Supplemental Material for
“Multivariate-sign-based high-dimensional tests for the two-sample location problem”

This supplemental file contains some more discussions on the proposed SS test, all the technical proofs and some additional simulation results. The following materials are included:

- Appendix B: Additional Simulation
- Appendix C: Discussion about non-negligible biases
- Appendix D: Proofs of Lemmas and Proposition 2
- Appendix E: Some properties of $r^{-1}$
- Appendix F: Discussion on the test using sparse covariance matrix estimates
Appendix B: Additional Simulation

First, we add some simulation results when \( p < n \). Table A1 reports the empirical sizes of SS and TS tests with different sample sizes and dimensions. The sample size \( n_i \) is chosen as 20, 50 and 100 and the dimension \( p = r n_i \), where \( r = 0.2, 0.4, 0.8 \). Table A3 reports the empirical size-corrected power of these two methods with the similar settings to those in Table 1 in the paper. The results are similar to those in Table 1; Our SS test still performs better than the TS test in most cases.

Table A1: Empirical size comparison at 5% significance under Scenarios (I)-(V) when \( p < n \)

| Scenario | \( r \)   | \( 25 \) | \( 50 \) | \( 75 \) | \( 100 \) |
|----------|---------|--------|--------|--------|--------|
|          | SS | TS | SS | TS | SS | TS | SS | TS |
| (I)      | 0.2 | 6.5 | 5.7 | 6.5 | 3.9 | 5.3 | 4.5 | 7.2 | 5.1 |
|          | 0.4 | 6.5 | 2.6 | 4.6 | 3.9 | 5.7 | 2.9 | 5.4 | 2.3 |
|          | 0.8 | 6.0 | 2.5 | 6.5 | 0.8 | 4.8 | 1.7 | 6.8 | 1.3 |
| (II)     | 0.2 | 7.0 | 5.3 | 7.0 | 4.0 | 5.8 | 4.5 | 6.9 | 4.5 |
|          | 0.4 | 6.6 | 2.6 | 5.2 | 2.7 | 5.9 | 3.8 | 5.8 | 2.6 |
|          | 0.8 | 6.0 | 0.9 | 6.4 | 1.5 | 4.6 | 1.8 | 6.5 | 1.1 |
| (III)    | 0.2 | 6.0 | 5.0 | 6.5 | 4.7 | 5.7 | 4.3 | 7.4 | 5.0 |
|          | 0.4 | 5.8 | 4.7 | 4.5 | 3.6 | 5.3 | 2.7 | 5.4 | 3.4 |
|          | 0.8 | 5.7 | 1.7 | 6.3 | 1.1 | 4.8 | 1.1 | 6.4 | 1.0 |
| (IV)     | 0.2 | 5.8 | 5.6 | 4.9 | 4.8 | 6.0 | 5.4 | 4.9 | 3.8 |
|          | 0.4 | 5.2 | 4.6 | 5.8 | 4.3 | 5.6 | 4.2 | 5.8 | 4.3 |
|          | 0.8 | 4.7 | 1.2 | 4.5 | 2.6 | 5.5 | 1.4 | 6.0 | 1.6 |
| (V)      | 0.2 | 6.2 | 5.6 | 6.4 | 4.0 | 5.7 | 3.9 | 6.9 | 4.9 |
|          | 0.4 | 5.9 | 3.8 | 4.4 | 3.3 | 5.6 | 4.0 | 5.5 | 4.1 |
|          | 0.8 | 5.8 | 0.8 | 6.4 | 1.7 | 4.9 | 1.6 | 6.5 | 1.9 |

Next, we consider the case \( p > n \). Here we also include the test proposed by Feng et al.
Table A2: Empirical size-corrected power comparison at 5% significance under Scenarios (I)-(V) when \( p < n \)

| Scenario | %   | Equal Allocation | Linear Allocation |
|-----------|-----|------------------|-------------------|
|           |     | \( p = 40 \)    | \( p = 60 \)     | \( p = 40 \) | \( p = 60 \) |
| (I)       | 50% | 43 | 19 | 67 | 25 | 41 | 18 | 67 | 23 |
|           | 95% | 67 | 40 | 84 | 46 | 44 | 35 | 72 | 41 |
| (II)      | 50% | 81 | 34 | 98 | 49 | 82 | 36 | 98 | 49 |
|           | 95% | 99 | 74 | 100| 85 | 91 | 78 | 100| 88 |
| (III)     | 50% | 68 | 26 | 92 | 44 | 68 | 28 | 91 | 35 |
|           | 95% | 73 | 62 | 96 | 76 | 77 | 63 | 97 | 81 |
| (IV)      | 50% | 92 | 56 | 94 | 76 | 99 | 49 | 98 | 75 |
|           | 95% | 100| 77 | 100| 89 | 100| 75 | 100| 86 |
| (V)       | 50% | 75 | 35 | 95 | 48 | 75 | 37 | 94 | 48 |
|           | 95% | 79 | 70 | 98 | 82 | 83 | 72 | 98 | 83 |

(2014) (BF). Table A3 reports the empirical sizes at a 5% nominal significance level with \((n, p) = (25, 120), (50, 480), (50, 1440)\). The empirical sizes of SKK, BF and GCT are a little conservative under the Scenario (III)-(V). It is not strange because all these methods are based on the diverging factor model or a strict moment condition. Tables A4, A5 and A6 show the empirical power of all these six methods with the same settings as those in Table 3 in the main paper. Now, the BF test performs similar to SKK in most cases and is less powerful than our SS test under non-normal cases.

Next, we show some results of the empirical sizes and power of these six methods under the moving average models (VI)-(IX). Because the empirical sizes of GCT largely deviate from the nominal level, we also tabulate the size-corrected power of GCT (GCT*; the last column). GCT* is not as powerful as the other scalar-invariant tests under these scenarios.
The comparison conclusion drawn in the paper still holds here. The SS test can well control the empirical sizes in most cases, though it is a little conservative when \( p/n_i \) is large. Our SS test outperforms all the other tests under the non-normal cases. Under the non-normal distributions, the advantage of our SS test is obvious.

Table A3: Empirical size at 5% significance under Scenarios (I)-(V)

| \((n_i, p)\) | Scenario | Size |
|-------------|----------|------|
|             |          | SS   | SKK  | CQ   | BF   | GCT  |
| (25,120)    | (I)      | 4.0  | 9.1  | 5.6  | 6.5  | 3.6  |
|             | (II)     | 4.2  | 9.1  | 5.5  | 6.5  | 2.6  |
|             | (III)    | 3.8  | 5.0  | 5.7  | 4.3  | 2.1  |
|             | (IV)     | 3.4  | 4.9  | 4.2  | 3.3  | 1.6  |
|             | (V)      | 3.2  | 3.7  | 6.0  | 2.9  | 1.3  |
| (50,480)    | (I)      | 4.9  | 7.4  | 5.6  | 5.9  | 4.2  |
|             | (II)     | 3.9  | 7.3  | 5.4  | 6.0  | 5.1  |
|             | (III)    | 4.7  | 3.9  | 6.0  | 3.3  | 2.6  |
|             | (IV)     | 4.8  | 5.0  | 6.6  | 3.6  | 3.5  |
|             | (V)      | 4.9  | 4.4  | 6.2  | 4.7  | 2.6  |
| (50,1440)   | (I)      | 4.4  | 5.0  | 7.0  | 5.3  | 3.4  |
|             | (II)     | 4.4  | 5.0  | 7.2  | 5.4  | 4.6  |
|             | (III)    | 4.4  | 1.6  | 6.0  | 2.6  | 2.5  |
|             | (IV)     | 3.2  | 1.4  | 6.0  | 2.0  | 4.0  |
|             | (V)      | 4.2  | 1.0  | 5.9  | 2.5  | 2.5  |

Finally, we compare our SS test with another method. Here, we simply applied scaling by the sample variance instead of our estimates \( \hat{D} \). The corresponding test is denoted as SS*. We consider the multivariate mixture normal distribution \( MN_{p,\gamma,100} \). \( X_{ij} \)'s are generated from \( \gamma f_p(\theta_i, R_i) + (1 - \gamma)f_p(\theta_i, 100R_i) \) and \( \gamma = 0.8 \). The other settings are the same as (V), except that \( \eta =: ||\theta_1 - \theta_2||^2 / \sqrt{\text{tr}(\Sigma_1^2) + \text{tr}(\Sigma_2^2)} = 0.01 \). Table A8 reports the empirical sizes and power comparison between SS and SS*. We can observe that the proposed SS test performs slightly better than SS* test. This demonstrates the usefulness of our robust estimators.
Table A4: Empirical power comparison at 5% significance under Scenarios (I)-(V) with $p = 120$, $n_1 = n_2 = 25$

| Scenario | %  | Equal Allocation | Linear Allocation |
|----------|----|------------------|-------------------|

### Appendix C: Discussion about non-negligible biases

A natural idea is mimicking Chen and Qin (2010) (or Bai and Saranadasa 1996) and considering the following test statistic

$$ G_n = \frac{\sum_{i \neq j} n_1 \hat{V}_{ij}^T \hat{V}_{ij}}{n_1(n_1 - 1)} + \frac{\sum_{i \neq j} n_2 \hat{V}_{2i}^T \hat{V}_{2j}}{n_2(n_2 - 1)} - 2 \frac{\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} \hat{V}_{1i}^T \hat{V}_{2j}}{n_1 n_2}, $$

where $\hat{V}_{ij} = U(X_{ij} - \hat{\theta})$ and $\hat{\theta}$ satisfy $\sum_{i=1}^{n_1} \sum_{j=1}^{n_2} U(X_{ij} - \theta) = 0$. If the sample spatial median $\hat{\theta}$ in $G_n$ is replaced by the true value $\theta$, it can be shown that under null hypothesis the resulting test statistic $G'_n$ satisfies

$$ \frac{G'_n}{\sqrt{\text{var}(G'_n)}} \xrightarrow{d} N(0,1), \quad \text{as } n \to \infty, \ p \to \infty, \quad (A.1) $$

which is parallel to the null distribution of Chen and Qin’s (2010) test. Unfortunately, this result is not valid for $G_n$ since the sample spatial median $\hat{\theta}$ is only root-$n$ consistent. When $p$ is fixed, this is acceptable because it does not affect the asymptotic properties of $G_n$. However, this substitution would yield a bias-term which is not negligible when $n/p = O(1)$. Even worse, when $n/p = o(1)$, the test based on (A.1) would have an asymptotic size 1 under $H_0$. In addition, it seems difficult to calculate the bias numerically in a high-dimensional setting.
Here we provide the detail calculation of the bias term of $G_n$. Taking the same procedure as Lemma 3 and the assumption that the spatial median of $X_{ij} - \theta_i$ is unique and zero, we can show that, for $k = 1, 2$

$$
\hat{\theta} = \theta + \frac{1}{n_k} A_4^{-1}\sum_{k=1}^2 \sum_{i=1}^{n_k} V_{ki}(1 + o_p(1)),
$$

where $A_4 = \tilde{c}_1 \kappa(I_p - \Omega_1) + \tilde{c}_2(1 - \kappa)(I_p - \Omega_2)$, $\Omega_k = E(V_{ki}V_{ki}^T)$, $\tilde{c}_k = E||X_{ki} - \theta_k||^{-1}$, $\tilde{r}_{ki} = ||X_{ki} - \theta_k||$ and $V_{ki} = U(X_{ki} - \theta_k)$. Then,

$$
\hat{V}_{ki} = V_{1i} - \frac{1}{\tilde{r}_{1i}} [I_p - V_{1i} V_{1i}^T ]\hat{\theta} - \frac{||\hat{\theta}||^2}{2\tilde{r}_{1i}^2} V_{1i} + o_p(n^{-1}).
$$

Note that

$$
E(\hat{V}_{1i}^T \hat{V}_{1j})
$$

$$
= E\left\{ \left[ V_{1i} - \frac{1}{\tilde{r}_{1i}} [I_p - V_{1i} V_{1i}^T ]\hat{\theta} - \frac{||\hat{\theta}||^2}{2\tilde{r}_{1i}^2} V_{1i} \right]^T \times \left[ V_{1j} - \frac{1}{\tilde{r}_{1j}} [I_p - V_{1j} V_{1j}^T ]\hat{\theta} - \frac{||\hat{\theta}||^2}{2\tilde{r}_{1j}^2} V_{1j} \right] \right\} + o(n^{-2})
$$

$$
= E(V_{1i}^T V_{1j}) - 2E\left( \frac{1}{\tilde{r}_{1i}^2} \hat{\theta}^T [I_p - V_{1i} V_{1i}^T ]V_{1j} \right) - 2E\left( \frac{||\hat{\theta}||^2}{2\tilde{r}_{1i}^3} V_{1i}^T V_{1i} \right)
$$

$$
+ E\left( \frac{1}{\tilde{r}_{1i}^2} \hat{\theta}^T [I_p - V_{1i} V_{1i}^T ] [I_p - V_{1j} V_{1j}^T ] \hat{\theta} \right) + 2E\left( \frac{||\hat{\theta}||^2}{2\tilde{r}_{1i}^3} V_{1i}^T [I_p - V_{1j} V_{1j}^T ] \hat{\theta} \right)
$$

$$
+ E\left( \frac{||\hat{\theta}||^4}{2\tilde{r}_{1i}^4} V_{1i}^T V_{1j} \right) + o(n^{-2}) \doteq E(V_{1i}^T V_{1j}) - 2\Delta_1 - \Delta_2 + \Delta_3 + 2\Delta_4 + \Delta_5 + o(n^{-2}).
$$

It can be verified that

$$
\Delta_1 = \frac{\tilde{c}_1}{n} \text{tr} \left[ A_4^{-1}(I_p - \Omega_1)\Omega_1 \right] (1 + o(1));
$$

$$
\Delta_2 = \frac{1}{n^2} E(\tilde{r}_{1i}^{-2}) \text{tr} \left[ A_4^{-2}\Omega_1^2 \right] (1 + o(1)) = o(n^{-2});
$$

$$
\Delta_3 = \frac{2}{n^2} E(\tilde{r}_{1i}^{-2}) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_1 \right) + \frac{n_2}{n^2} E(\tilde{r}_{1i}^{-2}) \text{tr} \left( A^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_2 \right)
$$

$$
+ \frac{n_1 - 2}{n^2} E(\tilde{r}_{1i}^{-2}) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_1 \right) + o(n^{-2});
$$

$$
\Delta_4 = E(\tilde{r}_{1i}^{-3}) O_p(n^{-1}) = o(n^{-2});
$$

$$
\Delta_5 = E(\tilde{r}_{1i}^{-4}) O_p(n^{-2}) = o(n^{-2}),
$$

10
where \( \hat{r}_k = ||X_{ki} - \theta_k|| \), \( k = 1, 2 \). Combining all these, we know that

\[
E(\mathbf{\hat{v}}_i^T \mathbf{\hat{v}}_{1j}) = -\frac{2\hat{c}_1}{n} \text{tr} \left[ A_4^{-1}(I_p - \Omega_1)\Omega_1 \right] + \frac{n_2}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_2 \right) + \frac{n_1 - 2}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_1 \right) + \frac{2}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_1 \right) + o(n^{-2}).
\]

Taking the same procedure, we can obtain that

\[
E(\mathbf{\hat{v}}_{2i}^T \mathbf{\hat{v}}_{2j}) = -\frac{2\hat{c}_2}{n} \text{tr} \left[ A_4^{-1}(I_p - \Omega_2)\Omega_2 \right] + \frac{n_1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]^2 A_4^{-1}\Omega_1 \right) + \frac{n_2}{n^2} E\left( \frac{1}{r_2^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]^2 A_4^{-1}\Omega_2 \right) + \frac{2}{n^2} E\left( \frac{1}{r_2^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]A_4^{-1}\Omega_2 \right) + o(n^{-2});
\]

\[
E(\mathbf{\hat{v}}_i^T \mathbf{\hat{v}}_{2j}) = -\frac{\hat{c}_1}{n} \text{tr} \left[ A_4^{-1}(I_p - \Omega_1)\Omega_1 \right] + \frac{n_1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_2 \right) + \frac{n_2}{n^2} E\left( \frac{1}{r_2^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_1 \right) + \frac{2}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_2 \right) + \frac{1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_1 \right) + o(n^{-2}).
\]

So the expectation of \( G_n \) is

\[
E(G_n) = -\frac{2\hat{c}_1}{n} \text{tr} \left[ A_4^{-1}(I_p - \Omega_1)\Omega_1 \right] + \frac{n_2}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_2 \right) + \frac{n_1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]^2 A_4^{-1}\Omega_1 \right) + \frac{2}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_2 \right) + \frac{1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_1 \right) + o(n^{-2});
\]

\[
E(G_n) = -\frac{2\hat{c}_2}{n} \text{tr} \left[ A_4^{-1}(I_p - \Omega_2)\Omega_2 \right] + \frac{n_1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]^2 A_4^{-1}\Omega_1 \right) + \frac{n_2}{n^2} E\left( \frac{1}{r_2^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]^2 A_4^{-1}\Omega_2 \right) + \frac{2}{n^2} E\left( \frac{1}{r_2^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]A_4^{-1}\Omega_2 \right) + \frac{1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]A_4^{-1}\Omega_1 \right) + o(n^{-2});
\]

\[
E(G_n) = -\frac{\hat{c}_1}{n} \text{tr} \left[ A_4^{-1}(I_p - \Omega_1)\Omega_1 \right] - \frac{2(n_2 - 1)}{n^2} \hat{c}_1\hat{c}_2 \text{tr} \left( A_4^{-1}[I_p - \Omega_1][I_p - \Omega_2]A_4^{-1}\Omega_2 \right) + \frac{n_2}{n^2} E\left( \frac{1}{r_2^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_2]^2 A_4^{-1}\Omega_1 \right) + \frac{2}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_2 \right) + \frac{1}{n^2} E\left( \frac{1}{r_1^2} \right) \text{tr} \left( A_4^{-1}[I_p - \Omega_1]A_4^{-1}\Omega_1 \right) + o(n^{-2}).
\]

Similarly, we can also show that

\[
\text{var}(G_n) = \frac{2}{n_1(n_1 - 1)} \text{tr}(\Omega_1^2) + \frac{2}{n_2(n_2 - 1)} \text{tr}(\Omega_2^2) + \frac{4}{n_1n_2} \text{tr}(\Omega_1\Omega_2) + o(n^{-2}).
\]

If \( n/p = O(1) \), \( E(G_n) = O(n^{-1}) \) and \( \text{var}(G_n) = O(n^{-2}) \). Then, \( E(G_n) \) is a non-negligible bias term to the asymptotic variance \( \text{var}(G_n) \).
Appendix D: Proofs of Lemmas and Proposition 2

Proof of Lemma 1: Define $M = (a_{lk})_{l,k=1}^p$, $u_{1i} = (u_{1i1}, \ldots, u_{1ip})^T$, so
\[
E((u_{1i}^T Mu_{1i})^2) = E\left(\left(\sum_{l,k=1}^p a_{lk} u_{1il} u_{1ik}\right)^2\right) = \sum_{l,k=1}^p \sum_{s,t=1}^p a_{lk}a_{st} E(u_{1il} u_{1ik} u_{1is} u_{1it}).
\]
Since $(u_{1i1}^2, \ldots, u_{1ip}^2)$ has the Dirichlet distribution $D_p(1/2, \ldots, 1/2)$, $E(u_{1it}^4) = \frac{3}{2p(p+1)}$ and $E(u_{1it}^2) = \frac{1}{p^2-2p}$. By the inequality
\[
E(u_{1it} u_{1ik} u_{1is} u_{1it}) \leq \sqrt{E(u_{1it}^2) E(u_{1ik}^2) E(u_{1is}^2) E(u_{1it}^2)},
\]
we get $E(u_{1it} u_{1ik} u_{1is} u_{1it}) = O(p^{-2})$. By the Cauchy inequality,
\[
\sum_{l,k,s,t} a_{lk}a_{st} \leq \sqrt{\sum_{l,k} a_{lk}^2 \sum_{s,t} a_{st}^2} = \text{tr}(M^T M).
\]
Thus, $E(u_{1i}^T Mu_{1i})^2 = O(p^{-2} \text{tr}(M^T M))$. Here, we complete the proof. 

Proof of Lemma 2:
\[
U(D_i^{-1/2}(X_{ij} - \theta_i)) = D_i^{-1/2} \Sigma_i^{-1/2} \epsilon_{ij} = D_i^{-1/2} \Sigma_i^{-1/2} u_{ij}
\]
\[
= D_i^{-1/2} \Sigma_i^{-1/2} u_{ij} + C_1 u_{ij}^T (R_i - I_p) u_{ij} D_i^{-1/2} \Sigma_i^{-1/2} u_{ij},
\]
where $C_1$ is a bounded random variable between $-0.5$ and $-0.5(1 + u_{ij}^T (R_i - I_p) u_{ij})^{-3/2}$.
Thus, according to the Cauchy inequality,
\[
E\left(U(D_i^{-1/2}(X_{ij} - \theta_i))\right) \leq C_2 \{E(u_{ij}^T (R_i - I_p) u_{ij})^2 E(D_i^{-1/2}(X_{ij} - \theta_i))^2\}^{1/2}
\]
\[
= O\left(p^{-1} \sqrt{\text{tr}(R_i^2)} - p\right) = o(n^{-1/2})
\]
by Condition (C4). Similarly, we can show that
\[
U(D_i^{-1/2}(X_{ij} - \theta_i)) U(D_i^{-1/2}(X_{ij} - \theta_i))^T
\]
\[
= \frac{1}{1 + u_{ij}^T (R_i - I_p) u_{ij}} D_i^{-1/2} \Sigma_i^{-1/2} u_{ij} u_{ij}^T \Sigma_i^{-1/2} D_i^{-1/2}
\]
\[
= D_i^{-1/2} \Sigma_i^{-1/2} u_{ij} u_{ij}^T \Sigma_i^{-1/2} D_i^{-1/2} + C_3 (u_{ij}^T (R_i - I_p) u_{ij}) D_i^{-1/2} \Sigma_i^{-1/2} u_{ij} u_{ij}^T \Sigma_i^{-1/2} D_i^{-1/2},
\]
12
where $C_3$ is a bounded random variable between $-1$ and $-(1 + u_{ij}^T(R_i - I_p)u_{ij})$. Thus, by the Cauchy inequality,

$$
E \left( \text{diag} \left\{ E \left( U(D_i^{-1/2}(X_{ij} - \theta_i))U(D_i^{-1/2}(X_{ij} - \theta_i))^T \right) \right\} - p^{-1}I_p \right)
\leq C_4 \left\{ E(u_{ij}^T(R_i - I_p)u_{ij})^2 E(\text{diag}\{ D_i^{-1/2}u_{ij}u_{ij}^T\Sigma_i^{-1/2}D_i^{-1/2}\} - p^{-1}I_p)^2 \right\}^{1/2}
= O \left( p^{-1}\sqrt{\text{tr}(R_i^2)} - p \right) = o(n^{-1/2})
$$

by Condition (C4). The above two equations define the functional equation for each component of $\eta_i$,

$$
T_{ij}(F_i, \eta_{ij}) = o_p(n^{-1/2}), \quad (A.2)
$$

where $F_i$ is the distribution function of $X_{ij}, \ i = 1, 2, \ \eta_i = (\eta_{i1}, \ldots, \eta_{ip})$. Similar to Hettmansperger and Randles (2002), the linearisation of this equation produces

$$
\sqrt{n_i}(\hat{\eta}_{ij} - \eta_{ij}) = -H_{ij}^{-1}\sqrt{n_i}(T_{ij}(F_{ni}, \eta_{ij}) - T_{ij}(F_i, \eta_{ij})) + o_p(1),
$$

where $F_{ni}$ is the empirical distribution function of $X_{ij}, \ j = 1, \ldots, n_i, \ H_{ij}$ is the corresponding Hessian matrix of the functional defined in (A.2), and

$$
T_i(F_{ni}, \eta_i) = \left( n_i^{-1} \sum_{j=1}^{n_i} U_{ij}^T, \text{vec} \left( \text{diag} \left( n_i^{-1} \sum_{j=1}^{n_i} U_{ij}U_{ij}^T - p^{-1}I_p \right) \right) \right)^T,
$$

where $T_i(F_{ni}, \eta_i) = (T_{i1}(F_{ni}, \eta_{i1}), \ldots, T_{ip}(F_{ni}, \eta_{ip}))$ and vec$(A)$ means the vector of the diagonal matrix of $A$. For each variance estimator $\hat{d}_{ij}$, we have

$$
\sqrt{n}(\hat{d}_{ij} - d_{ij}) \xrightarrow{p} N(0, \zeta_{ij}^2),
$$

where $\zeta_{ij}^2$ is the corresponding asymptotic variance. Define $\zeta_{max} = \max_{1 \leq i \leq 2, 1 \leq j \leq p} \zeta_{ij}$. As
Finally, \[ \max_{1 \leq j \leq p} (\hat{d}_{ij} - d_{ij}) = O_p(n_i^{-1/2}(\log p)^{1/2}). \]

\[ P \left( \max_{1 \leq j \leq p} (d_{ij} - d_{ij}) > \sqrt{2} \zeta_{\max} n_i^{-1/2}(\log p)^{1/2} \right) \\ \leq \sum_{j=1}^{p} P \left( \sqrt{n_i}(d_{ij} - d_{ij}) > \sqrt{2} \zeta_{\max} (\log p)^{1/2} \right) \\ = \sum_{i=1}^{p} \left( 1 - \Phi(\sqrt{2} \zeta_{\max} \sigma_{ij}^{-1}(\log p)^{1/2}) \right) \leq p \left( 1 - \Phi((2 \log p)^{1/2}) \right) \\ \leq \frac{p}{\sqrt{4 \pi \log p}} e^{-\log p} = (4 \pi)^{-1/2}(\log p)^{-1/2} \to 0. \]

Finally, \[ \max_{1 \leq j \leq p} (\hat{d}_{ij} - d_{ij}) = O_p(n_i^{-1/2}(\log p)^{1/2}). \]
Proof of Lemma 6: Note that

\[
E[Z_{nj}^2 | \mathcal{F}_{n,j-1}] = \frac{1}{\tilde{n}_j^2(\tilde{n}_j - 1)^2} \left\{ \sum_{i=1}^{j-1} Y_i^T \Xi_{i,j} Y_j \right\}^2 | \mathcal{F}_{n,j-1}
\]

\[
= \frac{1}{\tilde{n}_j^2(\tilde{n}_j - 1)^2} \left\{ \sum_{i=1}^{j-1} Y_i^T \Xi_{i,j} Y_j \Xi_{i_2,j} Y_{i_2} | \mathcal{F}_{n,j-1} \right\}
\]

\[
= \frac{1}{\tilde{n}_j^2(\tilde{n}_j - 1)^2} \sum_{i_1,i_2=1}^{j-1} Y_{i_1}^T \Xi_{i_1,j} Y_j \Xi_{i_2,j} Y_{i_2}
\]

where \( \tilde{A}_{i_1,i_2,j} = p^{-1} \Xi_{i_1,j} \Xi_{i_2,j}^T, \tilde{n}_j = n_1, \) for \( j \in [1, n_1] \) and \( \tilde{A}_{i_1,i_2,j} = p^{-1} \Xi_{i_1,j} \Xi_{i_2,j}^T, \tilde{n}_j = n_2, \) for \( j \in [n_1, n] \), and

\[
\Xi_{i,j} = \begin{cases} 
A_1, & i,j \in \{1,2,\ldots,n_1\}, \\
A_3, & i \in \{1,2,\ldots,n_1\}, j \in \{n_1+1,\ldots,n\}, \\
A_2, & i,j \in \{n_1+1, n_1+2, \ldots, n\}. 
\end{cases}
\]

Define \( \eta_n = \sum_{j=2}^{n} E[Z_{nj}^2 | \mathcal{F}_{n,j-1}] \). By some tedious algebra, we can obtain that \( E(\eta_n) = \frac{1}{4} \sigma_n^2 (1 + o(1)) \).

Now write \( E(\eta_n^2) \) as

\[
E(\eta_n^2) = E \left\{ \sum_{j=2}^{n} \frac{1}{\tilde{n}_j^2(\tilde{n}_j - 1)^2} \sum_{i_1,i_2=1}^{j-1} Y_{i_1}^T \tilde{A}_{i_1,i_2,j} Y_{i_2} \right\}^2
\]

\[
= 2E \left\{ \sum_{2 \leq j_1 < j_2} \frac{1}{\tilde{n}_{j_1}^2(\tilde{n}_{j_1} - 1)^2} \tilde{n}_{j_2}^2(\tilde{n}_{j_2} - 1)^2 \sum_{i_1,i_2=1}^{j_1-1} \sum_{i_3,i_4=1}^{j_2-1} Y_{i_1}^T \tilde{A}_{i_1,i_2,j_1} Y_{i_2} Y_{i_3}^T \tilde{A}_{i_3,i_4,j_2} Y_{i_4} \right\}
\]

\[
+ E \left\{ \sum_{j=2}^{n} \frac{1}{\tilde{n}_j^4(\tilde{n}_j - 1)^4} \sum_{i_1,i_2=1}^{j-1} \sum_{i_3,i_4=1}^{j-1} Y_{i_1}^T \tilde{A}_{i_1,i_2,j_0} Y_{i_2} Y_{i_3}^T \tilde{A}_{i_3,i_4,j} Y_{i_4} \right\}
\]

\( \doteq L_1 + L_2 \)
Consider the first part $L_1$.

$$
E \left\{ \sum_{2 \leq j_1 < j_2}^n \frac{1}{\tilde{n}_{j_1}^2 (\tilde{n}_{j_1} - 1)^2} \sum_{i_1, i_2 = 1}^{j_2 - 1} \sum_{i_3, i_4 = 1}^{j_1 - 1} Y_{i_1}^T \hat{A}_{i_1,i_2,j_1} Y_{i_2} Y_{i_3}^T \hat{A}_{i_3,i_4,j_2} Y_{i_4} \right\}
$$

\[= E \left\{ \sum_{2 \leq j_1 < j_2}^n \frac{1}{\tilde{n}_{j_1}^2 (\tilde{n}_{j_1} - 1)^2} \sum_{i_1, i_2 = 1}^{j_2 - 1} \sum_{i_3, i_4 = 1}^{j_1 - 1} Y_{i_1}^T \hat{A}_{i_1,i_2,j_1} Y_{i_2} Y_{i_3}^T \hat{A}_{i_3,i_4,j_2} Y_{i_4} \right\} + E \left\{ \sum_{2 \leq j_1 < j_2}^n \frac{1}{\tilde{n}_{j_1}^2 (\tilde{n}_{j_1} - 1)^2} \sum_{i_1, i_2 = 1}^{j_2 - 1} \sum_{i_3, i_4 = 1}^{j_1 - 1} Y_{i_1}^T \hat{A}_{i_1,i_2,j_1} Y_{i_2} Y_{i_3}^T \hat{A}_{i_3,i_4,j_2} Y_{i_4} \right\}
\]

\[\cdots L_{11} + L_{12} + L_{13}\]

Taking the same procedure as Lemma 5 and some tedious calculations, we can verify that $L_{11} = o(\sigma_n^4)$, $L_{12} + L_{13} = E^2(\eta_n)$ and $E(L_2^2) = o(\sigma_n^4)$. So, var($\eta_n$) = $E(\eta_n^2) - E^2(\eta_n) = o(\sigma_n^4)$. This completes the proof of Lemma 6.

\[\square\]

**Proof of Lemma 7:** First of all, we note that

$$\sigma_n^{-4} \sum_{j=2}^n E[Z_{nj}^2 I(|Z_{nj}| > \epsilon \sigma_n)] \leq \sigma_n^{-4} \epsilon - 2 \sum_{j=2}^n E[Z_{nj}^4 | F_{n,j-1}].$$

Accordingly, the assertion of this lemma is true if we can show

$$E \left\{ \sum_{j=2}^n E[Z_{nj}^4 | F_{n,j-1}] \right\} = o(\sigma_n^4).$$

Notice that

$$E \left\{ \sum_{j=2}^n E[Z_{nj}^4 | F_{n,j-1}] \right\} = \sum_{j=2}^n E(Z_{nj}^4) = O(n^{-8}) \sum_{j=2}^n E \left( \sum_{i=1}^{j-1} \phi_{ij} \right)^4.$$

Similar to Chen and Qin (2010), the last term can be decomposed as $3Q + P$, where

$$Q = O(n^{-8}) \sum_{j=2}^n \sum_{s \neq t}^{j-1} E(Y_{j}^T \Xi_{j,s} Y_{s} Y_{j} \Xi_{s,j} Y_{j}^T \Xi_{j,t} Y_{t} Y_{j}^T \Xi_{t,j} Y_{j}),$$

$$P = O(n^{-8}) \sum_{j=2}^n \sum_{s=1}^{j-1} E(Y_{s}^T \Xi_{s,j} Y_{j})^4.$$
Note that
\[ Q = O(n^{-8}) \sum_{j=2}^{n} \sum_{s \neq t} E(Y_j^T \Xi_{j,s} Y_s Y_j^T \Xi_{j,s} Y_j Y_j^T \Xi_{t,j} Y_j) \]
\[ = O(n^{-8} p^{-2}) \left\{ \sum_{j=2}^{n} \sum_{s \neq t} E(Y_j^T A_1 A_1 Y_j Y_j^T A_1 A_1 Y_j) \right. \]
\[ + \sum_{j=n_1+1}^{n} \sum_{s \neq t} p^{-2} E(Y_j^T \Xi_{j,s} \Xi_{s,j} Y_j Y_j^T \Xi_{j,s} \Xi_{t,j} Y_j) \right\} \]
\[ = O(n^{-1} \sigma_n^4), \]

where the last equation follows from the similar procedure in Lemma 5 with Condition (C2).

Accordingly, we can verify that \( Q = o(\sigma_n^4) \). In addition,
\[ P = O(n^{-8}) \sum_{j=2}^{n} \sum_{s=1}^{j-1} E(Y_s^T \Xi_{s,j} Y_j)^4 \]
\[ = O(n^{-8}) \left\{ \sum_{j=2}^{n} \sum_{s=1}^{j-1} E(Y_s^T A_1 Y_j)^4 + \sum_{j=n_1+1}^{n} \sum_{s=1}^{n_1} E(Y_s^T A_3 Y_j)^4 + \sum_{j=n_1+1}^{n} \sum_{s=n_1+1}^{j-1} E(Y_s^T A_2 Y_j)^4 \right\} \]
\[ = O(n^{-8})(P_1 + P_2 + P_3). \]

As the procedures for handling \( P_1, P_2, P_3 \) are similar, let us only consider \( P_2 \). Define
\( A_3 = (v_{ij})_{p \times p} \), and accordingly we can write
\[ E(u_{1i}^T A_3 u_{2i})^4 = E \left( \sum_{i=1}^{p} \sum_{j=1}^{p} v_{ij} u_{isi} u_{2tj} \right)^4 \]
\[ = \sum_{i_1, \ldots, i_4=1}^{p} \sum_{j_1, \ldots, j_4=1}^{p} v_{i_1j_1} v_{i_2j_2} v_{i_3j_3} v_{i_4j_4} E(u_{isi_1} u_{is_i2} u_{1si_3} u_{isi_4}) E(u_{2tj_1} u_{2tj_2} u_{2tj_3} u_{2tj_4}) \]
\[ = O(p^{-4}) \sum_{i_1, \ldots, i_4=1}^{p} \sum_{j_1, \ldots, j_4=1}^{p} v_{i_1j_1} v_{i_2j_2} v_{i_3j_3} v_{i_4j_4} \].

By the Cauchy inequality, we have
\[ \sum_{i_1, i_2, i_3, i_4=1}^{p} \sum_{j_1, j_2, j_3, j_4=1}^{p} v_{i_1j_1} v_{i_2j_2} v_{i_3j_3} v_{i_4j_4} \leq \frac{1}{4} \sum_{i_1, i_2, i_3, i_4=1}^{p} \sum_{j_1, j_2, j_3, j_4=1}^{p} (v_{i_1j_1}^2 + v_{i_2j_2}^2) (v_{i_3j_3}^2 + v_{i_4j_4}^2) \]
\[ = \sum_{i_1, i_2, j_1, j_2=1}^{p} v_{i_1j_1}^2 v_{i_2j_2}^2 = \left( \sum_{i_1, j_1} v_{i_1j_1}^2 \right)^2 = \text{tr}^2(A_3^2). \]
Similar to the proof of Lemma 5, we obtain that \( n^{-2}P_2 = O(p^{-4} \text{tr}(A_{ij}^2)\langle X \rangle^2) \) and thus \( O(n^{-8}P_2) = o(\sigma_n^4) \). Similarly, \( O(n^{-8}P_1) = o(\sigma_n^4) \) and \( O(n^{-8}P_3) = o(\sigma_n^4) \). This completes the proof of the lemma.

Proof of Proposition 2 First, we will show the ratio consistency of \( \hat{c}_i \).

\[
||\hat{D}_{i,j}^{-1/2}(X_{ij} - \theta_{i,j})|| = ||\hat{D}_{i,j}^{-1/2}(X_{ij} - \theta_{i,j})||(1 + r_{ij}^{-2})||\hat{D}_{i,j}^{-1/2} - D_{i,j}^{-1/2}||^2 \\
+ r_{ij}^{-2}||\hat{D}_{i,j}^{-1/2}\mu_{i,j}||^2 + 2r_{ij}^{-1}\hat{U}_{ij}^T(\hat{D}_{i,j}^{-1/2} - D_{i,j}^{-1/2})\hat{D}_{i,j}^{-1/2}U_{ij} \\
- 2r_{ij}^{-1}\hat{U}_{ij}^T\hat{D}_{i,j}^{-1/2}\mu_{i,j} - 2r_{ij}^{-1}\hat{U}_{ij}D_{i,j}^{-1/2}(\hat{D}_{i,j}^{-1/2} - D_{i,j}^{-1/2})\hat{D}_{i,j}^{-1/2}\mu_{i,j})^{1/2}.
\]

According to Lemmas 2 and 3, we can show that \( r_{ij}^{-2}||\hat{D}_{i,j}^{-1/2} - D_{i,j}^{-1/2}||^2 = O_p((\log p/n)^2) = o_p(1) \) and \( r_{ij}^{-2}||\hat{D}_{i,j}^{-1/2}\mu_{i,j}||^2 = O_p(n^{-1}) = o_p(1) \) and by the Cauchy inequality, the other parts are also \( o_p(1) \). So,

\[
n_{i}^{-1}\sum_{j=1}^{n_{i}}||\hat{D}_{i,j}^{-1/2}(X_{ij} - \theta_{i,j})|| - 1 = \left(n_{i}^{-1}\sum_{j=1}^{n_{i}}||\hat{D}_{i,j}^{-1/2}(X_{ij} - \theta_{i,j})|| - 1\right)(1 + o_p(1)).
\]

Obviously, we can show that \( E(n_{i}^{-1}\sum_{j=1}^{n_{i}}r_{ij}^{-1}) = c_{i} \) and \( \text{var}(n_{i}^{-1}c_{i}^{-1}\sum_{j=1}^{n_{i}}r_{ij}^{-1}) = O(n^{-1}) \).

Then the ratio consistent of \( \hat{c}_{i} \) follows. We only present the proof for the ratio consistency of \( \text{tr}(A_{ij}^2) \) as the proofs of the other two follow in the same way.

By Lemma 4 again,

\[
\frac{p^2c_2c_1^{-1}}{n_1(n_1 - 1)}\sum_{k=1}^{n_1}\sum_{l \neq k}^{n_1}\left(U_{i,l}\hat{D}_{2}^{-1/2}\hat{D}_{1}^{1/2}U_{1,k}\right)^2 = \frac{p^2c_2c_1^{-1}}{n_1(n_1 - 1)}\sum_{k=1}^{p}\sum_{l \neq k}^{n_1}\left(U_{i,l}\hat{D}_{2}^{-1/2}\hat{D}_{1}^{1/2}U_{1,k}\right)^2 + M_{n_1}.
\]

Taking the same procedure as Lemma 5, we can obtain that \( M_{n_1} = o_p(\text{tr}(A_{ij}^2)) \). Also, by the same arguments as \( G_{n_1} \),

\[
E\left(\frac{p^2c_2c_1^{-1}}{n_1(n_1 - 1)}\sum_{k=1}^{n_1}\sum_{l \neq k}^{n_1}\left(U_{i,l}\hat{D}_{2}^{-1/2}\hat{D}_{1}^{1/2}U_{1,k}\right)^2\right) = \text{tr}(A_{ij}^2)(1 + o(1)).
\]

Here, we only need to show that

\[
\text{var}\left(\frac{p^2c_2c_1^{-1}}{n_1(n_1 - 1)}\sum_{k=1}^{n_1}\sum_{l \neq k}^{n_1}\left(U_{i,l}\hat{D}_{2}^{-1/2}\hat{D}_{1}^{1/2}U_{1,k}\right)^2\right) = o(\text{tr}(A_{ij}^2)).
\]
By consider the possible combinations of the subscripts, it can be shown that

\[
\text{var} \left( \frac{p^2 c_2 c_1^{-1}}{n_1(n_1 - 1)} \sum_{k=1}^{n_1} \sum_{l \neq k} \left( U_{1l} D_2^{-1/2} D_1^{1/2} U_{1k} \right)^2 \right)
\]

\[
= \frac{2p^4 c_2^2 c_1^{-2}}{n_1^2(n_1 - 1)^2} \sum_{i=1}^{n_1} \sum_{j \neq i} \mathbb{E}((U_{1i}^T D_2^{-1/2} D_1^{1/2} U_{1j})^4)
\]

\[
+ \frac{4p^4 c_2^2 c_1^{-2}}{n_1(n_1 - 1)} \sum_{i=1}^{n_1} \mathbb{E}((U_{1i}^T D_2^{-1/2} D_1^{1/2} \mathbb{E}(U_{1i} U_{1i}^T) D_2^{-1/2} D_1^{1/2} U_{1i})^2) + o(\text{tr}^2(A_i^2)).
\]

Taking the same procedure as in Lemma 1 and $G_{n_1}$, we can show that

\[
\mathbb{E}(p^4 c_2^2 c_1^{-2}(U_{1i}^T D_2^{-1/2} D_1^{1/2} U_{1j})^4) = O(\text{tr}^2(A_i^2)).
\]

Similarly, we have $\mathbb{E}(p^4 c_2^2 c_1^{-2}(U_{1i}^T D_2^{-1/2} D_1^{1/2} \mathbb{E}(U_{1i} U_{1i}^T) D_2^{-1/2} D_1^{1/2} U_{1i})^2) = O(\text{tr}^2(A_i^2))$. Thus we complete the proof. \(\Box\)
Appendix E: Some properties of $r^{-1}$

When $X_i \sim N_p(0, I_p)$, we have

$$E(r^{-1}) = \frac{1}{\sqrt{2}} \frac{\Gamma(\frac{p-1}{2})}{\Gamma(\frac{p}{2})}, \quad E(r^{-2}) = \frac{\Gamma(\frac{p}{2} - 1)}{2 \Gamma(\frac{1}{2})} = \frac{1}{p - 2}, \quad E(r^{-3}) = \frac{\Gamma(\frac{p-3}{2})}{2 \sqrt{\Gamma(\frac{p}{2})}},$$

where $\Gamma(\cdot)$ are respectively the usual Beta and Gamma functions.

By Stirling formula

$$\lim_{x \to \infty} \frac{\Gamma(x + 1)}{(x/e)^x \sqrt{2\pi x}} = 1,$$

it is straightforward to see

$$\lim_{p \to \infty} \frac{E(r^{-2})}{[E(r^{-1})]^2} = \lim_{p \to \infty} \frac{e(p - 2)(p - 4)}{(p - 3)^2} \left[ \frac{1}{p - 4} \right]^{p - 4} = 1,$$

$$\lim_{p \to \infty} \frac{E(r^{-3})}{[E(r^{-1})]^3} = \lim_{p \to \infty} \frac{(p - 2)^2}{e(p - 3)^2} \left( 1 + \frac{1}{p - 3} \right)^{p - 3} = 1.$$
Appendix F: Discussion on the test using sparse covariance matrix estimates

When $\Sigma$ is a sparse covariance matrix, under regularity conditions, $\|\Sigma^{-1} - \hat{\Sigma}^{-1}\| = O_p(\sqrt{\log \frac{p}{n}})$, where $\hat{\Sigma}$ is a “good” sparse covariance estimator (e.g., Fan et al. 2011). By the lower bound derived by Cai et al. (2010), the convergence rate is minimax optimal for the sparse covariance estimation. Consider the Hotelling’s $T^2$ test statistic $T^2_n = \frac{n}{n_1 n_2} (\bar{X}_1 - \bar{X}_2)^T \hat{\Sigma}^{-1} (\bar{X}_1 - \bar{X}_2)$. If $\Sigma$ is used in $T^2_n$ (denoted as $\tilde{T}^2_n$), it can be seen that $(\tilde{T}^2_n - p)/\sqrt{2p} \xrightarrow{d} N(0, 1)$ as $(n, p) \to \infty$ under $H_0$. In order to make this asymptotic applicable for $T^2_n$, one needs to show that
\[
\frac{n}{\sqrt{p}} (\bar{X}_1 - \bar{X}_2)^T (\hat{\Sigma}^{-1} - \Sigma^{-1})(\bar{X}_1 - \bar{X}_2) = o_p(1).
\]
However, $\|\bar{X}_1 - \bar{X}_2\|^2 = O_p(p/n)$ under $H_0$. By the Cauchy-Schwartz inequality, we have
\[
\frac{n}{\sqrt{p}} |(\bar{X}_1 - \bar{X}_2)^T (\hat{\Sigma}^{-1} - \Sigma^{-1})(\bar{X}_1 - \bar{X}_2)| = O_p\left(\sqrt{\frac{p \log p}{n}}\right).
\]
We see that it requires $p \log p = o(n)$, which is basically a low-dimensional scenario. The above simple derivation uses, however, a Cauchy-Schwartz bound, which is too crude for a large $p$. More elaborate analysis may be available but requires further regularity conditions and other more technical arguments.
