to the control sample;

$^b$denotes the percentage change in the crystallite size of the Biofield Energy Treated sample with respect to the control sample.

The results suggested that the crystallite sizes and peak intensities of the Trivedi Effect®-Consciousness Energy Healing Treated sample were significantly altered compared to the control sample. The peak intensity of the crystalline compound changes according to the crystal morphology, and alterations in the PXRD pattern is the proof of polymorphic transitions [31-33]. The Trivedi Effect® Treatment might have produced a new polymorphic form of CrO$_3$ via neutrinos oscillation [10]. The change in the polymorphic forms of a compound have the significant effects on their physicochemical and thermal properties like melting point, energy, stability, and solubility [34,35]. Therefore, the Biofield Energy Treated CrO$_3$ would be more useful for the industries using it as a raw material for manufacturing.

Differential scanning calorimetry (DSC) analysis

![DSC thermograms of the control and the Biofield Energy Treated CrO$_3$ powder.](image-url)
The control and the Biofield Energy Treated CrO₂ sample showed sharp endothermic peaks at 198.34 °C and 201.85 °C, respectively (Figure 2) in the thermograms. The thermal analysis data of CrO₂ indicated that the thermal behavior of the Biofield Energy Treated sample was significantly altered compared to the control sample (Table 3). The melting point of the Biofield Energy Treated CrO₂ sample was increased by 1.77% compared to the control sample (Table 3). The latent heat of fusion (ΔH<sub>fusion</sub>) of the Biofield Energy Treated CrO₂ powder (336.3 J/g) was significantly increased by 556.45% compared to the control sample (51.23 J/g) (Table 3). The change in the latent heat of fusion can be attributed to the alteration in the molecular chains and the crystal structure [36]. Therefore, Gopal Nayak’s Biofield Energy Treatment (the Trivedi Effect<sup>®</sup>) might strengthen intermolecular bond/chains and crystal structure of CrO₂ which improved the thermal stability of the treated sample compared with the control sample.

**Table 3**: DSC data for both control and the Biofield Energy Treated samples of CrO₂ powder.

| Sample               | Melting point (°C) | ΔH (J/g) |
|----------------------|--------------------|----------|
| Control Sample       | 198.34             | 51.23    |
| Biofield Energy Treated | 201.85           | 336.3    |
| % Change*            | 1.77               | 556.45   |

ΔH: Latent heat of fusion.

**Conclusion**

These study results suggest that the Trivedi Effect<sup>®</sup>-Consciousness Energy Healing Treatment has a significant impact on the surface area, particle size, crystallite size, and thermal properties of CrO₂. The particle size values of the Biofield Energy Treated CrO₂ were increased by 2.39%, 4.52%, 4.42%, and 4.15% at d<sub>10</sub>, d<sub>002</sub>, d<sub>020</sub>, and D(4,3), respectively compared to the control sample. Thus, the SSA of the Biofield Energy Treated sample was decreased by 4.27% compared with the control sample. The PXRD peak intensities of the Biofield Energy Treated CrO₂ were significantly altered ranging from -73.48% to 212.5% compared with the control sample. Similarly, the crystallite sizes of the Biofield Energy Treated sample were significantly altered ranging from -38.7% to 167.39% compared to the control sample. However, the average crystallite size of the Biofield Energy Treated sample was increased by 4.25% compared with the control sample. The melting point of the Biofield Energy Treated CrO₂ was slightly increased by 1.77% compared with the control sample. The ΔH<sub>fusion</sub> of the Biofield Energy Treated sample was significantly increased by 556.45% compared with the control sample. The Trivedi Effect<sup>®</sup>-Consciousness Energy Healing Treatment might produce a new polymorphic form of CrO₂ which would be better powder flowability and lower solubility; hence it will show the lower absorption and toxicity on inhalation, ingestion, contact to skin and eye, chronic exposure, and aggravation of pre-existing conditions. As well Biofield Energy Treated CrO₂ sample would be very useful for the ceramic industry manufacturing the synthetic rubies, stripping agent of anodic coatings, aerospace parts, etc.
