For different nonlinear time-conformable derivative models, a versatile built-in gadget, namely the generalized \( \exp(-\varphi(\xi)) \)-expansion (GEE) method, is devoted to retrieving different categories of new explicit solutions. These models include the time-fractional approximate long-wave equations, the time-fractional variant-Boussinesq equations, and the time-fractional Wu-Zhang system of equations. The GEE technique is investigated with the help of fractional complex transform and conformable derivative. As a result, we found four types of exact solutions involving hyperbolic function, periodic function, rational functional, and exponential function solutions. The physical significance of the explored solutions depends on the choice of arbitrary parameter values. Finally, we conclude that the GEE method is more effective in establishing the explicit new exact solutions than the \( \exp(-\varphi(\xi)) \)-expansion method.

Keywords: time-fractional approximate long-wave equations, time-fractional variant-Boussinesq equations, time-fractional Wu-Zhang system of equations, the GEE method, exact solutions

INTRODUCTION

Analytical solutions of the non-linear partial differential equation (NPDEs) are significantly more important for describing the physical meaning for any real-world problems. Due to the rapid expansion of computer technologies and computer-based symbolic tools, researchers have concentrated increasingly on the analytical and numerical solutions for the NPDEs, including integer and fractional orders. During recent decades, several analytical and semi-analytical methods, such as the improved fractional sub-equation [1], the exp function method [2, 3], the \( G'/G \)-expansion [4–7], the \( \tan(\Phi(\xi)/2) \)-expansion [8], the modified Kudryashov [9, 10], the new extended direct algebraic [11], the extended \( \exp(-\varphi(\xi)) \)-expansion [12], the RB sub-ODE [13], the sine-Gordon expansion [14–16], the unified [17, 18], and the generalized unified [19, 20] methods, have been investigated and also employed for acquiring the new exact solutions of the well-known NPDEs that arise in applied sciences. Presenting new exact solution of PDEs provides a better understanding of the phenomena, which are governed by three special form of time-fractional WKB equations.
The time-fractional Whitham-Broer-Kaup (WBK) equation has the following structure [21]

$$\begin{align*}
D^\alpha_t u + uu_x + v_x + \beta u_{xx} = 0, \\
D^\alpha_t v + (uv)_x - \beta v_{xx} + \gamma u_{xxx} = 0,
\end{align*}$$

(1)

Eq. (1) describes the dispersive long wave in shallow water [22] where $u = u(x,t)$ is the velocity field in the horizontal direction, $v = v(x,t)$ is the height which deviates from the liquid balance position, and $\beta$ and $\gamma$ are real parameters [23]. $D^\alpha_t$ is the conformable derivative of order $\alpha$. In the past, many researchers studied the WBK equation via different analytical approaches according to their field, particularly within mathematical physics and ocean engineering. For instance, Guo et al. [24] employed the improved sub-equation method to extract analytical solutions for space- and time-fractional WBK equations. El-Borai et al. [25] applied the exp-function method under the sense of the improved Riemann-Liouville derivative for solving the time-fractional coupled Boussinesq equations.

If we choose the free parameters as $\beta = \frac{1}{2}$ and $\gamma = 0$, Eq. (1) is converted to the time-fractional approximate long-wave equations [21]:

$$\begin{align*}
D^\alpha_t u + uu_x + v_x + \frac{1}{2} u_{xx} = 0, \\
D^\alpha_t v + (uv)_x = 0,
\end{align*}$$

(2)

In past, Eq. (2) have been solved by the fractional sub-equation method [26], the $\exp$-function method [24], and the generalized Kudryashov method [27] for establishing different wave solutions.

Again, we substitute $\beta = 0$ and $\gamma = 1$ in Eq. (1), and Eq. (1) is converted to the following time-fractional variant Boussinesq equations [21]:

$$\begin{align*}
D^\alpha_t u + uu_x + v_x = 0, \\
D^\alpha_t v + (uv)_x + u_{xxx} = 0,
\end{align*}$$

(3)

Equation (3) was solved by Yan [26] by using fractional sub-equation method. The improved fractional sub-equation method [24] was applied for producing the new generalized exact solutions of the space-time-fractional variant Boussinesq equations.

Finally, if we choose the free parameter values $\beta = 0$ and $\gamma = \frac{1}{2}$ in Eq. (1), Eq. (1) is converted to the following time-fractional Wu-Zhang system of equations [27]:

$$\begin{align*}
D^\alpha_t u + uu_x + v_x = 0, \\
D^\alpha_t v + (uv)_x + \frac{1}{2} u_{xxx} = 0,
\end{align*}$$

(4)

Eslami et al. [27] solved the time-fractional Wu-Zhang system of equations using the first integral method by considering conformable fractional sense.

If we consider $\alpha = 1$ in Eq. (1), then it is converted to the classical coupled WBK equation, which was first introduced by Whitham [28], Broer [29], and Kaup [30]. When $\alpha = 1$, $\beta \neq 0$, and $\gamma = 1$, Eq. (1) is the classical long-wave equation that describes the shallow water wave with diffusion. When $\alpha = 1$, $\beta = 0$, and $\gamma = 1$, Eq. (1) reduces the classical variant Boussinesq equations [31], and when $\alpha = 1$, $\beta = 0$ and $\gamma = 1/3$, Eq. (1) reduces the classical Wu-Zhang system of equations [32]. Sometimes, the classical Wu-Zhang system of equations are introduced by the $(1+1)$ dimensional dispersive long-wave equations [33–35].

For the simplicity of the solutions, we did not consider solving the time-fractional WBK equations by the generalized $\exp(\varphi(\xi))$-expansion method. The main aim of this work is to construct the new exact traveling wave solutions of the three-special form of time-fractional WBK equations, such as the time-fractional approximate long-wave equations, the time-fractional variant Boussinesq equations, and the time-fractional Wu-Zhang system of equations using the generalized $\exp(\varphi(\xi))$-expansion method with a conformable derivative sense. The generalized $\exp(\varphi(\xi))$-expansion method is an effectual and easily applicable technique that is used to investigate the new exact solution for different integer- and fractional-order PDEs. Very recently, Lu et al. [36] used the generalized $\exp(\varphi(\xi))$-expansion method and construct the exact solutions of space-time-fractional generalized fifth-order KdV equation with Jumarie’s modified Riemann-Liouville derivatives.

The rest of the paper is arranged as follows. In section Conformable derivative and the generalized $\exp(\varphi(\xi))$-expansion method, some basic definitions of conformable derivative and the main steps of the generalized $\exp(\varphi(\xi))$-expansion method are given. In section Application of the generalized $\exp(\varphi(\xi))$-expansion method, we look for the exact solutions of Eq. (2) to Eq. (4) via the generalized $\exp(\varphi(\xi))$-expansion method. Finally, a brief conclusion is provided in the last section.

**THE CONFORMABLE DERIVATIVE AND THE GENERALIZED \(\exp(\varphi(\xi))\)-EXPANSION METHOD**

Khalil et al. [37] started to give us the first definition of the conformable derivative (CD) with a limit operator as follows.

**Definition 1.** If $f : (0, \infty) \to R$, then the CFD of $f$ order $\alpha$ is defined as

$$D^\alpha_t f (t) = \lim_{\varepsilon \to 0} \frac{f(t + \varepsilon t^{1-\alpha}) - f(t)}{\varepsilon},$$

for all $t > 0$, $0 < \alpha \leq 1$.

The CD satisfies some workable features that are demonstrated in the following theorems [37–41].

**Theorem 1.** Let $\alpha \in (0,1]$ and $f = f(t)$, $g = g(t)$ be $\alpha$-conformable differentiable at a point $t > 0$, then

1. $D^\alpha_t (af + bg) = aD^\alpha_t f + bD^\alpha_t g$, for all $a, b \in R$,
2. $D^\alpha_t (t^\mu) = \mu t^{\mu-\alpha}$, for all $\mu \in R$,
3. $D^\alpha_t (f g) = gD^\alpha_t (f) + fD^\alpha_t (g)$,
4. $D^\alpha_t \left( \frac{f}{g} \right) = \frac{gD^\alpha_t f - fD^\alpha_t g}{g^2}$.

Furthermore, if $f$ is differentiable, then $D^\alpha_t (f(t)) = t^{1-\alpha} \frac{df}{dt}$.
Theorem 2. Let \( f : (0, \infty) \to R \) be a function such that \( f \) is differentiable and \( \alpha \)-conformable differentiable. Also, let \( g \) be a differentiable function defined in the range of \( f \). Then

\[
D^\alpha_\xi \left[ (f(y) - g(t))^\alpha \right] g'(t)D^\alpha_\xi \left[ f(t) \right]_{t=y(g(t))}
\]

where prime denotes the classical derivatives with respect to \( t \).

Now, we impose the generalized \( \exp(-\varphi(\xi)) \)-expansion method for solving some fractional differential equations. In this respect, we described the essential steps of the generalized \( \exp(-\varphi(\xi)) \)-expansion method \cite{36} as follows.

Step-1: Suppose that a general form of the non-linear FDEs, say in two independent variables \( x \) and \( t \), is given by

\[
P_1 \left( u, v, D_t^\alpha u, D_t^\alpha v, D_t^{2\alpha} u, D_t^{2\alpha} v, u_x, v_x, u_{xx}, v_{xx}, \ldots \right) = 0
\]

\[
P_2 \left( u, v, D_t^\alpha u, D_t^\alpha v, D_t^{2\alpha} u, D_t^{2\alpha} v, u_x, v_x, u_{xx}, v_{xx}, \ldots \right) = 0
\]

where \( D_t^\alpha u \) and \( D_t^\alpha v \) are conformable derivatives of \( u \) and \( v \), respectively, \( u = u(x,t) \) and \( v = v(x,t) \) are unknown functions, and \( P_1 \) and \( P_2 \) are a polynomial in their arguments.

Step-2: To construct the exact solution of Eq. (5), we introduce the variable transformation, combine the real variables \( x \) and \( t \) by a compound variable \( \xi \)

\[
u = U(\xi), \quad v = V(\xi), \quad \xi = x - \left( \frac{\alpha}{\beta} \right) t^\alpha,
\]

where, \( \alpha \) is a constant which is determined later. The traveling wave transformation of Eq. (6) converts Eq. (5) into an ordinary differential equation (ODE) for \( u = U(\xi) \) and \( v = V(\xi) \):

\[
Q_1 \left( U, V, U', V', U'', V'', \ldots \right) = 0
\]

\[
Q_2 \left( U, V, U', V', U'', V'', \ldots \right) = 0
\]

where \( Q_1 \) and \( Q_2 \) are a polynomial of \( U, V \), and its derivatives with respect to \( \xi \).

Step 3: Suppose that the traveling wave solution of system Eq. (7) can be presented as follows

\[
U(\xi) = a_0 + \sum_{i=1}^{m} a_i \left( \exp \left( -\varphi(\xi) \right) \right)^i,
\]

\[
V(\xi) = b_0 + \sum_{i=1}^{n} b_i \left( \exp \left( -\varphi(\xi) \right) \right)^i
\]

where the arbitrary constants \( a_i (i = 1, 2, \ldots, m) \) and \( b_i (i = 1, 2, \ldots, n) \) are determined later, but \( a_m \neq 0 \) and \( b_n \neq 0 \) and also \( m \) and \( n \) are a positive integer, which can be determined by using homogeneous balance principle on Eq. (7), and \( \varphi = \varphi(\xi) \) satisfies the following new ansatz equation

\[
\varphi'(\xi) = p \exp(-\varphi(\xi)) + q \exp(\varphi(\xi)) + r
\]

where \( p, q, \) and \( r \) are constant. The general solutions of the equation are the following.

Case-I: When \( p = 1 \) and \( \Delta = r^2 - 4q \), one obtains

\[
\varphi(\xi) = \ln \left( \frac{\sqrt{-\Delta} \tan \left( \frac{\sqrt{-\Delta} (\xi + \xi_1)}{2q} \right)}{2q} \right), \quad q \neq 0, \quad \Delta = r^2 - 4q > 0
\]

\[
\varphi(\xi) = \ln \left( \frac{\sqrt{-\Delta} \cot \left( \frac{\sqrt{-\Delta} (\xi + \xi_1)}{2q} \right)}{2q} \right), \quad q \neq 0, \quad \Delta = r^2 - 4q > 0
\]

Case-II: When \( r = 0 \), one obtains

\[
\varphi(\xi) = \ln \left( \frac{\sqrt{\frac{p}{q}} \tan \left( \frac{\sqrt{pq} (\xi + \xi_1)}{q} \right)}{q} \right), \quad p > 0, q > 0
\]

\[
\varphi(\xi) = \ln \left( \frac{\sqrt{\frac{-p}{q}} \cot \left( \frac{\sqrt{pq} (\xi + \xi_1)}{q} \right)}{q} \right), \quad p < 0, q < 0
\]

\[
\varphi(\xi) = \ln \left( \frac{\sqrt{\frac{-p}{q}} \coth \left( \frac{\sqrt{pq} (\xi + \xi_1)}{q} \right)}{q} \right), \quad p < 0, q > 0
\]

Case-III: When \( q = 0 \) and \( r = 0 \), one obtains

\[
\varphi(\xi) = \ln \left( \sqrt{\frac{p}{q}} (\xi + \xi_1) \right)
\]

APPLICATION OF THE GENERALIZED \( \exp(-\varphi(\xi)) \)-EXPANSION METHOD

In this part, we will execute the generalized \( \exp(-\varphi(\xi)) \)-expansion method to solve three well-known non-linear fractional partial differential equations in shallow water, namely, the time-fractional approximate long wave (ALW) equations, the time-fractional variant-Boussinesq equations, and the time-fractional Wu-Zhang system of equations. All the above-mentioned equations are the special-form WBK equations that describe the physical phenomena arising in fluid mechanics.

The Time-Fractional ALW Equations

Let us consider the time-fractional ALW equations

\[
D^\alpha_t u + uu_x + v + \frac{1}{2} u_x = 0
\]

\[
D^\alpha_t v + (uv)_x = \frac{1}{2} v_{xx} = 0
\]

\[
t \geq 0, \quad 0 < \alpha \leq 1.
\]
Now, applying under the traveling wave transformation of Eq. (6), Eq. (19) reduces to a non-linear ODE as
\[
-cU' + UV' + V' + \frac{1}{2}U'' = 0 \\
-cV' + (UV)' - \frac{1}{2}V'' = 0
\] (20)

This integrates with respect to \( \xi \) of Eq. (20) and considers that the integration constant is zero. Eq. (20) then yields
\[
-cU + \frac{1}{2}U^2 + V + \frac{1}{2}U' = 0 \\
-cV + UV - \frac{1}{2}V' = 0
\] (21)

The balancing rule in Eq. (21) yields \( m = 1 \) and \( n = 2 \), assuming the general solution Eq. (21) in the presence Eq. (8) is given by
\[
\begin{align*}
U(\xi) &= a_0 + a_1 \exp(-\varphi(\xi)) \\
V(\xi) &= b_0 + b_1 \exp(-\varphi(\xi)) + b_2 \exp(-2\varphi(\xi))
\end{align*}
\] (22)

where \( a_1 \neq 0 \) and \( b_2 \neq 0 \).

Plugging Eq. (22) into Eq. (21), we obtain a set of an algebraic non-linear equations that solve to

**Set-1:**
\[
\begin{align*}
\alpha &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4pq + r^2}, \\
b_0 &= -p, \\
b_1 &= -pr, \\
b_2 &= -pr^2 \\
c &= \frac{1}{2} \sqrt{-4pq + r^2}, \\
-4pq + r^2 &= 0
\end{align*}
\]

By putting the values of Set-1 into Eq. (22) along with the Eq. (10) to Eq. (18), we obtain the following traveling wave solutions for the time-fractional ALW equations.

**For \( p = 1 \):**
\[
\begin{align*}
u_5(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4q - \frac{r^2}{(e^{\alpha t} - 1)} - \frac{r^2}{(e^{\alpha t} + 1)}}, \\
v_5(x,t) &= q - \frac{1}{2} \sqrt{-4q - \frac{r^2}{(e^{\alpha t} - 1)} - \frac{r^2}{(e^{\alpha t} + 1)}}
\end{align*}
\] (27)

and
\[
\begin{align*}
u_6(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4q + \frac{r^2}{(e^{\alpha t} + 1)}} \\
v_6(x,t) &= q + \frac{1}{2} \sqrt{\frac{r^2}{(e^{\alpha t} + 1)}}
\end{align*}
\] (28)

where, \( \xi = x - \frac{1}{2} \sqrt{-4q} \frac{r}{a} \) and \( r^2 - 4q > 0 \).

**For \( r = 0 \):**
\[
\begin{align*}
u_7(x,t) &= \frac{1}{2} \sqrt{-4pq + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)}} \\
v_7(x,t) &= -pq - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)} \\
u_8(x,t) &= \frac{1}{2} \sqrt{-4pq - \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)}} \\
v_8(x,t) &= -pq - \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)} \\
u_9(x,t) &= \frac{1}{2} \sqrt{-4pq - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)}} \\
v_9(x,t) &= -pq + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)} \\
u_{10}(x,t) &= \frac{1}{2} \sqrt{-4pq + \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)}} \\
v_{10}(x,t) &= -pq + \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)}
\end{align*}
\] (29)-(32)

where, \( \xi = x - \frac{1}{2} \sqrt{-4pq} \frac{r}{a} \), \( pq < 0 \).

**For \( q = 0 \) and \( r = 0 \):**
\[
\begin{align*}
u_{11}(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4q} \\
v_{11}(x,t) &= \frac{1}{2} \sqrt{-4q}
\end{align*}
\] (33)

**Set-2:**
\[
\begin{align*}
u_{12}(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4pq + r^2}, \\
v_{12}(x,t) &= -pq - pr, \\
v_{12}(x,t) &= -pr^2 \\
v_{12}(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4pq + r^2}
\end{align*}
\]

and
\[
\begin{align*}
u_{13}(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4q} \\
v_{13}(x,t) &= \frac{1}{2} \sqrt{-4q}
\end{align*}
\] (34)-(35)

Consequently, by substituting the values of Set-2 into Eq. (22) along with the Eq. (10) to Eq. (18), we produce the following traveling wave solutions for the time-fractional ALW equations.

**For \( p = 1 \):**
\[
\begin{align*}
u_5(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4q - \frac{r^2}{(e^{\alpha t} - 1)} - \frac{r^2}{(e^{\alpha t} + 1)}}, \\
v_5(x,t) &= q - \frac{1}{2} \sqrt{-4q - \frac{r^2}{(e^{\alpha t} - 1)} - \frac{r^2}{(e^{\alpha t} + 1)}}
\end{align*}
\]

and
\[
\begin{align*}
u_6(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4q + \frac{r^2}{(e^{\alpha t} + 1)}} \\
v_6(x,t) &= q + \frac{1}{2} \sqrt{\frac{r^2}{(e^{\alpha t} + 1)}}
\end{align*}
\] (27)

and
\[
\begin{align*}
u_7(x,t) &= \frac{1}{2} \sqrt{-4pq + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)}} \\
v_7(x,t) &= -pq - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)} \\
u_8(x,t) &= \frac{1}{2} \sqrt{-4pq + \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)}} \\
u_8(x,t) &= -pq - \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)} \\
u_9(x,t) &= \frac{1}{2} \sqrt{-4pq - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)}} \\
u_9(x,t) &= -pq + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi) + E)} \\
u_{10}(x,t) &= \frac{1}{2} \sqrt{-4pq + \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)}} \\
u_{10}(x,t) &= -pq + \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi) + E)}
\end{align*}
\] (29)-(32)

where, \( \xi = x - \frac{1}{2} \sqrt{-4pq} \frac{r}{a} \), \( pq < 0 \).

**For \( q = 0 \) and \( r = 0 \):**
\[
\begin{align*}
u_{11}(x,t) &= -\frac{1}{2}r + \frac{1}{2} \sqrt{-4q} \\
v_{11}(x,t) &= \frac{1}{2} \sqrt{-4q}
\end{align*}
\] (33)

**Set-2:**
\[
\begin{align*}
u_{12}(x,t) &= -\frac{1}{2}r - \frac{1}{2} \sqrt{-4pq + r^2}, \\
u_{12}(x,t) &= -pq - pr, \\
u_{12}(x,t) &= -pr^2 \\
u_{12}(x,t) &= -\frac{1}{2}r - \frac{1}{2} \sqrt{-4pq + r^2}
\end{align*}
\]

and
\[
\begin{align*}
u_{13}(x,t) &= -\frac{1}{2}r - \frac{1}{2} \sqrt{-4q} \\
u_{13}(x,t) &= \frac{1}{2} \sqrt{-4q}
\end{align*}
\] (34)-(35)

Consequently, by substituting the values of Set-2 into Eq. (22) along with the Eq. (10) to Eq. (18), we produce the following traveling wave solutions for the time-fractional ALW equations.

**For \( p = 1 \):**
\[
 u_{14}(x, t) = -\frac{1}{2} r - \frac{1}{2} \sqrt{r^2 - 4q} - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t^2, \\
 v_{14}(x, t) = -q - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t^2,
\]
\[
 u_{15}(x, t) = -\frac{1}{2} r - \frac{1}{2} \sqrt{r^2 - 4q} - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t^2, \\
 v_{15}(x, t) = -q - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t^2,
\]
\[
 u_{16}(x, t) = -\frac{1}{2} r - \frac{1}{2} \sqrt{r^2 - 4q} - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t^2, \\
 v_{16}(x, t) = -q - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t + \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t^2,
\]
where \( \xi = x + \left(\frac{1}{2} \sqrt{r^2 - 4q}\right) t^\alpha / q \) and \( r^2 - 4q > 0 \).

For \( r > 0 \):
\[
 u_{18}(x, t) = -\frac{1}{2} \sqrt{4pq} - \frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))} t^2, \\
 v_{18}(x, t) = -p - \left(\frac{\sqrt{pq}}{\tan(\sqrt{pq}(\xi + E))}\right)^2 t^2,
\]
\[
 u_{19}(x, t) = -\frac{1}{2} \sqrt{4pq} + \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi + E))} t^2, \\
 v_{19}(x, t) = -p - \left(\frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi + E))}\right)^2 t^2,
\]
\[
 u_{20}(x, t) = -\frac{1}{2} \sqrt{4pq} - \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi + E))} t^2, \\
 v_{20}(x, t) = -p + \left(\frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi + E))}\right)^2 t^2,
\]
and
\[
 u_{21}(x, t) = -\frac{1}{2} \sqrt{4pq} + \frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi + E))} t^2, \\
 v_{21}(x, t) = -p + \left(\frac{\sqrt{pq}}{\cot(\sqrt{pq}(\xi + E))}\right)^2 t^2,
\]
where \( \xi = x + \left(\frac{1}{2} \sqrt{4pq}\right) t^\alpha / p \), \( pq < 0 \).

For \( q > 0 \) and \( r = 0 \):
\[
 u_{22}(x, t) = -\frac{1}{2} \sqrt{4pq}, \\
 v_{22}(x, t) = -\frac{1}{2} \sqrt{4pq},
\]

\( Figs. 1, 2 \) represent the solutions given by Eq. (23) for different values of \( \alpha \) when \( r = 3 \), \( q = 2 \), and \( E = 0 \).

The Time-Fractional Variant-Boussinesq Equations

Let us consider the time-fractional variant-Boussinesq equations
\[
 D^\mu_t u + uu_x + u_x = 0, \quad D^\mu_t v + (uv)_x + u_{xxx} = 0, \quad t \geq 0, \quad 0 < \alpha \leq 1.
\]

Now, applying under the traveling wave transformation of Eq. (6), Eq. (45) reduces to a non-linear ODE as
\[
 -cU' + UU' + V' = 0, \\
 -cV' + (UV)' + U'' = 0.
\]
This integrates with respect to \( \xi \) of Eq. (46) and considers the integration constant to be zero. Eq. (46) then yields
\[
 -cU + \frac{1}{2} U^2 + V = 0, \\
 -cV + UV + U'' = 0 \quad \{47\}
\]

From the balancing condition in Eq. (47), we have \( m = 1 \) and \( n = 2 \). Now, the formal solution of (47) in the existence of (8) will be
\[
 U(\xi) = a_0 + a_1 \exp(-\psi(\xi)), \\
 V(\xi) = b_0 + b_1 \exp(-\psi(\xi)) + b_2 \exp(-2\psi(\xi)) \quad \{48\}
\]
where \( a_1 \neq 0 \) and \( b_2 \neq 0 \).

By inserting Eq. (48) into Eq. (47) along with Eq. (9) and using the same techniques investigated in the previous section we get

**Set-1:** \( a_0 = -r \pm \sqrt{-4pq + r^2} \), \( a_1 = -2p \), \( b_0 = -2pq \), \( b_1 = -2pr \), \( b_2 = -2p^2 \) and \( c = \pm \sqrt{-4pq + r^2} \), \( -4pq + r^2 > 0 \).

Therefore, by substituting the values of Set-1 into Eq. (48), along with the Eq. (10) to Eq. (18), we generate the following traveling wave solutions for the time-fractional variant-Boussinesq equations.

For \( p = 1 \):
\[
 u_1(x, t) = -r \pm \sqrt{r^2 - 4q} + \frac{4q}{\sqrt{\Delta} \tan h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \\
 v_1(x, t) = -2q + \frac{4q}{\sqrt{\Delta} \tan h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \quad \{49\}
\]
\[
 u_2(x, t) = -r \pm \sqrt{r^2 - 4q} + \frac{4q}{\sqrt{\Delta} \cot h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \\
 v_2(x, t) = -2q + \frac{4q}{\sqrt{\Delta} \cot h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \quad \{50\}
\]
\[
 u_3(x, t) = -r \pm \sqrt{r^2 - 4q} + \frac{4q}{\sqrt{\Delta} \tan h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \\
 v_3(x, t) = -2q - \frac{4q}{\sqrt{\Delta} \tan h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \quad \{51\}
\]
\[
 u_4(x, t) = -r \pm \sqrt{r^2 - 4q} + \frac{4q}{\sqrt{\Delta} \cot h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \\
 v_4(x, t) = -2q - \frac{4q}{\sqrt{\Delta} \cot h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \quad \{52\}
\]
\[
 u_5(x, t) = -r \pm \sqrt{r^2 - 4q} + \frac{4q}{\sqrt{\Delta} \tan h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \\
 v_5(x, t) = -2q - \frac{4q}{\sqrt{\Delta} \tan h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \quad \{53\}
\]
and
\[
 u_6(x, t) = -r \pm \sqrt{r^2 - 4q} + \frac{4q}{\sqrt{\Delta} \cot h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r, \\
 v_6(x, t) = -2q - \frac{4q}{\sqrt{\Delta} \cot h\left(\frac{1}{\sqrt{\Delta}} (\xi + E)\right)} t^r \quad \{54\}
\]
where \( \xi = x + \sqrt{r^2 - 4q} \frac{u}{\alpha} \) and \( r^2 - 4q > 0 \).

For \( r = 0 \):

\[
\begin{align*}
  u_7 (x, t) &= \pm \sqrt{-4pq} - \frac{2 \sqrt{pq}}{\tan (\sqrt{pq}(\xi + \beta))} \frac{t}{\Delta}, \\
  v_7 (x, t) &= -2pq - \left( \frac{2 \sqrt{pq}}{\tan (\sqrt{pq}(\xi + \beta))} \right) ^2, \\
  u_8 (x, t) &= \pm \sqrt{-4pq} + \frac{2 \sqrt{pq}}{\cot (\sqrt{pq}(\xi + \beta))} \frac{t}{\Delta}, \\
  v_8 (x, t) &= -2pq + \left( \frac{2 \sqrt{pq}}{\cot (\sqrt{pq}(\xi + \beta))} \right) ^2, \\
  u_9 (x, t) &= \pm \sqrt{-4pq} - \frac{2 \sqrt{pq}}{\tanh (\sqrt{pq}(\xi + \beta))} \frac{t}{\Delta}, \\
  v_9 (x, t) &= -2pq + \left( \frac{2 \sqrt{pq}}{\tanh (\sqrt{pq}(\xi + \beta))} \right) ^2, \\
  u_{10} (x, t) &= \pm \sqrt{-4pq} + \frac{2 \sqrt{pq}}{\coth (\sqrt{pq}(\xi + \beta))} \frac{t}{\Delta}, \\
  v_{10} (x, t) &= -2pq + \left( \frac{2 \sqrt{pq}}{\coth (\sqrt{pq}(\xi + \beta))} \right) ^2,
\end{align*}
\] (55)

where, \( \beta = x + \sqrt{4pq} \frac{v}{\alpha} \), \( pq < 0 \).

For \( q = 0 \) and \( r = 0 \):

\[
\begin{align*}
  u_{11} (x, t) &= -2 \frac{t}{\sqrt{E}}, \\
  v_{11} (x, t) &= -2 \left( \frac{1}{1 + \xi} \right) ^2,
\end{align*}
\] (59)

Set-2: \( a_0 = r \pm \sqrt{-4pq + r^2}, a_1 = 2p, b_0 = -2pq, b_1 = -2pr, b_2 = -2p^2 \), and \( c = \pm \sqrt{-4pq + r^2}, -4pq + r^2 > 0 \).

Consequently, by substituting the values of Set-2 into Eq. (48) along with the Eq. (10) to Eq. (18), we generate the following traveling wave solutions for the time-fractional variant-Boussinesq equations:

For \( p = 1 \):

\[
\begin{align*}
  u_{12} (x, t) &= r \pm \sqrt{t^2 - 4q} - \frac{2 \sqrt{pq}}{\tan (\sqrt{pq}(\xi + \beta))} \frac{t}{\Delta}, \\
  v_{12} (x, t) &= -2q + \left( \frac{2 \sqrt{pq}}{\tan (\sqrt{pq}(\xi + \beta))} \right) ^2, \\
  u_{13} (x, t) &= r \pm \sqrt{t^2 - 4q} - \frac{2 \sqrt{pq}}{\cot (\sqrt{pq}(\xi + \beta))} \frac{t}{\Delta}, \\
  v_{13} (x, t) &= -2q + \left( \frac{2 \sqrt{pq}}{\cot (\sqrt{pq}(\xi + \beta))} \right) ^2,
\end{align*}
\] (60)

\[
\begin{align*}
  u_{14} (x, t) &= - \frac{r}{\sqrt{\Delta}} \frac{t}{\Delta} \tan h \left( \frac{\sqrt{\Delta} (\xi + \beta) + t}{4q} \right) + \frac{2 \sqrt{pq}}{8pq} \left( \frac{2 \sqrt{pq}}{\tan (\sqrt{pq}(\xi + \beta))} \right) ^2, \\
  v_{14} (x, t) &= -2q - \left( \frac{2 \sqrt{pq}}{\tan (\sqrt{pq}(\xi + \beta))} \right) ^2, \\
  u_{15} (x, t) &= - \frac{r}{\sqrt{\Delta}} \frac{t}{\Delta} \cot h \left( \frac{\sqrt{\Delta} (\xi + \beta) + t}{4q} \right) - \frac{2 \sqrt{pq}}{8pq} \left( \frac{2 \sqrt{pq}}{\cot (\sqrt{pq}(\xi + \beta))} \right) ^2, \\
  v_{15} (x, t) &= -2q - \left( \frac{2 \sqrt{pq}}{\cot (\sqrt{pq}(\xi + \beta))} \right) ^2.
\end{align*}
\] (61)
\[ u_{14}(x,t) = r \pm \sqrt{r^2 - 4q} \]
\[ v_{14}(x,t) = -2q - \frac{\sqrt{\Delta} \tan \left( \frac{1}{2} \sqrt{\Delta} (\xi + E) \right)}{4q} \]
\[ u_{15}(x,t) = r \pm \sqrt{r^2 - 4q} \]
\[ v_{15}(x,t) = -2q - \frac{\sqrt{\Delta} \cot \left( \frac{1}{2} \sqrt{\Delta} (\xi + E) \right)}{4q} \]
\[ u_{16}(x,t) = r \pm \sqrt{r^2 - 4q} + \frac{2r}{e^{(q + r) - 1}} \]
\[ v_{16}(x,t) = -2q - \frac{2r}{e^{(q + r) - 1}} - \frac{2r^2}{e^{(q + r) - 1}} \]
\[ u_{17}(x,t) = r \pm \sqrt{r^2 - 4q} \]
\[ v_{17}(x,t) = -2q + \frac{r^2 (\xi + E)}{n(\xi + E) + 2} - \frac{1}{2} \left( \frac{r^2 (\xi + E)}{n(\xi + E) + 2} \right)^2 \]

where, \( \xi = x \mp \left( \sqrt{r^2 - 4q} \right) \frac{E}{\alpha} \) and \( r^2 - 4q > 0 \).

For \( r = 0 \):
\[ u_{18}(x,t) = \pm \frac{2q}{\sqrt{\tanh (\xi + E)}} \]
\[ v_{18}(x,t) = -2pq - \left( \frac{2q}{\sqrt{\tanh (\xi + E)}} \right) \]
\[ u_{19}(x,t) = \pm \frac{2q}{\sqrt{\tanh (\xi + E)}} \]
\[ v_{19}(x,t) = -2pq - \left( \frac{2q}{\sqrt{\tanh (\xi + E)}} \right)^2 \]
\[ u_{20}(x,t) = \pm \frac{2q}{\sqrt{\tanh (\xi + E)}} \]
\[ v_{20}(x,t) = -2pq + \left( \frac{2q}{\sqrt{\tanh (\xi + E)}} \right)^2 \]

and
\[ u_{21}(x,t) = \pm \frac{2q}{\sqrt{\tanh (\xi + E)}} \]
\[ v_{21}(x,t) = -2pq + \left( \frac{2q}{\sqrt{\tanh (\xi + E)}} \right)^2 \]

where, \( \xi = x \mp \left( \sqrt{\frac{4pq}{\alpha}} \frac{E}{\alpha} \right) \), \( p < 0 \).

For \( q = 0 \) and \( r = 0 \):
\[ u_{22}(x,t) = \frac{2}{1 + \frac{E}{\alpha}} \]
\[ v_{22}(x,t) = -2 \left( \frac{1}{1 + \frac{E}{\alpha}} \right)^2 \]

Figures 3, 4 represent the solutions given by Eq. (50) for different values of \( \alpha \) when \( r = 3 \), \( q = 2 \) and \( E = 0 \).

The Time-Fractional Wu-Zhang System of Equations
Let us consider the time-fractional Wu-Zhang system of equations
\[ D_t^\alpha u + uu_x + v_x = 0 \]
\[ D_t^\alpha v + (uv)_x + \frac{1}{3} u_{xxx} = 0 \]
\[ t \geq 0, \ 0 < \alpha \leq 1. \]
Now, applying under the traveling wave transformation of Eq. (6), Eq. (71) reduces to a non-linear ODE as

\[-cU' + UU' + V' = 0 \]
\[-cV' + (UV)' + \frac{1}{2} U'' = 0 \],

Integrating with respect to \( \xi \) of Eq. (71) and considering the integration constant is zero. Then Eq. (72) yields

\[-cU + \frac{1}{2} U^2 + V = 0 \]
\[-cV + UV + \frac{1}{3} U'' = 0 \].

Following the steps given in the last two sections we reach to

\[ U(\xi) = a_0 + a_1 \exp(-\phi(\xi)) \]
\[ V(\xi) = b_0 + b_1 \exp(-\phi(\xi)) + b_2 \exp(-2\phi(\xi)) \],

where \( a_1 \neq 0 \) and \( b_2 \neq 0 \).

Put Eq. (74) into Eq. (73) along with Eq. (9), and we get a new system of algebraic equations that solve to

Set-1: \( a_0 = \frac{1}{3} \sqrt{3} r \pm \frac{1}{3} \sqrt{3} (r^2 - 4pq) \), \( a_1 = \frac{2}{3} \sqrt{3} \), \( b_0 = -\frac{3}{2} pq \), \( b_1 = -\frac{3}{2} pr \), \( b_2 = -\frac{3}{2} p^2 \)

and \( c = \pm \frac{1}{3} \sqrt{3} (r^2 - 4pq) \), \(-4pq + r^2 > 0\).

Therefore, by substituting the values of Set-1 into Eq. (74) along with the Eq. (10) to Eq. (18), we generate the following traveling wave solutions for the time-fractional Wu-Zhang system of equations.

\[ u_1(x,t) = \frac{1}{3} \sqrt{3} r \pm \frac{1}{3} \sqrt{3} (r^2 - 4pq) \]
\[ -\frac{4}{3} \sqrt{3} \tan \left( \frac{1}{3} \sqrt{3} (t + \xi) \right) \]
\[ v_1(x,t) = -\frac{2}{3} q + \frac{4}{3} \sqrt{3} \tan \left( \frac{1}{3} \sqrt{3} (t + \xi) \right) \]
\[ -\frac{8}{3} \left( \frac{1}{\sqrt{3} \tan \left( \frac{1}{3} \sqrt{3} (t + \xi) \right)} \right) \],

\[ u_2(x,t) = \frac{1}{3} \sqrt{3} r \pm \frac{1}{3} \sqrt{3} (r^2 - 4pq) \]
\[ -\frac{4}{3} \sqrt{3} \cot \left( \frac{1}{3} \sqrt{3} (t + \xi) \right) \]
\[ v_2(x,t) = -\frac{2}{3} q + \frac{4}{3} \sqrt{3} \cot \left( \frac{1}{3} \sqrt{3} (t + \xi) \right) \]
\[ -\frac{8}{3} \left( \frac{1}{\sqrt{3} \cot \left( \frac{1}{3} \sqrt{3} (t + \xi) \right)} \right) \],

\[ u_3(x,t) = \frac{1}{3} \sqrt{3} r \pm \frac{1}{3} \sqrt{3} (r^2 - 4pq) \]
\[ + \frac{2}{3} \sqrt{3} \tan \left( \frac{1}{3} \sqrt{3} (t + \xi) \right) \]
\[ v_3(x,t) = -\frac{2}{3} q - \frac{4}{3} \sqrt{3} \tan \left( \frac{1}{3} \sqrt{3} (t + \xi) \right) \]
\[ -\frac{8}{3} \left( \frac{1}{\sqrt{3} \tan \left( \frac{1}{3} \sqrt{3} (t + \xi) \right)} \right) \].
where, \( \xi = \left( \frac{3}{2} (r^2 - 4q) \right)^{1/3} \) and \( \Delta = r^2 - 4q > 0 \).

For \( r = 0 \):

\[
\begin{align*}
  u_7 (x, t) &= \frac{1}{2} \sqrt{3} \left[ \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) + \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right], \\
  v_7 (x, t) &= -\frac{1}{2} \left( \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) - \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right), \\
  u_8 (x, t) &= \frac{1}{2} \sqrt{3} \left[ \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) - \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right], \\
  v_8 (x, t) &= -\frac{1}{2} \left( \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) + \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right)
\end{align*}
\]

and

\[
\begin{align*}
  u_9 (x, t) &= \frac{1}{2} \sqrt{3} \left[ \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) + \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right], \\
  v_9 (x, t) &= -\frac{1}{2} \left( \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) - \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right), \\
  u_{10} (x, t) &= \frac{1}{2} \sqrt{3} \left[ \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) - \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right], \\
  v_{10} (x, t) &= -\frac{1}{2} \left( \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) + \frac{1}{2} \tan \left( \frac{\sqrt{3}r}{2(r^2 + E)} \right) \right)
\end{align*}
\]

where, \( \xi = \left( \frac{3}{2} \sqrt{3} (r^2 - 4q) \right)^{1/3} \), \( pq < 0 \).

For \( q = 0 \) and \( r = 0 \):

\[
\begin{align*}
  u_{11} (x, t) &= \frac{3}{3 \sqrt{3} \sqrt{E}} \left( \frac{3}{2} \sqrt{3} \right), \\
  v_{11} (x, t) &= -\frac{1}{3 \sqrt{3} \sqrt{E}} \left( \frac{3}{2} \sqrt{3} \right)
\end{align*}
\]

Set-2: \( a_0 = -\frac{1}{2} \sqrt{3} r \pm \frac{3}{2} \sqrt{3} (r^2 - 4q), a_1 = -\frac{3}{2} \sqrt{3} p, b_0 = -\frac{3}{2} pq, b_1 = -\frac{3}{2} p r, b_2 = -\frac{3}{4} p^2 \) and \( c = \pm \frac{3}{2} \left( r^2 - 4q \right), -4pq + r^2 > 0 \).

Consequently, by substituting the values of Set-2 into Eq. (74) along with the Eq. (10) to Eq. (18), we generate the following traveling wave solutions for the time-fractional Wu-Zhang system of equations.
For $p = 1$:

\[
\begin{align*}
  u_{12}(x, t) &= -\frac{1}{2} \sqrt{3} r \pm \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) \\
  + 4 \frac{\sqrt{3} q}{\sqrt{\alpha} \tan h \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) \right)} \\
  v_{12}(x, t) &= -\frac{2}{3} q + 4 \frac{\sqrt{3} \tan h \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) \right)}{r} \\
  - 8 \frac{1}{\left( \sqrt{\alpha} \tan h \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) \right) \right)^2} \\
  u_{13}(x, t) &= -\frac{1}{2} \sqrt{3} r \pm \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) \\
  + 4 \frac{\sqrt{3} q}{\sqrt{\alpha} \coth h \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) + r \right)} \\
  v_{13}(x, t) &= -\frac{2}{3} q + 4 \frac{\sqrt{3} \coth h \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) + r \right)}{r} \\
  - 8 \frac{1}{\left( \sqrt{\alpha} \coth h \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) + r \right) \right)^2} \\
  u_{14}(x, t) &= -\frac{1}{2} \sqrt{3} r \pm \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) \\
  + 4 \frac{\sqrt{3} q}{\sqrt{\alpha} \tan \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) - r \right)} \\
  v_{14}(x, t) &= -\frac{2}{3} q + 4 \frac{\sqrt{3} \tan \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) - r \right)}{r} \\
  - 8 \frac{1}{\sqrt{\alpha} \tan \left( \frac{1}{2} \sqrt{3} (\xi + \varepsilon) - r \right)^2} \\
\end{align*}
\]

\[(85)\]

\[
\begin{align*}
  u_{15}(x, t) &= -\frac{1}{3} \sqrt{3} r \pm \frac{1}{3} \sqrt{3} \left( r^2 - 4q \right) \\
  v_{15}(x, t) &= -\frac{2}{3} q - \frac{4}{3} \sqrt{\alpha} \cot \left( \frac{1}{2} \sqrt{3} \left( \xi + \varepsilon \right) - r \right) \\
  u_{16}(x, t) &= -\frac{1}{3} \sqrt{3} r \pm \frac{1}{3} \sqrt{3} \left( r^2 - 4q \right) \\
  v_{16}(x, t) &= -\frac{2}{3} q - \frac{4}{3} \sqrt{\alpha} \cot \left( \frac{1}{2} \sqrt{3} \left( \xi + \varepsilon \right) - r \right) \\
\end{align*}
\]

\[(86)\]

\[
\begin{align*}
  u_{17}(x, t) &= -\frac{1}{3} \sqrt{3} r \pm \frac{1}{3} \sqrt{3} \left( r^2 - 4q \right) \\
  v_{17}(x, t) &= -\frac{2}{3} q + \frac{4}{3} \sqrt{\alpha} \cot \left( \frac{1}{2} \sqrt{3} \left( \xi + \varepsilon \right) + r \right) \\
\end{align*}
\]

\[(87)\]

and

\[
\begin{align*}
  u_{18}(x, t) &= \pm \frac{1}{3} \sqrt{3} r q - \frac{2}{3} \sqrt{\alpha} \cot \left( \frac{1}{2} \sqrt{3} \left( \xi + \varepsilon \right) \right) \\
  v_{18}(x, t) &= -\frac{2}{3} q - \frac{4}{3} \sqrt{\alpha} \cot \left( \frac{1}{2} \sqrt{3} \left( \xi + \varepsilon \right) \right) \\
\end{align*}
\]

\[(88)\]

where, $\xi = x \mp \left( \frac{1}{2} \sqrt{3} \left( r^2 - 4q \right) \right)^\frac{1}{3}$ and $\Delta = r^2 - 4q > 0$.

For $r = 0$:

\[
\begin{align*}
  u_{19}(x, t) &= \pm \frac{1}{3} \sqrt{3} r q - \frac{2}{3} \sqrt{\alpha} \cot \left( \frac{1}{2} \sqrt{3} \left( \xi + \varepsilon \right) \right) \\
  v_{19}(x, t) &= -\frac{2}{3} q - \frac{4}{3} \sqrt{\alpha} \cot \left( \frac{1}{2} \sqrt{3} \left( \xi + \varepsilon \right) \right) \\
\end{align*}
\]

\[(89)\]
\[ u_{20}(x, t) = \pm \frac{2}{3} \sqrt{-3pq} - \frac{2}{3} \tanh\left(\frac{\sqrt{-3pq}}{2} (\xi + E)\right) \]  
\[ v_{20}(x, t) = -\frac{2}{3} pq + \frac{2}{3} \left(\frac{\sqrt{-pq}}{\tanh\left(\frac{\sqrt{-pq}}{2} (\xi + E)\right)} \right)^2 \], (93)

and

\[ u_{21}(x, t) = \pm \frac{2}{3} \sqrt{-3pq} + \frac{2}{3} \coth\left(\frac{\sqrt{-pq}}{2} (\xi + E)\right) \]  
\[ v_{21}(x, t) = -\frac{2}{3} pq + \frac{2}{3} \left(\frac{\sqrt{pq}}{\coth\left(\frac{\sqrt{-pq}}{2} (\xi + E)\right)} \right)^2 \], (94)

where, \(\xi = x \mp \left(\frac{2}{3} \sqrt{-3pq}\right) \frac{\alpha}{\alpha} \), \(pq < 0\).

For \(q = 0\) and \(r = 0\):

\[ u_{22}(x, t) = \frac{2}{3} \sqrt{\frac{x}{x+E}} \]  
\[ v_{22}(x, t) = -\frac{2}{3} \left(\frac{1}{x+E}\right)^2 \], (95)

Figures 5, 6 represent the solutions given by Eq. (79) for different values of \(\alpha\) when \(r = 3\), \(q = 2\) and \(E = 0\).

**CONCLUSION**

This research successfully applied the generalized \(\exp(-\varphi(\xi))\)-expansion method combined with the complex fractional transformation and conformable derivative to exactly solve a special class of time-fractional WBK equations in shallow water, such as the time-fractional ALW equations, the time-fractional variant-Boussinesq equations, and the time fractional Wu-Zhang system of equations. Afterwards, a sequence of new analytical wave solutions for these models were established. Finally, some 3D and 2D plots were added for some of the gained solutions for every model to illustrate the effect of the parameter \(\alpha\) on the behaviors of these solutions. In conclusion, we found that the method mentioned here—with the aid of symbolic computations—is aspiring and efficient, and it is a superior mathematical construction with which to deal with the NPDEs.

**DATA AVAILABILITY STATEMENT**

The original contributions presented in the study are included in the article/supplementary materials, further inquiries can be directed to the corresponding author/s.

**AUTHOR CONTRIBUTIONS**

All authors listed have made a substantial, direct and intellectual contribution to the work, and approved it for publication.
