ABSTRACT

Background: Vector borne diseases are one of the major public health problems worldwide. There is significant disease burden contributed to morbidity and mortality due to Dengue. Vector control is the ideal way to control dengue. But vector control methods can be successful with community participation. Hence it becomes important to assess the community’s knowledge regarding the disease. The objective of the study was to assess the knowledge regarding the dengue disease among people in an urban area.

Methods: A community based cross sectional study was conducted among 400 participants. Participants were selected by using systematic random sampling method. Data was collected by house to house visit using predesigned questionnaire.

Results: Majority of them (87.75%) identified fever as a cardinal symptom of dengue fever. Only 32.25% knew that dengue fever is transmitted by Aedes mosquitoes. 42% of participants had good knowledge of dengue The main source of information on dengue was from the television.

Conclusions: Key finding of this study is that knowledge is poor among the study participants although majority of people had clear understanding of fever, headache, joint pain as common signs and symptoms of dengue fever.

Keywords: Knowledge, Dengue fever, Breeding sites

INTRODUCTION

Vector borne diseases are one of the major public health problems in India occurring in epidemic form almost on an annual basis.¹² They account for more than 17% of all infectious diseases.³

Aedes mosquito is the vector for dengue. Aedes mosquito is usually found in manmade containers.⁴⁵ Dengue fever is characterized by high fever, headache, muscle and joints pain, and rash.⁶⁷ In India dengue is endemic in 31 states.⁸

National vector borne disease control programme is one of most comprehensive and multifaceted public health activities in India including prevention and control of mosquito-borne diseases.⁹ In India during 2014, 33,320 cases and 86 deaths have been reported.¹⁰

Since there is no vaccine available, vector control is the ideal way to control dengue. But vector control methods can be successful with community participation. Hence it becomes important to assess the community’s knowledge regarding the disease, its mode of transmission and breeding sites. Knowledge study act as educational diagnosis of population. So study of this kind will not only help in assessing the level of awareness and relation to dengue disease as well as also help Government and policy makers to formulate strategies to fill the gap in level of awareness and implementation of control programme acceptable to risk population. Hence the
present study was planned to assess the knowledge, among people in urban area regarding dengue disease.

**METHODS**

**Source of data**

The present study was conducted in urban field practice area of Department of Community Medicine, Jawaharlal Nehru Medical College, KAHER, Belagavi.

**Methods of collection of data**

House to house survey with questionnaire.

**Study design**

A community based cross sectional study.

**Study period**

The study was conducted over a period of one year from January 2017 to 31st December 2017.

**Study population**

Residents residing in Ashoknagar area.

**Sample size**

As per literature review due to varied prevalence of knowledge regarding dengue disease “p” was taken as 50% and sample size was calculated as 400.

**Sampling procedure**

The population of Ashoknagar, an urban field practice area was 24,794.

Ashoknagar field practice area has six areas out of which one area i.e. Ashoknagar was randomly selected for the study. Total households in Ashoknagar area is 1388.

First house (1st) was selected randomly. There after every third (3rd) house was selected by systematic random sampling method for collecting information.

In the selected house, an adult member in the family, who was present at the time of visit, was interviewed

**Inclusion criteria**

Residents who are residing in Ashoknagar area at least for the period of one year in the study.

**Exclusion criteria**

Residents residing for less than one year in study area.

**Data collection procedure**

The subjects were interviewed by using predesigned and pre-tested questionnaire. A detailed questionnaire included information on:

- Socio-demographic information (age, sex, occupation and education).
- Knowledge about dengue disease.

All the subjects were informed about the purpose of study and after obtaining informed consent, they were interviewed.

The overall knowledge of study participants was assessed using mean scores.

Knowledge was assessed by scoring: 1-Yes, 0-No.

Mean score >13 was considered as good knowledge.

Mean score <13 was considered as poor knowledge.

**Ethical considerations**

The study was approved by the institutional ethics committee.

**RESULTS**

In the present study, out of 400 respondents 89 (22.25%) were aged 18 to 27 years, 103 (25.75%) were aged 28 to 37 years followed by 87 (21.75%) aged 38 to 47 years, 61 (15.25%) aged 48 to 57 years, 33 (8.25%) aged 58 to 67 years and 27 (6.75%) were aged 68 years and above. The mean age (±S.D) of study participants was 40.43±15.14 years.

In our study, 224 (56.00%) of the participants were Hindus, followed by 168 (42.00%) were Muslims and eight (2.00%) were Christians.

In our study, according to modified B.G. Prasad classification maximum 116 (29.00%) of study participants were from socioeconomic class III and 114 (28.50%) were from class II, 96 (24.00%) from class IV, 47 (11.75%) and 27 (6.75%) from classes I and V respectively.

In the present study among the total participants 232 (58%) had poor knowledge regarding dengue disease and only 168 (42%) had good knowledge.

In the present study, 258 (64.50%) participants said that they had information regarding dengue from television, 60 (15.00%) from news-paper, 23 (5.75%) from radio, 33 (8.25%) knew from friends and relatives and 26 (6.50%) of them acquired information through doctors and health staff.
Table 1: Demographic characteristics (n=400).

| Demographic characteristics | Study participants |
|-----------------------------|--------------------|
| No | % |
| **Age in years** | |
| 18 to 27 | 89 | 22.25 |
| 28 to 37 | 103 | 25.75 |
| 38 to 47 | 87 | 21.75 |
| 48 to 57 | 61 | 15.25 |
| 58 to 67 | 33 | 8.25 |
| 68 and above | 27 | 6.75 |
| **Gender** | |
| Male | 135 | 33.75 |
| Female | 265 | 66.25 |
| **Literacy status** | |
| Illiterate | 25 | 6.25 |
| Primary | 86 | 21.50 |
| Secondary | 162 | 40.50 |
| Collegiate | 127 | 31.75 |
| **Religion** | |
| Hindu | 224 | 56.00 |
| Muslim | 168 | 42.00 |
| Christian | 8 | 2.00 |
| **Socioeconomic status** | |
| Class I | 47 | 11.75 |
| Class II | 114 | 28.50 |
| Class III | 116 | 29.00 |
| Class IV | 96 | 24.00 |
| Class V | 27 | 6.75 |

Table 2: Distribution of study participants according to their overall knowledge, regarding dengue.

| Variable | Number | Percentage (%) | Mean score |
|----------|--------|----------------|------------|
| **Knowledge** | | | |
| Poor | 232 | 58 | <13.0 |
| Good | 168 | 42 | >13.0 |

Table 3: Distribution of study participants according to their knowledge of symptoms.

| Variables | Yes | No |
|-----------|-----|----|
| | No. | Percentage (%) | No. | Percentage (%) |
| Fever | 351 | 87.75 | 49 | 12.25 |
| Headache | 289 | 72.75 | 111 | 27.25 |
| Joint pain | 272 | 68.00 | 128 | 32.00 |
| Abdominal pain | 194 | 48.50 | 206 | 51.50 |
| Muscular pain | 203 | 50.75 | 197 | 49.25 |
| Vomiting | 236 | 59.00 | 164 | 41.00 |
| Skin rashes or Spots | 100 | 25.00 | 300 | 75.00 |
| Pain behind the eyes | 79 | 19.75 | 321 | 80.25 |
| Multiple | 323 | 80.75 | 77 | 19.25 |

Table 4: Distribution of study participants according to their knowledge of transmission.

| Variables | Number | Percentage (%) |
|-----------|--------|----------------|
| **Is dengue transmitted by Aedes mosquito** | | |
| Yes | 129 | 32.25 |
| No | 271 | 67.75 |
| **Dengue is transmitted by (n=271)** | | |
| All mosquitoes | 93 | 8.95 |
| Ticks | 71 | 6.84 |
| Houseflies | 65 | 6.26 |
| Person to person | 120 | 11.60 |
| Unhygienic food | 166 | 15.99 |
| Drinking water | 184 | 17.72 |
| Sexual contact | 47 | 4.52 |
| Needle stick injury | 136 | 13.10 |
| Blood transfusion | 156 | 15.02 |
| Total | 1038 | 100.00 |

Table 5: Distribution of study participants according to their knowledge of breeding places of mosquitoes causing dengue.

| Variables | Number | Percentage (%) |
|-----------|--------|----------------|
| **Does mosquito causing dengue breed in artificially collected water sources?** | | |
| Yes | 157 | 39.25 |
| No | 243 | 60.75 |
| **Other Mosquito breeding places (n=243)** | | |
| Dirty water | 55 | 10.95 |
| Mud | 113 | 22.50 |
| Garbage | 168 | 33.50 |
| Plants and vegetation | 166 | 33.05 |
| Total | 502 | 100.00 |

Table 6: Distribution of study participants according to their knowledge regarding protective measures.

| Variables | Yes | No |
|-----------|-----|----|
| | No. | Percentage | No. | Percentage |
| Covering water containers | 351 | 87.75 | 49 | 12.25 |
| Screening of windows and use of bed nets | 309 | 77.25 | 91 | 22.75 |
| Covering of body with full sleeved clothes | 351 | 87.75 | 49 | 12.25 |
| Insecticide sprays | 276 | 69.00 | 124 | 31.00 |
| Removal of stagnant water | 355 | 88.75 | 45 | 11.25 |
| Use of mosquitoes repellents | 257 | 64.25 | 143 | 35.75 |
| Multiple | 345 | 86.25 | 55 | 13.75 |
DISCUSSION

Mean age±SD of participants was 40.43±15.14 years. Majority of the study participants were in the age group of 18-47 years. Around 66.25% participants were females and only 6.25% were illiterates. Similar findings were seen in a study conducted in Kannamangala village, Bengaluru. Almost half of them were from socioeconomic status class-III and class-IV. A study conducted in urban area of Jhansi (UP) showed that half of the participants were from the upper middle class.

42% of participants had good knowledge of dengue which was similar to study conducted in Jhansi city (UP) which reported 56%, whereas study conducted in Kuala Kangsar district reported figure of 68.5% while a study in Kuala Lumpur reported 14.3% knowledge of participants on dengue.

Only 32.25% of respondents knew that the dengue is transmitted by Aedes mosquitoes. Whereas study conducted in Chitradurga, Karnataka showed that 18.63% correctly responded the causative vector. About 39.25% of study participants had knowledge that dengue mosquito breeds in artificially collected water sources. Similarly a study conducted at Jhansi city (UP) revealed that 82% of participants had knowledge about breeding site as standing clean water.

Correct knowledge regarding protective measures against dengue as covering of water containers, screening of windows and use of bed nets, covering of body with full sleeved clothes, use of insecticide sprays, removal of stagnant water and use of mosquito repellents was known by 87.75%, 77.25%, 87.75%, 69.00%, 88.75% and 64.25% participants respectively. Similar results were reported from a studies conducted in Yemen, Bihar and Patiala.

In our study, 64.50% participants had information regarding dengue from television. Similarly study conducted in Patiala showed that 69.27% had information regarding dengue from television, whereas study conducted in Laos showed that 43.9% of the participants got the information from friends and relatives. Various studies have shown that mass media has a major role in disseminating information about dengue whereas in Thailand, Jhansi city (UP).

Limitation

Since the study is cross-sectional it cannot show cause and effect relationship between different factors with outcome variables.

CONCLUSION

Key finding of this study is that knowledge is poor among the study participants although majority of people had clear understanding of fever, headache, joint pain as common signs and symptoms of dengue fever. However a considerable proportion exhibited vague perception of other signs and symptoms including muscular pain and skin rashes. Only few of them knew that dengue is caused by mosquito bite, and were aware that the mosquito causing dengue breeds in artificially collected water.

ACKNOWLEDGEMENTS

The authors would like to thank the Principal, Staff of Department of Public Health, Community Medicine JNMC, Belagavi and study participants for their cooperation throughout the study. We are also thankful to Dr. Shivanand B. Jawali for his help in Statistical analysis and Dr. Prashant Giribhattanavar for technical support.

Funding: No funding sources
Conflict of interest: None declared
Ethical approval: The study was approved by the Institutional Ethics Committee
