MODERN PRACTICE OF IDENTIFYING AND MEASURING THE INFORMAL ECONOMY

T. V. Обелець,
к. е. н., старший викладач,
Національний технічний університет України "Київський політехнічний інститут імені Ігоря Сікорського"

The analytical assessment of the consequences of system transformations and the development of effective economic policies stimulates the emergence of new variants of the theory of convergence of socio-economic systems. In connection with this, the importance of clarifying the general theoretical issues and considering the problems associated with new socio-economic trends, taking into account the peculiarities of development of different countries. The main directions of modern economic thought show the continuity of the improvement of well-known scientific views and the emergence of new scientific approaches that are in line with the needs of economic reality.

The article attempts to comprehend the modern conceptual approach to the definition of an informal economy and to measure its scale in countries that are at different stages of economic development. Interest in the informal sector of the economy exists throughout the world. This is due to the fact that, contrary to the forecasts, the informal economy not only persists in low-income countries, but also develops in new forms in developed countries. In addition, modern scholars recognize that the informal economy is inextricably linked to the formal economy and contributes to the economy as a whole. The paper focuses on the possibilities of combining the conceptual and methodological framework used to measure employment in the informal sector and informal employment in developing countries and in developed countries. In addition, the article presents the tendencies of development and the profile of Ukrainian informal employment against the backdrop of contemporary world tendencies. The reduction of informal employment in Ukraine and its legalization requires, first of all, the implementation of anti-crisis employment policy measures. These measures require a scientifically sound integrated national employment promotion program aimed at ensuring a balanced supply and demand for labor based on productive employment. The practical value of scientific results is to provide an effective tool for analysing informal employment in countries with different income levels. This will allow for an effective economic policy aimed at minimizing possible social risks.
INTRODUCTION

Creation in Ukraine of the socially oriented labour relations in the conditions of strengthening of a role of globalization and the international competition, on the one hand, and a deformalization of the social and labour relations, deepening of inequality and a shadowing of income of the population, on the other hand, demands strategic approach to formation and effective use of labour potential. The shadowing of national economy at the present stage makes impossible acceleration of economic reforms, growth of social standards of life of the population and integration into the European community. High level of a shadowing of economy is a consequence of low legal and tax culture, reflection of weakness of social and economic institutes and is considered as threat to the vital national interests. One of the biggest obstacles in a way of formation of effective model of the social and labour relations and stable economic development in our country is the shadowing of income that is a consequence of distribution of informal employment and activity in the informal sector of economy. A labour market brightening is important among relevant problems of economic development. Now the sharpness of a problem of legalization of shadow income is caused by scales of informal employment and risks, which accompany her uses.

The rationale for the theoretical foundations of the functioning of the informal economy and the use of informal employment were at the center of attention of the world scientific community. Foreign researchers M. Armstrong, E. Giddens, V. Gimpelson, R. Gussman, R. Kapelyushnikov, M. Castells, A. Porthes, E. Feig, E. Hoffman, L. Chizhova analysed informal employment and its constituent elements. A significant contribution to the development of theoretical, methodological and applied aspects of this problem was made by such Ukrainian scientists as A. Amosh, S. Bandur, A. Grishnova, L. Emelianenko, E. Libanova, A. Novikova, I. Petrova, L. Tkachenko, L. Shaulskaya and others. However, modern scientists have not yet developed an effective tool and comparable data sets for analysing informal employment in countries with different levels of income. There is also a growing recognition that supporting informal employment and risks, which accompany her uses.

The key ways to reduce poverty and inequality. Since women tend to be concentrated in more unstable forms of informal employment, support for working poor women in the informal sector of the economy is one of the key ways to reduce poverty and gender inequality.

PURPOSE OF THE ARTICLE

The renewal of interest to the informal economy is accompanied by the need to provide qualitative statistical assessments of this phenomenon. At the heart of this article, in response to this call, several interrelated assumptions are set out. First, there is some statistical information on measuring the extent of informal employment in developing countries, where modern industrial workers have never been a significant part of the labour force. Secondly, more and more developing countries are trying to use the recommendations of international organizations on official statistical definitions. This makes it possible to operate with comparable sets of data that are extremely necessary for conducting research and targeted policies. Third, the conceptual and methodological framework used to measure informal employment in developing countries can and should be applied in developed countries where modern industrial workers are increasingly deformed, and in some countries where self-employment is actively increasing. In addition, the article presents the development tendencies and the profile of Ukrainian informal employment against the background of modern world trends.

STATEMENT OF THE MAIN MATERIAL

The concept of “informal sector” and “informal employment” are relatively new in the field of statistics. In 1993, the International Conference of Labour Statisticians (ICLS) adopted the international statistical definition of the “informal sector”, which was subsequently included in the revised international system of national accounts of 1993 [13, p. 138]. In order to fit into the systems of national accounts and ensure a separate accounting of gross domestic product (GDP) in the informal sector, the definition was based on the characteristics of production units or enterprises, rather than labour relations. The “informal sector” refers to employment and production taking place in unincorporated (where at least some goods or services are produced for sale or exchange), small (where fewer than five employees work) or unregistered according to the current legislation enterprises [15, p. 67].

Ten years later, in 2003, following the 2002 International Labour Conference Resolution on “Decent Work and the Informal Economy”, the 17th International Conference of Labour Statisticians discussed conceptual changes in the measure-

| Table 1. Conceptual matrix for the definition of informal employment |
|---------------------------------------------------------------|
| **Production units by type** | **Work on the status of employment** | **Self-employed** | **Employers** | **Family Workers** | **Hired workers** | **Members of producer cooperatives** |
|--------------------------------|------------------------------------|-----------------|--------------|-----------------|-----------------|----------------------------------|
| **Enterprises of the formal sector** | **Informal** | Informal | Formal | 1 | 2 | Informal |
| **Enterprises of the informal sector** | **Informal** | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |

Key words: social and labour relations, informal employment, informal economy, brightening of income.

Ключові слова: соціально-трудові відносини, неформальна зайнятість, неформальна економіка, детинізація доходів.
Informal employment outside the informal sector includes:
- employees of official enterprises (including state enterprises, the public sector, private companies and non-profit organizations) that are not covered by social protection, national labour laws, or the right to receive certain assistance at the workplace, such as annual paid leave or sick leave;
- workers in households (for example, paid workers employed as domestic workers) who are not covered by social protection, national labour legislation, or the right to receive certain assistance at the workplace, such as annual paid leave or sick leave;
- unpaid family workers employed in official enterprises.

Summarizing the terminology, there are three related statistical definitions based on the ICLS resolutions. "Informal sector" refers to unincorporated enterprises, which can also be registered and / or small. "Informal employment" refers to employment without social protection when working within and outside the informal sector. "Informal economy" refers to all informal units or enterprises, as well as workers working in formal enterprises, but have informal jobs. Together, the workers listed in these categories form a significant stratum of labour, both nationally and globally.

The informal sector is an indispensable attribute of any economy. The informal sector, as a rule, is extremely heterogeneous in its composition and performs various functions, including ensuring the simple survival of people, on the one hand, and the development of entrepreneurship on the other. The increase in the number of countries collecting data on informal employment, both inside and outside the informal sector, and improving the quality of these data, provides an opportunity to form a statistical picture of informal economy in the world. In countries with a higher level of economic development, the share of employed in the informal sector is less than in the underdeveloped economies (Table 2), [18]. Transition economies as a whole occupy an intermediate position in the informal sector. For example, informal employment accounts for more than half of non-agricultural employment in most developing regions of the world — in particular 82% in South Asia, 66% in sub-Saharan Africa, 65% in East and South-East Asia, 51% in Latin America. Informal employment in the Middle East and North Africa accounts for 45% of non-agricultural employment. The lowest level of informal employment — 10% — in Eastern Europe and Central Asia.

Table 2 gives estimates of employment in the informal sector and informal employment as a share of total non-agricultural employment. Distribution of employment in the informal sector occurs according to the same patterns as the distribution of precarious work: its high level in low-income countries. In middle-income groups, the share of informal employment is approximately the same for men and women: in countries with incomes above the average, 39.0% of men and 38.7% of women work informally, in countries with below average income of 36.1% and 35.2% per cent, respectively.

In countries of one of the three groups of regions, gender differences are clearly delineated, the share of informal employment relative to total non-agricultural employment is higher for women. In poor countries informal employment is more accessible source of non-agricultural employment. In countries with below-average income of 56.1% and 55.2%.

| Countries by income level | Informal employment, % Non-agricultural employment | Employment in the informal sector, % Non-agricultural employment |
|--------------------------|-----------------------------------------------|-------------------------------------------------------------|
|                          | Women | Men | Total | Women | Men | Total |
| Low                      | 80.8  | 67.0 | 79.1  | 76.9  | 56.8 | 66.6  |
| Below the average        | 55.2  | 56.1 | 55.5  | 56.8  | 33.0 | 53.9  |
| Above average            | 38.7  | 39.0 | 40.8  | 41.5  | 35.0 | 37.5  |

* High-income countries are not represented
** Ukraine is included in the group of countries with lower than average income.

Employment in the informal economy: from working in the informal sector to informal employment and expanded the concept of "informal employment" [16, p. 120]. Total employment was distributed in terms of jobs as a production unit (formal sector enterprises, informal sector enterprises, households); by status of employment (self-employed without employees, employers, family workers, members of production cooperatives) and formal or informal character work (Table 1), [20].

Thus, according to the methodology of the International Labour Organization, informal employment is indicated in the matrix by cells 1—6 and 8—10, employment in the informal sector by cells 3—8, and informal employment outside the informal sector is outlined by cells 1, 2, 9 and 10. Informal employment refers to all labour agreements that leave workers without social protection as part of their employment, be it economic units, or they work or do not work in formal enterprises, informal enterprises or in households.

Informal employment, according to international standards, when defining and assessing informal employment, it includes [16, p. 125]°:
- self-employed persons working at their own expense and at their own enterprise of the informal sector (the 3rd cell);
- employers who work in their own informal sector enterprises (the 4th cell);
- unpaid family workers employed without a contract of employment and do not have legal or social protection, regardless of whether they work in factories in the real economy or in the informal sector (cells 1 and 5);
- members of informal production cooperatives (8th cell);
- hired workers who occupy informal jobs in real economy enterprises, informal sector enterprises or paid workers employed in households (2, 6 and 10 cells);
- hired workers working in informal enterprises, but have formal jobs, for example, when businesses are defined as informal, using size as the sole criterion (the 7th cell);
- persons working at their own expense and engaged in the production of goods exclusively for their own final consumption at their own house (the 9th cell).

The components of the informal economy can be further classified by categories of the International Classification of the Status of Employee Employment. Within this framework, developed by R. Goossman, certain groups of workers employed in the informal sector and in informal employment outside the informal sector (including rare cases when workers are formally employed in the informal sector) are classified as follows.

Informal employment in the informal sector consists of the following groups:
- self-employed workers in their informal enterprises;
- employers of informal enterprises;
- workers in informal enterprises;
- unpaid family workers employed by informal enterprises;
- members of informal producer cooperatives.
low levels of informal employment. Significantly higher risk of informal employment for Ukrainian men, but it should be borne in mind that in Table 1 only non-agricultural employment is represented. In our economy, according to the State Statistical Service of Ukraine for 2016, more than 40% of the employed worked informally in agriculture, a significant part of informal employment was in wholesale and retail trade, repair of motor vehicles and motorcycles (20.9%), industry (6.1%) and construction (15.5%), which is traditionally male economic activities.

Estimates of the scale of the informal economy by group of countries provide an overall picture, but hide the diversity that exists in the regions. Informal employment, for example, was estimated at 79.1 per cent of non-agricultural employment in low-income countries, but this percentage varies from 60.1 per cent in Liberia to 93.5 per cent in Uganda. Similarly, in countries with incomes below the average, the aggregate indicator is 53.5%, while the share of informal employment in the Republic of Moldova is 14.0% of non-agricultural employment, in Ukraine — 17.6%, and in Pakistan — 78.4%. In countries with higher than average income, the variation in informal employment is also large: the average regional indicator is 39.0%, with a maximum of 72.2% in Peru, and the lowest in Serbia — 7.3%.

In developed countries of the world with a high level of income, there are no statistics on informal employment. In some developed countries, there is a tendency to increase the proportion of people working under agreements that offer limited social protection. To designate labour agreements to be defined in accordance with the international methodological approaches outlined above, such as informal employment in developing countries, in developed countries concepts such as non-standard or atypical employment are often used.

For example, the study of the polarization of employment and quality of labour conditions conducted by the European Fund has shown that in the European labour market there is a de-standardization of the labour relations of workers employed in low-skilled, low-paid jobs. Researchers note that part-time employment increased sharply, a more modest polarized growth in self-employment was observed, while temporary work was dramatically reduced at the beginning of the recession, but after mid-2009, most countries reported a positive increase in such employment [19, p. 23].

Many, but not all, individuals working under de-standardized labour agreements in developed countries are likely to be defined as informally employed, and their working conditions will not be completely identical to informal jobs in developing countries. The arrangements in question are, as a rule, called non-standard employment. This concept is associated with the concept of informal employment, but it is not synonymous with it. Not all non-standard employment in developed countries is informal, and not all informal employment is non-standard. The mechanisms in question are called precarious work because they tend not to give employees a sense of security and remedies and social benefits built around standard, regular paid employment, which is determined by perpetual full-time employment contracts. The following groups of employees refer to non-standard employees:

— temporary workers, including employees, whose employment is carried out for a certain period through specialized recruitment agencies;
— workers whose employment contract is concluded on a part-time basis.

The share of self-employed in high-income countries according to the estimates of the ILO in 2016 was 9%, and in the G20 — 30.6% of the total number of employed.

The share of temporary employment ranges from a maximum of 26.7% of hired workers in Spain, to a low of about 3% in the Baltic countries and 4% in the United States of America. Non-permanent employment exceeds 30% in 14 of the 80 countries for which the ILO provides data for 2016, peaking at 42.7% in the Netherlands. In this country, the "national experiment" on part-time work becomes more extensive and is accompanied by a significant increase in both self-employment and temporary work. Part-time workers account for more than 20 percent of the total number of employed in 21 countries, 11 to 19 percent of underemployment is in 29 countries, below 10 percent in 15 countries (Figure 2) [19].

1 International Labour Organization statistics http://www.ilo.org/iostat/
Since these estimates are based on data from published sources, it is not possible to calculate the total index of precarious employment as a simple sum of constituent forms of non-standard, because one form of precarious employment can be combined with one or more others. For example, temporary workers may be employed part-time, excluding their double counting is necessary for the formation of indicators of summary statistics. In addition, in developed countries, the estimation of total precarious employment is not an exhaustive or accurate indicator of informal employment in the country, because the form of precarious work may not be reflected in statistics, that is, work with aspects of informality can be regarded as part of a permanent (standard) employment. It is also evident that not all employees with non-standard forms of employment should be classified as informally employed.

In order to obtain complete data for the analysis of all forms of informal and precarious employment, it is necessary to develop a classification of the full range of labour situations in both developed and developing countries. It would be worthwhile to justify the markers of informality, which would help to combine the definitions of informal employment with statistical indicators of non-standard employment categories used in developed countries.

These markers should determine the institutional differences in social and labour relations in different countries. For example, when comparing the size of informal employment, it is important to take into account the national institutional difference between countries with general health insurance and those where only standard temporary workers and part-time workers are covered by social protection according to labour legislation, while others are not. On the one hand, some self-employed people have the right and can afford to pay for their social protection; on the other hand, there may be people in informal employment who occupy informal jobs.

In a number of OECD countries, primarily low— and middle-income countries, unregistered employment is identified as a segment of informal employment. The shortfall in tax revenues is primarily assessed as the risk of using unregistered employment, but there is also the recognition that persons working under such conditions are denied access to social protection and can receive lower wages, especially when they receive cash in envelopes. An example of informality can also be employed by a permanent full-time employment contract for employees whose employers do not pay a portion of their social security contributions in order to reduce labour costs and pay wages "in envelopes", creating so-called "shadow" incomes.

Shadow employment in Ukraine, which manifests itself in the employment of wage earners without entering into a labour agreement and shadow wages, has been rapidly spreading in recent years, covering a significant number of workers in enterprises and organizations of the formal and informal sector of the economy. Shadow economic activity can be defined as such economic activity and income that goes beyond state regulation, taxation or supervision. For the period from 1991 — 2015 gg. The IMF estimated the size of the shadow sector in the structure of the Ukrainian economy at 44.8% (Figure 3), [19].

Figure 3. Size and development of the shadow economy in 1991—2015

Figure 4. Distribution in Ukraine of the number of full-time employees by the amount of their salary for December 2016
So, according to calculations of IMF specialists, the average size of the shadow economy of Ukraine from 1991 to 2015 is estimated at 44.8% of GDP, and in 2015 — 42.9%. For comparison: in the Netherlands, the indicators of the shadow economy averaged 10.77% and in 2015 7.83% of GDP; in Germany — 11.97% and 7.75% of GDP; Poland — 23.1% and 16.67%; Uganda — 38.74% and 31.88% of GDP, respectively. Since 1991, when the shadow economy of Ukraine was estimated at 38.96% of GDP, the indicator continued to grow until 1998, reaching a peak of 57%. The downward trend was observed until 2008: the indicator fell to 36.65%. The financial crisis caused a worsening of the situation, and during 2009 — 2014, the level of the shadow economy ranged from 39.2% to 43.5%. In 2015, the Ukrainian shadow economy was estimated at 42.9% of GDP.

To determine the scale of the shadow economy, the IMF experts used the definition of the Organization for Economic Cooperation and Development in 2016, which takes into account the tax burden and the amount of contributions to social security, labour market regulation, unemployment, the activities of unregistered enterprises, including illegal economic activity (GDP, account for criminal activity), production for own needs of households, self-employment, that is, a key element of the shadow economy and serves informal employment and economic activity in the informal economy.

Moving a large part of the employed population from the official sector of the economy to the informal sector is one of the negative phenomena of the modern labour market in Ukraine, which leads to a number of social and economic problems. The excessive use of informal employment, its close intertwining with the formal, causes the unregulated processes in the social and labour sphere. The main motivation for the spread of informal employment is the desire to receive income sufficient to meet personal needs. The official salary of a large part of those working in the formal sector does not fulfill the stimulating, motivational and reproductive functions.

The impractical decision-making in the sphere of remuneration of labour will only slow down the further resolution of problems of its shadowing, the spread of informal employment, and other social problems. One of the directions of modern social policy in this direction, according to Ukrainian economists, is the gradual introduction of a policy of social quality, which is widely used in developed countries of Europe. Ukraine at the present stage of development has a rather small macroeconomic "window of opportunity" for the formation of a society functioning on the basis of the "social quality" principle. The corresponding macroeconomic basis should be based on a high level of labour productivity and the structural proportions of the economy inherent in developed countries [1, p. 81].

In Ukraine, the share of labour payment in the total household income of the population averaged 47.7% in 2016, and in some regions, for example, in the Transcarpathian region only 27.7%. At the same time, 9.3% of households had per capita equivalent monetary incomes per month below the statutory subsistence minimum in 2016, and 63.1% below the actual subsistence minimum [3, p. 76]. In Ukraine, according to a survey of enterprises on labour statistics, the average monthly salary of full-time employees in 2016 was $183 UAH. This is 3.2 times higher than the subsistence minimum for able-bodied people. In December 2016, 59.4% of workers received wages below the national average, and 2.8% below the subsistence minimum (Figure 4), [10].

Motivation for the spread of informal employment is the desire to receive income sufficient to meet personal needs. The official salary of a large part of those working in the formal sector does not fulfill the stimulating, motivational and reproductive functions.

The impractical decision-making in the sphere of remuneration of labour will only slow down the further resolution of problems of its shadowing, the spread of informal employment, and other social problems. One of the directions of modern social policy in this direction, according to Ukrainian economists, is the gradual introduction of a policy of social quality, which is widely used in developed countries of Europe. Ukraine at the present stage of development has a rather small macroeconomic "window of opportunity" for the formation of a society functioning on the basis of the "social quality" principle. The corresponding macroeconomic basis should be based on a high level of labour productivity and the structural proportions of the economy inherent in developed countries [1, p. 81].

In Ukraine, the share of labour payment in the total household income of the population averaged 47.7% in 2016, and in some regions, for example, in the Transcarpathian region only 27.7%. At the same time, 9.3% of households had per capita equivalent monetary incomes per month below the statutory subsistence minimum in 2016, and 63.1% below the actual subsistence minimum [3, p. 76]. In Ukraine, according to a survey of enterprises on labour statistics, the average monthly salary of full-time employees in 2016 was $183 UAH. This is 3.2 times higher than the subsistence minimum for able-bodied people. In December 2016, 59.4% of workers received wages below the national average, and 2.8% below the subsistence minimum (Figure 4), [10].
The highest percentage of full-time employees who earned wages within the subsistence minimum for the able-bodied person operating in December 2016, at postal and courier companies (11.8%), in enterprises engaged in the delivery of goods and services (6.8%) and in agriculture (4.7%) [3, p. 76]. Comparing the trends in the development of formal and informal employment in Ukraine in recent years, it should be noted that informal employment is growing at a rapid pace (Figure 7), [12].

The employment rate of the population aged 15—70 years in Ukraine for the period from 2000 to 2016. Grew from 53.8% to 56.3%, or just 2.5 percentage points (pp). On the contrary, employment in the informal sector, on the contrary, grew actively and increased 1.6 times from 14.8% in 2000 to 24.3% in 2016 that is 9.5 percentage points rise in the level of informal employment over the period under review.

The study of the gender characteristics of informal employment showed that the employment rate in the informal sector is 2.4 percentage points higher among men than among women (27.1% versus 21.3%). This is mainly due to the unpreparedness of the formal economy to attract workers to work with decent wage conditions, such that wages adequately fulfill their reproductive function. Income should provide a sense of security and create opportunities for sufficient material support for workers and their families, since men are more likely to take on more risky, unstable, but often better-paid jobs, so they are more likely to enter the employment sector without any guarantees and dominate the informal economy.

Gender differences between men and women show a difference in the distribution of informal employment by age groups. At the same time, if for women the highest level of informal labour relations is typical for persons of retirement age, then among men the most common is employment among young people aged 15—24 years. In addition, at the working age in men with increasing age, the tendency to informal employment decreases, in women the opposite relationship is typical for persons of retirement age, then among men the most common is employment among young people aged 15—24 years. In this category of the population that are most vulnerable and socially unprotected in the current economic conditions.

The spread of informal employment among persons of retirement age, especially women, is explained by the search for earnings during education, the spread of informal employment to improve their material well-being, and the intensity of informal employment among persons of retirement age, primarily due to low rates of pension replacement, which results in high levels of poverty among the elderly and encourages them to search for informal sources of additional means of livelihood.

The desire to continue working involves the search for earnings during education, the spread of informal employment among persons of retirement age, primarily due to low rates of pension replacement, which results in high levels of poverty among the elderly and encourages them to search for informal sources of additional means of livelihood. The desire to continue working involves the search for earnings during education, the spread of informal employment among persons of retirement age, primarily due to low rates of pension replacement, which results in high levels of poverty among the elderly and encourages them to search for informal sources of additional means of livelihood. The desire to continue working involves the search for earnings during education, the spread of informal employment among persons of retirement age, primarily due to low rates of pension replacement, which results in high levels of poverty among the elderly and encourages them to search for informal sources of additional means of livelihood. The desire to continue working involves the search for earnings during education, the spread of informal employment among persons of retirement age, primarily due to low rates of pension replacement, which results in high levels of poverty among the elderly and encourages them to search for informal sources of additional means of livelihood.

Table 3. Number of informally employed population by age group in 2016

| Total number of people |
|------------------------|
| Age group            |

Figure 8. Distribution of informally employed people by types of economic activity in 2016, in % of the entire informal workforce

The data presented in Figures 4 and 5 show that in the last 12 months of 2016 only 4.4% of households felt their financial situation improved, more than half (65.7%) of respondents felt that their financial situation had worsened, and in the next 12 months 2017 the situation will not improve, and even worsen (50.3% of answers). The same pessimistic expectations for the next 12 months among the households surveyed and the development of the Ukrainian economy: 37.6% of respondents estimate the future economic conditions as unfavorable, 22.2% — partially unfavorable, 27.9% — do not expect tangible changes, and only 1,1% of households will hope for positive trends in the development of the national economy.
Social, Labour and Professional Mobility. Among the unemployed, the ability to master new professions, is an important mechanism of unemployment benefits; the containment of the growth of unemployment; the reduction in the number of unemployed and a strain on the formation of a number of socio-economic transformations: adapting the country’s population to unfavorable consequences.

In addition, the main economic activities of the informal sector of the economy after agricultural production were construction, trade, repair of cars, household products and personal items; the activities of hotels and restaurants, and this, mainly, traditionally male economic activities (Figure 8).

Among the types of economic activity, the “leader” in the spread of informal labour relations remains rural, forestry and fisheries. Despite a 1.7-fold decrease in the level of informal employment over the past five years, the value of this indicator remains quite high — 40.8%. Other types of economic activity, where this type of employment is very common, is wholesale, retail trade and repair of vehicles — 20.9%, construction — 15.5%.

A factor in determining the choice of persons in favour of informal employment in Ukraine is the level of education. According to official statistics, the level of informal employment is declining with the growth of education in both urban and rural areas. In 2016, among the informal working population, 34.3% were persons with full secondary education, 33.2% with vocational and technical secondary education, 27.5% with a full higher education.

The informal application of labour has regional features (Figure 9). In general, the territorial division of the scale of the spread of informal employment is once again more serious, first of all, its greater concentration in the regions of the agrarian orientation.

The geography of distribution shows that informal employment is most concentrated in the western regions of the country: in Ivano-Frankivsk, Chernivtsi, Rivne and Dnipropetrovsk regions. The level of informal employment in the eastern and central regions with developed infrastructure of industrial enterprises is three times lower than in the western regions. At the same time, the number of employed in the formal sector (at large and medium-sized enterprises) did not increase during this period, but even decreased markedly. This is an additional indirect evidence that the costs of creating new jobs in the formal sector remain prohibitively high, and the main generator of jobs is the informal sector of the Ukrainian economy.

It should be noted that as a result of the use of informal employment and the expansion of the functioning of the informal sector of the economy, there are mixed consequences.

Informal employment can be seen as a forced form of adapting the country’s population to unfavorable economic conditions. Positive in this situation is the formation of a number of socio-economic transformations: a reduction in the number of unemployed and a strain on the labour market; the possibility for a certain period of time to receive income that is higher compared to social unemployment benefits; the containment of the growth of social tension in society; the opportunity to gain new skills, to improve professional qualifications, to gain new skills of social, labour and professional mobility. Among the employed is an informally large number of elderly people whose pension is insignificant for sufficient material provision of individual needs, and informal employment opens up opportunities for obtaining additional income. For representatives of this age group employed, employment opportunities in enterprises in the formal sector of the economy are sharply narrowed. The deficit of the Pension Fund’s resources is blocked by grants from the State Budget of Ukraine, and a change in this trend is unlikely in the near future, so the increase in pensions will be extremely slow, and informal employment will remain an important source of additional income for them.

In addition, informal employment often paves the way for small business development. Administrative barriers to entry into business and the rigidity of labour legislation do not motivate entrepreneurs to register their business. Unauthorized self-employment allows entrepreneurs to start entrepreneurial activity, develop experience, gain certain skills, form social capital, create a material “safety cushion”, which guarantees a successful transition to registered formal employment.

The use of informal employment creates certain risks for the state. Thus, a shortage of tax funds by budgets of all levels and non-fulfilment of social funds due to shadowing of incomes in the informal sector of the economy leads to a deterioration in the economic situation of the population and the growth of social tensions in society as a whole. The deficit of revenues to the budget and social funds, which could be directed to the development of the socio-economic sphere and the improvement of the level and quality of life of the population.

Informal employment contributes to the growth of corruption and the shadow economy; complicates control over monetary circulation; limits the possibility of obtaining complete and reliable statistical information, negatively affects the processes of macroeconomic forecasting, the development of effective programs for the social and economic development of the state. In addition, informal employment in the informal sector limits the ability to implement social rights and guarantees provided by labour law; increases the risk of income instability; makes it difficult to monitor the working conditions and the quality of goods and services provided.

CONCLUSIONS

The implementation of reforms in Ukraine has the ultimate goal of building a modern European country with a developed economy capable of meeting the social needs of its citizens. However, a protracted period of complex political and economic transformations led to a crisis situation in virtually all spheres. Under such conditions, social guarantees for the realization of one of the fundamental human rights — the right to work are not fully ensured in the country. The current state of the labour market in Ukraine is characterized by
unfavorable trends in terms of employment and inefficient use of labour. At this time, shadow employment acquired an extraordinary spread, which is accompanied by negative consequences for both the state and employees. Therefore, one of the main tasks of the policy of Ukraine is the concentration of efforts at all levels in the implementation of employment policy measures, and the reduction of shadow employment is impossible without a scientifically based integrated national policy aimed at balancing the supply and demand for labour based on productive employment.

The employment policy should be aimed at redistribution of the labour force by sectors of the economy and territorial types of economic growth of labour productivity, with the maximum possible social support of the employed. At the same time, it should be taken into account that the initiated reforms of the economic sector and the loss of significant production potential in the ATU zone will ultimately lead to a change in the sectoral and territorial structure of the economy, and hence to a change in the demand for labour. Therefore, it is important to introduce scientifically based forecasting of the scope and directions of such changes, as well as the demand structure in the labour market for the medium and long term.

The priority task for the social development of the national economy is the formation of a labour force on the basis of highly skilled, paid model of social and labour relations. That will lead to the conclusion from the shadow of informal employment. The implementation of the employment policy using employment creation programs should be aimed at the development of small business. Supporting the development of the small business structure through the introduction of a more flexible tax system, improving the implementation of preferential terms for entrepreneurs to access legal and information and consulting services should be an important direction to reduce informal employment.

Reducing the scope of informal employment and shadowing wages in the informal sector of the economy also requires accelerating the reduction in the volume of the social sphere, which will help to incentivize the labour market to be de-institutionalized and introduce a social insurance system; strengthening employers’ accountability for compliance with labour law. To do this, it is necessary to introduce changes and additions to the legislation on increasing sanctions for evading the registration of social and labour relations between the employee and the employer, pursuing a more brutal policy to strengthen the responsibility of labour market subjects for evading taxes and contributions to social funds and improving their administration. All activities — regulatory, organizational, administrative, regulatory, financial and economic, information should be coordinated and be comprehensive and systematic.
