Abstract. For any finite-dimensional Lie bialgebra $\mathfrak{g}$, we construct a bialgebra $A_{u,v}(\mathfrak{g})$ over the ring $\mathbb{C}[u][v]$, which quantizes simultaneously the universal enveloping bialgebra $U(\mathfrak{g})$, the bialgebra dual to $U(\mathfrak{g}^*)$, and the symmetric bialgebra $S(\mathfrak{g})$. Following [Tur89], we call $A_{u,v}(\mathfrak{g})$ a biquantization of $S(\mathfrak{g})$. We show that the bialgebra $A_{u,v}(\mathfrak{g}^*)$ quantizing $U(\mathfrak{g}^*)$, $U(\mathfrak{g})^*$, and $S(\mathfrak{g}^*)$ is essentially dual to the bialgebra obtained from $A_{u,v}(\mathfrak{g})$ by exchanging $u$ and $v$. Thus, $A_{u,v}(\mathfrak{g})$ contains all information about the quantization of $\mathfrak{g}$. Our construction extends Etingof and Kazhdan’s one-variable quantization of $U(\mathfrak{g})$ [EK96].

Résumé. Étant donné une bigèbre de Lie $\mathfrak{g}$ de dimension finie, nous construisons une $\mathbb{C}[u][v]$-bigèbre $A_{u,v}(\mathfrak{g})$ qui quantifie simultanément la bigèbre enveloppante $U(\mathfrak{g})$, la bigèbre duale de $U(\mathfrak{g}^*)$ et la bigèbre symétrique $S(\mathfrak{g})$. Suivant [Tur89], nous appelons $A_{u,v}(\mathfrak{g})$ une biquantification de $S(\mathfrak{g})$. Nous montrons que la bigèbre $A_{u,v}(\mathfrak{g}^*)$ qui quantifie $U(\mathfrak{g}^*)$, $U(\mathfrak{g})^*$ et $S(\mathfrak{g}^*)$ est en dualité avec la bigèbre obtenue à partir de $A_{u,v}(\mathfrak{g})$ en échangeant $u$ et $v$. La bigèbre $A_{u,v}(\mathfrak{g})$ contient ainsi toutes les informations sur la quantification de $\mathfrak{g}$. Notre construction généralise la quantification en une variable de $U(\mathfrak{g})$ par Etingof et Kazhdan [EK96].

Introduction

The notion of a Lie bialgebra was introduced by Drinfeld [Dri82], [Dri87] in the framework of his algebraic formalism for the quantum inverse scattering method. A Lie bialgebra is a Lie algebra $\mathfrak{g}$ provided with a Lie cobracket $\mathfrak{g} \to \mathfrak{g} \otimes \mathfrak{g}$ which is related to the Lie bracket by a certain compatibility condition. The notion of a Lie bialgebra is self-dual: if $\mathfrak{g}$ is a finite-dimensional Lie bialgebra over a field, then the dual $\mathfrak{g}^*$ is also a Lie bialgebra.

Drinfeld raised the question of quantizing Lie bialgebras (see loc. cit. and [Dri92]). For any Lie bialgebra $\mathfrak{g}$, its universal enveloping algebra $U(\mathfrak{g})$ is a co-Poisson bialgebra. The quantization problem for $\mathfrak{g}$ consists in finding a (topological) bialgebra structure on the module of formal power series $U(\mathfrak{g})[[h]]$ which induces the given bialgebra structure and Poisson cobracket on $U(\mathfrak{g}) = U(\mathfrak{g})[[h]]/(h)$. This problem is solved in the theory of quantum groups for certain semisimple $\mathfrak{g}$. Recently, P. Etingof and D. Kazhdan [EK96] quantized an arbitrary Lie bialgebra $\mathfrak{g}$ over a field $\mathbb{C}$ of characteristic zero. Their construction is based on a delicate analysis of Drinfeld associators.

Besides $U(\mathfrak{g})$, there are other Poisson and co-Poisson bialgebras associated with a Lie bialgebra $\mathfrak{g}$. One can consider, for instance, the (appropriately defined) Poisson bialgebra $U(\mathfrak{g})^*$ dual to $U(\mathfrak{g})$, as well as similar bialgebras $U(\mathfrak{g}^*), U(\mathfrak{g}^*)^*$ associated with $\mathfrak{g}^*$. Note also that the symmetric algebra $S(\mathfrak{g}) = \bigoplus_{n \geq 0} S^n(\mathfrak{g})$ is a bialgebra with Poisson bracket and cobracket extending the Lie bracket and cobracket in $\mathfrak{g}$. The Etingof-Kazhdan theory provides us with quantizations of $U(\mathfrak{g})$ and $U(\mathfrak{g}^*)$ in the category of topological bialgebras. It is essentially clear that, taking the dual bialgebras, we obtain quantizations of $U(\mathfrak{g})^*$ and $U(\mathfrak{g}^*)^*$. The bialgebras $S(\mathfrak{g})$ and $S(\mathfrak{g}^*)$ stay apart and need to be considered separately. At this point, the relationship between all these bialgebras and their quantizations looks a little messy and needs clarification.

The aim of our paper is to sort out and unify these quantizations. We shall show that there is a bialgebra $A(\mathfrak{g})$ quantizing simultaneously $U(\mathfrak{g}), U(\mathfrak{g}^*)^*$, and $S(\mathfrak{g})$. Moreover, the bialgebra $A(\mathfrak{g}^*)$ quantizing $U(\mathfrak{g}^*), U(\mathfrak{g}^*), S(\mathfrak{g}^*)$ is essentially dual to $A(\mathfrak{g})$. Thus, we can view $A(\mathfrak{g})$ as a “master” bialgebra containing all information about the quantization of $\mathfrak{g}$.

To formalize our results, we appeal to the notion of biquantization introduced in [Tur89], [Tur91]. It was inspired by a topological study of skein classes of links in the cylinder over a surface. The idea consists in introducing two independent quantization variables, $u$ and $v$, responsible for the quantization of multiplication and comultiplication, respectively. Let us illustrate this idea with the following construction. Let $A$ be a bialgebra over the ring of formal power series $\mathbb{C}[[u,v]]$. Assume that $A$ is topologically free as a $\mathbb{C}[[u,v]]$-module, commutative modulo $u$, and cocommutative modulo $v$. It is clear that $A/uA$ is a commutative bialgebra with Poisson bracket

$$\{p_u(a), p_u(b)\} = p_u\left(\frac{ab - ba}{u}\right),$$

where $a, b \in A$ and $p_u : A \to A/uA$ is the projection. The morphism $p_u$ is a quantization of the Poisson bialgebra $A/uA$. Similarly, the comultiplication $\Delta$ in $A$ induces on $A/vA$ the structure of a cocommutative bialgebra with Poisson cobracket

$$\delta(p_v(a)) = (p_v \otimes p_v)\left(\frac{\Delta(a) - \Delta^{op}(a)}{v}\right).$$

2
where \( a \in A \) and \( p_v : A \to A/vA \) is the projection. The morphism \( p_v : A \to A/vA \) is a quantization of the co-Poisson bialgebra \( A/vA \). By similar formulas, the quotient \( A/(u,v) = A/(uA + vA) \) acquires both a Poisson bracket and a Poisson cobracket, and becomes a bi-Poisson bialgebra. The projections of \( A/uA \) and \( A/vA \) onto \( A/(u,v) \) quantize the comultiplication and the multiplication in \( A/(u,v) \), respectively. We sum up these observations in the following commutative diagram of projections

\[
\begin{array}{ccc}
A & \longrightarrow & A/uA \\
\downarrow & & \downarrow \\
A/vA & \longrightarrow & A/(u,v)
\end{array}
\] (0.1)

called a biquantization square. This square involves four bialgebras and four bialgebra morphisms quantizing either the multiplication or the comultiplication in their targets. The bialgebra \( A \) appears as the summit of the square, quantizing three other bialgebras. We say that \( A \) is a biquantization of the bi-Poisson bialgebra \( A/(u,v) \). The notion of a biquantization allows us to combine four quantizations of three bialgebras in a single bialgebra. Note that instead of the ring \( C[[u,v]] \) one can use subrings containing \( u \) and \( v \).

In this paper, as a ground ring for biquantization, we use the ring \( C \) of characteristic zero, the bi-Poisson bialgebra \( S(g) \) admits a biquantization. More precisely, we construct a topological \( C[u[[v]] \)-bialgebra \( A_{u,v}(g) \) biquantizing \( S(g) \). Specifically, \( A_{u,v}(g) \) is free as a topological \( C[[u,v]] \)-module, is commutative modulo \( u \) and cocommutative modulo \( v \), and \( A_{u,v}(g)/(u,v) = S(g) \) as bi-Poisson bialgebras. This gives us a biquantization square (0.1) with \( A = A_{u,v}(g) \).

Our main result is that, for any finite-dimensional Lie bialgebra \( g \) over a field \( C \) of characteristic zero, the bi-Poisson bialgebra \( S(g) \) admits a biquantization. More precisely, we construct a topological \( C[u[[v]] \)-bialgebra \( A_{u,v}(g) \) biquantizing \( S(g) \). Specifically, \( A_{u,v}(g) \) is free as a topological \( C[[u,v]] \)-module, is commutative modulo \( u \) and cocommutative modulo \( v \), and \( A_{u,v}(g)/(u,v) = S(g) \) as bi-Poisson bialgebras. This gives us a biquantization square (0.1) with \( A = A_{u,v}(g) \).

Our second result computes the left-bottom corner \( A/vA \) of the biquantization square (0.1), where \( A = A_{u,v}(g) \). Consider the \( C[u] \)-algebra \( V_u(g) \) defined in the same way as the universal enveloping algebra \( U(g) \), except that the identity \( xy - yx = [x,y] \) is replaced by \( xy - yx = u[x,y] \), where \( x, y \in g \). We view \( V_u(g) \) as a parametrized version of \( U(g) \); note that \( V_u(g)/(u-1) = U(g) \). Similarly to \( U(g) \), we provide \( V_u(g) \) with the structure of a co-Poisson bialgebra. We prove that \( A_{u,v}(g)/vA_{u,v}(g) = V_u(g) \) as co-Poisson bialgebras. According to the remarks above, the projection \( A_{u,v}(g) \to A_{u,v}(g)/vA_{u,v}(g) = V_u(g) \) is a quantization of \( V_u(g) \). This is a refined version of the Etingof-Kazhdan quantization of \( U(g) \). Indeed, quotienting both \( A_{u,v}(g) \) and \( V_u(g) \) by \( u - 1 \), we obtain the Etingof-Kazhdan quantization of \( U(g) \) (cf. Remark 8.4).

Our third result concerns the right-top corner \( A/uA \) of the biquantization square for \( A = A_{u,v}(g) \). Namely, we prove that \( A/uA \) is isomorphic to a topological dual of \( V_v(g^*) \) consisting of \( C[v] \)-linear maps \( V_v(g^*) \to C[[v]] \) continuous with respect to the \( v \)-adic topology in \( C[[v]] \) and a suitable topology in \( V_v(g^*) \). This dual is a Poisson bialgebra over \( C[[v]] \). It is isomorphic to the Poisson bialgebra \( E_v(g) \) of functions on the Poisson-Lie group associated with \( g^* \otimes C[[v]] \), cf. [Tur91, Sections 11–12]. (As an algebra, \( E_v(g) = S(g)[[v]] \).) According to the remarks above, the projection \( A_{u,v}(g) \to A_{u,v}(g)/uA_{u,v}(g) \cong E_v(g) \) is a quantization of \( E_v(g) \).

To sum up, the \( C[u[[v]] \)-bialgebra \( A_{u,v}(g) \) quantizes \( S(g) \), \( V_u(g) \), and the topological dual \( E_v(g) \) of \( V_v(g^*) \).
We can apply the same constructions to the dual Lie bialgebra \( g^* \). It is convenient to exchange \( u \) and \( v \), i.e., to consider the \( C[[v]][[u]] \)-bialgebra \( A_{v,u}(g^*) \) obtained from \( A_{u,v}(g^*) \) via an appropriate tensoring with \( C[[v]][[u]] \). As above, \( A_{v,u}(g^*) \) quantizes \( S(g^*) \), \( V_v(g^*) \), and the topological dual \( E_u(g^*) \) of \( V_u(g) \). Observe that the three lower level corners of the biquantization square for \( A_{v,u}(g^*) \) are dual to the lower level corners of the biquantization square for \( A_{u,v}(g) \). We prove that the bialgebras \( A_{u,v}(g) \) and \( A_{v,u}(g^*) \) are essentially dual to each other.

Our definition of \( A_{u,v}(g) \) is obtained by an elaboration of Etingof and Kazhdan’s quantization of \( U(g) \) and can be regarded as an extension of their work. The definition goes in two steps. First we replace the variable \( h \) by the product \( uv \), which allows us to introduce two variables into the game. In particular, the universal \( R \)-matrix \( R_h \) constructed in [EK96] gives rise to a two-variable universal \( R \)-matrix \( R_{u,v} \). Then we separate the variables \( u, v \) in an expression for \( R_{u,v} \) by collecting all powers of \( u \) (resp. \( v \)) in the first (resp. second) tensor factor. The algebra \( A_{u,v}(g) \) is generated by the first tensor factors appearing in such an expression.

The plan of the paper is as follows. In Section 1 we recall the notions of Poisson, co-Poisson, and bi-Poisson bialgebras, as well as the definitions of quantizations and biquantizations. In Section 2 we formulate the main results of the paper (Theorems 2.3, 2.6, 2.9, and 2.11). In Section 3 we recall a construction due to Drinfeld producing certain linear maps out of a bialgebra comultiplication. We use these maps to show that every bialgebra over \( C[[u]] \) has a canonical subalgebra that is commutative modulo \( u \). In Section 4 we collect several useful facts concerning \( C[[u,v]] \)-modules. In Section 5 we recall the basic facts concerning Etingof and Kazhdan’s quantization \( U_h(g) \) of a Lie bialgebra \( g \). In Section 6 we define \( A_{u,v}(g) \) and show that it is a topologically free module. The proof that \( A_{u,v}(g) \) is an algebra is also given in Section 6; it uses Lemma 6.10 whose proof is postponed to Section 7. In Section 7 we introduce a completion \( \hat{A}_{u,v}(g) \) of \( A_{u,v}(g) \) and define a bialgebra structure on \( A_{u,v}(g) \). Section 8 is devoted to the proofs of Theorems 2.3 and 2.6, and the first part of Theorem 2.9. In Section 9 we investigate the two-variable universal \( R \)-matrix \( R_{u,v} \) and construct a nondegenerate bialgebra pairing between \( A_{u,v}(g) \) and a certain bialgebra \( A_{\cop} \). In Section 10, using the pairing of Section 9, we relate \( S(g)[[v]] \) to the topological dual of \( V_v(g^*) \), which allows us to complete the proof of Theorem 2.9. Section 11 complements Etingof and Kazhdan’s work [EK96]: in Theorem 11.1 we compare their constructions of quantization for a Lie bialgebra and its dual. In Section 12 we use the results of Section 11 to show that \( A_{\cop} \cong A_{v,u}(g^*) \) and prove Theorem 2.11. In the appendix we describe explicitly the biquantization of a trivial Lie bialgebra.

We fix once and for all a field \( C \) of characteristic zero.
1. Poisson bialgebras and their quantizations

We introduce the basic notions used throughout the paper. All objects will be considered over a field $\mathbb{C}$ of characteristic zero. Given a commutative $\mathbb{C}$-algebra $\kappa$, we recall that a $\kappa$-bialgebra is an associative, unital $\kappa$-algebra $A$ equipped with morphisms of algebras $\Delta : A \to A \otimes \kappa A$, the comultiplication, and $\varepsilon : A \to \kappa$, the counit, such that

$$(\Delta \otimes \text{id}_A)\Delta = (\text{id}_A \otimes \Delta)\Delta$$

and

$$(\varepsilon \otimes \text{id}_A)\Delta = (\text{id}_A \otimes \varepsilon)\Delta = \text{id}_A,$$

where $\text{id}_A$ denotes the identity map of $A$. We shall also consider topological bialgebras. A topological bialgebra $A$ is defined in terms of a two-sided ideal $I \subset A$. The definition is the same as for a $\kappa$-bialgebra, except that the comultiplication takes values in the completed tensor product $A \hat{\otimes} \kappa A = \lim_{\leftarrow n} (A/I^n \otimes \kappa A/I^n)$.

The topological bialgebra $A$ is equipped with the $I$-adic topology, namely the linear topology for which the powers of $I$ form a fundamental system of neighbourhoods of 0 (see [Bou61, Chap. 3]).

1.1. Poisson Bialgebras. A Poisson bracket on a commutative algebra $B$ over the field $\mathbb{C}$ is a Lie bracket $\{ , \} : B \times B \to B$ satisfying the Leibniz rule, i.e., such that for all $a, b, c \in B$ we have

$$\{ab, c\} = a\{b, c\} + b\{a, c\}. \quad (1.1)$$

A Poisson bracket on $B$ defines a Poisson bracket on $B \otimes B$ by

$$\{a \otimes a', b \otimes b'\} = ab \otimes \{a', b'\} + \{a, b\} \otimes a'b' \quad (1.2)$$

where $a, a', b, b' \in B$.

A Poisson bialgebra is a commutative $\mathbb{C}$-bialgebra $B$ equipped with a Poisson bracket such that the comultiplication $\Delta : B \to B \otimes B$ preserves the Poisson bracket:

$$\Delta(\{a, b\}) = \{\Delta(a), \Delta(b)\} \quad (1.3)$$

for all $a, b \in B$.

The following well-known construction yields examples of Poisson bialgebras. Let $A$ be a bialgebra over the ring $\mathbb{C}[u]$ of polynomials in a variable $u$. Assume that $A$ is commutative modulo $u$ in the sense that $ab - ba \in uA$ for all $a, b \in A$. If the multiplication by $u$ is injective on $A$, then the quotient bialgebra $A/uA$ is a Poisson bialgebra with Poisson bracket defined for all $a, b \in A$ by

$$\{p(a), p(b)\} = p\left(\frac{ab - ba}{u}\right), \quad (1.4)$$

where $p : A \to A/uA$ is the projection.

The inverse of this construction is called quantization. More precisely, a quantization of a Poisson $\mathbb{C}$-bialgebra $B$ is a $\mathbb{C}[u]$-bialgebra $A$ which is isomorphic as a $\mathbb{C}[u]$-module to
the module \( B[u] \) of polynomials in \( u \) with coefficients in \( B \), is commutative modulo \( u \), and such that \( A/uA \) is isomorphic to \( B \) as a Poisson bialgebra. The latter condition implies that Equality (1.4) holds for all \( a, b \in A \), where \( p : A \to A/uA \cong B \) is the projection and \( \{ , \} \) is the Poisson bracket in \( B \).

One can similarly define quantization over the ring \( \mathbb{C}[[u]] \) of formal power series. To shorten, we call \( \mathbb{C}[[u]] \)-bialgebra a topological \( \mathbb{C}[[u]] \)-algebra \( A \) where the topology is the \( u \)-adic topology, i.e., is defined by the ideal \( uA \).

It is straightforward to dualize the definitions of Section 1.1. Assume that \( A \) is a cocommutative \( \mathbb{C} \)-coalgebra with comultiplication of \( \Delta \) satisfying the Leibniz rule, i.e., such that

$$\delta(a) \Delta(b) + \Delta(a) \delta(b)$$

for all \( a, b \in A \).

We obtain co-Poisson bialgebras by dualizing the constructions of Section 1.1. Here again we have the choice between the ring \( \mathbb{C}[v] \) of polynomials and the ring \( \mathbb{C}[[v]] \) of formal power series in a variable \( v \). In the context of co-Poisson bialgebras, it will be more relevant to work with formal power series. So let \( A \) be a bialgebra over \( \mathbb{C}[[v]] \) in the sense of Section 1.1. Assume that \( A \) is cocommutative modulo \( v \), i.e., for all \( a \in A \) we have

$$\Delta(a) - \Delta^{\text{op}}(a) \in vA \otimes_{\mathbb{C}[[v]]} A,$$

where \( \Delta \) denotes the comultiplication and \( \Delta^{\text{op}} \) the opposite comultiplication of \( A \). If \( v \) acts injectively on \( A \otimes_{\mathbb{C}[[v]]} A \), then the quotient bialgebra \( A/vA \) is a co-Poisson bialgebra with comultiplication and

$$\delta(p(a)) = (p \otimes p) \left( \frac{\Delta(a) - \Delta^{\text{op}}(a)}{v} \right)$$

for \( a \in A \), where \( p : A \to A/vA \) is the projection.

A coquantization of a co-Poisson \( \mathbb{C} \)-bialgebra \( B \) is a \( \mathbb{C}[[v]] \)-bialgebra \( A \) which is isomorphic to \( B[[v]] \) as a \( \mathbb{C}[[v]] \)-module, is cocommutative modulo \( v \), and such that \( A/vA \) is isomorphic to \( B \) as a co-Poisson bialgebra. This implies that Formula (1.8) holds for any \( a \in A \), where \( p : A \to A/vA \cong B \) is the projection and \( \delta \) is the Poisson cobracket in \( B \).
1.3. Bi-Poisson Bialgebras. Following [Tur89, 91], we combine the definitions given above and define the concepts of bi-Poisson bialgebras and their biquantizations. A bi-Poisson bialgebra is a commutative and cocommutative bialgebra $B$ equipped with Poisson bracket $\{ \cdot, \cdot \}$ and Poisson cobracket $\delta$ turning $B$ into a Poisson and co-Poisson bialgebra, and satisfying the additional condition:

$$\delta(\{a,b\}) = \{\delta(a), \Delta(b)\} + \{\Delta(a), \delta(b)\}$$

for all $a, b \in B$.

In order to introduce biquantization, we use two variables $u$ and $v$ and the ring $\mathbb{C}[u][[v]]$ which consists of formal power series in $v$ whose coefficients are polynomials in $u$. The following definitions can easily be adapted to the rings $\mathbb{C}[u,v]$, $\mathbb{C}[u][[v]]$, and $\mathbb{C}[v][[u]]$.

By a $\mathbb{C}[u][[v]]$-bialgebra $A$ we mean a topological $\mathbb{C}[u][[v]]$-algebra $A$, where the topology is defined by the ideal $vA$, so that the comultiplication takes values in

$$A \hat{\otimes} \mathbb{C}[u][[v]] A = \lim_{\leftarrow n} \left( A/v^n A \otimes \mathbb{C}[u][[v]]/(v^n) A/v^n A \right).$$

Let $A$ be a $\mathbb{C}[u][[v]]$-bialgebra that is commutative modulo $u$ and cocommutative modulo $v$. If $u$ and $v$ act injectively on $A$, then the quotient bialgebra $A/(uA + vA)$ is a bi-Poisson bialgebra over $\mathbb{C}$ with Poisson bracket given by (1.4) and Poisson cobracket given by (1.8), where $p : A \to A/(uA + vA)$ is the projection. Inverting this construction, we obtain the following notion of biquantization.

1.4. Definition.— A biquantization of a bi-Poisson $\mathbb{C}$-bialgebra $B$ is a $\mathbb{C}[u][[v]]$-bialgebra $A$ which is isomorphic to $B[u][[v]]$ as a $\mathbb{C}[u][[v]]$-module, is commutative modulo $u$ and cocommutative modulo $v$, and such that $A/(uA + vA) = B$ as bi-Poisson bialgebras.

Any biquantization $A$ gives rise to a “biquantization square” as follows. Observe that $A/vA$ is a cocommutative co-Poisson bialgebra over $\mathbb{C}[u]$ and that $A/uA$ is a commutative Poisson bialgebra over $\mathbb{C}[[v]]$. We form the commutative square

$$\begin{array}{ccc}
A & \xrightarrow{p_u} & A/uA \\
\downarrow p_v & & \downarrow q_v \\
A/vA & \xrightarrow{q_u} & B
\end{array}$$

where $p_u, p_v, q_u, q_v$ are the natural projections. The morphisms $p_u$ and $q_u$ are quantizations whereas $p_v$ and $q_v$ are coquantizations. The projection $p : A \to B$ can therefore be factored in two ways as a composition of a quantization and a coquantization: $p = q_v p_u = q_u p_v$.

2. Statement of the main results

Any Lie bialgebra $\mathfrak{g}$ gives rise to a bi-Poisson bialgebra $S(\mathfrak{g})$. In this section, after recalling the necessary facts on Lie bialgebras, we state our main theorems concerning a biquantization of $S(\mathfrak{g})$.  

7
2.1. Lie Bialgebras (cf. [Dri82]). A Lie cobracket on a vector space $g$ over $C$ is a linear map $\delta : g \to g \otimes g$ such that

$$\sigma \delta = -\delta \quad \text{and} \quad (\text{id} + \tau + \tau^2)(\delta \otimes \text{id}) = 0$$

where $\sigma$ (resp. $\tau$) is the automorphism of $g \otimes g$ (resp. of $g \otimes g \otimes g$) given by $\sigma(x \otimes y) = y \otimes x$ (resp. $\tau(x \otimes y \otimes z) = y \otimes z \otimes x$). It is clear that the transpose map $\delta^* : g^* \otimes g^* \subset (g \otimes g)^* \to g^*$ is a Lie bracket in the dual space $g^* = \text{Hom}_C(g, C)$.

A Lie bialgebra is a vector space over $C$ equipped with a Lie bracket $[\, , ] : g \otimes g \to g$ and a Lie cobracket $\delta : g \to g \otimes g$ such that

$$\delta([x,y]) = x\delta(y) - y\delta(x)$$

for all $x, y \in g$. Here $g$ acts on $g \otimes g$ by the adjoint action $(x, z, z') \in g$:

$$x(z \otimes z') = [x, z] \otimes z' + z \otimes [x, z'].$$

Let $g$ be a Lie bialgebra with Lie bracket $[\, , ]$ and Lie cobracket $\delta$. It is easy to check that, if we replace $[\, , ]$ by $-[\, , ]$ without changing the Lie cobracket, then we obtain a new Lie bialgebra, which we denote $g^{\text{op}}$. If we leave the Lie bracket in $g$ unaltered and replace $\delta$ by $-\delta$, then we obtain another Lie bialgebra denoted $g^{\text{cop}}$. The opposite $-\text{id}_g$ of the identity map of $g$ is an isomorphism of Lie bialgebras $g^{\text{op}} \to g^{\text{cop}}$ and $g \to (g^{\text{op}})^{\text{cop}}$.

When the Lie bialgebra $g$ is finite-dimensional, then the dual vector space $g^*$ with the transpose bracket and cobracket is also a Lie bialgebra. Clearly, $(g^*)^{\text{op}} = (g^{\text{cop}})^*$ and $(g^*)^{\text{cop}} = (g^{\text{op}})^*$.

2.2. A Bi-Poisson Bialgebra Associated to $g$ (cf. [Tur89, 91]). For any vector space $g$, the symmetric algebra $S(g) = \bigoplus_{n \geq 0} S^n(g)$ has a structure of bialgebra with comultiplication $\Delta$ determined by $\Delta(x) = x \otimes 1 + 1 \otimes x$ for all $x \in g = S^1(g)$. If $g$ is a Lie algebra with Lie bracket $[\, , ]$, then $S(g)$ is a Poisson bialgebra with Poisson bracket determined by

$$\{x, y\} = [x, y]$$

for all $x, y \in g$. If $g$ is a Lie coalgebra, then $S(g)$ is a co-Poisson bialgebra with the unique Poisson cobracket such that its restriction to $S^1(g) = g$ is the Lie cobracket of $g$. If, furthermore, $g$ is a Lie bialgebra, then $S(g)$ is a bi-Poisson bialgebra ([Tur91, Theorem 16.2.4]).

We now state our first main theorem.

2.3. Theorem.— Given a finite-dimensional Lie bialgebra $g$, there exists a biquantization $A_{u,v}(g)$ for $S(g)$.

The construction of $A_{u,v}(g)$ will be given in Section 6. It is an extension of Etingof and Kazhdan’s quantization of $U(g)$, as constructed in [EK96]. As in loc. cit., our definition of $A_{u,v}(g)$ is based on the choice of a Drinfeld associator. We nevertheless believe that it is unique up to isomorphism. We shall not discuss this point in this paper.

The fundamental feature of our construction is that the bialgebras in the lower left and the upper right corners in the biquantization square (1.11) when $A = A_{u,v}(g)$ are
closely related to the universal enveloping bialgebra \( U(\mathfrak{g}) \) of \( \mathfrak{g} \) and to the dual of \( U(\mathfrak{g}^*) \). We shall give precise statements in the remaining part of this section. We begin with a short discussion of \( U(\mathfrak{g}) \) and its parametrized version \( V_u(\mathfrak{g}) \).

2.4. The Bialgebra \( V_u(\mathfrak{g}) \). Let \( \mathfrak{g} \) be a Lie algebra over \( \mathbb{C} \). Consider the \( \mathbb{C}[u] \)-algebra \( T(\mathfrak{g})[u] \) of polynomials with coefficients in the tensor algebra \( T(\mathfrak{g}) = \bigoplus_{n \geq 0} \mathfrak{g} \otimes \cdots \otimes \mathfrak{g} \). Let \( V_u(\mathfrak{g}) \) be the quotient of \( T(\mathfrak{g})[u] \) by the two-sided ideal generated by the elements

\[
x \otimes y - y \otimes x - u[x, y],
\]

where \( x, y \in \mathfrak{g} \). The composition of the natural linear maps \( \mathfrak{g} = T^1(\mathfrak{g}) \subset T(\mathfrak{g}) \subset T(\mathfrak{g})[u] \to V_u(\mathfrak{g}) \) is an embedding whose image generates \( V_u(\mathfrak{g}) \) as a \( \mathbb{C}[u] \)-algebra. The algebra \( V_u(\mathfrak{g}) \) is a bialgebra with comultiplication \( \Delta \) determined by

\[
\Delta(x) = x \otimes 1 + 1 \otimes x \quad (2.4)
\]

for all \( x \in \mathfrak{g} \). Clearly, \( V_u(\mathfrak{g})/(u - 1)V_u(\mathfrak{g}) = U(\mathfrak{g}) \) and \( V_u(\mathfrak{g})/uV_u(\mathfrak{g}) = S(\mathfrak{g}) \).

In this paper, we will use the fact that \( V_u(\mathfrak{g}) \) embeds in the polynomial algebra \( U(\mathfrak{g})[u] \). The algebra \( U(\mathfrak{g})[u] \) is equipped with a \( \mathbb{C}[u] \)-bialgebra structure whose comultiplication \( \Delta \) is also given by (2.4). Let \( i : V_u(\mathfrak{g}) \to U(\mathfrak{g})[u] \) be the morphism of \( \mathbb{C}[u] \)-bialgebras defined by \( i(x) = ux \) for all \( x \in \mathfrak{g} \subset V_u(\mathfrak{g}) \). Using the Poincaré-Birkhoff-Witt theorem (cf. [Dix74, Chap. 2]), we see that \( V_u(\mathfrak{g}) \) is a free \( \mathbb{C}[u] \)-module and that \( i \) is injective. To describe its image, recall the standard filtration \( U^0(\mathfrak{g}) = \mathbb{C} \subset U^1(\mathfrak{g}) \subset U^2(\mathfrak{g}) \subset \cdots \) of \( U(\mathfrak{g}) \): the subspace \( U^m(\mathfrak{g}) \) is the image of \( \bigoplus_{k=0}^m \mathfrak{g} \otimes \cdots \otimes \mathfrak{g} \) under the projection \( T(\mathfrak{g}) \to U(\mathfrak{g}) \). Then

\[
i(V_u(\mathfrak{g})) = \left\{ \sum_{m \geq 0} a_m u^m \in U(\mathfrak{g})[u] \mid a_m \in U^m(\mathfrak{g}) \text{ for all } m \geq 0 \right\}.
\]

We also have \( U^m(\mathfrak{g})/U^{m-1}(\mathfrak{g}) = S^m(\mathfrak{g}) \) for all \( m, n \geq 0 \). From now on, we identify \( V_u(\mathfrak{g}) \) with \( i(V_u(\mathfrak{g})) \) and \( S(\mathfrak{g}) \) with the graded algebra \( \bigoplus_{m \geq 0} U^m(\mathfrak{g})/U^{m-1}(\mathfrak{g}) \). Under these identifications, the natural projection \( q_u : V_u(\mathfrak{g}) \to S(\mathfrak{g}) \) sends any element \( \sum_{m \geq 0} a_m u^m \in V_u(\mathfrak{g}) \) to \( \sum_{m \geq 0} a_m \in S(\mathfrak{g}) \), where \( a_m \in S^m(\mathfrak{g}) \) is the class of \( a_m \in U^m(\mathfrak{g}) \) modulo \( U^{m-1}(\mathfrak{g}) \). These observations lead to the following easy fact.

2.5. Lemma.— The \( \mathbb{C}[u] \)-bialgebra \( V_u(\mathfrak{g}) \) is a quantization of the Poisson bialgebra \( S(\mathfrak{g}) \).

Suppose now that \( \mathfrak{g} \) is a Lie bialgebra with Lie cobracket \( \delta \). It was shown in [Tur91, Theorem 7.4] that \( \delta \) induces a co-Poisson bialgebra structure on \( V_u(\mathfrak{g}) \) with Poisson co-bracket \( \delta_u \) determined for all \( x \in \mathfrak{g} \) by

\[
\delta_u(ux) = u^2 \delta(x) \in u\mathfrak{g} \otimes u\mathfrak{g} \subset V_u(\mathfrak{g}) \otimes \mathbb{C}[u] V_u(\mathfrak{g}). \quad (2.5)
\]

The projection \( q_u : V_u(\mathfrak{g}) \to S(\mathfrak{g}) \) preserves the co-Poisson structure; in other words, \( V_u(\mathfrak{g}) \) is a quantization of \( S(\mathfrak{g}) \) in the category of co-Poisson bialgebras.

2.6. Theorem.— For the bialgebra \( A_{u,v}(\mathfrak{g}) \) of Theorem 2.3, there is an isomorphism of co-Poisson \( \mathbb{C}[u] \)-bialgebras

\[
A_{u,v}(\mathfrak{g})/vA_{u,v}(\mathfrak{g}) = V_u(\mathfrak{g}).
\]

Theorem 2.6 will be proved in Section 8.
2.7. The Bialgebra $E_v(\mathfrak{g})$. Let $\mathfrak{g}$ be a finite-dimensional Lie coalgebra with Lie cobracket $\delta$. By Section 2.2 the cobracket $\delta$ induces a co-Poisson bialgebra structure on $S(\mathfrak{g})$.

Turaev ([Tur89, Sections 4–5] and [Tur91, Sections 11–12]) constructed a (topological) $C[[v]]$-bialgebra $E_v(\mathfrak{g})$ which may be viewed as the bialgebra of functions on the simply-connected Lie group associated to the dual Lie algebra $\mathfrak{g}^*$. As an algebra, $E_v(\mathfrak{g})$ is the algebra of formal power series with coefficients in $S(\mathfrak{g})$:

$$E_v(\mathfrak{g}) = S(\mathfrak{g})[[v]].$$

To define the comultiplication in $E_v(\mathfrak{g})$, consider the Campbell-Hausdorff series

$$\mu(X,Y) = \log(e^X e^Y) = X + Y + \frac{1}{2} [X,Y] + \frac{1}{12} ([X,[X,Y]] + [[X,Y],Y]) + \cdots$$

(2.6)

where $X, Y \in \mathfrak{g}^*$. Let us multiply all Lie brackets of length $n$ by $v^n$. This yields the modified Campbell-Hausdorff series

$$\mu_v(X,Y) = \frac{1}{v} \log(e^{vX} e^{vY}) = X + Y + \frac{v}{2} [X,Y] + \frac{v^2}{12} ([X,[X,Y]] + [[X,Y],Y]) + \cdots.$$ 

(2.7)

The comultiplication $\Delta'$ in $E_v(\mathfrak{g})$ is given by $a \mapsto a \circ \mu_v$, which makes sense when we identify elements of $E_v(\mathfrak{g})$ with $C[[v]]$-valued polynomial functions on $\mathfrak{g}^*$. For $x \in \mathfrak{g} \subset E_v(\mathfrak{g})$ we have

$$\Delta'(x) = x \otimes 1 + 1 \otimes x + \frac{v}{2} \delta(x) + \frac{v^2}{12} \sum_i (x_i' x_i'' \otimes x_i''' + x_i''' x_i'' \otimes x_i') + \cdots,$$

(2.8)

where $(\text{id} \otimes \delta)(x) = \sum_i x_i' \otimes x_i'' \otimes x_i'''$. For details, see loc. cit.

Let $q_v : E_v(\mathfrak{g}) \to S(\mathfrak{g})$ be the algebra morphism sending an element of $E_v(\mathfrak{g})$ to its class modulo $vE_v(\mathfrak{g})$. Formula (2.8) implies that the induced map $E_v(\mathfrak{g})/vE_v(\mathfrak{g}) \to S(\mathfrak{g})$ is an isomorphism of co-Poisson bialgebras. This leads to the following.

2.8. Lemma.— The $C[[v]]$-bialgebra $E_v(\mathfrak{g})$ is a coquantization of the co-Poisson bialgebra $S(\mathfrak{g})$.

If the Lie coalgebra $\mathfrak{g}$ has a Lie bracket $[\ ,\ ]$ turning it into a Lie bialgebra, then $E_v(\mathfrak{g})$ carries a structure of a Poisson bialgebra whose Poisson bracket $\{\ ,\ \}$ is uniquely determined by the condition

$$\{x_1, x_2\} \equiv [x_1, x_2] \mod \left( \bigoplus_{n \geq 2} S^n(\mathfrak{g}) \right)[[v]].$$

(2.9)

for all $x_1, x_2 \in \mathfrak{g}$ (cf. [Tur91, Theorem 11.4 and Remark 11.7]).

2.9. Theorem.— For the bialgebra $A_{u,v}(\mathfrak{g})$ of Theorem 2.3, there is an isomorphism of Poisson $C[[v]]$-bialgebras

$$A_{u,v}(\mathfrak{g})/uA_{u,v}(\mathfrak{g}) = E_v(\mathfrak{g}).$$

Theorem 2.9 will be proved in two steps: in Section 8.2 we prove that $A_{u,v}(\mathfrak{g})/uA_{u,v}(\mathfrak{g}) = S(\mathfrak{g})[[v]]$ as an algebra; in Section 10.7 we determine its coalgebra structure.
2.10. Duality. By Theorem 2.3 we have a biquantization square

\[ A_{u,v}(g) \quad \xrightarrow{p_u} \quad A_{u,v}(g)/uA_{u,v}(g) \]
\[ \quad \xrightarrow{q_v} \quad \frac{A_{u,v}(g)}{uA_{u,v}(g)} \]
\[ \xrightarrow{p_v} \quad \frac{A_{v,u}(g')}{vA_{v,u}(g')} \quad \xrightarrow{q_u} \quad S(g) \]  \hspace{1cm} (2.10a)

Replacing \( g \) by the Lie bialgebra \( g' = (g^*)^{\text{cop}} \) (see Section 2.1 for the notation) and exchanging \( u \) and \( v \), we obtain the biquantization square

\[ \frac{A_{v,u}(g')}{vA_{v,u}(g')} \quad \xrightarrow{p_v} \quad \frac{A_{v,u}(g')}{vA_{v,u}(g')} \]
\[ \xrightarrow{q_u} \quad S(g') \]  \hspace{1cm} (2.10b)

We prove that these squares are in duality as follows.

Let \( K \) be a commutative \( \mathbf{C} \)-algebra together with two subalgebras \( K_1 \) and \( K_2 \). Given a \( K_1 \)-module \( A \) and a \( K_2 \)-module \( B \), a \( \mathbf{C} \)-bilinear map \((\ , \ ) : A \times B \to K\) will be called a pairing if

\[ (\lambda_1 a, \lambda_2 b) = \lambda_1 \lambda_2 (a, b) \]

for all \( \lambda_1 \in K_1 \subset K, \, \lambda_2 \in K_2 \subset K, \, a \in A, \) and \( b \in B \). We say that the pairing \((\ , \ )\) is nondegenerate if both annihilators

\[ \{ a \in A \mid (a, b) = 0 \text{ for all } b \in B \} \quad \text{and} \quad \{ b \in B \mid (a, b) = 0 \text{ for all } a \in A \} \]

vanish. The pairing \( A \times B \to K \) induces a pairing \((\ , \ ) : (A \otimes_{K_1} A) \times (B \otimes_{K_2} B) \to K \) by

\[ (a \otimes a', b \otimes b') = (a, b) (a', b') \]

for all \( a, a' \in A \) and \( b, b' \in B \). Suppose, in addition, that \( A \) and \( B \) are bialgebras over \( K_1 \) and \( K_2 \), respectively. The pairing \((\ , \ ) : A \times B \to K\) is a bialgebra pairing if

\[ (a, bb') = (\Delta(a), b \otimes b'), \]
\[ (aa', b) = (a \otimes a', \Delta(b)), \]
\[ (a, 1) = \varepsilon(a), \]
\[ (1, b) = \varepsilon(b) \]  \hspace{1cm} (2.11)

for all \( a, a' \in A \) and \( b, b' \in B \), where \( \Delta \) denotes the comultiplication and \( \varepsilon \) the counit.

2.11. Theorem. — Let \( g \) be a finite-dimensional Lie bialgebra and \( g' = (g^*)^{\text{cop}} \). Then there is a nondegenerate bialgebra pairing

\[ A_{u,v}(g) \times A_{v,u}(g') \to \mathbf{C}[[u, v]], \]

which induces the standard bialgebra pairing

\[ S(g) \times S(g') = A_{u,v}(g)/(u, v) \times A_{v,u}(g')/(u, v) \to \mathbf{C}, \]

uniquely determined by \((x, y) = (x, y)\) for all \( x \in g \) and \( y \in g' = g^* \), where \((\ , \ ) : g \times g^* \to \mathbf{C}\) is the evaluation pairing.

Theorem 2.11 will be proved in Section 12. Note that, quotienting by \( u \) (resp. \( v \)), we obtain nondegenerate bialgebra pairings

\[ E^v(g) \times V^v(g') \to \mathbf{C}[[v]] \quad \text{and} \quad V^u(g) \times E^u(g') \to \mathbf{C}[[u]]. \]
3. The maps $\delta^n$

Let $A$ be a $\mathbb{C}[[u]]$-bialgebra in the sense of Section 1.1. In [Dri87, Section 7] Drinfeld used a general procedure to construct a $\mathbb{C}[[u]]$-subalgebra $A'$ of $A$. In Drinfeld’s terms, if $A$ is a quantized universal enveloping algebra, then $A'$ is a quantized formal series Hopf algebra. The subalgebra $A'$ is defined using a family of linear maps $(\delta^n : A \to A^{\otimes n})_{n \geq 0}$, whose definition will be recalled below.

In this section, we prove that $A'$ is commutative modulo $u$. To this end, we establish some properties of the maps $\delta^n$.

3.1. Definition of $\delta^n$. Starting from a bialgebra $A$ over a commutative ring $\kappa$ with comultiplication $\Delta$ and counit $\varepsilon$, we define for each $n \geq 0$ a morphism of algebras $\Delta^n : A \to A^{\otimes n}$ as follows: $\Delta^0 = \varepsilon : A \to \kappa$, $\Delta^1 = \text{id}_A : A \to A$, the map $\Delta^2 : A \to A^{\otimes 2}$ is the comultiplication $\Delta$ and, for $n \geq 3$,

$$\Delta^n = (\Delta \text{id}_A^\otimes (n-2)) \Delta^{n-1}.$$ 

Let us embed $A^{\otimes n}$ into $A^{\otimes (n+1)}$ by tensoring on the right by the unit $1 \in A$. We thus get a direct system of algebras

$$A \to A^{\otimes 2} \to A^{\otimes 3} \to \cdots$$

whose limit we denote by $A^{\otimes \infty}$. In this way, each $A^{\otimes n}$ is naturally embedded in $A^{\otimes \infty}$.

Let $I$ be a finite subset of the set of positive integers $\mathbb{N}' = \{1, 2, 3, \ldots\}$. If $n = |I|$ is the cardinality of $I$, we define an algebra morphism $j_I : A^{\otimes n} \to A^{\otimes \infty}$ as follows. If $I = \{i_1, \ldots, i_n\}$ with $i_1 < \ldots < i_n$, then $j_I(a_1 \otimes \cdots \otimes a_n) = b_1 \otimes b_2 \otimes \cdots$, where $b_i = 1$ if $i \notin I$ and $b_{i_p} = a_p$ for $p = 1, \ldots, n$. If $I = \emptyset$, then $j_I : \kappa \to A^{\otimes \infty}$ is the $\kappa$-linear map sending the unit of $\kappa$ to the unit of $A^{\otimes \infty}$.

Suppose we have a $\kappa$-linear map $f : A \to A^{\otimes n}$ for some $n \geq 0$. For any set $I \subset \mathbb{N}'$ of cardinality $n$, we define a linear map $f_I : A \to A^{\otimes \infty}$ by $f_I = j_I \circ f$. If $I = \{1, \ldots, n\}$, then $f_I$ is equal to $f$ composed with the standard embedding of $A^{\otimes n}$ in $A^{\otimes \infty}$. This shows that knowing the linear map $f : A \to A^{\otimes n}$ is equivalent to knowing the family of maps $f_I : A \to A^{\otimes \infty}$ indexed by the subsets $I$ of $\mathbb{N}'$ of cardinality $n$. In particular, from each $\Delta^n : A \to A^{\otimes n}$ we obtain the family of linear maps $(\Delta_I)$ indexed by the sets $I \subset \mathbb{N}'$ of cardinality $n$ and defined by $\Delta_I = (\Delta^n)_I : A \to A^{\otimes \infty}$.

After these preliminaries, we define the maps $\delta^n : A \to A^{\otimes n}$ for $n \geq 0$ by the following relation in terms of finite sets $I \subset \mathbb{N}'$:

$$\delta_I = \sum_{J \subset I} (-1)^{|J|-|I|} \Delta_J. \quad (3.1)$$

By the inclusion-exclusion principle, we have the equivalent relation

$$\Delta_I = \sum_{J \subset I} \delta_J. \quad (3.2)$$

It follows immediately from (3.1) that

$$\delta_I(1) = \begin{cases} 1 & \text{if } I = \emptyset, \\ 0 & \text{otherwise.} \end{cases} \quad (3.3)$$
3.2. Lemma.— Let \( a, b \in A \) and \( K \) be a finite subset of \( \mathbb{N}' \). Then
\[
\delta_K(ab) = \sum_{I, J \subset K, I \cup J = K} \delta_I(a) \delta_J(b).
\] (3.4)

Moreover, if \( K \neq \emptyset \), then
\[
\delta_K(ab - ba) = \sum_{I, J \subset K, I \cap J \neq \emptyset} \left( \delta_I(a) \delta_J(b) - \delta_J(b) \delta_I(a) \right).
\] (3.5)

Proof.— In order to prove (3.4), we first observe that by (3.2),
\[
\sum_{K' \subset K} \delta_{K'}(ab) = \Delta_K(ab) = \delta_I(a) \delta_J(b).
\] (3.6)

We rewrite (3.6) as follows:
\[
\sum_{K' \subset K} \delta_{K'}(ab) = \sum_{K' \subset K} \left( \sum_{I, J \subset K', I \cup J = K} \delta_I(a) \delta_J(b) \right).
\] (3.7)

Let us prove (3.4) by induction on the cardinality of \( K \). If \( K = \emptyset \), then \( \delta_K = j_\emptyset \circ \varepsilon \), which is a morphism of algebras. Suppose now that (3.4) holds for all sets of cardinality \(< |K| \), in particular for all proper subsets \( K' \) of \( K \). Thus, the right-hand side of (3.7) equals
\[
\sum_{K' \subset K, K' \neq K} \delta_{K'}(ab) + \sum_{I, J \subset K, I \cup J = K} \delta_I(a) \delta_J(b).
\]

We get the desired formula by subtracting the summands corresponding to the proper subsets \( K' \) of \( K \) from both sides of (3.7).

Formula (3.5) follows from (3.4) and the fact that \( \delta_I(a) \) and \( \delta_J(b) \) commute when \( I \cap J = \emptyset \).

3.3. Remark.— Note that, if \( I \) and \( J \subset \mathbb{N}' \) are disjoint finite sets, then
\[
(\delta_I \otimes \delta_J) \circ \Delta = \delta_{I \cup J}.
\] (3.8)

Eric Müller observed (private communication) that \( \delta^n : A \to A^{\otimes n} \) can also be defined as \( \delta^n = (\text{id}_A - \varepsilon)^{\otimes n} \circ \Delta^{\otimes n} \).

3.4. Definition of \( A' \). Let \( A \) be a bialgebra over \( \mathbb{C}[[u]] \) in the sense of Section 1.1. Using the comultiplication \( \Delta : A \to A \otimes \mathbb{C}[[u]] A \), we define \( \mathbb{C}[[u]] \)-linear maps \( \delta^n : A \to A^{\otimes n} \) as in Section 3.1. Observe that Formulas (3.1)–(3.5) hold in this setting as well. Following Drinfeld [Dri87, Section 7], we introduce the submodule \( A' \) of \( A \) by
\[
A' = \left\{ a \in A \mid \delta^n(a) \in u^n A^{\otimes n} \text{ for all } n > 0 \right\}.
\] (3.9)

It follows from (3.3) and (3.4) that \( A' \) is a subalgebra of \( A \).
3.5. Proposition.— If the multiplication by $u$ is injective on $A^\otimes n$ for all $n \geq 1$, then the algebra $A'$ is commutative modulo $u$, i.e., $ab - ba \in uA'$ for all $a, b \in A'$.

Proof.— Let us first observe that there exists $a_1 \in A$ such that $a = ua_1 + \varepsilon(a)$. This follows from the fact that $id_A = \Delta^1 = \delta^1 + \delta^0 = \delta^1 + \varepsilon 1$ and $\delta^1(a) \in uA$. Similarly, there exists $b_1 \in A$ such that $b = ub_1 + \varepsilon(b)$. Hence, $ab - ba = uc$, where $c = u(a_1b_1 - b_1a_1)$. It suffices to show that $c \in A'$. To this end, it is enough to check that $\delta_K(c)$ is divisible by $u|K|^1$ for any nonempty finite subset $K$ of $\mathbb{N}$. Since the multiplication by $u$ is injective on $A^\otimes |K|$, it is enough to check that $\delta_K(ab - ba)$ is divisible by $u|K|^1$. We apply Formula (3.5). Let $I$ and $J$ be subsets of $K$ such that $I \cup J = K$ and $I \cap J \neq \emptyset$. Then $|I| + |J| \geq |K| + 1$. Since $\delta_I(a)$ is divisible by $u|I|$ and $\delta_J(b)$ is divisible by $u|J|$, it follows from (3.5) that $\delta_K(ab - ba)$ is divisible by $u|I| + |J|$, hence by $u|K|^1$. □

3.6. Remark.— If $A$ is topologically free, i.e., isomorphic to $V[[u]]$ as a $\mathbb{C}[[u]]$-module for some vector space $V$, then so is $A'$. A similar, but more complicated statement will be proved in Lemma 7.2.

3.7. Example.— Consider a Lie algebra $\mathfrak{g}$ and its universal enveloping bialgebra $U(\mathfrak{g})$. Let $U(\mathfrak{g})[[u]]$ be the $\mathbb{C}[[u]]$-bialgebra consisting of the formal power series over $U(\mathfrak{g})$, with comultiplication $\Delta$ given by (2.4). Using the notation of Section 2.4, we introduce a subalgebra $\hat{V}_u(\mathfrak{g})$ of $U(\mathfrak{g})[[u]]$ by

$$\hat{V}_u(\mathfrak{g}) = \left\{ \sum_{m \geq 0} a_m u^m \in U(\mathfrak{g})[[u]]\ |\ a_m \in U^m(\mathfrak{g}) \text{ for all } m \geq 0 \right\}. \quad (3.10)$$

Clearly, $V_u(\mathfrak{g}) \subset \hat{V}_u(\mathfrak{g})$. Let $I_u$ be the two-sided ideal of $V_u(\mathfrak{g})$ generated by $uV_u(\mathfrak{g})$ and by $u\mathfrak{g} \subset uU^1(\mathfrak{g}) \subset V_u(\mathfrak{g})$; it is the kernel of the morphism of algebras

$$V_u(\mathfrak{g}) \overset{q_u}{\longrightarrow} S(\mathfrak{g}) \longrightarrow S(\mathfrak{g})/(\bigoplus_{n \geq 1} S^n(\mathfrak{g})) = \mathbb{C},$$

cf. Section 2.4. It is easy to check that $\hat{V}_u(\mathfrak{g})$ is the $I_u$-adic completion of $V_u(\mathfrak{g})$.

3.8. Proposition.— If $A = U(\mathfrak{g})[[u]]$, then $A' = \hat{V}_u(\mathfrak{g})$.

Proof.— Let $a = \sum_{m \geq 0} a_m u^m$ be a formal power series with coefficients in $U(\mathfrak{g})$. For $n \geq 1$, the condition $\delta^n(a) \in u^nU(\mathfrak{g})^\otimes n[[u]]$ implies that $\delta^n(a_{n-1}) = 0$. We claim that

$$\text{Ker}(\delta^n : U(\mathfrak{g}) \to U(\mathfrak{g})^\otimes n) = U^{n-1}(\mathfrak{g}) \quad (3.11)$$

for all $n \geq 1$. It follows from this claim that $a_{n-1} \in U^{n-1}(\mathfrak{g})$, hence, $a \in \hat{V}_u(\mathfrak{g})$.

Equality (3.11) is probably well known, but we give a proof for the sake of completeness. The standard symmetrization map $\eta : S(\mathfrak{g}) \to U(\mathfrak{g})$ is known to be an isomorphism of coalgebras (cf. [Dix74, Chap. 2]). Hence, $\eta^\otimes n = \delta^n \eta$, where $\delta^n$ stands for the corresponding maps both on $S(\mathfrak{g})$ and $U(\mathfrak{g})$. Moreover, $\eta^{-1}(U^{n-1}(\mathfrak{g})) = \bigoplus_{k=0}^{n-1} S^k(\mathfrak{g})$. Therefore, Equality (3.11) is equivalent to

$$\text{Ker}(\delta^n : S(\mathfrak{g}) \to S(\mathfrak{g})^\otimes n) = \bigoplus_{k=0}^{n-1} S^k(\mathfrak{g}).$$
If \( (x_i)_i \) is a totally ordered basis of \( \mathfrak{g} \), we get a basis of \( S(\mathfrak{g}) \) by taking all words \( w = x_{i_1} \cdots x_{i_p} \) such that \( x_{i_1} \leq \cdots \leq x_{i_p} \). We call subword of a word \( w \) any word obtained from \( w \) by deleting some letters. With this convention, the comultiplication \( \Delta \) of \( S(\mathfrak{g}) \) is given on a basis element \( w \) by \( \Delta(w) = \sum w_1 \otimes w_2 \), where the sum is over all subwords \( w_1, w_2 \) of \( w \) such that \( w = w_1 w_2 \). Iterating \( \Delta \), we get for all \( n \geq 1 \)

\[
\Delta^n(w) = \sum w_1 \otimes \cdots \otimes w_n,
\]

where the sum is over all subwords \( w_1, \ldots, w_n \) of \( w \) such that \( w = w_1 \ldots w_n \). This, together with (3.1) or (3.2), implies that

\[
\delta^n(w) = \sum w_1 \otimes \cdots \otimes w_n, \tag{3.12}
\]

where the sum is now over all nonempty subwords \( w_1, \ldots, w_n \) of \( w \) such that \( w = w_1 \ldots w_n \). This shows that, if \( w \) is of length \( < n \), then the right-hand side of (3.12) is empty and \( \delta^n(w) = 0 \). Therefore,

\[
\bigoplus_{k=0}^{n-1} S^k(\mathfrak{g}) \subset \text{Ker}(\delta^n).
\]

To prove the opposite inclusion, it is enough to check that the restriction of \( \delta^n \) to the subspace \( \bigoplus_{k \geq n} S^k(\mathfrak{g}) \) is injective. This is a consequence of the following observation: if \( w \) is a basis element of length \( \geq n \) and \( \mu \) is the multiplication in \( S(\mathfrak{g}) \), then (3.12) implies that \( \mu \delta^n(w) = \|w\| w \), where \( \|w\| > 0 \) is the number of summands on the right-hand side of (3.12). \( \square \)

4. Topologically free \( \mathbb{C}[[u, v]] \)-modules

In this section, we establish a few technical results on modules over the ring \( \mathbb{C}[[u, v]] \) of formal power series in two commuting variables \( u \) and \( v \) with coefficients in \( \mathbb{C} \). They are modelled on similar results for modules over the ring \( \mathbb{C}[[h]] \) of formal power series in \( h \).

4.1. Modules over \( \mathbb{C}[[h]] \). We recall a few facts about \( \mathbb{C}[[h]] \)-modules (see, e. g., [Kas95, Sections XVI.2–3]). A \( \mathbb{C}[[h]] \)-module \( M \) is called topologically free if it is isomorphic to a module \( V[[h]] \) consisting of all formal power series with coefficients in the vector space \( V \). A \( \mathbb{C}[[h]] \)-module \( M \) is topologically free if and only if there is no nonzero element \( m \in M \) such that \( hm = 0 \) and the natural map \( M \to \varprojlim_n M/h^n M \) is an isomorphism. We define a topological tensor product \( \hat{\otimes}_{\mathbb{C}[[h]]} \) for \( \mathbb{C}[[h]] \)-modules \( M \) and \( N \) by

\[
M \hat{\otimes}_{\mathbb{C}[[h]]} N = \varprojlim_n \left( M/h^n M \otimes_{\mathbb{C}[[h]]/(h^n)} N/h^n N \right).
\]

For all vector spaces \( V, W \), we have \( V[[h]] \hat{\otimes}_{\mathbb{C}[[h]]} W[[h]] \cong (V \otimes_{\mathbb{C}} W)[[h]] \).

Let us extend these considerations to \( \mathbb{C}[[u, v]] \)-modules.
4.2. **Basic Definitions.** Let $M$ be a $C[[u, v]]$-module. We say that $M$ is *u-torsion-free* (resp. *v-torsion-free*) if there is no nonzero element $m \in M$ such that $um = 0$ (resp. such that $vm = 0$).

We say that $M$ is *admissible* if any element divisible by both $u$ and $v$ in $M$ is divisible by $uv$ in $M$. In other words, $M$ is admissible if, for any $m \in M$ such that there exists $m_1, m_2 \in M$ with $m = um_1 = vm_2$, there exists $m_0 \in M$ such that $m = wmm_0$.

Observe that, if $M$ is admissible and $u$-torsion-free, then any element of $M$ divisible by $u^n$ and by $v$ is divisible by $u^n v$, where $n > 0$.

We denote by $\hat{M}_{(u, v)}$ the $(u, v)$-adic completion of $M$: it is the projective limit of the projective system $(M/(u, v)^n M)_{n \geq 1}$, where $(u, v) M = uM + vM$. The projections $M \to M/(u, v)^n M$ induce a natural $C[[u, v]]$-linear map $i : M \to \hat{M}_{(u, v)}$. The kernel of $i$ is the intersection of the submodules $(u, v)^n M$ of $M$. We say that the module $M$ is separated (resp. complete) if the map $i : M \to \hat{M}_{(u, v)}$ is injective (resp. surjective).

Given a vector space $V$ over $C$, consider the vector space $V[[u, v]]$ consisting of formal power series $\sum m_{n, n \geq 0} x_{mn} u^m v^n$, where the coefficients $x_{mn}$ ($m, n \geq 0$) are elements of $V$. The standard multiplication of formal power series endows $V[[u, v]]$ with a $C[[u, v]]$-module structure. A $C[[u, v]]$-module $M$ isomorphic to a module of the form $V[[u, v]]$ will be called *topologically free*.

It is easy to check that a topologically free $C[[u, v]]$-module is $u$-torsion-free, $v$-torsion-free, admissible, separated, and complete. We now prove the converse.

4.3. **Lemma.**— *Any* $u$-torsion-free, $v$-torsion-free, admissible, separated, complete $C[[u, v]]$-module $M$ is topologically free.

**Proof.**— Let $V$ be a vector subspace of $M$ supplementary to the submodule $(u, v)M$. We claim that for all $n \geq 0$ we have the direct sum decomposition of vector spaces

$$(u, v)^n M = (u, v)^{n+1} M \oplus \bigoplus_{k, \ell \geq 0} u^k v^{\ell} V. \quad (4.1)$$

From (4.1) we derive

$$M = (u, v)^{n+1} M \oplus \bigoplus_{k, \ell \geq 0} u^k v^{\ell} V.$$

Consequently,

$$M/(u, v)^{n+1} M = \bigoplus_{k, \ell \geq 0} u^k v^{\ell} V = V[[u, v]]/(u, v)^{n+1} V[[u, v]].$$

Using the hypotheses, we get the following chain of $C[[u, v]]$-linear isomorphisms:

$$M \cong \hat{M}_{(u, v)} \cong V[[u, v]]/(u, v) \cong V[[u, v]].$$

It remains to check (4.1). We shall prove it by induction on $n$. If $n = 0$, the identity (4.1) holds by definition of $V$. If $n > 0$, let us first show that

$$(u, v)^n M = (u, v)^{n+1} M + \sum_{k, \ell \geq 0} u^k v^{\ell} V. \quad (4.2)$$
Indeed, any element of \((u, v)^n M\) is of the form \(um' + vm''\), where \(m', m'' \in (u, v)^{n-1}M\). By the induction hypothesis, \(m'\) and \(m''\) belong to
\[
(u, v)^n M + \sum_{k, \ell \geq 0} u^k v^\ell V.
\]
This implies (4.2).

Suppose now that we have elements \(m \in (u, v)^{n+1} M\) and \(x_0, x_1, \ldots, x_n \in V\) such that
\[
m + \sum_{k=0}^n u^k v^{n-k} x_{n-k} = 0. \tag{4.3}
\]
We have to show that \(m = x_0 = x_1 = \cdots = x_n = 0\). The element \(m \in (u, v)^{n+1} M\) is of the form \(m = u^{n+1} m_0 + vm''\), where \(m_0 \in M\) and \(m'' \in (u, v)^n M\). The element \(u^nx_0 + u^{n+1}m_0 = u^n(x_0 + um_0)\) is divisible by \(u^n\). It follows from (4.3) that it is also divisible by \(v\). Since \(M\) is admissible and \(v\)-torsion-free, there exists \(m_1 \in M\) such that \(u^n(x_0 + um_0) = u^nm_1\). Hence, \(x_0 + um_0 - vm_1 = 0\). Now, \(x_0 \in V\) and \(um_0 - vm_1 \in (u, v)M\) belong to supplementary subspaces. Therefore, \(x_0 = um_0 - vm_1 = 0\) and \(m = u^{n+1}m_0 + vm'' = vm'\), where \(m' = u^nm_1 + m'' \in (u, v)^n M\). Now, (4.3) becomes \(v(m' + \sum_{k=0}^{n-1} u^k v^{n-1-k} x_{n-k}) = 0\). Since \(M\) is \(v\)-torsion-free, we get \(m' + \sum_{k=0}^{n-1} u^k v^{n-1-k} x_{n-k} = 0\). By the induction hypothesis, \(m' = x_1 = \cdots = x_n = 0\).

\[\square\]

4.4. **Topological Tensor Product.** Given \(C[[u, v]]\)-modules \(M\) and \(N\), we define their topological tensor product over \(C[[u, v]]\) by
\[
M \hat{\otimes}_{C[[u, v]]} N = \lim_n \left( M/(u, v)^n M \otimes_{C[[u, v]]} N/(u, v)^n N \right).
\]
For example, \(M \hat{\otimes}_{C[[u, v]]} C[[u, v]] = \hat{M}_{(u, v)}\).

4.5. **Lemma.** (a) If \(M \cong V[[u, v]]\) and \(N \cong W[[u, v]]\) are topologically free \(C[[u, v]]\)-modules, then \(M \hat{\otimes}_{C[[u, v]]} N\) is topologically free:
\[
M \hat{\otimes}_{C[[u, v]]} N \cong (V \otimes C W)[[u, v]].
\]
(b) If \(i : M' \to M\) and \(j : N' \to N\) are injective \(C[[u, v]]\)-maps of topologically free modules, then so is the map \(i \hat{\otimes} j : M' \otimes_{C[[u, v]]} N' \to M \hat{\otimes}_{C[[u, v]]} N\).

**Proof.** — (a) Proceed as in the proof of [Kas95, Proposition XVI.3.2].

(b) Since \(i \hat{\otimes} j = (id \otimes j) (i \otimes id)\), it is enough to prove Part (b) when \(N = N'\) or \(M = M'\).

We give a proof for \(N = N'\).

Let \(V, V', W\) be vector spaces such that \(M = V[[u, v]], M' = V'[[u, v]],\) and \(N = W[[u, v]]\). Take a basis \((f_m)_{m}\) of \(W\). By Part (a), any element \(Y\) of \(M \hat{\otimes}_{C[[u, v]]} N\) can be uniquely written as \(Y = \sum_m X_m \otimes f_m\), where \(X_m \in M\). Set \(j_m(Y) = X_m\). This defines for all \(m\) a \(C[[u, v]]\)-linear map \(j_m : M \hat{\otimes}_{C[[u, v]]} N \to M\). Using the same basis of \(W\), we define a linear map \(j'_m : M' \hat{\otimes}_{C[[u, v]]} N \to M'\) similarly. Clearly, \(j_m \circ (i \otimes id) = i \circ j'_m\) for all \(m\). Now, take \(Y' \in M' \hat{\otimes}_{C[[u, v]]} N\) such that \((i \otimes id)(Y') = 0\). By the previous equality, we have \(i(j'_m(Y')) = 0\) for all \(m\). The map \(i\) being injective, we get \(j'_m(Y') = 0\) for all \(m\). Therefore, \(Y' = \sum_m j'_m(Y') \otimes f_m = 0\) and \(i \otimes id\) is injective. \(\square\)
4.6. **From One Variable to Two Variables.** One of the crucial steps in our constructions will be to transform a module \( N \) over \( \mathbb{C}[[h]] \) into a module \( \tilde{N} \) over \( \mathbb{C}[[u,v]] \). This is done as follows.

Let \( \iota : \mathbb{C}[[h]] \to \mathbb{C}[[u,v]] \) be the algebra morphism sending \( h \) to the product \( uv \). Observe that \( \iota \) factors through the subalgebras \( \mathbb{C}[u][[v]] \) and \( \mathbb{C}[v][[u]] \). The morphism \( \iota \) sends the ideal \( (h^n) \) into the ideal \( (u,v)^{2n} \). Given a \( \mathbb{C}[[h]] \)-module \( N \), we consider the projective system of \( \mathbb{C}[[u,v]] \)-modules

\[
N/(h^n) \otimes \mathbb{C}[[h]]/(h^n) \subset C[[u,v]]/(u,v)^{2n}
\]

where \( n = 1, 2, 3, \ldots \) and set

\[
\tilde{N} = \lim_n \left( N/(h^n) \otimes \mathbb{C}[[h]]/(h^n) \subset C[[u,v]]/(u,v)^{2n} \right).
\]

Clearly, for any \( x \in N \), there is defined a corresponding element \( \tilde{x} \in \tilde{N} \).

4.7. **Lemma.** — (a) If \( N = V[[h]] \) for some vector space \( V \) over \( \mathbb{C} \), then \( \tilde{N} = V[[u,v]] \).

(b) If \( N \) and \( N' \) are topologically free \( \mathbb{C}[[h]] \)-modules, then

\[
(N \hat{\otimes} \mathbb{C}[[h]]N')^\sim = \tilde{N} \hat{\otimes} \mathbb{C}[[u,v]] \tilde{N}'.
\]

(c) Let \( i : N' \to N \) be an injective map of topologically free \( \mathbb{C}[[h]] \)-modules. Then the induced \( \mathbb{C}[[u,v]] \)-map \( \tilde{i} : \tilde{N}' \to \tilde{N} \) is also injective.

**Proof.** — (a) We have the following chain of \( \mathbb{C}[[u,v]] \)-linear isomorphisms

\[
\tilde{N} = \lim_n V[[h]]/(h^n) \otimes \mathbb{C}[[h]]/(h^n) \subset C[[u,v]]/(u,v)^{2n}
= \lim_n V \hat{\otimes} C[[h]]/(h^n) \otimes \mathbb{C}[[h]]/(h^n) \subset C[[u,v]]/(u,v)^{2n}
= \lim_n V \otimes \mathbb{C}[[u,v]]/(u,v)^{2n}
= \lim_n V[[u,v]]/(u,v)^{2n}
= V[[u,v]].
\]

The first isomorphism follows from the definition of \( \tilde{N} \), the second and the fourth ones from the finite-dimensionality of \( \mathbb{C}[[h]]/(h^n) \) and of \( \mathbb{C}[[u,v]]/(u,v)^{2n} \).

(b) This is an easy exercise which follows from Part (a) and the properties of the topological tensor products over \( \mathbb{C}[[h]] \) and \( \mathbb{C}[[u,v]] \) stated in Section 4.1 and in Lemma 4.5 (a).

(c) We assume that \( N = V[[h]] \) and \( N' = V'[[h]] \) for some vector spaces \( V \) and \( V' \). Let \( (e_k)_k \) be a basis of \( V' \) and \( (f_j)_j \) a basis of \( V \). The \( \mathbb{C}[[h]] \)-linear map \( i : N' \to N \) is determined by \( i(e_k) = \sum_{j \geq 0} f_j x_{k,\ell} h^\ell \), where \( (x_{k,\ell})_{j,k,\ell} \) is a family of scalars such that for each couple \( (k,\ell) \) the set of \( j \) with \( x_{k,\ell}^{j} \neq 0 \) is finite. Any element \( X \in N' \) of the
form $X = \sum_{n \geq 0; k} \alpha^k_n e_k h^n$, where $(\alpha^k_n)_{k, n}$ is a family of scalars such that for each $n \geq 0$ the set of $k$ with $\alpha^k_n \neq 0$ is finite. We have

$$i(X) = \sum_{\ell, n \geq 0; j, k} x^j_{k, \ell} \alpha^k_n f_j h^{\ell + n} = \sum_{p \geq 0} \left( \sum_{\ell, n \geq 0; j, k} x^j_{k, \ell} \alpha^k_n f_j \right) h^p.$$  

The coefficient of $f_j h^p$ in $i(X)$ is

$$\sum_{\ell, n \geq 0; k} x^j_{k, \ell} \alpha^k_n = \sum_{\ell, k} x^j_{k, \ell} \alpha^k_{p - \ell}.$$  

This allows us to reformulate the injectivity of $i$ as follows: the equations on a family of scalars $(\alpha^k_n)_{k; n \geq 0}$

$$\sum_{\ell, k} x^j_{k, \ell} \alpha^k_{p - \ell} = 0 \quad (4.5)$$

holding for all $j$ and $p \geq 0$ imply that $\alpha^k_n = 0$ for all $k$ and $n \geq 0$.

By Part (a) we have $\tilde{N} = V[[u, v]]$ and $\tilde{N}' = V'[[u, v]]$. On the basis $(e_k)_k$ the map $\tilde{i}$ is defined by $\tilde{i}(e_k) = \sum_{\ell \geq 0; j} x^j_{k, \ell} f_j u^\ell v^j$. Any element $Y \in \tilde{N}'$ is of the form $Y = \sum_{m, n \geq 0; k} \beta^k_{mn} e_k u^m v^n$, where $(\beta^k_{mn})_{k, m, n}$ is a family of scalars such that for each $m, n \geq 0$ the set of $k$ with $\beta^k_{mn} \neq 0$ is finite. We have

$$\tilde{i}(Y) = \sum_{\ell, m, n \geq 0; j, k} x^j_{k, \ell} \beta^k_{mn} f_j u^{\ell + m} v^{\ell + n} = \sum_{p, q \geq 0} \left( \sum_{\ell, m, n \geq 0; j, k} x^j_{k, \ell} \beta^k_{mn} f_j \right) u^p v^q.$$  

Note that the sum in the brackets is finite. Suppose that $\tilde{i}(Y) = 0$. For all $p, q \geq 0$ and all $j$ we have

$$\sum_{\ell, m, n \geq 0; k} x^j_{k, \ell} \beta^k_{mn} = \sum_{\ell, k} x^j_{k, \ell} \beta^k_{p - \ell, q - \ell} = 0.$$  

Fixing $q \geq p \geq 0$ and setting $\alpha^k_n = \beta^k_{n, q - p + n}$, we get (4.5) for all $j$. This implies that $\beta^k_{n, q - p + n} = \alpha^k_n = 0$ for all $k, n, p, q$. If $p > q \geq 0$, we set $\alpha^k_n = \beta^k_{p - q + n, n}$ and we conclude likewise. Therefore, $Y = 0$.  

We define a $C[[u, v]]$-bialgebra as a topological $C[[u, v]]$-bialgebra $A$ with respect to the ideal $(u, v) = uA + vA$. As a consequence of Lemma 4.7, we have the following.

4.8. COROLLARY.— If $A$ is a $C[[h]]$-bialgebra that is topologically free as a $C[[h]]$-module, then $\tilde{A}$ is a $C[[u, v]]$-bialgebra that is topologically free as a $C[[u, v]]$-module.

PROOF.— The $C[[u, v]]$-module $\tilde{A}$ is topologically free by Lemma 4.7 (a). It is a $C[[u, v]]$-bialgebra as a consequence of Lemma 4.7 (b).
5. On Etingof and Kazhdan’s quantization of a Lie bialgebra

In this section, we recall the results from Etingof and Kazhdan’s work [EK96] needed in the sequel.

5.1. The Co-Poisson Bialgebra $U(g)$. Let $g$ be a Lie bialgebra with Lie cobracket $\delta$. Consider the universal enveloping algebra $U(g)$ of $g$ with standard cocommutative comultiplication given by (2.4). By [Dri87], the bialgebra $U(g)$ has a unique co-Poisson bialgebra structure with a Poisson cobracket whose restriction to $g \subset U(g)$ is the Lie cobracket $\delta$. Recall from Section 1.2 that a coquantization $A$ of $U(g)$ is a $\mathbb{C}[[h]]$-bialgebra $A$ such that $A \cong U(g)[[h]]$ as a $\mathbb{C}[[h]]$-module and $A/hA = U(g)$ as co-Poisson bialgebras.

In [EK96] Etingof and Kazhdan constructed a coquantization $U_h(g)$ of $U(g)$ in this sense. To this end, they first constructed a coquantization $A_h(g)$ of $U(g)$, which he called the double of $g$. We recall the definition of $d$.

5.2. Double of a Lie Bialgebra. Let $g = g_+ \oplus g_-$ be a finite-dimensional Lie bialgebra over $\mathbb{C}$ with Lie bracket $[,]$ and cobracket $\delta$. Let $g_- = (g_+^\text{op})^* = (g_+^\text{cop})$ be the dual Lie bialgebra modified as in Section 2.1.

Consider the direct sum $d = g_+ \oplus g_-$. Drinfeld [Dri82, 87] showed that there is a unique structure of Lie bialgebra on $d$, which he called the double of $g_+$, such that

- (a) the inclusions of $g_+$ and $g_-$ into $d$ are morphisms of Lie bialgebras and
- (b) the Lie bracket $[x,y]$ for $x \in g_+$ and $y \in g_-$ is given by

$$[x,y] = (y \otimes 1) \delta(x) + x \cdot y,$$

(5.1)

where $x \cdot y \in g_- \subset d$ is defined by $(x \cdot y)(x') = -y([x,x'])$ for $x' \in g_+$.

The Lie cobracket on $d$ (hence on $g_\pm$) is given by

$$\delta(X) = [X \otimes 1 + 1 \otimes X, r] = \sum_{i=1}^d \left([X, x_i] \otimes y_i + x_i \otimes [X, y_i]\right)$$

(5.2)

for $X \in d$. Here $r = \sum_{i=1}^d x_i \otimes y_i$ is the canonical element of $g_+ \otimes g_- \subset d \otimes d$, where $(x_i)_{i=1}^d$ is a basis of $g_+$ and $(y_i)_{i=1}^d$ is the dual basis of $g_-$.  

5.3. The Bialgebra $U_h(d)$. By [EK96, Section 3] there exists a $\mathbb{C}[[h]]$-bialgebra $U_h(d)$ with the following features:

- (i) As a $\mathbb{C}[[h]]$-algebra, $U_h(d) = U(d)[[h]]$, i.e., the multiplication is the standard formal power series product.

- (ii) There exists an invertible element $J_h \in (Ud \otimes Ud)[[h]]$ with constant term $1 \otimes 1$ such that the comultiplication $\Delta_h$ of $U_h(d)$ is given for all $a \in U(d)$ by

$$\Delta_h(a) = J_h^{-1} \Delta(a) J_h,$$

(5.3)

where $\Delta$ is the standard comultiplication in $U(d)$. The first terms of the formal power series $J_h$ are given by

$$J_h \equiv 1 \otimes 1 + \frac{h}{2} r \mod h^2$$

(5.4)
where \( r \in \mathfrak{g} \otimes \mathfrak{g} \) was defined in Section 5.2. From (5.2–5.4) it follows that for \( x \in \mathfrak{g} \subset U_h(\mathfrak{g}) \) we have
\[
\Delta_h(x) - \Delta_h^{op}(x) \equiv h \delta(x) \mod h^2,
\]
where \( \Delta_h^{op} \) is the opposite comultiplication and \( \delta \) is the Lie cobracket (5.2).

(iii) If we set \( t = r + r_{21} = \sum_{i=1}^d (x_i \otimes y_i + y_i \otimes x_i) \), then the element
\[
R_h = (J_h^{-1})_{21} \exp\left(\frac{ht}{2}\right) J_h \in (U\mathfrak{g} \otimes U\mathfrak{g})[[h]] = U_h(\mathfrak{g}) \widehat{\otimes}_{\mathbb{C}[[h]]} U_h(\mathfrak{g})
\]
defines a quasitriangular structure on \( U_h(\mathfrak{g}) \). This means that \( \Delta_h^{op}(a) = R_h \Delta_h(a) R_h^{-1} \) for all \( a \in U_h(\mathfrak{g}) \) and that
\[
(\Delta_h \otimes \text{id})(R_h) = (R_h)_{13}(R_h)_{23} \quad \text{and} \quad (\text{id} \otimes \Delta_h)(R_h) = (R_h)_{13}(R_h)_{12}.
\]
Formula (5.4) implies
\[
R_h = 1 \otimes 1 + h R'_h,
\]
where \( R'_h \in U_h(\mathfrak{g}) \widehat{\otimes}_{\mathbb{C}[[h]]} U_h(\mathfrak{g}) \) such that \( R'_h \equiv r \mod h \).

From (i) and (ii) it is clear that \( U_h(\mathfrak{g}) \) is a coquantization of the co-Poisson bialgebra \( U(\mathfrak{g}) \).

### 5.4. The Bialgebras \( U_h(\mathfrak{g}_\pm) \).

In [EK96, Section 4] Etingof and Kazhdan constructed a \( \mathbb{C}[[h]] \)-bialgebra \( U_h(\mathfrak{g}_\pm) \) (with \( h \)-adic topology) with the following properties:

(i) As a \( \mathbb{C}[[h]] \)-module, \( U_h(\mathfrak{g}_\pm) \) is isomorphic to \( U(\mathfrak{g}_\pm)[[h]] \).

(ii) \( U_h(\mathfrak{g}_\pm) \) is a \( \mathbb{C}[[h]] \)-subbialgebra of \( U_h(\mathfrak{g}) \). The map \( p_h : U_h(\mathfrak{g}_\pm) \subset U_h(\mathfrak{g}) = U(\mathfrak{g})[[h]] \to U(\mathfrak{g}) = U(\mathfrak{g})[[h]]/h U(\mathfrak{g})[[h]] \) induces a bialgebra isomorphism
\[
U_h(\mathfrak{g}_\pm)/h U_h(\mathfrak{g}_\pm) = U(\mathfrak{g}_\pm) \subset U(\mathfrak{g}).
\]

(iii) The element \( R'_h \in U_h(\mathfrak{g}) \widehat{\otimes}_{\mathbb{C}[[h]]} U_h(\mathfrak{g}) \) of (5.8) belongs to \( U_h(\mathfrak{g}_+) \widehat{\otimes}_{\mathbb{C}[[h]]} U_h(\mathfrak{g}_-) \). So does the universal \( R \)-matrix \( R_h \).

(iv) The coalgebra structure on \( U_h(\mathfrak{g}_\pm) \) induces an algebra structure on the dual module \( U_h^*(\mathfrak{g}_\pm) = \text{Hom}_{\mathbb{C}[[h]]}(U_h(\mathfrak{g}_\pm), \mathbb{C}[[h]]) \). By (iii) we can define linear maps \( \rho_\pm : U_h^*(\mathfrak{g}_\pm) \to U_h(\mathfrak{g}_\pm) \) by
\[
\rho_+(f) = (\text{id} \otimes f)(R_h) \quad \text{and} \quad \rho_-(g) = (g \otimes \text{id})(R_h)
\]
for all \( f \in U_h^*(\mathfrak{g}_-) \) and \( g \in U_h^*(\mathfrak{g}_+) \). In [EK96, Propositions 4.8 and 4.10] it was shown that \( \rho_+ \) is an injective antimorphism of algebras and \( \rho_- \) is an injective morphism of algebras.

The construction of \( U_h(\mathfrak{g}) \) and \( U_h(\mathfrak{g}_\pm) \) depends on a Drinfeld associator, see Sections 11.2–11.4. Nevertheless, it was shown in [EK97] (and in Section 10 of the revised version of [EK96]) that the assignment \( (\mathfrak{g}_+, \mathfrak{g}_-) \mapsto \left( U_h(\mathfrak{g}_+) \hookrightarrow U_h(\mathfrak{g}) \twoheadrightarrow U_h(\mathfrak{g}_-) \right) \) is functorial when the Drinfeld associator is fixed.

### 5.5. The Linear Forms \( f_x \).

Choose a \( \mathbb{C}[[h]] \)-linear isomorphism \( \alpha_- : U_h(\mathfrak{g}_-) \to U(\mathfrak{g}_-)[[h]] \) such that \( \alpha_-(1) = 1 \) and \( \alpha_- \equiv \text{id} \mod h \). Choose also a \( \mathbb{C} \)-linear projection \( \pi_- : U(\mathfrak{g}_-) \to U^1(\mathfrak{g}_-) = \mathbb{C} \oplus \mathfrak{g}_- \) that is the identity on \( U^1(\mathfrak{g}_-) \). For any \( x \in \mathfrak{g}_+ \) we
define a $\mathbb{C}$-linear form $\langle x, - \rangle : U^1(\mathfrak{g}_-) \to \mathbb{C}$ extending the evaluation map $\langle x, - \rangle : \mathfrak{g}_- \to \mathbb{C}$ and such that $\langle x, 1 \rangle = 0$.

Given $x \in \mathfrak{g}_+$ we define a $\mathbb{C}[[h]]$-linear form $f_x : U_h(\mathfrak{g}_-) \to \mathbb{C}[[h]]$ by

$$f_x(b) = \langle x, \pi_- \alpha_-(b) \rangle = \sum_{n \geq 0} \langle x, \pi_-(b_n) \rangle h^n,$$

(5.10)

where $b \in U_h(\mathfrak{g}_-)$ and the elements $b_n \in U(\mathfrak{g}_-)$ are defined by $\alpha_-(b) = \sum_{n \geq 0} b_n h^n$. It follows from the definition that $f_x(1) = 0$.

Applying the map $\rho_+$ of (5.9) to $f_x \in U_h^*(\mathfrak{g}_-)$, we get an element $\rho_+(f_x) \in U_h(\mathfrak{g}_+)$. Fix a basis $(x_1, \ldots, x_d)$ of $\mathfrak{g}_+$. Given a $d$-tuple $j = (j_1, \ldots, j_d)$ of nonnegative integers, we set $|j| = j_1 + \cdots + j_d$ and $x_j = x_1^{j_1} \cdots x_d^{j_d} \in U(\mathfrak{g}_+)$. Note that $(x_j)$ is a basis of $U(\mathfrak{g}_+)$.  

5.6. Lemma.— (a) For any $d$-tuple $j = (j_1, \ldots, j_d)$ of nonnegative integers, there exists an element $t_j \in U_h(\mathfrak{g}_+)$ such that

$$\rho_+(f_{x_j})^{j_1} \cdots \rho_+(f_{x_d})^{j_d} = h^{|j|} t_j \quad \text{and} \quad p_h(t_j) = x_j,$$

where $p_h : U_h(\mathfrak{g}_+) \to U_h(\mathfrak{g}_+)/hU_h(\mathfrak{g}_+) = U(\mathfrak{g}_+)$ is the canonical projection.

(b) For any $a \in U_h(\mathfrak{g}_+)$, there is a unique family of scalars $\lambda^{(n)}_j \in \mathbb{C}$ indexed by a nonnegative integer $n$ and a finite sequence $j = (j_1, \ldots, j_d)$ of nonnegative integers such that

$$a = \sum_{n \geq 0} \left( \sum_{|j| \leq c(n)} \lambda^{(n)}_j t_j \right) h^n,$$

where $c(n)$ is an integer depending on $a$ and $n$.

(c) If $a \in \text{Im} \rho_+$, then $c(n) = n$, that is, $\lambda^{(n)}_j = 0$ whenever $n < |j|$, where $\lambda^{(n)}_j$ are the scalars above.

Proof.— (a) For any $x \in \mathfrak{g}_+$, we have $\rho_+(f_x) = h t_x$ for some $t_x \in U_h(\mathfrak{g}_+)$ such that $p_h(t_x) = x$. This follows from (5.8) (cf. [EK96, Lemma 4.6]). We set $t_j = t_{x_1}^{j_1} \cdots t_{x_d}^{j_d}$.

(b) The proof of Proposition 4.5 of [EK96] implies that any $a \in U_h(\mathfrak{g}_+)$ can be expanded as above. Let us check that such an expression is unique. If

$$\sum_{n \geq 0} \left( \sum_{|j| \leq c(n)} \lambda^{(n)}_j t_j \right) h^n = 0,$$

(5.11)

then $\sum_{|j| \leq c(0)} \lambda^{(0)}_j x_j = 0$ by application of the projection $p_h$. Since the elements $(x_j)$ form a basis of $U(\mathfrak{g}_+)$, we conclude that $\lambda^{(0)}_j = 0$ for all $j$. We may then divide the left-hand side of (5.11) by $h$ and start again. This implies the vanishing of $\lambda^{(1)}_j = 0$ for all $j$, and so on.

(c) Clearly, $U^*_h(\mathfrak{g}_-) = U(\mathfrak{g}_-)^*[[h]]$ where $U(\mathfrak{g}_-)^* = \text{Hom}_\mathbb{C}(U(\mathfrak{g}_-), \mathbb{C})$. We provide $U^*_h(\mathfrak{g}_-)$ with the multiplication induced by the comultiplication of $U_h(\mathfrak{g}_-)$. We claim
that the family of linear forms \( (f_{x_1}^{j_1} \ldots f_{x_n}^{j_n})_t \in U^*_h(\mathfrak{g}_-) \) is linearly independent and that the \( \mathbb{C}[h] \)-module it spans is dense in \( U^*_h(\mathfrak{g}_-) \) for the \( I^*_h \)-adic topology, where \( I^*_h \) is the two-sided ideal of \( U^*_h(\mathfrak{g}_-) \) generated by \( h \) and \( f_{x_k}^i (k = 1, \ldots, d) \). It suffices to prove that the images \( \theta_{x_1}^{j_1} \ldots \theta_{x_n}^{j_n} \in U^*_h(\mathfrak{g}_-) \) of \( f_{x_1}^{j_1} \ldots f_{x_n}^{j_n} \) under the algebra morphism \( U^*_h(\mathfrak{g}_-) \to U^*_h(\mathfrak{g}_-)/hU^*_h(\mathfrak{g}_-)= U^*_h(\mathfrak{g}_-) \) are linearly independent and that their linear span is dense in \( U^*_h(\mathfrak{g}_-)^* \) for the \( I^*_h \)-adic topology, where \( I^*_h \) is the two-sided ideal of \( U^*_h(\mathfrak{g}_-) \) generated by \( \theta_{x_k} (k = 1, \ldots, d) \). Now, by definition of \( f_{x_i} \), we have \( \theta_{x_i} = (x_i, \pi_-(-)) \). This implies that, for all \( i, j = 1, \ldots, d \), we have

\[
\theta_{x_i}(1) = 0 \quad \text{and} \quad \theta_{x_i}(y_j) = \delta_{ij}, \quad (5.12)
\]

where \( (y_1, \ldots, y_d) \) is the dual basis of the basis \( (x_1, \ldots, x_d) \). We compute the values of the linear form \( \theta_{x_1}^{j_1} \ldots \theta_{x_n}^{j_n} \) on the basis \( (y_{d_1}^{k_1} \ldots y_{d_n}^{k_n})_{k_1,\ldots,k_n \geq 0} \) of \( U^*_h(\mathfrak{g}_-) \):

\[
(\theta_{x_1}^{j_1} \ldots \theta_{x_n}^{j_n})(y_{d_1}^{k_1} \ldots y_{d_n}^{k_n}) = (\theta_{x_1}^{j_1} \otimes \ldots \otimes \theta_{x_n}^{j_n})(\Delta^{d_1}(y_{d_1}^{k_1} \ldots y_{d_n}^{k_n})).
\]

A simple computation, using (5.12) and the definition of \( \Delta \) (cf. the proof of Proposition 3.8), shows that

\[
(\theta_{x_1}^{j_1} \ldots \theta_{x_n}^{j_n})(y_{d_1}^{k_1} \ldots y_{d_n}^{k_n}) = \begin{cases} 
0 & \text{if } k_1 + \ldots + k_d < j_1 + \ldots + j_d, \\
\delta_{j_1,k_1} \ldots \delta_{j_d,k_d} & \text{if } k_1 + \ldots + k_d = j_1 + \ldots + j_d. 
\end{cases} \quad (5.13)
\]

The claim about the linear forms \( \theta_{x_1}^{j_1} \ldots \theta_{x_n}^{j_n} \in U^*_h(\mathfrak{g}_-) \) follows immediately from (5.13).

Part (a) of this lemma and the claim established above imply that the \( \mathbb{C}[h] \)-linear span of the set \( (\rho_+(f_{x_1}^{j_1}) \ldots \rho_+(f_{x_n}^{j_n}))_{j} \) is dense in \( \text{Im} \rho_+ \) for the \( h \)-adic topology. It is enough to prove (c) for an element \( a \) in this span. By Part (a), \( a = \sum_{n \geq 0} P_{\frac{n}{j}} h^{\frac{n}{j}} t_{\frac{n}{j}} \) with \( P_{\frac{n}{j}} \in \mathbb{C}[h] \). By Part (b), the element \( a \) can be written uniquely as \( a = \sum_{n \geq 0} \lambda_{\frac{n}{j}}^{(n)} h^n t_{\frac{n}{j}} \).

Hence, for any \( j \), the formal power series \( \sum_{n \geq 0} \lambda_{\frac{n}{j}}^{(n)} h^n \) is divisible by \( h^{\frac{n}{j}} \), which implies the vanishing of \( \lambda_{\frac{n}{j}}^{(n)} \) for \( n < |j| \).

\[\square\]

6. The algebra \( A_+ = A_{u,v}(\mathfrak{g}_+) \)

We first define a two-variable version \( U_{u,v}(\mathfrak{g}_+) \) of Etingof and Kazhdan’s quantization. Then we construct the algebra \( A_+ = A_{u,v}(\mathfrak{g}_+) \) appearing in Theorem 2.3. We use the notation \( \mathfrak{g}_+, \mathfrak{d} \) defined in Section 5.

6.1. The bialgebras \( U_{u,v}(\mathfrak{d}) \) and \( U_{u,v}(\mathfrak{g}_+) \). Applying the construction of Section 4.6 to the \( \mathbb{C}[h] \)-bialgebras \( U_h(\mathfrak{d}) \) and \( U_h(\mathfrak{g}_+) \), we obtain \( \mathbb{C}[u, v] \)-modules

\[
U_{u,v}(\mathfrak{d}) = \widehat{U_h(\mathfrak{d})} \quad \text{and} \quad U_{u,v}(\mathfrak{g}_+) = \widehat{U_h(\mathfrak{g}_+)}. \quad (6.1)
\]

As a consequence of Lemma 4.5, Lemma 4.7, Corollary 4.8, and of the results summarized in Sections 5.3 and 5.4, we get the following proposition.
6.2. Proposition. — (a) The \( \mathbb{C}[[u, v]] \)-modules \( U_{u,v}(\mathfrak{d}) \) and \( U_{u,v}(\mathfrak{g}_\pm) \) are topologically free.
(b) \( U_{u,v}(\mathfrak{d}) \) has a bialgebra structure whose underlying algebra is the algebra \( U(\mathfrak{d})[[u, v]] \) of formal power series with coefficients in \( U \).
(c) \( U_{u,v}(\mathfrak{g}_\pm) \) has a bialgebra structure such that the \( \mathbb{C}[[u, v]] \)-linear map \( U_{u,v}(\mathfrak{g}_\pm) \to U_{u,v}(\mathfrak{d}) \) induced by \( U_h(\mathfrak{g}_\pm) \subset U_h(\mathfrak{d}) \) is an embedding of bialgebras.
(d) There are canonical isomorphisms of bialgebras

\[
U_{u,v}(\mathfrak{d})/(u, v)U_{u,v}(\mathfrak{d}) = U(\mathfrak{d}) \quad \text{and} \quad U_{u,v}(\mathfrak{g}_\pm)/(u, v)U_{u,v}(\mathfrak{g}_\pm) = U(\mathfrak{g}_\pm).
\]

By Proposition 6.2 (c) we may view \( U_{u,v}(\mathfrak{g}_\pm) \) as a subset (in fact, a subbialgebra) of \( U_{u,v}(\mathfrak{d}) \). We denote the comultiplication in \( U_{u,v}(\mathfrak{d}) \) and in \( U_{u,v}(\mathfrak{g}_\pm) \) by \( \Delta_{u,v} \). To Etingof and Kazhdan’s universal \( R \)-matrix \( R_h \in U_h(\mathfrak{d}) \otimes \mathbb{C}[[\hbar]] \) \( U_h(\mathfrak{d}) \) corresponds an element \( R_{u,v} \in U_{u,v}(\mathfrak{d}) \otimes \mathbb{C}[[u, v]] U_{u,v}(\mathfrak{d}) \). By Section 5.4 (iii) and Lemma 4.5 (b), we have \( R_{u,v} \in U_{u,v}(\mathfrak{g}_+) \otimes \mathbb{C}[[u, v]] U_{u,v}(\mathfrak{g}_-) \). The following is a consequence of (5.7) and (5.8).

6.3. Lemma. — (a) We have

\[
(\Delta_{u,v} \otimes \text{id})(R_{u,v}) = (R_{u,v})_{13}(R_{u,v})_{23} \quad \text{and} \quad (\text{id} \otimes \Delta_{u,v})(R_{u,v}) = (R_{u,v})_{13}(R_{u,v})_{12}.
\]

(b) There is a unique \( R' \in U_{u,v}(\mathfrak{g}_+) \otimes \mathbb{C}[[u, v]] U_{u,v}(\mathfrak{g}_-) \) such that \( R_{u,v} = 1 \otimes 1 + uvR' \).
The image of \( R' \) under the projection

\[
U_{u,v}(\mathfrak{g}_+ \otimes \mathbb{C}[[u, v]] U_{u,v}(\mathfrak{g}_-) \to (U_{u,v}(\mathfrak{g}_+) \otimes \mathbb{C}[[u, v]] U_{u,v}(\mathfrak{g}_-))/(u, v) = U(\mathfrak{g}_+) \otimes \mathbb{C} U(\mathfrak{g}_-)
\]

is the element \( r = \sum_{i=1}^d x_i \otimes y_i \) defined in Section 5.2.

Following 5.4, consider the dual spaces \( U_{u,v}^*(\mathfrak{g}_\pm) = \text{Hom}_{\mathbb{C}[[u, v]]}(U_{u,v}(\mathfrak{g}_\pm), \mathbb{C}[[u, v]]) \), and define \( \mathbb{C}[[u, v]] \)-linear maps \( \rho_+ : U_{u,v}^*(\mathfrak{g}_-) \to U_{u,v}(\mathfrak{g}_+) \) and \( \rho_- : U_{u,v}^*(\mathfrak{g}_+) \to U_{u,v}(\mathfrak{g}_-) \) by

\[
\rho_+(f) = (\text{id} \otimes f)(R_{u,v}) \quad \text{and} \quad \rho_-(g) = (g \otimes \text{id})(R_{u,v}) \quad (6.2)
\]

for \( f \in U_{u,v}^*(\mathfrak{g}_-) \) and \( g \in U_{u,v}^*(\mathfrak{g}_+) \). The dual space \( U_{u,v}^*(\mathfrak{g}_\pm) \) carries a \( \mathbb{C}[[u, v]] \)-algebra structure. The map \( \rho_+ \) is an antimorphism of algebras and \( \rho_- \) is a morphism of algebras. This follows by a standard argument from Lemma 6.3 (b) (cf. [EK96, Proposition 4.8]).

6.4. The Linear Forms \( \tilde{f}_x \). In Section 5.5 we constructed a \( \mathbb{C}[[\hbar]] \)-linear form \( f_x : U_h(\mathfrak{g}_-) \to \mathbb{C}[[\hbar]] \) for all \( x \in \mathfrak{g}_+ \). The construction depends on the choice of an isomorphism \( \alpha_- : U_h(\mathfrak{g}_-) \to U(\mathfrak{g}_-)[[\hbar]] \) and a projection \( \pi_- : U(\mathfrak{g}_-) \to U^1(\mathfrak{g}_-) \). By extension of scalars, we obtain a \( \mathbb{C}[[u, v]] \)-linear form \( \tilde{f}_x : U_{u,v}(\mathfrak{g}_-) \to \mathbb{C}[[u, v]] \). We have \( \tilde{f}_x(1) = 0 \).

Let us apply \( \rho_+ : U_{u,v}^*(\mathfrak{g}_-) \to U_{u,v}(\mathfrak{g}_+) \) to \( \tilde{f}_x \). The following is a consequence of Lemma 6.3 (b).

6.5. Lemma. — The element \( \rho_+(\tilde{f}_x) \in U_{u,v}(\mathfrak{g}_+) \) is divisible by \( uv \).
6.6. Definition of $A_+$. Let $(x_1, \ldots, x_d)$ be the basis of $g_+$ fixed in Section 5.5. The set $(u^j x^d_j)$, where $j = (j_1, \ldots, j_d)$ runs over all finite sequences of nonnegative integers, is a basis of the free $C[u]$-module $V_u(g_+)$ introduced in Section 2.4. In view of Lemma 6.5, we can define a $C[u]$-linear map $\psi_+ : V_u(g_+) \to U_{u,v}(g_+)$ by $\psi_+(1) = 1$ and

$$\psi_+(u^j x^d_j) = v^{-|j|} \rho_+(f_{x_1})^{j_1} \cdots \rho_+(f_{x_d})^{j_d},$$

(6.3)

where $j = (j_1, \ldots, j_d)$ is a $d$-tuple of nonnegative integers with $|j| \geq 1$. This map extends uniquely to a $C[u][[v]]$-linear map, still denoted $\psi_+$, from $V_u(g_+)[[v]]$ to $U_{u,v}(g_+)$ by

$$\psi_+ \left( \sum_{n \geq 0} w_n v^n \right) = \sum_{n \geq 0} \psi_+(w_n) v^n,$$

where $w_0, w_1, w_2, \ldots \in V_u(g_+)$. We define the $C[u][[v]]$-module $A_+$ by

$$A_+ = \psi_+(V_u(g_+)[[v]]) \subset U_{u,v}(g_+).$$

(6.4)

The remaining part of Section 6 is concerned with the study of $A_+$. The relevant results are stated in Theorem 6.9.

We choose a $C[[t]]$-linear isomorphism $\alpha_+ : U_h(g_+) \to U(g_+)[[t]]$ such that $\alpha_+(1) = 1$ and $\alpha_+ \equiv \text{id}$ modulo $h$. Such an isomorphism exists by Section 5.4 (ii). Extending the scalars, we get a $C[[u,v]]$-linear isomorphism $\tilde{\alpha}_+ : U_{u,v}(g_+) \to U(g_+)[[u,v]]$ such that $\tilde{\alpha}_+ \equiv \text{id}$ modulo $uv$. Let us consider the composed map

$$p_v : U_{u,v}(g_+) \xrightarrow{\tilde{\alpha}_+} U(g_+)[[u,v]] \to U(g_+)[[u]],$$

where the second map is the projection $v \mapsto 0$. We equip $U(g_+)[[u]]$ with the power series multiplication and the comultiplication (2.4).

6.7. Lemma. — The map $p_v : U_{u,v}(g_+) \to U(g_+)[[u]]$ is a morphism of bialgebras.

Proof. — The multiplication and the comultiplication of $U_h(g_+)$ transfer, via the $C[[t]]$-linear isomorphism $\alpha_+ : U_h(g_+) \to U(g_+)[[t]]$, to a multiplication $\mu_h$ and a comultiplication $\Delta_h$ on $U(g_+)[[t]]$. Expanding $\mu_h$ and $\Delta_h$ into formal power series, we obtain

$$\mu_h = \mu_0 + h\mu_1 + h^2\mu_2 + \cdots \quad \text{and} \quad \Delta_h = \Delta_0 + h\Delta_1 + h^2\Delta_2 + \cdots,$$

(6.5)

where $\mu_i : U(g_+) \otimes \cdots \otimes U(g_+)$ and $\Delta_i : U(g_+) \to U(g_+) \otimes \cdots \otimes U(g_+)$ are linear maps for all $i = 0, 1, \ldots$. Since $U_h(g_+)/hu_n(g_+) = U(g_+)$ as bialgebras, we see that $\mu_0$ and $\Delta_0$ are the standard multiplication and comultiplication of $U(g_+)$. The multiplication and the comultiplication of $U_{u,v}(g_+)$ give rise, via $\tilde{\alpha}_+$, to a multiplication $\mu_{u,v}$ and a comultiplication $\Delta_{u,v}$ on $U(g_+)[[u,v]]$ of the form

$$\mu_{u,v} = \mu_0 + uv\mu_1 + u^2v^2\mu_2 + \cdots \quad \text{and} \quad \Delta_{u,v} = \Delta_0 + uv\Delta_1 + u^2v^2\Delta_2 + \cdots,$$

(6.6)

where the maps $\mu_i$ and $\Delta_i$ are the same as in (6.5). It follows that $p_v$ is a morphism of bialgebras, where $U(g_+)[[u]]$ is equipped with $\mu_0$ and $\Delta_0$. \qed
The following result is an elaboration of Lemma 5.6 (a).

6.8. **Lemma.**— (a) For any d-tuple \( \underline{j} = (j_1, \ldots, j_d) \), the element \( \psi_+(u^{\underline{j}} \underline{x}) \) defined by (6.3) belongs to \( u^{\underline{j}} U_{u,v}(\mathfrak{g}_+) \) and

\[
p_v(\psi_+(u^{\underline{j}} \underline{x})) = u^{\underline{j}} \underline{x} \in U(\mathfrak{g}_+)[[u]].
\]

(b) We have \( p_v(A_+) = V_u(\mathfrak{g}_+) \) and \( p_v \circ \psi_+ : V_u(\mathfrak{g}_+)[[v]] \to V_u(\mathfrak{g}_+) \) is the projection sending \( v \) to 0.

**Proof.**— (a) By multiplicativity of \( p_v \), it suffices to prove that \( v^{-1} \rho_+(\tilde{f}_x) \) belongs to \( u U_{u,v}(\mathfrak{g}_+) \) and that \( p_v(v^{-1} \rho_+(\tilde{f}_x)) = uv \) for any \( x \in \mathfrak{g}_+ \). The first assertion follows from Lemma 6.5.

Let us compute \( p_v(v^{-1} \rho_+(\tilde{f}_x)) \). Recall the isomorphism \( \alpha_- : U_h(\mathfrak{g}_-) \to U(\mathfrak{g}_-)[[h]] \) from Section 5.5 and the isomorphism \( \alpha_+ : U_h(\mathfrak{g}_+) \to U(\mathfrak{g}_+)[[h]] \) defined above. Let \( X_i \in U_h(\mathfrak{g}_+) \) be defined by \( X_i = \alpha_+^{-1}(x_i) \) and \( Y_i \in U_h(\mathfrak{g}_-) \) by \( Y_i = \alpha_-^{-1}(y_i) \), where \( (x_1, \ldots, x_d) \) is the fixed basis of \( \mathfrak{g}_+ \) and \( (y_1, \ldots, y_d) \) is the dual basis. By (5.10),

\[
f_x(Y_i) = \langle x, \pi_- \alpha_-(Y_i) \rangle = \langle x, \pi_- (y_i) \rangle = \langle x, y_i \rangle.
\]

(6.7)

It follows from (5.8) that

\[
R_h = 1 \otimes 1 + h \sum_{i=1}^d X_i \otimes Y_i + h^2 Z,
\]

(6.8)

where \( Z \in U_h(\mathfrak{g}_+) \hat{\otimes} \mathbb{C}[[h]] U_h(\mathfrak{g}_-) \). By extension of scalars from \( \mathbb{C}[[h]] \) to \( \mathbb{C}[[u,v]] \), we get

\[
R_{u,v} = 1 \otimes 1 + uv \sum_{i=1}^d \tilde{X}_i \otimes \tilde{Y}_i + v^2 \tilde{Z},
\]

(6.9)

where \( \tilde{X}_i \in U_{u,v}(\mathfrak{g}_+) \), \( \tilde{Y}_i \in U_{u,v}(\mathfrak{g}_-) \), and \( \tilde{Z} \in U_{u,v}(\mathfrak{g}_+) \hat{\otimes} \mathbb{C}[[u,v]] U_{u,v}(\mathfrak{g}_-) \). Moreover, using the definition of \( p_v \) and Formula (6.7), we have

\[
p_v(\tilde{X}_i) = x_i, \quad \text{and} \quad \tilde{f}_x(\tilde{Y}_i) = \langle x, y_i \rangle.
\]

(6.10)

Applying \( \text{id} \otimes \tilde{f}_x \) to \( R_{u,v} \) and using (6.9) and (6.10), we obtain

\[
\rho_+(\tilde{f}_x) = (\text{id} \otimes \tilde{f}_x)(R_{u,v})
\]

\[
= \tilde{f}_x(1) + uv \sum_{i=1}^d \tilde{X}_i \tilde{f}_x(\tilde{Y}_i) + u^2 v^2 (\text{id} \otimes \tilde{f}_x)(\tilde{Z})
\]

\[
= uv \sum_{i=1}^d \langle x, y_i \rangle \tilde{X}_i + u^2 v^2 (\text{id} \otimes \tilde{f}_x)(\tilde{Z}).
\]

26
Therefore,

\[ v^{-1} \rho_+(\tilde{f}_x) = u \sum_{i=1}^{d} \langle x, y_i \rangle \tilde{X}_i + u^2 v (\text{id} \otimes \tilde{f}_x)(\tilde{Z}). \]

This implies, in view of (6.10),

\[ p_v(v^{-1} \rho_+(\tilde{f}_x)) = u \sum_{i=1}^{d} \langle x, y_i \rangle p_v(\tilde{X}_i) = u \sum_{i=1}^{d} \langle x, y_i \rangle x_i = ux. \]

(b) It follows from Part (a) and the definition of \( A_+ \).

\[ \square \]

6.9. Theorem. — (a) The map \( \psi_+ : U_u(\mathfrak{g}_+)[[v]] \rightarrow A_+ \) is an isomorphism of \( \mathbb{C}[u][[v]] \)-modules.

(b) \( A_+ \) is a subalgebra of \( U_{u,v}(\mathfrak{g}_+) \).

(c) The algebra \( A_+ \) is independent of the choices made in Section 5.5.

Proof. — (a) The map \( \psi_+ \) is surjective by definition of \( A_+ \). Let us check that it is injective. Let \( w = \sum_{n \geq 0} w_n v^n \in V_u(\mathfrak{g}_+)[[v]] \) with \( w_0, w_1, w_2, \ldots \in V_u(\mathfrak{g}_+) \). Assume that \( w \neq 0 \). Take the minimal \( N \geq 0 \) such that \( w_N \neq 0 \) and define \( w' \) by \( w = v^N w' \). By Lemma 6.8, we have \( p_v(\psi_+(w')) = w_N \neq 0 \), hence \( \psi_+(w') \neq 0 \). As \( A_+ \subset U_{u,v}(\mathfrak{g}_+) \) has no \( v \)-torsion, we see that \( \psi_+(w) = v^N \psi_+(w') \neq 0 \).

(b) Let us check that \( \psi_+(u|\tilde{f}_x|_j) \psi_+(u|\tilde{f}_x|_j) \in A_+ \) for all \( d \)-tuples \( \tilde{j} = (i_1, \ldots, i_d) \) and \( j = (j_1, \ldots, j_d) \). Since \( \rho_+ : U_h^*(\mathfrak{g}_-) \rightarrow U_h(\mathfrak{g}_+) \) is an antimorphism of algebras, the product

\[ \rho_+(f_{x_1})^{i_1} \cdots \rho_+(f_{x_d})^{i_d} \rho_+(f_{x_1})^{j_1} \cdots \rho_+(f_{x_d})^{j_d} \]

belongs to the image of \( \rho_+ \). Therefore, by Lemma 5.6 (b–c), it can be expanded as

\[ \rho_+(f_{x_1})^{i_1} \cdots \rho_+(f_{x_d})^{i_d} \rho_+(f_{x_1})^{j_1} \cdots \rho_+(f_{x_d})^{j_d} = \sum_{n \geq 0} \left( \sum_{|k| \leq n} \lambda_k^{(n)} t_k \right) h^n, \]

where \( \lambda_k^{(n)} \in \mathbb{C} \). By Lemma 5.6 (a),

\[ \rho_+(f_{x_1})^{i_1} \cdots \rho_+(f_{x_d})^{i_d} \rho_+(f_{x_1})^{j_1} \cdots \rho_+(f_{x_d})^{j_d} = \sum_{n \geq 0; \ k, |k| \leq n} \lambda_k^{(n)} \rho_+(f_{x_1})^{k_1} \cdots \rho_+(f_{x_d})^{k_d} h^n - |k|. \]

By extension of scalars from \( \mathbb{C}[[h]] \) to \( \mathbb{C}[[u, v]] \), we have \( \rho_+(\tilde{f}_x) = \rho_+(\tilde{f}_x) \). Therefore,

\[ \rho_+(\tilde{f}_x)^{i_1} \cdots \rho_+(\tilde{f}_x)^{i_d} \rho_+(\tilde{f}_x)^{j_1} \cdots \rho_+(\tilde{f}_x)^{j_d} = \sum_{n \geq 0; \ k, |k| \leq n} \lambda_k^{(n)} \rho_+(\tilde{f}_x)^{k_1} \cdots \rho_+(\tilde{f}_x)^{k_d} u^{n - |k|} v^n - |k|. \]

Using (6.3), we obtain

\[ v^{i_1 + j_1} \psi_+(u^{i_1} |\tilde{f}_x|) \psi_+(u^{j_1} |\tilde{f}_x|) = \sum_{n \geq 0; \ k, |k| \leq n} \lambda_k^{(n)} \psi_+(u^{i_1} |\tilde{k}| x_k) u^{n - |k|} v^n - |k|. \]

\[ = \sum_{n \geq 0} \left( \sum_{|k| \leq n} \lambda_k^{(n)} u^{n - |k|} \psi_+(u^{i_1} |\tilde{k}| x_k) \right) v^n. \]
Thus, \( v^{[i]+[j]} \psi_{+}(u^{[i]} x_j) \psi_{+}(u^{[j]} x_j) \) is a formal power series in \( v \) whose coefficients belong to the \( \mathbb{C}[u] \)-linear span of the elements \( \psi_{+}(u^{[i]} x_j) \). Hence, \( v^{[i]+[j]} \psi_{+}(u^{[i]} x_j) \psi_{+}(u^{[j]} x_j) \in A_{+} \). Applying Lemma 6.10 below \( [i]+[j] \) times, we obtain \( \psi_{+}(u^{[i]} x_j) \psi_{+}(u^{[j]} x_j) \in A_{+} \).

(c) The definition of \( A_{+} \) in Section 6.6 was based on the choice of a \( \mathbb{C}[h] \)-linear isomorphism \( \alpha_{-} : U_{h}(\mathfrak{g}_{-}) \to U(\mathfrak{g}_{-})[[h]] \) such that \( \alpha_{-}(1) = 1 \) and \( \alpha_{-} \equiv \text{id} \) modulo \( h \), of a \( \mathbb{C} \)-linear projection \( \pi_{-} : U(\mathfrak{g}_{-}) \to U^{1}(\mathfrak{g}_{-}) \) that restricts to the identity on \( U^{1}(\mathfrak{g}_{-}) \), and of a basis \( (x_1, \ldots, x_d) \) of \( \mathfrak{g}_{+} \). We have to check that \( A_{+} \) is independent of these choices as a subset of \( U_{u,v}(\mathfrak{g}_{+}) \).

(i) Suppose that we take another \( \mathbb{C}[h] \)-linear isomorphism \( \alpha'_{-} : U_{h}(\mathfrak{g}_{-}) \to U(\mathfrak{g}_{-})[[h]] \) such that \( \alpha'_{-}(1) = 1 \) and \( \alpha'_{-} \equiv \text{id} \) modulo \( h \). This gives us a new linear form \( f'_{x} : U_{h}(\mathfrak{g}_{-}) \to \mathbb{C}[h] \) and, by extension of scalars, a new linear form \( \tilde{f}'_{x} : U_{u,v}(\mathfrak{g}_{-}) \to \mathbb{C}[[u,v]] \) for all \( x \in \mathfrak{g}_{+} \). Lemma 6.5 also holds for \( \tilde{f}'_{x} \). By Part (b) it is enough to check that \( v^{-1} \rho_{+}(\tilde{f}'_{x}) \) belongs to \( A_{+} \). Since \( \alpha'_{-} \equiv \alpha_{-} \) modulo \( h \), we have \( f'_{x} \equiv f_{x} \) modulo \( h \). By the proof of Lemma 5.6 (c), we see that

\[
f'_{x} = f_{x} + \sum_{n \geq 1} h^{n} \left( \sum_{\jmath} \lambda^{(n)}_{\jmath} f_{x_{d}}^{j_{d}} \cdots f_{x_{1}}^{j_{1}} \right),
\]

where \( \lambda^{(n)}_{\jmath} \in \mathbb{C} \) are indexed by a nonnegative integer \( n \) and a \( d \)-tuple \( \jmath = (j_1, \ldots, j_d) \) of nonnegative integers. Applying \( \rho_{+} \), we get

\[
\rho_{+}(f'_{x}) = \rho_{+}(f_{x}) + \sum_{n \geq 1} h^{n} \left( \sum_{\jmath} \lambda^{(n)}_{\jmath} \rho_{+}(f_{x_{d}}^{j_{d}}) \cdots \rho_{+}(f_{x_{1}}^{j_{1}}) \right).
\]

By extension of scalars, we have

\[
\rho_{+}(\tilde{f}'_{x}) = \rho_{+}(\tilde{f}_{x}) + \sum_{n \geq 1} u^{n} v^{n} \left( \sum_{\jmath} \lambda^{(n)}_{\jmath} \rho_{+}(\tilde{f}_{x_{d}}^{j_{d}}) \cdots \rho_{+}(\tilde{f}_{x_{1}}^{j_{1}}) \right).
\]

Using (6.3), we obtain

\[
v^{-1} \rho_{+}(\tilde{f}'_{x}) = v^{-1} \rho_{+}(\tilde{f}_{x}) + \sum_{n \geq 1} u^{n} v^{n-1} \left( \sum_{\jmath} \lambda^{(n)}_{\jmath} \rho_{+}(\tilde{f}_{x_{d}}^{j_{d}}) \cdots \rho_{+}(\tilde{f}_{x_{1}}^{j_{1}}) \right)
= \psi_{+}(ux) + \sum_{n \geq 1} u^{n} v^{n-1} \left( \sum_{\jmath} \lambda^{(n)}_{\jmath} v^{[j]} \psi_{+}(u^{[j]} x_j) \right)
= \psi_{+}(ux) + \sum_{k \geq 1} u^{k} \left( \sum_{\jmath: |\jmath| \leq k} \lambda^{(n)}_{\jmath} u^{k-|\jmath|+1} \psi_{+}(u^{[j]} x_j) \right).
\]

This shows that \( v^{-1} \rho_{+}(\tilde{f}'_{x}) \) is a formal power series in \( v \) whose coefficients belong to the \( \mathbb{C}[u] \)-linear span of the elements \( \psi_{+}(u^{[j]} x_j) \). Hence, \( v^{-1} \rho_{+}(\tilde{f}'_{x}) \in A_{+} \).

(ii) Suppose now that we take another projection \( \pi'_{-} : U(\mathfrak{g}_{-}) \to U^{1}(\mathfrak{g}_{-}) \) whose restriction to \( U^{1}(\mathfrak{g}_{-}) \) is the identity. We denote by \( f'_{x} \) the new linear form \( U_{h}(\mathfrak{g}_{-}) \to \mathbb{C}[h] \),
obtained by using $\pi'$. By extension of scalars, we obtain a new linear form $f'_x : U_{u,v}(g_-) \to \mathbb{C}[u,v]$ for $x \in g_+$.

Since $\pi' - \pi_- = 0$ on $U^1(g_-)$, it follows from the proof of Lemma 5.6 (c) that

$$f_x' = f_x + \sum_{|j| \geq 2} \lambda_j^{(0)} f_{x_d} \cdots f_{x_1} + \sum_{n \geq 1} h^n \left( \sum_j \lambda_j^{(n)} f_{x_d} \cdots f_{x_1} \right),$$

(6.12)

where $\lambda_j^{(n)} \in \mathbb{C}$ are scalars. Note the difference with (6.11): in (6.12) there are extra terms of degree 0 in $h$. Nevertheless, the same arguments as in Part (i) allow us to conclude.

(iii) Since $x \mapsto f_x$ is linear, it follows that $A_+$ is independent of the basis in $g_+$.

6.10. **Lemma.** We have $A_+ \cap vU_{u,v}(g_+) = vA_+$.

Lemma 6.10 will be proved in Section 7.7.

### 7. Bialgebra structure on $A_+$

In this section we establish that $A_+$ has a $\mathbb{C}[u[[v]]]$-bialgebra structure. We begin with a $\mathbb{C}[u,v]$-subalgebra $\hat{A}_+$ of $U_{u,v}(g_+)$ in which $A_+$ sits as a dense subalgebra.

#### 7.1. The Algebra $\hat{A}_+$

Using the comultiplication $\Delta_{u,v}$ of $U_{u,v}(g_+)$ and proceeding as in Section 3.1, we obtain $\mathbb{C}[u,v]$-linear maps $\delta^n : U_{u,v}(g_+) \to U_{u,v}(g_+) \otimes^n$ for all $n \geq 1$. Formulas (3.1)-(3.5) hold in this setting. We define a $\mathbb{C}[u,v]$-submodule $\hat{A}_+$ of $U_{u,v}(g_+)$ by

$$\hat{A}_+ = \left\{ a \in U_{u,v}(g_+) \mid \delta^n(a) \in u^nU_{u,v}(g_+) \otimes^n \text{ for all } n \geq 1 \right\}.$$

(7.1)

It follows from (3.3) and (3.4) that $\hat{A}_+$ is a subalgebra of $U_{u,v}(g_+)$.

#### 7.2. **Lemma.** $\hat{A}_+$ is a topologically free $\mathbb{C}[u,v]$-module.

**Proof.** By Lemma 4.3 it is enough to check that $\hat{A}_+$ is a $u$-torsion-free, $v$-torsion-free, admissible, separated, and complete $\mathbb{C}[u,v]$-module.

We use the fact that $\hat{A}_+$ is a submodule of the topologically free module $U_{u,v}(g_+)$. Since the latter is separated, $u$-torsion-free, and $v$-torsion-free, so is any of its submodules. We are left with checking admissibility and completeness.

Admissibility: Let $a, a_1, a_2 \in \hat{A}_+$ be such that $a = ua_1 = va_2$. Since $U_{u,v}(g_+)$ is topologically free, hence admissible, there exists $a_0 \in U_{u,v}(g_+)$ such that $a = uva_0$. We shall prove that $a_0 \in \hat{A}_+$, i.e., that $\delta^n(a_0) \in u^nU_{u,v}(g_+) \otimes^n$. Since $u(va_0 - a_1) = 0$ and $U_{u,v}(g_+)$ has no $u$-torsion, we have $a_1 = va_0$. Therefore, $v\delta^n(a_0) \in u^nU_{u,v}(g_+) \otimes^n$. In other words, $v\delta^n(a_0)$ is divisible both by $v$ and by $u^n$ in $U_{u,v}(g_+) \otimes^n$, which is topologically free. By an observation in Section 4.2. $v\delta^n(a_0) = u^n vZ$ for some $Z \in U_{u,v}(g_+) \otimes^n$. Since $U_{u,v}(g_+) \otimes^n$ has no $v$-torsion, $\delta^n(a_0) = u^n Z$. 

29
Completeness: Let \((a_n)_{n \geq 0}\) be a sequence of elements of \(\hat{A}_+\) such that for all \(n \geq 0\) the image of \(a_{n+1}\) in \(\hat{A}_+/(u,v)^{n+1}\) maps onto the image of \(a_n\) in \(\hat{A}_+/(u,v)^n\). Since \(U_{u,v}(g_+)\) is complete, it contains an element \(a\) such that \(a - a_n \in (u,v)^n U_{u,v}(g_+)\) for all \(n \geq 0\). We shall show that \(a \in \hat{A}_+\), i.e., that \(\delta^p(a)\) is divisible by \(u^p\) for all \(p \geq 1\). For any \(n \geq p\),
\[
\delta^p(a) - \delta^p(a_n) \in (u,v)^n U_{u,v}(g_+) \hat{\otimes} p \quad \text{and} \quad \delta^p(a_n) \in u^p U_{u,v}(g_+) \hat{\otimes} p,
\]
which implies that \(\delta^p(a) \in u^p U_{u,v}(g_+) \hat{\otimes} p + (u,v)^n U_{u,v}(g_+) \hat{\otimes} p\). Consequently, \(\delta^p(a)\) is divisible by \(u^p\) in \(\lim_{n \to \infty} U_{u,v}(g_+) \hat{\otimes} p/(u,v)^n = U_{u,v}(g_+) \hat{\otimes} p\). □

Consider the morphism \(p_v : U_{u,v}(g_+) \to U(g_+)[[u]]\) of Lemma 6.7. Recall from (3.10) the algebra
\[
\hat{V}_u(g_+) = \{ \sum_{m \geq 0} a_m u^m \mid a_m \in U^m(g_+) \text{ for all } m \geq 0 \} \subset U(g_+)[[u]].
\]

7.3. Lemma.— (a) The morphism \(p_v\) sends \(\hat{A}_+\) into \(\hat{V}_u(g_+)\).
(b) We have \(\text{Ker}(p_v : \hat{A}_+ \to \hat{V}_u(g_+)) = \hat{A}_+ \cap v U_{u,v}(g_+^) = v \hat{A}_+\).

Proof.— (a) By (3.1) and (6.6) the map \(\delta^n\) for \(U_{u,v}(g_+)\) is of the form
\[
\delta^n = \delta^n_0 + uv\delta^n_1,
\]
where \(\delta^n_0\) is obtained by (3.1) from the standard comultiplication \(\Delta\) of \(U(g_+)[[u]]\). Hence, \(p_v \hat{\otimes} \delta^n = \delta^n_0 p_v\). Therefore, Part (a) follows from the definitions and Proposition 3.8.

(b) Let \(a \in \hat{A}_+\) and \(b \in U_{u,v}(g_+)\) be such that \(a = vb\). We have to check that \(b \in \hat{A}_+\). For any \(n \geq 1\), the element \(\delta^n(a) = v\delta^n(b)\) is divisible both by \(v\) and by \(u^n\) in \(U_{u,v}(g_+) \hat{\otimes} n\). Since the latter is topologically free, there exists \(Z \in U_{u,v}(g_+) \hat{\otimes} n\) such that \(v\delta^n(b) = u^n v Z\). Hence, \(\delta^n(b) = u^n Z\), which shows that \(b \in \hat{A}_+\). □

7.4. Lemma.— We have \(A_+ \subset \hat{A}_+\).
Proof.— Let us first prove that \(\psi_+(ux) = v^{-1}\rho_+(\tilde{f}_x)\) belongs to \(\hat{A}_+\) for all \(x \in g_+\). Given \(n \geq 1\), we have to check that \(\delta^n(v^{-1}\rho_+(\tilde{f}_x))\) is divisible by \(u^n\). Formula \((\Delta_{u,v} \otimes \text{id})(R) = R_{13} R_{23}\) for \(R = R_{u,v}\) implies
\[
(\Delta_{u,v} \otimes \text{id})(R) = R_{1,n+1} R_{2,n+1} \cdots R_{n-1,n+1} R_{n,n+1}.
\]
Therefore,
\[
(\delta^n \otimes \text{id})(R) = (R_{1,n+1} - 1)(R_{2,n+1} - 1) \cdots (R_{n-1,n+1} - 1)(R_{n,n+1} - 1).
\]
Since \(R = 1 \otimes 1 + uv R'\), we have
\[
(\delta^n \otimes \text{id})(R) = u^n v^n R'_{1,n+1} R'_{2,n+1} \cdots R'_{n-1,n+1} R'_{n,n+1}.
\]
It follows that
\[
\delta^n(\rho_+(\tilde{f}_x)) = \delta^n((\text{id} \otimes \tilde{f}_x)(R)) = (\delta^n \otimes \tilde{f}_x)(R) = (\text{id} \otimes \tilde{f}_x)((\delta^n \otimes \text{id})(R)) = u^n v^n (\text{id} \otimes \tilde{f}_x)(R') \in u^n U_{u,v}(g_+)^{\otimes n}.
\]
Hence, for \(n \geq 1\),
\[
\delta^n(v^{-1} \rho_+(\tilde{f}_x)) = u^n v^{n-1}(\text{id} \otimes \tilde{f}_x)(R') \in u^n U_{u,v}(g_+)^{\otimes n}.
\]
Since \(\hat{A}_+\) is a subalgebra of \(U_{u,v}(g_+), \psi_+(u[j] x_j) \in \hat{A}_+\) for any \(d\)-tuple \(j\). Since \(\hat{A}_+\) is topologically free (hence complete) by Lemma 7.2, the map
\[
\psi_+ : V_u(g_+)[[v]] \to U_{u,v}(g_+)
\]
takes its values in \(\hat{A}_+\). We conclude with Formula (6.4).

7.5. Lemma. — The \(\mathbb{C}[u][[v]]\)-linear map \(\psi_+ : V_u(g_+)[[v]] \to U_{u,v}(g_+)\) extends to a \(\mathbb{C}[[u,v]]\)-linear map \(\hat{\psi}_+ : \hat{V}_u(g_+)[[v]] \to U_{u,v}(g_+)\). The map \(\hat{\psi}_+\) is injective, its image is \(\hat{A}_+\):
\[
\hat{\psi}_+(\hat{V}_u(g_+)[[v]]) = \hat{A}_+,
\]
and \(p_v \circ \hat{\psi}_+ : \hat{V}_u(g_+)[[v]] \to \hat{V}_u(g_+)\) is the projection sending \(v\) to 0.

Proof. — Any element of \(\hat{V}_u(g_+)\) is of the form \(w = \sum_{m \geq 0} a_m u^m\), where
\[
a_m = \sum_{j: |j| \leq m} \nu^{(m)}_j x_j
\]
and \(\nu^{(m)}_j \in \mathbb{C}\). By Lemma 6.8 (a), the element \(\psi_+(a_m u^m)\) belongs to \(u^m U_{u,v}(g_+)\). Since \(\hat{U}_{u,v}(g_+)\) is topologically free over \(\mathbb{C}[[u,v]]\), the series \(\sum_{m \geq 0} \psi_+(a_m u^m)\) converges in \(U_{u,v}(g_+)\), so that we can define
\[
\hat{\psi}_+(w) = \sum_{m \geq 0} \psi_+(a_m u^m).
\]
By Lemma 7.4 and (7.1), for each \(m \geq 0\), \(\delta^n(\psi_+(a_m u^m))\) is divisible by \(u^n\) for all \(n \geq 1\). It follows that \(\delta^n(\hat{\psi}_+(w))\) is also divisible by \(u^n\) for all \(n \geq 1\). Therefore, \(\hat{\psi}_+(w) \in \hat{A}_+\). Now any element of \(\hat{V}_u(g_+)[[v]]\) is of the form \(\sum_{n \geq 0} w_n v^n\), where \(w_n \in \hat{V}_u(g_+)\) for all \(n \geq 0\). Clearly, \(\sum_{n \geq 0} \hat{\psi}_+(w_n) v^n\) converges in \(\hat{A}_+\). We set \(\hat{\psi}_+(w_n v^n) = \sum_{n \geq 0} \hat{\psi}_+(w_n) v^n\).
Lemma 6.8 (b) implies that $p_v \circ \hat{\psi}_+ \circ \hat{\psi}_+ = 1$. Proceeding as in the proof of Theorem 6.9 (a), we see that $\hat{\psi}_+$ is injective on $\hat{V}_u(g_+)[[v]]$

It remains to prove that the image of $\hat{\psi}_+$ is $\hat{A}_+$. For $a \in \hat{A}_+$, set $w_0 = p_v(a) \in \hat{V}_u(g_+)$, cf. Lemma 7.3 (a). Viewing $w_0$ as a constant formal power series in $\hat{V}_u(g_+)[[v]]$, we consider the element $a - \hat{\psi}_+(w_0) \in \hat{A}_+$; it clearly sits in the kernel of $p_v$, which is $v \hat{A}_+$ by Lemma 7.3 (b). Therefore, there exists $a_1 \in \hat{A}_+$ such that $a - \hat{\psi}_+(w_0) = va_1$. Similarly, there exists $w_1 \in \hat{V}_u(g_+)$ and $a_2 \in \hat{A}_+$ such that $a_1 - \hat{\psi}_+(w_1) = va_2$. Repeating this construction and using the separatedness of $\hat{A}_+$, we obtain an element $w = \sum_{n \geq 0} w_n v^n \in \hat{V}_u(g_+)[[v]]$ such that $a = \hat{\psi}_+(w)$.

**7.6. Corollary.** We have

$$A_+ \cap v \hat{A}_+ = vA_+ \quad \text{and} \quad A_+ \cap u \hat{A}_+ = uA_+.$$

**Proof.** By Theorem 6.9 (a) and Lemma 7.5, it is enough to check that

$$V_u(g_+)[[v]] \cap v \hat{V}_u(g_+)[[v]] = vV_u(g_+)[[v]]$$

and

$$V_u(g_+)[[v]] \cap u \hat{V}_u(g_+)[[v]] = uV_u(g_+)[[v]].$$

The former is clear; the latter is a consequence of $V_u(g_+) \cap u \hat{V}_u(g_+) = uV_u(g_+)$, which is easy to check.

**7.7. Proof of Lemma 6.10.** It is a consequence of Lemmas 7.3 (b) and 7.4, and the first inclusion of Corollary 7.6.

We can now show that $A_+$ has a bialgebra structure. (For the definition of $\hat{\otimes} C[u][[v]]$ and $\hat{\otimes} C[[u,v]]$, see Sections 1.3 and 4.4.)

**7.8. Proposition.** (a) We have the inclusions

$$A_+ \otimes C[u][[v]] A_+ \subset \hat{A}_+ \otimes C[[u,v]] \hat{A}_+ \subset U_{u,v}(g_+) \otimes C[[u,v]] U_{u,v}(g_+).$$

(b) If $\Delta_{u,v}$ denotes the comultiplication of $U_{u,v}(g_+)$, then

$$\Delta_{u,v}(A_+) \subset A_+ \otimes C[u][[v]] A_+$$

and

$$\Delta_{u,v}(\hat{A}_+) \subset \hat{A}_+ \otimes C[[u,v]] \hat{A}_+. $$
Proof. — (a) The inclusion $\hat{A}_+ \otimes_{\mathbb{C}[u,v]} \hat{A}_+ \subset U_{u,v}(\mathfrak{g}_+) \otimes_{\mathbb{C}[u,v]} U_{u,v}(\mathfrak{g}_+)$ follows from Proposition 6.2 (a), Lemma 7.2, and Lemma 4.5 (b).

Let us consider the first inclusion. By Theorem 6.9 (a) and Lemma 7.5, it is enough to prove that the natural map

$$V_u(\mathfrak{g}_+)[[v]] \otimes_{\mathbb{C}[u][[v]]} V_u(\mathfrak{g}_+)[[v]] \to \hat{V}_u(\mathfrak{g}_+)[[v]] \otimes_{\mathbb{C}[u,v]} \hat{V}_u(\mathfrak{g}_+)[[v]]$$

(7.2)

induced by the inclusion $V_u(\mathfrak{g}_+)[[v]] \subset \hat{V}_u(\mathfrak{g}_+)[[v]]$ is injective. By definition of $\hat{\otimes}_{\mathbb{C}[u][[v]]}$, we see that

$$V_u(\mathfrak{g}_+)[[v]] \otimes_{\mathbb{C}[u][[v]]} V_u(\mathfrak{g}_+)[[v]] = (V_u(\mathfrak{g}_+) \otimes_{\mathbb{C}[u]} V_u(\mathfrak{g}_+))[[v]] = V_u(\mathfrak{g}_+ \oplus \mathfrak{g}_+)[[v]].$$

On the other hand,

$$\hat{V}_u(\mathfrak{g}_+)[[v]] \otimes_{\mathbb{C}[u,v]} \hat{V}_u(\mathfrak{g}_+)[[v]] = \lim_n \left( \hat{V}_u(\mathfrak{g}_+)[[v]]/(u,v)^n \otimes_{\mathbb{C}[u,v]/(u,v)^n} \hat{V}_u(\mathfrak{g}_+)[[v]]/(u,v)^n \right)$$

$$= \lim_n \left( V_u(\mathfrak{g}_+)[v]/(u,v)^n \otimes_{\mathbb{C}[u,v]/(u,v)^n} V_u(\mathfrak{g}_+)[v]/(u,v)^n \right)$$

$$= \lim_n \left( V_u(\mathfrak{g}_+ \oplus \mathfrak{g}_+)[v]/(u,v)^n \right)$$

$$= \lim_n \hat{V}_u(\mathfrak{g}_+ \oplus \mathfrak{g}_+)[[v]]/(u,v)^n$$

$$= \hat{V}_u(\mathfrak{g}_+ \oplus \mathfrak{g}_+)[[v]].$$

The last equality holds because $\hat{V}_u(\mathfrak{g}_+ \oplus \mathfrak{g}_+)[[v]]$ is a topologically free $\mathbb{C}[u,v]$-module. The injectivity of (7.2) follows.

(b) In order to prove that the image of $\Delta_{u,v}$ under $\Delta_{u,v}$ lies in the subalgebra $A_+ \otimes_{\mathbb{C}[u][[v]]} A_+$, it is enough to show that $\Delta_{u,v}(\psi_+(ux))$ belongs to this subalgebra for all $x \in \mathfrak{g}_+$.

Let us consider the linear form $f_x \in U_h^*(\mathfrak{g}_-)$ of Section 5.5. Since $\rho_+ : U_h^*(\mathfrak{g}_-) \to U_h(\mathfrak{g}_+)$ is a morphism of coalgebras (see [EK96, Proposition 4.8]), we have $\Delta_h(\rho_+(f_x)) \in \text{Im} \rho_+ \otimes_{\mathbb{C}[h]} \text{Im} \rho_+$.

It follows from Lemma 5.6 that for any element $a \in U_h(\mathfrak{g}_+) \otimes_{\mathbb{C}[h]} U_h(\mathfrak{g}_+)$, there exists a unique family $\nu_{j,k}^{(n)} \in \mathbb{C}$ indexed by a nonnegative integer $n$ and two $d$-tuples $j$ and $k$ such that

$$a = \sum_{n \geq 0} \left( \sum_{|j|+|k| \leq c(n)} \nu_{j,k}^{(n)} t_j \otimes t_k \right) h^n,$$

where $c(n)$ is an integer depending on $a$ and $n$. If, in addition, $a \in \text{Im} \rho_+ \otimes_{\mathbb{C}[h]} \text{Im} \rho_+$, then $c(n) = n$, i.e., $\nu_{j,k}^{(n)} = 0$ whenever $n < |j| + |k|$. Applying this to $a = \Delta_h(\rho_+(f_x))$, we
obtain a family \( \nu^{(n)}_{j,k} \in C \) as above such that

\[
\Delta_h(\rho_+(fx)) = \sum_{n \geq 0} \left( \sum_{|j| + |k| \leq n} \nu^{(n)}_{j,k} t_j \otimes t_k \right) h^n = \sum_{n \geq 0,j,k} \nu^{(n)}_{j,k} \rho_+(fx_1)^{j_1} \cdots \rho_+(fx_d)^{j_d} \otimes \rho_+(fx_1)^{k_1} \cdots \rho_+(fx_d)^{k_d} h^{n - |j| - |k|},
\]

where \( j = (j_1, \ldots, j_d) \) and \( k = (k_1, \ldots, k_d) \). Extending the scalars from \( C[[h]] \) to \( C[[u,v]] \) and using (6.3), we obtain

\[
\Delta_{u,v}(\rho_+(\tilde{f}x)) = \sum_{n \geq 0,j,k} \nu^{(n)}_{j,k} \rho_+(\tilde{f}x_1)^{j_1} \cdots \rho_+(\tilde{f}x_d)^{j_d} \otimes \rho_+(\tilde{f}x_1)^{k_1} \cdots \rho_+(\tilde{f}x_d)^{k_d}(uv)^{n - |j| - |k|}
\]

\[
= \sum_{n \geq 0;j,k} \nu^{(n)}_{j,k} \psi_+(u\tilde{j}|x_j) \otimes \psi_+(u\tilde{k}|x_k) u^{n - |j| - |k|} v^n
\]

\[
= \sum_{n \geq 0} \left( \sum_{j,k} \nu^{(n)}_{j,k} u^{n - |j| - |k|} \psi_+(u\tilde{j}|x_j) \otimes \psi_+(u\tilde{k}|x_k) \right) v^n.
\]

Therefore, \( v \Delta_{u,v}(\psi_+(ux)) = \Delta_{u,v}(\rho_+(\tilde{f}x)) \) is a formal power series in \( v \) whose coefficients belong to the \( C[u] \)-linear span of the elements \( \psi_+(u\tilde{j}|x_j) \otimes \psi_+(u\tilde{k}|x_k) \). Hence, \( v \Delta_{u,v}(\psi_+(ux)) \) belongs to \( A_+ \otimes C[[u,v]] A_+ \).

The element \( \Delta_{u,v}(\psi_+(ux)) \in U_{u,v}(g_+) \otimes C[[u,v]] U_{u,v}(g_+) \) can be expanded as

\[
\Delta_{u,v}(\psi_+(ux)) = \sum_i a_i \otimes z_i,
\]

where \( (a_i)_i \) is a basis of the topologically free \( C[[u,v]] \)-module \( U_{u,v}(g_+) \) and \( z_i \in U_{u,v}(g_+) \).

Since

\[
\sum_i a_i \otimes vz_i = v \Delta_{u,v}(\psi_+(ux)) \in U_{u,v}(g_+) \otimes C[[u,v]] \hat{A}_+,
\]

we have \( vz_i \in \hat{A}_+ \) for all \( i \). By Lemma 7.3 (b) it follows that \( z_i \in \hat{A}_+ \) for all \( i \). Now taking a basis \( (b_j)_j \) of the topologically free \( C[[u,v]] \)-module \( \hat{A}_+ \), we can write

\[
\Delta_{u,v}(\psi_+(ux)) = \sum_j z_j' \otimes b_j,
\]

where \( z_j' \in U_{u,v}(g_+) \). Since \( \sum_j vz_j' \otimes b_j = v \Delta_{u,v}(\psi_+(ux)) \in \hat{A}_+ \otimes C[[u,v]] \hat{A}_+ \), we have \( vz_j' \in \hat{A}_+ \), hence \( z_j' \in \hat{A}_+ \) for all \( j \). Therefore,

\[
\Delta_{u,v}(\psi_+(ux)) \in \hat{A}_+ \otimes C[[u,v]] \hat{A}_+.
\]
The desired inclusion \( \Delta_{u,v}(\psi_+(ux)) \in A_+ \otimes_{C[[u]][[v]]} A_+ \) follows from

\[
A_+^\otimes^2 \cap v\left(\hat{A}_+^\otimes^2\right) = v\left(A_+^\otimes^2\right). \tag{7.3}
\]

In view of Theorem 6.9 (a) and Lemma 7.5, Equality (7.3) is equivalent to

\[
V_u(g_+)[[v]]^\otimes^2 \cap v\left(\hat{V}_u(g_+)[[v]]^\otimes^2\right) = v\left(V_u(g_+)[[v]]^\otimes^2\right),
\]

which is proved by using the identifications of the proof of Part (a). We have thus established that \( \Delta_{u,v}(A_+) \subset A_+ \otimes_{C[[u]][[v]]} A_+ \).

We now check that \( \Delta_{u,v}(\hat{A}_+) \subset \hat{A}_+ \otimes_{C[[u,v]]} \hat{A}_+ \). By Lemma 7.5 any element of \( \hat{A}_+ \) is of the form \( \hat{\psi}_+(a) \), where \( a \in \hat{V}_u(g_+)[[v]] \). For any \( N > 0 \), there exists \( b \in V_u(g_+)[[v]] \) such that \( a - b = \sum_{n \geq 0} a_n v^n \) with \( a_n \in \bigoplus_{p \geq N} U^p(g_+)u^p \). Now, \( \hat{\psi}_+(b) = \psi_+(b) \in A_+ \), and \( \hat{\psi}_+(a - b) \in u^N U_{u,v}(g_+) \) by Lemma 6.8 (a). Therefore,

\[
\Delta_{u,v}(\hat{\psi}_+(a)) \equiv \Delta_{u,v}(\psi_+(b)) \mod u^N. \tag{7.4}
\]

It follows from the considerations above that

\[
\Delta_{u,v}(\psi_+(b)) \in A_+ \otimes_{C[[u]][[v]]} A_+ \subset \hat{A}_+ \otimes_{C[[u,v]]} \hat{A}_+.
\]

The latter \( C[[u,v]] \)-module being topologically free, Formula (7.4) for all \( N > 0 \) implies

\[
\Delta_{u,v}(\hat{\psi}_+(a)) \in \hat{A}_+ \otimes_{C[[u,v]]} \hat{A}_+.
\]

7.9. COROLLARY.— The algebras \( A_+ \) and \( \hat{A}_+ \) are subbialgebras of \( U_{u,v}(g_+) \).

7.10. REMARK.— The bialgebra \( A_+ \) has the following alternative definition. Define the \( C[[u]][[v]] \)-bialgebra

\[
U_{u,v}'(g_+) = \lim_n U_h(g_+) \otimes_{C[[h]]/(h^n)} C[[u]][[v]]/(v^n),
\]

where \( C[[u]][[v]] \) is a \( C[[h]] \)-module by the morphism \( \iota \) of Section 4.6. One can check that \( U_{u,v}'(g_+) \) embeds as a subbialgebra into the bialgebra \( U_{u,v}(g_+) \) of Section 6.1, that the map \( \hat{\alpha}_+ \) of Section 6.6 sends the \( C[[u]][[v]] \)-module \( U_{u,v}'(g_+) \) isomorphically onto \( U(g_+)[[u]][[v]] \), and that the bialgebra morphism \( p_v \) of Lemma 6.7 maps \( U_{u,v}'(g_+) \) onto the bialgebra \( U(g_+)[[u]] \) of polynomials with coefficients in \( U(g_+) \).

Adapting the proofs of Sections 6–7, one can prove that \( A_+ \) is in \( U_{u,v}'(g_+) \) and that

\[
A_+ = \left\{ a \in U_{u,v}'(g_+) \mid \delta^n(a) \in u^n U_{u,v}'(g_+) \hat{\otimes}^n \text{ for all } n \geq 1 \right\}.
\]
8. Proofs of Theorems 2.3, 2.6, and 2.9 (I)

Let $A_{u,v}(\mathfrak{g}_+)=A_+$ be the bialgebra constructed in Sections 6–7. We first prove Theorem 2.6 and then determine $A_+/uA_+$ as an algebra (Part I of Theorem 2.9). The proof of Theorem 2.3 follows.

8.1. Proof of Theorem 2.6. — It follows from Lemma 6.7, Lemma 6.8 (b), Theorem 6.9, and Corollary 7.9 applied to $\mathfrak{g}_+=\mathfrak{g}$ that the morphism of bialgebras $p_v:U_{u,v}(\mathfrak{g}_+)\to U(\mathfrak{g}_+)[[u]]$ restricts to a surjective morphism of bialgebras $p_v:A_+\to V_u(\mathfrak{g}_+)$ whose kernel is $vA_+$. Therefore, the induced map $A_+/vA_+\to V_u(\mathfrak{g}_+)$ is an isomorphism of bialgebras. It remains to check that this isomorphism preserves the cobracket.

The bialgebra structure on $A_+$ induces on $V_u(\mathfrak{g}_+)$ a Poisson cobracket $\delta'$ given by (1.8), where $p=p_v$. We have to check that $\delta'$ coincides with the Poisson cobracket $\delta_u$ of $V_u(\mathfrak{g}_+)$ defined by (2.5). Since the algebra $V_u(\mathfrak{g}_+)$ is generated by the elements $ux$ with $x\in\mathfrak{g}_+$, it suffices to show that $\delta'(ux)=\delta_u(ux)$ for all $x\in\mathfrak{g}_+$.

We identify the module $U_{u,v}(\mathfrak{g}_+)$ with $U(\mathfrak{g}_+)[[u,v]]$ via the isomorphism $\tilde{\alpha}_+$ of Section 6.6. Let $a\in\tilde{\alpha}_+^{-1}(ux)\subset U_{u,v}(\mathfrak{g}_+)$. We have $p_v(a)=ux$. Viewing $U_{u,v}(\mathfrak{g}_+)$ as a subalgebra of $U_{u,v}(\mathfrak{d})$, we see by (5.3)–(5.4) that the comultiplication $\Delta_{u,v}$ of $U_{u,v}(\mathfrak{g}_+)$ satisfies

$$\Delta_{u,v}(a)\equiv \Delta(a) + uv[\Delta(a), \frac{r}{2}] \mod u^2v^2 U_{u,v}(\mathfrak{d})\otimes^2,$$

where $\Delta$ is the standard comultiplication (2.4) on $U_{u,v}(\mathfrak{d})=U(\mathfrak{d})[[u,v]]$. Therefore,

$$\frac{\Delta_{u,v}(a) - \Delta_{u,v}^{op}(a)}{v} \equiv u[\Delta(a), \frac{r-r_{21}}{2}] \mod u^2v U_{u,v}(\mathfrak{d})\otimes^2.$$

It follows that

$$\delta'(ux) = (p_v \otimes p_v) \left( \frac{\Delta_{u,v}(a) - \Delta_{u,v}^{op}(a)}{v} \right)$$

$$= u [\Delta(ux), \frac{r-r_{21}}{2}]$$

$$= u^2 [x \otimes 1 + 1 \otimes x, \frac{r-r_{21}}{2}]$$

$$= u^2 \left( [x \otimes 1 + 1 \otimes x, r] - \frac{1}{2} [x \otimes 1 + 1 \otimes x, r + r_{21}] \right)$$

$$= u^2 [x \otimes 1 + 1 \otimes x, r] = u^2 \delta(x) = \delta_u(ux).$$

The vanishing of $[x \otimes 1 + 1 \otimes x, r + r_{21}]$ is due to the invariance of the 2-tensor $r + r_{21}$. The identity $\delta(x) = [x \otimes 1 + 1 \otimes x, r]$ follows from (5.2).

8.2. Proof of Theorem 2.9. Part I. — We prove here that $A_+/uA_+=S(\mathfrak{g}_+)[[v]]$ as a $\mathbb{C}[[v]]$-algebra. We first observe that the algebra $A_+/uA_+$ is commutative. Indeed, $A_+/uA_+ \subset \tilde{A}_+/u\tilde{A}_+$ by the second equality of Corollary 7.6. By Proposition 3.4, the quotient algebra $\tilde{A}_+/u\tilde{A}_+$ is commutative; hence, so is $A_+/uA_+$. 36
Consider the $C[u][v]$-linear isomorphism $\psi_+ : V_u(g_+)[[v]] \to A_+$ of Theorem 6.9 (a). It induces a $C[[v]]$-linear isomorphism

$$\Psi_+ : S(g_+)[[v]] = V_u(g_+)[[v]] / u V_u(g_+)[[v]] \to A_+ / u A_+.$$ 

By definition,

$$\Psi_+(x_{j_1}^{i_1} \ldots x_{j_d}^{i_d}) = v^{-|j|} \rho_+(\bar{f}_{x_1}^{j_1}) \ldots \rho_+(\bar{f}_{x_d}^{j_d}) \mod u A_+ \quad (8.1)$$

for all $d$-tuples $\hat{j} = (j_1, \ldots, j_d)$. (Recall that $(x_1, \ldots, x_d)$ is a fixed basis of $g_+$. ) Since $A_+/u A_+$ is commutative, $\Psi_+$ is an algebra morphism. \hfill \Box

8.3. **Proof of Theorem 2.3.** — By Theorem 6.9 (a), the $C[u][v]$-module $A_+$ is isomorphic to $V_u(g_+)[[v]]$, hence to $S(g_+)[u][v]$ (see Section 2.4 and Lemma 2.5). As a consequence of Theorem 2.6 and Section 8.2, the bialgebra $A_+$ is commutative modulo $u$ and co-commutative modulo $v$. It follows from Theorem 2.6 and Lemma 2.5 that $A_+/(u, v) = S(g)$ as bi-Poisson bialgebras. \hfill \Box

8.4. **Remark.** — Since $A_+$ is a $C[u][v]$-module, we may set $u = 1$. We claim that the quotient bialgebra $A_+/(u-1)$ is isomorphic to Etingof and Kazhdan’s bialgebra $U_v(g_+)$ of Section 5.4 (with $h$ replaced by $v$). Indeed, the bialgebra inclusion $A_+ \subset U_{u,v}(g_+)$ of Remark 7.10 induces a bialgebra morphism $\xi : A_+/(u-1) \to U_{u,v}(g_+)/(u-1) = U_v(g_+)$. It remains to show that $\xi$ is an isomorphism. The isomorphism $\psi_+$ of Theorem 6.9 (a) induces a $C[[v]]$-linear isomorphism $\psi_+ : U(g_+)[[[v]] = V_u(g_+)[[v]] / (u-1) \to A_+/(u-1)$. It now suffices to check that the composite map $\xi \circ \psi_+$ is a morphism. By Sections 5.5, 6.4, and 6.6 the map $\xi \circ \psi_+$ sends $x_{\hat{j}} = x_1^{j_1} \ldots x_d^{j_d} \in U(g_+)[[v]]$ to $v^{-|\hat{j}|} \rho_+(\bar{f}_{x_1}^{j_1}) \ldots \rho_+(\bar{f}_{x_d}^{j_d})$ for all $d$-tuples $(j_1, \ldots, j_d)$. In view of Lemma 5.6 (a) it follows that $\xi \circ \psi_+$ is an isomorphism modulo $v$; hence, it is an isomorphism of topologically free $C[[v]]$-modules.

9. **A nondegenerate bialgebra pairing**

In this section, we construct a pairing between $A_+$ and a $C[v][u]$-bialgebra $A_-$, using the element $R_{u,v} \in U_{u,v}(g_+) \otimes_{C[[u,v]]} U_{u,v}(g_-)$ introduced in Section 6. We start by defining $A_-$, then we prove an important property of $R_{u,v}$. We resume the notation of Sections 5–8.

9.1. **The Bialgebras $A_-$ and $\hat{A}_-$.** They are defined by analogy with $A_+$ and $\hat{A}_+$. Let us begin with the definition of $A_-$. Consider the $C[[h]]$-linear isomorphism $\alpha_+ : U_h(g_+) \to U(g_+)[[h]]$ of Section 6.6. We have $\alpha_+(1) = 1$ and $\alpha_+ \equiv \text{id} \mod h$. Choose a $C$-linear projection $\pi_+ : U(g_+) \to U^1(g_+) = C \oplus g_+$ that is the identity on $U^1(g_+)$. For any $y \in g_-$ we define a $C$-linear form $\langle - , y \rangle : U^1(g_+) \to C$ extending the evaluation map $\langle - , y \rangle : g_+ \to C$ and such that $\langle 1 , y \rangle = 0$. We obtain a $C[[h]]$-linear form $g_y : U_h(g_+) \to C[[h]]$ by

$$g_y(a) = \langle \pi_+ \alpha_+(a) , y \rangle = \sum_{n \geq 0} \langle \pi_+ (a_n) , y \rangle h^n,$$  

(9.1)
where \( a \in U_{h}(g_+) \) and the elements \( a_n \in U(g_) \) are defined by \( \alpha_+(a) = \sum_{n \geq 0} a_nh^n \). We have \( g_+(1) = 0 \).

By extension of scalars, we obtain a \( C[[u,v]] \)-linear form \( \tilde{g}_y : U_{u,v}(g_+) \to C[[u,v]] \) such that \( \tilde{g}_y(1) = 0 \). We apply the map \( \rho_- : U_{u,v}^{*}(g_+) \to U_{u,v}(g_-) \) of (6.2) to \( \tilde{g}_y \). By Lemma 6.5 adapted to this situation, \( \rho_-(\tilde{g}_y) \in U_{u,v}(g_-) \) is divisible by \( uv \).

Let \( V_v(g_-) \) be the \( C[v] \)-bialgebra introduced in Section 2.4, where we have now replaced \( u \) by \( v \). Let \((y_1, \ldots, y_d) \) be the basis of \( g_- \) dual to the fixed basis \((x_1, \ldots, x_d) \) of \( g_+ \). The family \((v^{|k|}y_k) \), where \( k \) runs over all \( d \)-tuples of nonnegative integers, is a \( C[v] \)-basis of \( V_v(g_-) \). We define a \( C[v] \)-linear map \( \psi_- : V_v(g_-) \to U_{u,v}(g_-) \) by \( \psi_-(1) = 1 \) and

\[
\psi_-(v^{|k|}y_k) = \frac{1}{k!} \rho_-(\tilde{g}_y)^{|k|} \rho_-(\tilde{g}_{y_1}) \cdots \rho_-(\tilde{g}_{y_d}),
\]

where \( k = (k_1, \ldots, k_d) \) is a \( d \)-tuple with \(|k| \geq 1 \). This map extends uniquely to a \( C[v][[u]] \)-linear map, still denoted \( \psi_- \), from \( V_v(g_-)[[u]] \) to \( U_{u,v}(g_-) \) by

\[
\psi_- \left( \sum_{n \geq 0} w_nu^n \right) = \sum_{n \geq 0} \psi_-(w_n)u^n,
\]

where \( w_0, w_1, w_2, \ldots \in V_v(g_-) \). We then define the \( C[v][[u]] \)-module \( A_- \) by

\[
A_- = \psi_-(V_v(g_-)[[u]]) \subset U_{u,v}(g_-).
\]

Recall the isomorphism \( \alpha_- : U_{h}(g_-) \cong U(g_-)[[h]] \) of Section 5.5. It induces a \( C[[u,v]] \)-linear isomorphism \( \tilde{\alpha}_- : U_{u,v}(g_-) \cong U(g_-)[[u,v]] \) such that \( \tilde{\alpha}_- \equiv \text{id} \) modulo \( uv \). Consider the composed map

\[
p_u : U_{u,v}(g_-) \xrightarrow{\tilde{\alpha}_-} U(g_-)[[u,v]] \to U(g_-)[[v]],
\]

where the second map is the projection \( u \to 0 \). The map \( p_u \) is a morphism of bialgebras when we equip \( U(g_-)[[v]] \) with the power series multiplication and the comultiplication (2.4). Moreover, \( p_u \) sends \( A_- \) onto \( V_v(g_-) \) and \( p_u \circ \psi_- : V_v(g_-)[[u]] \to V_v(g_-) \) is the projection sending \( u \) to 0. This is proved as in Section 6.

By analogy with Section 7.1, we define a \( C[[u,v]] \)-subalgebra \( \tilde{A}_- \) of \( U_{u,v}(g_-) \) by

\[
\tilde{A}_- = \left\{ a \in U_{u,v}(g_-) \mid \delta^n(a) \in v^nU_{u,v}(g_-) \otimes^n \text{ for all } n \geq 1 \right\}.
\]

It is clear that the results of Sections 6–8 apply to \( A_- \) and \( \tilde{A}_- \), namely we have the following properties.

(i) The map \( \psi_- : V_v(g_-)[[u]] \to A_- \) is an isomorphism of \( C[v][[u]] \)-modules. It extends to an isomorphism of \( C[[u,v]] \)-modules \( \tilde{\psi}_- : V_v(g_-)[[u]] \to \tilde{A}_- \).

(ii) \( A_- \subset \tilde{A}_- \) are subalgebras of \( U_{u,v}(g_-) \).

(iii) \( A_- \) is independent of the choices of the isomorphism \( \alpha_+ : U_{h}(g_+) \to U(g_+)[[h]] \), of the projection \( \pi_+ : U(g_+) \to U^1(g_+) \), and of the basis of \( g_- \).

(iv) \( A_- \) and \( \tilde{A}_- \) are topological bialgebras for the \( u \)-adic topology and the \((u,v)\)-adic topology, respectively.
(v) $A_-$ and $\widehat{A}_-$ are commutative modulo $v$ and cocommutative modulo $u$. There are isomorphisms of co-Poisson bialgebras

$$A_-/uA_- = V_v(\mathfrak{g}_-),$$

(9.5) isomorphisms of bi-Poisson bialgebras

$$A_-/(u,v)A_- = S(\mathfrak{g}_-),$$

(9.6) and isomorphisms of algebras

$$A_-/vA_- = S(\mathfrak{g}_-)[[u]].$$

(9.7)

Recall the two-variable universal $R$-matrix $R_{u,v} \in U_{u,v}(\mathfrak{g}_+) \hat{\otimes}_{C[[u,v]]} U_{u,v}(\mathfrak{g}_-)$ of Section 6. We now give a stronger version of Lemma 6.3 (b).

9.2. LEMMA.— The element $R_{u,v} - 1 \otimes 1$ belongs to the submodules

$$v \widehat{A}_+ \hat{\otimes}_{C[[u,v]]} U_{u,v}(\mathfrak{g}_-) \quad \text{and} \quad U_{u,v}(\mathfrak{g}_+) \hat{\otimes}_{C[[u,v]]} u \widehat{A}_-$$
of $U_{u,v}(\mathfrak{g}_+) \hat{\otimes}_{C[[u,v]]} U_{u,v}(\mathfrak{g}_-)$.

PROOF.— Recall the element $R' \in U_{u,v}(\mathfrak{g}_+) \hat{\otimes}_{C[[u,v]]} U_{u,v}(\mathfrak{g}_-)$ of Lemma 6.3 (b). It is enough to show that

$$uR' \in \widehat{A}_+ \hat{\otimes}_{C[[u,v]]} U_{u,v}(\mathfrak{g}_-) \quad \text{and} \quad vR' \in U_{u,v}(\mathfrak{g}_+) \hat{\otimes}_{C[[u,v]]} \widehat{A}_-.$$

We shall prove the first inclusion. The second one has a similar proof.

Let $(b_j)_j$ be a basis over $C[[u,v]]$ of the (topologically free) $C[[u,v]]$-module $U_{u,v}(\mathfrak{g}_-)$. We can expand $R'$ as $R' = \sum_j z_j \otimes b_j$, where $z_j$ are elements of $U_{u,v}(\mathfrak{g}_+)$. The proof of Lemma 7.4 shows that $(\delta^n \otimes \text{id})(uvR')$ is divisible by $u^n$ for any $n \geq 1$. Hence,

$$(\delta^n \otimes \text{id})(R') = \sum_j \delta^n(z_j) \otimes b_j$$
is divisible by $u^{n-1}$. The elements $b_j$ being linearly independent, it follows that $\delta^n(z_j)$ is divisible by $u^{n-1}$ for all $n \geq 1$ and all $j$. Therefore, $uz_j \in \widehat{A}_+$ for all $j$ and $uR' \in \widehat{A}_+ \hat{\otimes}_{C[[u,v]]} U_{u,v}(\mathfrak{g}_-)$. 

\[\square\]

9.3. COROLLARY.— The element $R_{u,v}$ belongs to the submodules

$$\widehat{A}_+ \hat{\otimes}_{C[[u,v]]} U_{u,v}(\mathfrak{g}_-) \quad \text{and} \quad U_{u,v}(\mathfrak{g}_+) \hat{\otimes}_{C[[u,v]]} \widehat{A}_-.$$

We consider the dual $C[[u,v]]$-modules $\widehat{A}_+^* = \text{Hom}_C[[u,v]](\widehat{A}_+, C[[u,v]])$ and $\widehat{A}_-^* = \text{Hom}_C[[u,v]](\widehat{A}_-, C[[u,v]])$. In view of Corollary 9.3, Formulas (6.2) now define $C[[u,v]]$-linear maps $\widehat{A}_+^* \to U_{u,v}(\mathfrak{g}_+)$ and $\widehat{A}_-^* \to U_{u,v}(\mathfrak{g}_-)$, which we still denote by $\rho_+$ and $\rho_-$, respectively. The comultiplications of $\widehat{A}_+$ and of $\widehat{A}_-$ induce algebra structures on $\widehat{A}_+^*$ and $\widehat{A}_-^*$. As in Section 6, the map $\rho_+$ is an antimorphism of algebras and $\rho_-$ is a morphism of algebras.
9.4. Lemma.— We have

\[ A_+ \subset \rho_+(\hat{A}^*_+) \subset \hat{A}_+ \quad \text{and} \quad A_- \subset \rho_-(\hat{A}^*_+) \subset \hat{A}_-. \]

Proof.— Let us prove the first two inclusions. The other two inclusions have similar proofs.

(a) We use the notation of Sections 6.4 and 6.6. We first show that, for any \( x \in g_+ \), the element \( v^{-1}\rho_+(\tilde{f}_x) \in A_+ \) sits in \( \rho_+(\hat{A}^*_+) \). Indeed, if \( b \in \hat{A}_- \), then \( \delta^1(b) = b - \varepsilon(b)1 \) is divisible by \( v \) in \( U_{u,v}(g_-) \). Hence, \( \tilde{f}_x(b) = \tilde{f}_x(b) - \varepsilon(b)\tilde{f}_x(1) \in C[[u,v]] \) is divisible by \( v \).

We then define \( \tilde{f}_x \in \hat{A}^*_+ \) by

\[ \tilde{f}_x(b) = v^{-1}\tilde{f}_x(b) \in C[[u,v]] \quad (9.8) \]

for any \( b \in \hat{A}_- \). It follows that the restriction of \( \tilde{f}_x \) to \( \hat{A}_- \) equals \( v\tilde{f}_x \). Therefore, \( v^{-1}\rho_+(\tilde{f}_x) = \rho_+(\tilde{f}_x) \in \rho_+(\hat{A}^*_+) \).

By Section 6.6, any element \( a \in A_+ \) is of the form

\[ a = \sum_{n \geq 0} v^n \left( \sum_j P_j(u) v^{-\lfloor j \rfloor+1} \rho_+(\tilde{f}_{x_1})^j \cdots \rho_+(\tilde{f}_{x_d})^j \right), \]

where the sums inside the brackets are finite and \( P_j(u) \in C[u] \). The formal power series

\[ \sum_{n \geq 0} v^n \left( \sum_j P_j(u) \tilde{f}_{x_d}^j \cdots \tilde{f}_{x_1}^j \right) \]

converges to an element \( f \) in the topologically free \( C[[u,v]] \)-module \( \hat{A}^*_+ \). Since \( \rho_+: \hat{A}^*_+ \to U_{u,v}(g_+) \) is an antimorphism of algebras, we have \( \rho_+(f) = a \). This implies that \( A_+ \subset \rho_+(\hat{A}^*_+) \).

(b) Let us prove that \( \rho_+(\hat{A}^*_+) \subset \hat{A}_+ \). Given \( f \in \hat{A}^*_+ \), we have to check that \( \delta^n(\rho_+(f)) \) is divisible by \( u^n \) for all \( n \geq 1 \). By Lemma 9.2, \( vR' \in U_{u,v}(g_+) \otimes C[[u,v]] \hat{A}_- \), hence

\[ v^nR'_{1,n+1}R'_{2,n+1} \cdots R'_{n-1,n+1}R'_{n,n+1} \in U_{u,v}(g_+) \otimes \hat{C}[[u,v]] \hat{A}_- \]

This allows us to apply \( \text{id} \otimes f \) to \( v^nR'_{1,n+1}R'_{2,n+1} \cdots R'_{n-1,n+1}R'_{n,n+1} \). A computation similar to the one in the proof of Lemma 7.4 yields

\[ \delta^n(\rho_+(f)) = u^n(\text{id} \otimes f)(v^nR'_{1,n+1}R'_{2,n+1} \cdots R'_{n-1,n+1}R'_{n,n+1}) \in u^nU_{u,v}(g_+) \hat{\otimes} n. \]

\[ \square \]
9.5. Lemma.— For $a \in A_+$ and $b \in A_-$, the formulas

$$(a, b)_{u,v} = (\rho_+^{-1}(a))(b) = (\rho_-^{-1}(b))(a),$$

yield a well-defined bialgebra pairing $A_+ \times A_\mathbb{C}^\text{op} \to \mathbb{C}[[u,v]]$.

Here $A_\mathbb{C}^\text{op}$ denotes the bialgebra $A_-$ with the opposite comultiplication. The pairing $(\ , \)_{u,v}$ is in the sense of Section 2.10 with $K_1 = \mathbb{C}[u][[v]], K_2 = \mathbb{C}[v][[u]],$ and $K = \mathbb{C}[[u,v]]$.

Proof.— Let us prove that the expression $(\rho_-^{-1}(b))(a)$ is well defined. It suffices to check that, if $g \in \hat{A}_+$ satisfies $\rho_-(g) = 0$, then $g(a) = 0$. Suppose first that $a = \psi_+(u^{|j|}x_\underline{j})$ for some $d$-tuple $j$. By (6.3), $v^{|j|}a = \rho_+(f)$, where $f = \tilde{f}_{x_\underline{j}} \cdots \tilde{f}_{x_\underline{j}} \in U^*_v(g_-)$. Applying $(g \otimes f)$ to $R_{u,v} \in \hat{A}_+ \widehat{\otimes} \mathbb{C}[u,v] U_{u,v}(g_-)$, we obtain

$$v^{|j|} g(a) = g(\rho_+(f)) = (g \otimes f)(R_{u,v}) = f(\rho_-(g)) = 0.$$

Since $\mathbb{C}[[u,v]]$ is $\nu$-torsion-free, we obtain $g(a) = 0$. By $\mathbb{C}[[u,v]]$-linearity, $g(a) = 0$ for all $a \in \hat{A}_+$.

A similar argument proves that $(\rho_+^{-1}(a))(b)$ is well defined. Let us show that

$$(\rho_+^{-1}(a))(b) = (\rho_-^{-1}(b))(a).$$

By linearity, it suffices to consider the case $a = \psi_+(u^{|j|}x_\underline{j})$ as above. We have $v^{|j|}a = \rho_+(f)$ with $f \in U^*_v(g_-)$. Let $g \in \rho_-(b) \subset \hat{A}_+$. Then

$$v^{|j|}(\rho_+^{-1}(a))(b) = f(b) = f(\rho_-(g)) = (g \otimes f)(R_{u,v}) = g(\rho_+(f)) = v^{|j|} g(a) = v^{|j|}(\rho_-^{-1}(b))(a).$$

Hence, (9.10) holds.

That $(\ , \)_{u,v}$ is a bialgebra pairing follows directly from the fact that $\rho_+$ is an antihomorphism of algebras and $\rho_-$ is a morphism of algebras. □

9.6. Remark.— Proceeding as in the proof of Lemma 9.5, we can show that the maps $\rho_+: \hat{A}_+ \to \hat{A}_+$ and $\rho_-: \hat{A}_+ \to \hat{A}_-$ are injective.

9.7. Induced Bialgebra Pairings. Passing to the quotient modulo $u$, the pairing $(\ , \)_{u,v}$ induces a bialgebra pairing

$$(\ , \)_v: A_+/uA_+ \times A_-/uA_- \to \mathbb{C}[[v]].$$

(The bialgebra $A_-/uA_-$ is cocommutative by (9.5), so that $(A_-/uA_-)^{\text{cop}} = A_-/uA_-$.)

Recall the isomorphism of algebras $\Psi_+: S(g_+)[[v]] \to A_+/uA_+$ defined by (8.1). On the other hand, the composition of $\psi_- : V_v(g_-) \to A_-$ defined by (9.2) and the projection $A_- \to A_-/uA_-$ is an isomorphism of $\mathbb{C}[v]$-bialgebras $\Psi_- : V_v(g_-) \to A_-/uA_-$, which is defined on the $\mathbb{C}[v]$-basis $(v^{|k|}y_k)_\underline{k}$ of $V_v(g_-)$ by

$$\Psi_-(v^{|k|}y_k) = \psi_-(v^{|k|}y_k) \mod uA_- = u^{-|k|} \rho_-(\tilde{g}_{y_1})k_1 \cdots \rho_-(\tilde{g}_{y_d})k_d \mod uA_-,$$

where $k = (k_1, \ldots, k_d)$ and the maps $\tilde{g}_{y_i}$ were introduced in Section 9.1.
9.8. Lemma. — If \( \underline{j} = (j_1, \ldots, j_d) \) and \( \underline{k} = (k_1, \ldots, k_d) \) are \( d \)-tuples of nonnegative integers, then

\[
(\Psi_+(x_{\underline{j}}), \Psi'_-(v|\underline{k}| y_{\underline{k}}))_v = \begin{cases} 
0 & \text{if } |\underline{j}| > |\underline{k}|, \\
\delta_{j_1,k_1} \cdots \delta_{j_d,k_d} j_1! \cdots j_d! & \text{if } |\underline{j}| = |\underline{k}|, \\
\in v|\underline{k}| - |\underline{j}| \mathbb{C}[v] & \text{if } |\underline{j}| < |\underline{k}|.
\end{cases}
\]

Proof. — We first claim that for any \( x \in g_+ \) and any \( d \)-tuple \( \underline{k} = (k_1, \ldots, k_d) \),

\[
(\Psi_+(x), \Psi'_-(v|\underline{k}| y_{\underline{k}}))_v = \begin{cases} 
0 & \text{if } |\underline{k}| = 0, \\
v|\underline{k}|-1 \langle x, \pi_-(y_{\underline{k}}) \rangle & \text{if } |\underline{k}| \geq 1.
\end{cases}
\]  

(9.13)

Indeed, consider the diagram

\[
\begin{array}{ccc}
U_{u,v}(g_-) & \xrightarrow{\alpha} & U(g_-)[[u,v]] \\
\downarrow p_u & & \downarrow \text{id} \\
U(g_-)[[v]] & \xrightarrow{\text{id}} & U(g_-)[[v]]
\end{array}
\]

where the unmarked vertical maps are the projections sending \( u \) to 0. The left-hand and the right-hand squares commute by definition of \( p_u \) and by linearity, respectively. It follows that, for any \( b \in U_{u,v}(g_-) \),

\[
\tilde{f}_x(b) \mod u\mathbb{C}[[u,v]] = \langle x, \pi_-(p_u(b)) \rangle.
\]  

(9.14)

Since \( \Psi_+(x) = v^{-1} \rho_+(\tilde{f}_x) \mod uA_+ \) and \( \Psi'_-(v|\underline{k}| y_{\underline{k}}) = \psi_-(v|\underline{k}| y_{\underline{k}}) \mod uA_- \), we have

\[
(\Psi_+(x), \Psi'_-(v|\underline{k}| y_{\underline{k}}))_v = v^{-1} \tilde{f}_x(\psi_-(v|\underline{k}| y_{\underline{k}})) \mod u\mathbb{C}[[u,v]]
\]

\[
= v^{-1} \langle x, \pi_-(p_u(\psi_-(v|\underline{k}| y_{\underline{k}}))) \rangle
\]

\[
= v^{-1} \langle x, v|\underline{k}| \pi_-(y_{\underline{k}}) \rangle = v|\underline{k}|-1 \langle x, \pi_-(y_{\underline{k}}) \rangle
\]

for all \( \underline{k} \). If \( |\underline{k}| = 0 \), then \( v|\underline{k}| y_{\underline{k}} = 1 \), on which \( \langle x, - \rangle \) vanishes. This proves (9.13).

Formula (9.13) implies that Lemma 9.8 holds for any \( \underline{j} \) and \( \underline{k} \) such that \( |\underline{j}| = 1 \). For the general case, observe that

\[
(\Psi_+(x_{\underline{j}}), \Psi'_-(v|\underline{k}| y_{\underline{k}}))_v = (\Psi_+(x_1)^{j_1} \cdots \Psi_+(x_d)^{j_d}, \Psi'_-(v|\underline{k}| y_{\underline{k}}))_v
\]

\[
= (\Psi_+(x_1)^{\otimes j_1} \otimes \cdots \otimes \Psi_+(x_d)^{\otimes j_d}, \Delta_{u,v}^{|\underline{j}|}(\Psi'_-(v|\underline{k}| y_{\underline{k}}))_v)
\]

(9.15)

in view of Lemma 9.6 (a), and the fact that \( \Psi_+ \) preserves the multiplication and \( \Psi'_- \) preserves the comultiplication. Here \( \Delta \) is given by (2.4). Then the formulas of Lemma 9.8 for a general \( \underline{j} \) follow from (2.4), (9.15), and the formulas for \( \underline{j} \) such that \( |\underline{j}| = 1 \). \( \Box \)
Passing to the quotients modulo $v$ and modulo $(u,v)$, the pairing $(\ , \)_u,v$ induces bialgebra pairings

$$(\ , \)_u : A_+/vA_+ \times (A_-/vA_-)^\text{cop} \to \mathbf{C}[[u]]$$

(9.16)

and

$$A_+/(u,v) \times A_-/(u,v) \to \mathbf{C}.$$  

(9.17)

The latter can also be obtained from the pairing $(\ , \)_v$ of (9.11) by setting $v=0$.

The isomorphism $\Psi_+ : S(\mathfrak{g}_+)[[v]] \to A_+/uA_+$ defined by (8.1) induces a canonical isomorphism of bialgebras $S(\mathfrak{g}_+) = A_+/(u,v)$. The isomorphism $\Psi'_- : V_v(\mathfrak{g}_-) \to A_-/uA_-$ defined above induces a canonical isomorphism of bialgebras $S(\mathfrak{g}_-) = A_-/(u,v)$. We denote by $(\ , \)_0 the bialgebra pairing $S(\mathfrak{g}_+) \times S(\mathfrak{g}_-) \to \mathbf{C}$ obtained from (9.17) under these identifications. Lemma 9.8 implies that

$$(x_j, y_k)_0 = \begin{cases} 0 & \text{if } |j| \neq |k|, \\ \delta_{j_1,k_1} \cdots \delta_{j_d,k_d} j_1! \cdots j_d! & \text{if } |j| = |k| \end{cases}$$

(9.18)

for all $d$-tuples $j = (j_1, \ldots, j_d)$ and $k = (k_1, \ldots, k_d)$.

9.9. Corollary.— The pairings

$$(\ , \)_{u,v} : A_+ \times A_-^\text{cop} \to \mathbf{C}[[v]], \quad (\ , \)_v : A_+/uA_+ \times A_-/uA_- \to \mathbf{C}[[v]],$$

$$(\ , \)_u : A_+/vA_+ \times (A_-/vA_-)^\text{cop} \to \mathbf{C}[[u]], \quad \text{and} \quad (\ , \)_0 : S(\mathfrak{g}_+) \times S(\mathfrak{g}_-) \to \mathbf{C}$$

are nondegenerate.

Proof.— It follows from (9.18) that $(\ , \)_0$ is nondegenerate. (Actually, $(\ , \)_0$ is the standard pairing between $S(\mathfrak{g}_+)$ and $S(\mathfrak{g}_-)$.)

We check that $(\ , \)_v$ is nondegenerate. Let $a \in A_+/uA_+$ such that $(a, -)_v = 0$. If $\bar{a}$ denotes the image of $a$ under the projection $A_+/uA_+ \to S(\mathfrak{g}_+)$, then $(\bar{a}, -)_0 = 0$. It follows from the nondegeneracy of $(\ , \)_0 that $\bar{a} = 0$, which implies that $a \in vA_+/uA_+$. Let $a_1 \in A_+/uA_+$ be such that $a = va_1$. We now have $(a_1, -)_v = 0$. A similar argument shows that $a_1$ is divisible by $v$, hence $a$ is divisible by $v^2$ in $A_+/uA_+$. Proceeding in the same way, we see that $a$ is divisible by any power of $v$, which is possible only if $a = 0$. A similar argument shows that $(-, b)_v = 0$ implies $b = 0$.

The nondegeneracy of $(\ , \)_{u,v}$ and $(\ , \)_u is proved in a similar fashion. \qed

10. Completion of the proof of Theorem 2.9

Before proceeding to prove Theorem 2.9, we establish a few facts about a topological dual of the $\mathbf{C}[v]$-bialgebra

$$V_v(\mathfrak{g}_-) = \left\{ \sum_{n \geq 0} b_nv^n \in U(\mathfrak{g}_-)[v] \mid b_n \in U^n(\mathfrak{g}_-) \text{ for all } n \geq 0 \right\}.$$
10.1. **A Topological Dual.** Inside the dual $V_v^*(g_-) = \text{Hom}_{C[[v]]}(V_v(g_-), C[[v]])$ of $V_v(g_-)$ there is a $C[[v]]$-submodule $V_v^o(g_-)$ consisting of all $f \in V_v^*(g_-)$ satisfying the following condition: for every $m \geq 0$ there exists $N \geq 0$ such that

$$f(U^p(g_-) v^p) \subset v^m C[[v]]$$

(10.1)

for all $p \geq N$. In other words, $V_v^o(g_-)$ consists of all $C[v]$-linear forms that are continuous when we equip $C[[v]]$ with the $v$-adic topology and $V_v(g_-)$ with the $I$-adic topology, where $I$ is the two-sided ideal $I = \bigoplus_{p \geq 1} U^p(g_-) v^p \subset V_v(g_-)$.

10.2. **Lemma.** — The $C[[v]]$-module $V_v^o(g_-)$ is topologically free and

$$V_v^o(g_-) \cap v V_v^o(g_-) = v V_v^o(g_-).$$

**Proof.** — For the first statement, it is enough to check that, if $(f_n)_{n \geq 0}$ is a family of elements of $V_v^o(g_-)$ such that $f_n \equiv f_{n+1} \text{ mod } v^n$ for all $n \geq 0$, then there exists a unique $f \in V_v^o(g_-)$ such that $f \equiv f_n \text{ mod } v^n$ for all $n \geq 0$.

Indeed, since the linear forms $f_n$ are with values in $C[[v]]$, there exists a unique $f \in V_v^o(g_-)$ such that $f \equiv f_n \text{ mod } v^n$ for all $n \geq 0$. Let us show that $f$ belongs to $V_v^o(g_-)$. Fix $m \geq 0$. By definition of $V_v^o(g_-)$, there exists $N \geq 0$ such that $f_m(U^p(g_-) v^p) \subset v^m C[[v]]$ for all $p \geq N$. Since $f \equiv f_m \text{ mod } v^m$, we have $f(a) \equiv f_m(a) \text{ mod } v^m$ for all $a \in V_v(g_-)$, hence

$$f(U^p(g_-) v^p) \equiv f_m(U^p(g_-) v^p) \equiv 0 \text{ mod } v^m$$

for all $p$. Therefore, $f(U^p(g_-) v^p) \subset v^m C[[v]]$ for all $p \geq N$.

The second statement is an easy exercise left to the reader. □

We now relate $V_v^o(g_-)$ to $S(g_+)[[v]]$. As before, we fix a basis $(x_1, \ldots, x_d)$ of $g_+$ and the dual basis $(y_1, \ldots, y_d)$ of $g_-$. The family of elements $x_j = x_1^{j_1} \cdots x_d^{j_d}$ indexed by all $d$-tuples $j = (j_1, \ldots, j_d)$ of nonnegative integers is a $C$-basis of $S(g_+)$; the family of elements $(v^{|k|} y_k)$ indexed by all $d$-tuples $k$ of nonnegative integers is a $C[v]$-basis of $V_v^o(g_-)$.

Suppose there exists a pairing $(, ) : S(g_+)[[v]] \times V_v(g_-) \to C[[v]]$ (in the sense of Section 2.11 with $K = K_1 = C[[v]] \supset K_2 = C[v]$) such that for all $j = (j_1, \ldots, j_d)$ and $k = (k_1, \ldots, k_d)$ we have

$$(x_j, v^{|k|} y_k) = \begin{cases} 0 & \text{if } |j| > |k|, \\ \delta_{j_1, k_1} \cdots \delta_{j_d, k_d} j_1! \cdots j_d! & \text{if } |j| = |k|, \\ v^{|k| - |j|} C[[v]] & \text{if } |j| < |k|. \end{cases}$$

(10.2)

The pairing $(, )$ induces a $C[[v]]$-linear map $\varphi : S(g_+)[[v]] \to V_v^*(g_-)$ defined for $a \in S(g_+)[[v]]$ by $\varphi(a) = (a, -)$.

10.3. **Proposition.** — *Under Condition (10.2) the map $\varphi$ sends $S(g_+)[[v]]$ isomorphically onto $V_v^o(g_-)$.*
The same argument as in the proof of Corollary 9.9 shows that the pairing \(( , )\) is nondegenerate. This implies the injectivity of \(\varphi\).

Let us prove that \(\varphi\) sends \(S(\mathfrak{g}_+)[[v]]\) into \(V_v^\circ(\mathfrak{g}_-)\). Any element of \(S(\mathfrak{g}_+)[[v]]\) is of the form

\[
a = \sum_{n \geq 0; \underline{j}} \mu_{\underline{j},n} x_{\underline{j}} v^n,
\]

where \((\mu_{\underline{j},n})_{n \geq 0; \underline{j}}\) is a family of scalars indexed by a nonnegative integer \(n\) and a \(d\)-tuple \(\underline{j}\) of nonnegative integers, such that for all \(n\) there exists an integer \(N_n\) with \(\mu_{\underline{j},n} = 0\) whenever \(|\underline{j}| \geq N_n\).

In order to check that \(\varphi(a)\) lies in \(V_v^\circ(\mathfrak{g}_-)\), we have to prove that, given \(m \geq 0\), there exists \(N\) such that for all \(p \geq N\) we have

\[
\varphi(a)(U^p(\mathfrak{g}_+) v^p) \subset v^m \mathbb{C}[[v]].
\]

Let \(N'_m\) be any integer such that \(N'_m \geq N_n\) for all \(n = 0, \ldots, m - 1\). It is clear that \(\mu_{\underline{j},n} = 0\) when \(|\underline{j}| \geq N'_m\) and \(0 \leq n \leq m - 1\). For any \(p \geq 1\), the family \((v^p y_{\underline{k}})\) with \(|\underline{k}| \leq p\) is a basis of \(U^p(\mathfrak{g}_-) v^p\). Let us compute \(\varphi(a)(v^p y_{\underline{k}})\) when \(|\underline{k}| \leq p\). Using (10.2), we get

\[
\varphi(a)(v^p y_{\underline{k}}) = (a, v^p y_{\underline{k}}) = \sum_{n \geq 0; \underline{j}} \mu_{\underline{j},n} (x_{\underline{j}}, v^p y_{\underline{k}}) v^n = \sum_{n \geq 0; \underline{j}} \mu_{\underline{j},n} (x_{\underline{j}}, v^{\underline{k}} y_{\underline{k}}) v^{n+p-|\underline{k}|} = \sum_{|\underline{j}| \leq |\underline{k}|} P_{\underline{j}}(v),
\]

where \(P_{\underline{j}}(v) = \left(\sum_{n \geq 0} \mu_{\underline{j},n} v^n\right) (x_{\underline{j}}, v^{\underline{k}} y_{\underline{k}}) v^{p-|\underline{k}|}\). If \(|\underline{j}| \geq N'_m\), then

\[
\sum_{n \geq 0} \mu_{\underline{j},n} v^n = \sum_{n \geq m} \mu_{\underline{j},n} v^n
\]

is divisible by \(v^m\). Hence \(P_{\underline{j}}(v)\) is divisible by \(v^m\). If \(|\underline{j}| < N'_m\) and \(|\underline{j}| \leq |\underline{k}|\), then by (10.2) \((x_{\underline{j}}, v^{\underline{k}} y_{\underline{k}})\) is divisible by \(v^{|\underline{k}|-|\underline{j}|}\). Therefore, \(P_{\underline{j}}(v)\) is divisible by \(v^{p-|\underline{j}|}\), hence by \(v^{p-N'_m+1}\). If \(|\underline{j}| < N'_m\) and \(|\underline{j}| > |\underline{k}|\), then \(p - |\underline{k}| \geq p - N'_m + 1\). Therefore, \(P_{\underline{j}}(v)\) is divisible by \(v^{p-N'_m+1}\). Summing up, we see that \(\varphi(a)(U^p(\mathfrak{g}_+) v^p) \subset v^m \mathbb{C}[[v]]\) for all \(p \geq m + N'_m - 1\). Hence, \(\varphi(a) \in V_v^\circ(\mathfrak{g}_-)\).

It remains to show that \(V_v^\circ(\mathfrak{g}_-) \subset \varphi(S(\mathfrak{g}_+)[[v]])\). Since \((v^{\underline{j}} y_{\underline{j}})_{\underline{j}}\) is a \(\mathbb{C}[v]\)-basis of \(V_v(\mathfrak{g}_-)\), a \(\mathbb{C}[v]\)-linear form \(f \in V_v^\circ(\mathfrak{g}_-)\) is uniquely determined by the family \((v_{\underline{j}}(v))_{\underline{j}}\) of formal power series defined by

\[
v_{\underline{j}}(v) = f(v^{\underline{j}} y_{\underline{j}}) \in \mathbb{C}[[v]].
\]
Suppose that \( f \in V_0^\circ(g_-) \). Then for every \( m \) there exists \( N \) such that for all \( j \) with \(|j| \geq N\) the formal power series \( \nu_j(v) \) is divisible by \( v^m \). Consider the formal sum

\[
a_0 = \sum_{\underline{j}} \frac{\nu_\underline{j}(v)}{\underline{j}!} x_{\underline{j}},
\]

where \( \underline{j}! = j_1! \cdots j_d! \) if \( \underline{j} = (j_1, \ldots, j_d) \). By the divisibility property of \( \nu_j(v) \) obtained above, \( a_0 \) is a well-defined element of \( S(g_+)[[v]] \). Let us compute \( \varphi(a_0) \in V_0^\circ(g_-) \).

Given a \( d \)-tuple \( \underline{k} = (k_1, \ldots, k_d) \), we have

\[
\varphi(a_0)(v^{\underline{|k|}} y_{\underline{k}}) = (a_0, v^{\underline{|k|}} y_{\underline{k}}) = \sum_{\underline{j}: \underline{j} = \underline{|k|}} \frac{\nu_{\underline{j}}(v)}{\underline{j}!} (x_{\underline{j}}, v^{\underline{|k|}} y_{\underline{k}}) = \sum_{\underline{j}: \underline{j} = \underline{|k|}} \frac{\nu_{\underline{j}}(v)}{\underline{j}!} (x_{\underline{j}}, v^{\underline{|k|}} y_{\underline{k}}) + \sum_{\underline{j}: \underline{j} < \underline{|k|}} \frac{\nu_{\underline{j}}(v)}{\underline{j}!} (x_{\underline{j}}, v^{\underline{|k|}} y_{\underline{k}}).
\]

From (10.2) we derive

\[
\sum_{\underline{j}: \underline{j} = \underline{|k|}} \frac{\nu_{\underline{j}}(v)}{\underline{j}!} (x_{\underline{j}}, v^{\underline{|k|}} y_{\underline{k}}) = \sum_{\underline{j}: \underline{j} = \underline{|k|}} \frac{\nu_{\underline{j}}(v)}{\underline{j}!} \delta_{\underline{j}, \underline{k}} \underline{k}! = \nu_{\underline{k}}(v),
\]

where \( \delta_{\underline{j}, \underline{k}} = \delta_{j_1, k_1} \cdots \delta_{j_d, k_d} \). On the other hand, by (10.2), \( (x_{\underline{j}}, v^{\underline{|k|}} y_{\underline{k}}) \) is divisible by \( v \) if \(|\underline{j}| < |\underline{k}|\). It follows that, for all \( \underline{k} \),

\[
\varphi(a_0)(y_{\underline{k}} v^{\underline{|k|}}) = \nu_{\underline{k}}(v) + v C[[v]] = f(y_{\underline{k}} v^{\underline{|k|}}) + v C[[v]].
\]

Therefore, \( f = \varphi(a_0) + v f_1 \), where \( f_1 \) is a linear form on \( V_v(g_-) \) such that \( v f_1 \) belongs to the subspace \( V_v^\circ(g_-) \). By Lemma 10.2, this implies that \( f_1 \in V_v^\circ(g_-) \). Starting all over again, we get an element \( f_2 \in V_v^\circ(g_-) \) and an element \( a_1 \in S(g_+)[[v]] \) such that \( f_1 = \varphi(a_1) + v f_2 \). Hence, \( f = \varphi(a_0 + v a_1) + v^2 f_2 \). Proceeding in this way, we see that for all \( n \geq 0 \)

\[
V_v^\circ(g_-) = \varphi(S(g_+)[[v]]) + v^n V_v^\circ(g_-).
\]

Together with the topological freeness of \( V_v^\circ(g_-) \) proved in Lemma 10.2, this implies that \( V_v^\circ(g_-) \) sits inside the image of \( \varphi \).

Recall the nondegenerate bialgebra pairing (9.11)

\[
(\ , \ )_v : A_+/uA_+ \times A_-/uA_- \to C[[v]]
\]

and the bialgebra isomorphism \( \Psi_v : V_v(g_-) \to A_-/uA_- \) of Section 9.7. They give rise to a \( C[[v]] \)-linear morphism of algebras \( \varphi : A_+/uA_+ \to V_v^\circ(g_-) \) defined for \( a \in A_+/uA_+ \) and \( b \in V_v(g_-) \) by

\[
\varphi(a)(b) = (a, \Psi_-)(b)_v.
\]

(10.3)
10.4. **Corollary.**— $V_v^\circ(g_-)$ is a subalgebra of $V_v^*(g_-)$ and $\varphi : A_+/uA_+ \to V_v^*(g_-)$ is an injective morphism of algebras whose image is $V_v^\circ(g_-)$.

**Proof.**— By Lemma 9.8 the pairing

$$ (-, -) = (\Psi_+(-), \Psi'_-(-)) : S(g_+)[[v]] \times V_v(g_-) \to \mathbb{C}[[v]] $$

satisfies Condition (10.2). By Proposition 10.3 the map $\varphi \circ \Psi_+$ is injective with image $V_v^\circ(g_-)$. Since $\varphi \circ \Psi_+$ is an algebra morphism, its image $V_v^\circ(g_-)$ is necessarily a subalgebra of $V_v^*(g_-)$. One concludes by recalling that $\Psi_+ : S(g_+)[[v]] \to A_+/uA_+$ is an algebra isomorphism. 

Consider the Poisson $\mathbb{C}[[v]]$-bialgebra $E_v(g_+)$ of Section 2.8. As an algebra, $E_v(g_+) = S(g_+)[[v]]$. By (2.8) its comultiplication $\Delta'$ fulfills the following condition: for all $x \in g_+ \subset E_v(g_+)$,

$$ \Delta'(x) = x \otimes 1 + 1 \otimes x + \sum_{k \geq 1} X_k v^k, \quad (10.4) $$

where $X_k \in \bigoplus_{p+q=k+1} S^p(g_+) \otimes S^q(g_+)$ for all $k \geq 1$. The Poisson bracket $\{ , \}$ of $E_v(g_+)$ is uniquely determined by Condition (2.9).

In [Tur91, Section 12] a bialgebra pairing $( , )' : E_v(g_+) \times V_v(g_-) \to \mathbb{C}[[v]]$ was constructed such that

$$ (x, vy)' = \langle x, y \rangle \in \mathbb{C} \quad (10.5) $$

for all $x \in g_+ \subset S(g_+)[[v]] = E_v(g_+)$ and $vy \in g_- \subset V_v(g_-)$, where $\langle , \rangle : g_+ \times g_- \to \mathbb{C}$ is the evaluation pairing. The pairing $( , )'_v$ has the following properties.

10.5. **Lemma.**— Let $X_1, \ldots, X_m \in g_+$ and $Y_1, \ldots, Y_n \in g_-$. If $m > n$, then

$$ (X_1 \cdots X_m, v^n Y_1 \cdots Y_n)'_v = 0. \quad (10.6) $$

If $m = n$, then

$$ (X_1 \cdots X_m, v^n Y_1 \cdots Y_n)'_v = \sum_{\sigma} \langle X_{\sigma(1)}, Y_1 \rangle \cdots \langle X_{\sigma(m)}, Y_m \rangle, \quad (10.7) $$

where $\sigma$ runs over all permutations of $\{1, \ldots, n\}$.

If $m < n$, then

$$ (X_1 \cdots X_m, v^n Y_1 \cdots Y_n)'_v \subset v^{n-m} \mathbb{C}[[v]]. \quad (10.8) $$

**Proof.**— (i) We prove (10.6) and (10.7) by induction on $n$, using (2.11) and (10.5). The case $m = n = 1$ follows from (10.5). If $m > n = 1$, then by (2.4) and (2.11)

$$ (X_1 \cdots X_m, v Y_1)'_v = (X_1 \otimes X_2 \cdots X_m, \Delta(v Y_1))'_v = (X_1 \otimes X_2 \cdots X_m, v Y_1 \otimes 1 + 1 \otimes v Y_1)'_v $$

$$ = (X_1, v Y_1)'_v (X_2 \cdots X_m, 1)'_v + (X_1, 1)'_v (X_2 \cdots X_m, v Y_1)'_v = 0. $$

47
Suppose we have proved (10.6) and (10.7) for $1, \ldots, n-1$. By (2.4),
\[
\Delta(Y_1 \cdots Y_n) = 1 \otimes Y_1 \cdots Y_n + \sum_{p=1}^{n-1} \sum_{\sigma} Y_{\sigma(1)} \cdots Y_{\sigma(p)} \otimes Y_{\sigma(p+1)} \cdots Y_{\sigma(n)} + Y_1 \cdots Y_n \otimes 1,
\]
where $\sigma$ runs over all $(p, n-p)$-shuffles, i.e., all permutations of $\{1, \ldots, n\}$ such that $\sigma(1) < \cdots < \sigma(p)$ and $\sigma(p+1) < \cdots < \sigma(n)$. Therefore,
\[
(X_1 \cdots X_m, v^n Y_1 \cdots Y_n)'_v = (X_1 \otimes X_2 \cdots X_m, \Delta(v^n Y_1 \cdots Y_n))'_v
\]
\[
= (X_1, 1)'_v (X_2 \cdots X_m, Y_1 \cdots Y_n)'_v
\]
\[
+ \sum_{p=1}^{n-1} \sum_{\sigma} (X_1, v^p Y_{\sigma(1)} \cdots Y_{\sigma(p)})'_v (X_2 \cdots X_m, v^{n-p} Y_{\sigma(p+1)} \cdots Y_{\sigma(n)})'_v
\]
\[
+ (X_1, v^n Y_1 \cdots Y_n)'_v (X_2 \cdots X_m, 1)'_v,
\]
where $\sigma$ runs over the same set of permutations as above. The first and last terms vanish by (2.11). If $m > n$, the middle sum is zero by the induction hypothesis on (10.6). If $m = n$, by (10.6), the only nonzero term is for $p = 1$, so that
\[
(X_1 \cdots X_m, v^n Y_1 \cdots Y_n)'_v = \sum_{\sigma} (X_1, v Y_{\sigma(1)})'_v (X_2 \cdots X_m, v^{n-1} Y_{\sigma(2)} \cdots Y_{\sigma(n)})'_v,
\]
where $\sigma$ runs over all permutations of $\{1, \ldots, n\}$ such that $\sigma(2) < \cdots < \sigma(n)$. Therefore,
\[
(X_1 \cdots X_m, v^n Y_1 \cdots Y_n)'_v = \sum_{i=1}^{n} (X_1, v Y_i)'_v (X_2 \cdots X_m, v^{n-1} Y_1 \cdots \hat{Y}_i \cdots Y_n)'_v,
\]
where the hat on $Y_i$ means that it is omitted from the product. We conclude with (10.5) and the induction hypothesis on (10.7).

We also prove (10.8) by induction on $n$. If $n = 1$, then necessarily $m = 0$ and the claim follows from (2.11). For the inductive step, observe that (10.4) implies that, for $X_1, \ldots, X_m \in g_+$,
\[
\Delta'(X_1 \cdots X_m) = \sum_{k \geq 0} X'_k \otimes X''_k v^k,
\]
where $X'_k \otimes X''_k \in \bigoplus_{p+q = k+m} S^p(g_+) \otimes S^q(g_+)$. By (2.11), we obtain
\[
(X_1 \cdots X_m, v^n Y_1 \cdots Y_n)'_v = \Delta'(X_1 \cdots X_m, v Y_1 \otimes v^{n-1} Y_2 \cdots Y_n)'_v
\]
\[
= \sum_{k \geq 0} v^k (X'_k, v Y_1)'_v (X''_k, v^{n-1} Y_2 \cdots Y_n)'_v.
\]
By (10.6) the only case where $(X'_k, v Y_1)'_v$ may be nonzero is when $X'_k \in S^1(g_+)$, therefore when $X''_k \in S^{k+m-1}(g_+)$. If $k + m - 1 \leq n - 1$, we use (10.7) and the induction hypothesis on (10.8). Thus, $(X''_k, v^{n-1} Y_2 \cdots Y_n)'_v$ is divisible by $v^{n-m-k}$. If $k + m - 1 > n - 1$, then $(X''_k, v^{n-1} Y_2 \cdots Y_n)'_v = 0$ by (10.6). Therefore, $(X''_k, v^{n-1} Y_2 \cdots Y_n)'_v$ is divisible by $v^{n-m-k}$ in all cases. Hence, $(X_1, \cdots X_m, v^n Y_1 \cdots Y_n)'_v$ is divisible by $v^{n-m}$. \(\square\)

From the bialgebra pairing $(\cdot, \cdot)'_v$ we get a morphism of algebras $\varphi' : E_v(g_+) \to V^*_v(g_-)$ defined by $\varphi'(a) = (a, -)'_v$ for $a \in E_v(g_+)$.  

48
10.6. **Corollary.**— The bialgebra pairing $(\ , \ )'_V$ is nondegenerate and the morphism of algebras $\varphi'$ induces an isomorphism

$$\varphi': E_v(g_+) \rightarrow V_v^o(g_-) \subset V_v^e(g_-).$$

**Proof.**— By Proposition 10.3 it is enough to check that the pairing $(\ , \ )'_V$ satisfies Condition (10.2). An easy computation shows that (10.2) is equivalent to (10.6–10.8). □

10.7. **Proof of Theorem 2.9. Part II.**— By Corollaries 10.4 and 10.6 we have two algebra isomorphisms $\varphi: A_+/uA_+ \rightarrow V_v^o(g_-)$ and $\varphi': E_v(g_+) \rightarrow V_v^o(g_-)$. Composing $\varphi$ with the inverse of $\varphi'$, we obtain an algebra isomorphism

$$\chi = \varphi'^{-1} \varphi: A_+/uA_+ \rightarrow E_v(g_+).$$

Let us check that $\chi$ is a morphism of coalgebras. By definition of $\varphi$, $\varphi'$ and $\chi$,

$$(a, \Psi'_-(b))_v = \varphi(a)(b) = \varphi'((\chi(a))(b)) = (\chi(a), b)_v'$$

for all $a \in A_+/uA_+$ and $b \in V_v(g_-)$. (For the definition of $\Psi'_-$, see Section 9.7.) Using (2.11) and (10.9), we obtain

$$(\Delta'(\chi(a)), b_1 \otimes b_2)_v' = (\chi(a), b_1 b_2)_v'$$

$$= (a, \Psi'_-(b_1 b_2))_v$$

$$= (a, \Psi'_-(b_1) \Psi'_-(b_2))_v$$

$$= (\Delta(a), \Psi'_-(b_1 \otimes \Psi'_-(b_2))_v$$

$$= ((\chi \otimes \chi)(\Delta(a)), b_1 \otimes b_2)_v'$$

for all $a \in A_+/uA_+$ and $b_1, b_2 \in V_v(g_-)$. Here $\Delta'$ is the comultiplication in $E_v(g_+)$ and $\Delta$ is the comultiplication in $A_+/uA_+$ induced by $\Delta_{u,v}$. Since the pairing $(\ , \ )'_V$ is nondegenerate, $\Delta' \chi = (\chi \otimes \chi) \Delta$.

The bialgebra $A_+/uA_+$ is a (commutative) Poisson bialgebra with Poisson bracket $\{\ , \}_v$ defined for $a_1, a_2 \in A_+$ by

$$\{p(a_1), p(a_2)\}_v = p \left( \frac{a_1 a_2 - a_2 a_1}{u} \right),$$

where $p: A_+ \rightarrow A_+/uA_+$ is the projection. The bialgebra isomorphism $\chi: A_+/uA_+ \rightarrow E_v(g_+)$ transfers this Poisson bracket to a Poisson bracket $\{\ , \}'_v$ on $E_v(g_+)$. In order to show that $\chi$ is a morphism of Poisson bialgebras, we have to prove that $\{\ , \}'_v = \{\ , \}$. It suffices to check that $\{\ , \}'_v$ satisfies Condition (2.9).

The pairing of Lemma 9.5 pairs the bialgebras $A_+$ and $A_+^{\text{cop}}$. Consequently,

$$(a_1 a_2 - a_2 a_1, b)_{u,v} = (a_1 \otimes a_2, \Delta_{u,v}^{\text{cop}}(b) - \Delta_{u,v}(b))_{u,v}$$

49
for all $a_1, a_2 \in A_+$ and $b \in A_-$. The bialgebra $A_-$ being cocommutative modulo $u$ (see Section 9.1), it follows that $\Delta_{u,v}^{\text{op}}(b) - \Delta_{u,v}(b)$ is divisible by $u$; hence,

$$
\left( \frac{a_1 a_2 - a_2 a_1}{u}, b \right)_{u,v} = \left( a_1 \otimes a_2, \frac{\Delta_{u,v}^{\text{op}}(b) - \Delta_{u,v}(b)}{u} \right)_{u,v}.
$$

By Section 8.1 applied to $A_-$ and by (9.5), the isomorphism $\psi_-. : V_v(g_-)[[u]] \rightarrow A_-$ of Section 9.1 induces the isomorphism $\Psi'_-. : V_v(g_-) \rightarrow A_-/uA_-$ of co-Poisson bialgebras. Therefore,

$$(\Psi'_- \otimes \Psi'_-)(\delta_-(vy)) = \frac{\Delta_{u,v}(b) - \Delta_{u,v}^{\text{op}}(b)}{u} \mod u A_- \hat{\otimes} C[v][[u]] A_-$$

for $vy \in v g_- \subset V_v(g_-)$ and $b \in A_-$ mapped onto $\Psi'_-(vy)$ under the projection $A_- \rightarrow A_-/uA_-$. Here, $\delta_-. : V_v(g_-) \rightarrow V_v(g_-) \otimes C[v] V_v(g_-)$ is the Poisson cobracket defined by (2.5), where we have replaced $u$ by $v$, and the Lie cobracket $\delta$ of $g_-$ by the Lie cobracket $\delta_-$ of $g_-$. By definition of $g_- = (g_+)^*$,

$$
\langle x_1 \otimes x_2, \delta_-(y) \rangle = -\langle [x_1 \otimes x_2], y \rangle
$$

for all $x_1, x_2 \in g_+$ and $y \in g_-$. Combining (10.10)–(10.12), we obtain

$$(\{p(a_1), p(a_2)\}_v, \Psi'_-(vy))_v = -\langle p(a_1) \otimes p(a_2), (\Psi'_- \otimes \Psi'_-)(\delta_-(vy)) \rangle_v$$

for all $a_1, a_2 \in A_+$ and $y \in g_-$. It follows from (2.5), (10.9), (10.13), and (10.14) that

$$
(\{x_1, x_2\}'_v, vy)_v' = (\chi^{-1}(\{x_1, x_2\}'_v), \Psi'_-(vy))_v
$$

$$
= (\{\chi^{-1}(x_1), \chi^{-1}(x_2)\}_v, \Psi'_-(vy))_v
$$

$$
= -\langle \chi^{-1}(x_1) \otimes \chi^{-1}(x_2), (\Psi'_- \otimes \Psi'_-)(\delta_-(vy)) \rangle_v
$$

$$
= -\langle x_1 \otimes x_2, \delta_-(vy) \rangle'_v
$$

$$
= -\langle x_1 \otimes x_2, \delta_-(y) \rangle'_v
$$

$$
= \langle [x_1, x_2], vy \rangle'_v
$$

for all $x_1, x_2 \in g_+$ and $y \in g_-$. On the other hand, the Poisson bracket $\{ , \}'$ induces the Poisson bracket (2.3) on $E_v(g_+)/vE_v(g_+) = S(g_+)$. Consequently, for all $x_1, x_2 \in g_+$,

$$
\{x_1, x_2\}' = [x_1, x_2] + \sum_{m \geq 1} X_m v^m,
$$

where $X_m \in g_+$. Let $X_m^{(p)}$ be the component of $X_m$ in $S^p(g_+)$. In order to check Condition (2.9) for $\{ , \}'$, it is enough to show that $X_m^{(p)} = 0$ for all $p = 0, 1$ and $m \geq 1$.  

50
For the case $p = 0$, we use the counits $\varepsilon$ of the bialgebras involved. Since $\varepsilon$ vanishes on commutators in $A_+$, we have $\varepsilon(\{a_1, a_2\}_v) = 0$ in the quotient bialgebra $A_+/uA_+$. The map $\chi$ being also a morphism of bialgebras, $\varepsilon(\{x_1, x_2\}') = 0$ for all $x_1, x_2 \in g_+$. The map $\varepsilon$ vanishing on $S^p(g_+)$ for $p \geq 1$ and being the identity on $S^0(g_+)$, Formula (10.16) implies

$$0 = \varepsilon(\{x_1, x_2\}') = \varepsilon([x_1, x_2]) + \sum_{m \geq 1} \varepsilon(X_m) v^m = \sum_{m \geq 1} X_m^{(0)} v^m.$$  

Hence, $X_m^{(0)} = 0$ for all $m \geq 1$.

For $p = 1$, we use Lemma 10.5, (10.2), (10.15) and (10.16) in the following computation holding for all $x_1, x_2 \in g_+$ and $y \in g_-$:

$$0 = (\{x_1, x_2\}' - [x_1, x_2], vy)_v' = \sum_{m \geq 1} (X_m^{(1)}, vy)' v^m + \sum_{m \geq 1; p \geq 2} (X_m^{(p)}, vy)' v^m = \sum_{m \geq 1} \langle X_m^{(1)}, y \rangle v^m.$$

Hence, $\langle X_m^{(1)}, y \rangle = 0$ for all $y \in g_-$ and all $m \geq 1$. Therefore, $X_m^{(1)} = 0$ for all $m \geq 1$. □

10.8. Remark.— Our definition of the Poisson bracket $\{, \}'$ gives a construction of a Poisson bracket on $E_v(g_+)$ that is independent of [Tur91, Theorem 11.4]. We have also proved that the topological dual $V^o_v(g_-)$ has a natural structure of a Poisson $\mathbb{C}[[v]]$-bialgebra.

10.9. Remark.— There are similar versions of Theorems 2.3, 2.6, and 2.9 for the bialgebra $\hat{A}_+$ of Section 7.1. To state them, we need the bi-Poisson bialgebra $\hat{S}(g_+)$. As an algebra, it is the completion of $S(g)$ with respect to its augmentation ideal $I_0 = \bigoplus_{m \geq 1} S_m^m(g_+)$:

$$\hat{S}(g_+) = \prod_{n \geq 0} S_n(g_+).$$

The bi-Poisson bialgebra structure on $S(g_+)$ defined in Section 2.2 extends to a topological bi-Poisson bialgebra structure on $\hat{S}(g_+)$, where the comultiplication and the Poisson cobracket take values in the completed tensor product

$$\hat{S}(g) \hat{\otimes}_C \hat{S}(g) = \lim_{\leftarrow n} \left( S(g)/I_0^n \hat{\otimes}_C S(g)/I_0^n \right).$$

The natural projection $q_u : V_u(g_+) \to S(g_+)$ of Section 2.4 extends to a bialgebra morphism $\hat{V}_u(g_+) \to \hat{S}(g_+)$ that induces a canonical isomorphism of bi-Poisson bialgebras

$$\hat{V}_u(g_+)/u\hat{V}_u(g_+) = \hat{S}(g_+).$$
Similarly, the Poisson $\mathbb{C}[[v]]$-bialgebra structure on $E_v(\mathfrak{g}_+) = S(\mathfrak{g}_+)[[v]]$ extends uniquely to a topological Poisson $\mathbb{C}[[v]]$-bialgebra structure on $\hat{E}_v(\mathfrak{g}_+) = \hat{S}(\mathfrak{g}_+)[[v]]$. The projection $\hat{E}_v(\mathfrak{g}_+) \to \hat{S}(\mathfrak{g}_+)$ sending $v$ to 0 induces a canonical isomorphism of bi-Poisson bialgebras

$$\hat{E}_v(\mathfrak{g}_+)/v\hat{E}_v(\mathfrak{g}_+) \to \hat{S}(\mathfrak{g}_+).$$

Proceeding for $\hat{A}_+$ as we did for $A_+$ in Sections 8–10, we can prove that there is an isomorphism of co-Poisson bialgebras $\hat{A}_+/v\hat{A}_+ = \hat{V}_u(\mathfrak{g}_+)$, an isomorphism of Poisson bialgebras $\hat{A}_+/u\hat{A}_+ \cong \hat{E}_v(\mathfrak{g}_+)$, and an isomorphism of bi-Poisson bialgebras $\hat{A}_+/u, v = \hat{S}(\mathfrak{g}_+)$. 

11. Exchanging $\mathfrak{g}_+$ and $\mathfrak{g}_-$

Consider the Lie bialgebra $\mathfrak{g}'_+ = \mathfrak{g}_-$ and its double $\mathfrak{d}'$. By definition of the double, $\mathfrak{d}'$ contains $\mathfrak{g}'_- = (\mathfrak{g}'_+)^{\text{cop}}$ as a Lie subbialgebra. Following Sections 5.3–5.4 for $\mathfrak{g}_+$, we obtain three $\mathbb{C}[[h]]$-bialgebras $U_h(\mathfrak{d}') \hookrightarrow U_h(\mathfrak{d}) \hookrightarrow U_h(\mathfrak{d})^{\text{cop}}$. The aim of this section is to prove the following addition to [EK96], [EK97]. Here, for a bialgebra $A$, we denote by $A^{\text{cop}}$ the bialgebra $A$ obtained by replacing the comultiplication by the opposite comultiplication.

11.1. Theorem.— There is an isomorphism of $\mathbb{C}[[h]]$-bialgebras

$$U_h(\mathfrak{d}') \cong U_h(\mathfrak{d})^{\text{cop}}$$

sending $U_h(\mathfrak{d}')$ onto $U_h(\mathfrak{d})^{\text{cop}}$ and $U_h(\mathfrak{d}_-)$ onto $U_h(\mathfrak{d}_+)$. 

Theorem 11.1 does not follow directly from the functoriality of Etingof and Kazhdan’s quantization because in general there is no isomorphism between the triples $(\mathfrak{g}_+, \mathfrak{d}, \mathfrak{g}_-)$ and $(\mathfrak{g}'_+, \mathfrak{d}', \mathfrak{g}'_-)$. Thus, in order to prove this theorem, we have to go back to the original definitions of the bialgebras $U_h(\mathfrak{d})$, $U_h(\mathfrak{d}_+)$, $U_h(\mathfrak{d}_-)$ as given in [EK96]. This will be done in Sections 11.2–11.4 below.

11.2. A Braided Monoidal Category. Consider the double Lie bialgebra $\mathfrak{d} = \mathfrak{g}_+ \oplus \mathfrak{g}_-$ of $\mathfrak{g}_+$ and let $\mathcal{S}$ be the category of $U(\mathfrak{d})$-modules. This is a symmetric monoidal category: the tensor product of two $U(\mathfrak{d})$-modules is given by $M \otimes N = M \otimes_{\mathbb{C}} N$ on which $U(\mathfrak{d})$ acts through its comultiplication, and the symmetry $\sigma_{M,N} : M \otimes N \to N \otimes M$ by the standard transposition $m \otimes n \mapsto n \otimes m$. The category $\mathcal{S}$ has an infinitesimal braiding $t_{M,N} : M \otimes N \to M \otimes N$ in the sense of Cartier [Car93] (see also [Kas95, Definition XX.4.1]). The morphism $t_{M,N}$ is given by the action of the two-tensor $t = r + r_{21} = \sum_{i=1}^d (x_i \otimes y_i + y_i \otimes x_i)$ of Section 5.3.

We now fix a Drinfeld associator $\Phi$, as defined, e.g., in [Dri89], [Dri90], [Kas95, Section XIX.8], [KT98, Section 4.6]. This is a series $\Phi(A, B)$ in two non-commuting variables $A$ and $B$ with coefficients in $\mathbb{C}$ and constant term 1, subject to a certain set of equations (for details see the references above). Such a $\Phi$ exists by [Dri90] and can be assumed to be the exponential of a Lie series in $A$ and $B$. 

52
From $\mathcal{S}$ and $\Phi$ we construct a braided monoidal category $\mathcal{C}$ as follows: The objects of $\mathcal{C}$ are the same as the objects of $\mathcal{S}$. A morphism from $M$ to $N$ in $\mathcal{C}$ is a formal power series $\sum f_n h^n$, where $f_n \in \text{Hom}_\mathcal{S}(M, N) = \text{Hom}_{U(\mathfrak{g})}(M, N)$ for all $n$. The composition in $\mathcal{C}$ is defined using the composition in $\mathcal{S}$ and the standard multiplication of formal power series. The identity morphism of an object $M$ in $\mathcal{C}$ is the constant formal power series $\sum \sigma_n$, where $\sigma_0 = \text{id}_M$ and $\sigma_n = 0$ when $n > 0$. The category $\mathcal{C}$ has a tensor product: on objects it is the same as on the objects of $\mathcal{S}$; on morphisms it is obtained by extending $\mathcal{C}[[h]]$-linearly the tensor product of morphisms of $\mathcal{S}$. The unit object is the same as in $\mathcal{S}$, namely the trivial module $\mathcal{C}$. From $\mathcal{S}$ we construct a braided monoidal category $\mathcal{C}$ and $\Phi$.

For any triple $(L, M, N)$ of objects in $\mathcal{C}$ we define an associativity isomorphism $a_{L, M, N}$ and a braiding $c_{M, N}$ by

$$a_{L, M, N} = \Phi(h t_{L, M} \otimes \text{id}_N, h \text{id}_L \otimes t_{M, N}) : (L \otimes M) \otimes N \xrightarrow{\sim} L \otimes (M \otimes N)$$

and

$$c_{M, N} = \sigma_{M, N} \exp\left(\frac{h}{2} t_{M, N}\right) : M \otimes N \xrightarrow{\sim} N \otimes M,$$

where $\sigma_{M, N}$ is the transposition. For details, see [Kas95, XX.6].

The construction of $\mathcal{C}$, Formulas (11.1–11.2), and $\Phi(0, 0) = 1$ imply that the braided monoidal category obtained as the quotient of $\mathcal{C}$ by the subclass of morphisms whose constant term as a formal power series in $h$ is 0 is nothing else than the category $\mathcal{S}$ we started from. In this sense, $\mathcal{C}$ is a quantization of $\mathcal{S}$.

### 11.3. Definition of $J_h$

Following [EK96, Section 2.3], we first define $U(\mathfrak{g})$-modules $M_{\pm} = U(\mathfrak{g}) \otimes_{U(\mathfrak{g}_{\pm})} \mathcal{C}$, where $\mathcal{C}$ is the trivial $U(\mathfrak{g}_{\pm})$-module. The Verma module $M_{\pm}$ is a free $U(\mathfrak{g}_\pm)$-module on a generator $1_{\pm}$ such that $a \cdot 1_{\pm} = \varepsilon(a) 1_{\pm}$ for all $a \in U(\mathfrak{g}_{\pm})$, where $\varepsilon$ is the counit of $U(\mathfrak{g}_{\pm})$. There is an isomorphism $\varphi : U(\mathfrak{g}) \to M_{+} \otimes M_{-}$ of $U(\mathfrak{g})$-modules such that

$$\varphi(1) = 1_{+} \otimes 1_{-}. \quad (11.3)$$

There are also $U(\mathfrak{g})$-linear maps $i_{\pm} : M_{\pm} \to M_{+} \otimes M_{\mp}$ defined by $i_{\pm}(1_{\pm}) = 1_{\pm} \otimes 1_{\mp}$.

In the braided monoidal category $\mathcal{C}$ of Section 11.2 consider the isomorphism

$$\chi = \beta^{-1} \circ (\text{id}_{\pm} \otimes c_{M_{-}, M_{-}} \otimes \text{id}_{-}) \circ \alpha : (M_{+} \otimes M_{+}) \otimes (M_{-} \otimes M_{-}) \to (M_{+} \otimes M_{-}) \otimes (M_{-} \otimes M_{-}),$$

where $\text{id}_{\pm}$ is the identity morphism of $M_{\pm}$, $c_{M_{+}, M_{-}} : M_{+} \otimes M_{-} \to M_{-} \otimes M_{+}$ is the braiding, $\alpha$ is the composition of the associativity isomorphisms

$$a^{-1}_{M_{+}, M_{+}, M_{-}, M_{-}} \otimes \text{id}_{-} : (M_{+} \otimes M_{+}) \otimes (M_{-} \otimes M_{-}) \to (M_{+} \otimes M_{+}) \otimes (M_{-} \otimes M_{-})$$

and $\beta$ is the composition of the isomorphisms

$$a^{-1}_{M_{+}, M_{-}, M_{-, M_{+}}} : (M_{+} \otimes M_{-}) \otimes (M_{+} \otimes M_{-}) \to (M_{+} \otimes M_{-}) \otimes (M_{-} \otimes M_{+}) \otimes M_{-}. \quad (11.4)$$
Then, by [EK96, Formula (3.1)], the element $J_h \in (U(\mathfrak{g}) \otimes U(\mathfrak{g}))[h]$ determining the comultiplication of $U_h(\mathfrak{g})$ in (5.3) is defined by

$$(\varphi \otimes \varphi)(J_h) = \chi(1_+ \otimes 1_+ \otimes 1_- \otimes 1_-) = \chi(i_+ \otimes i_-)(\varphi(1)). \quad (11.4)$$

11.4. Definition of $U_h(\mathfrak{g}_\pm)$. For any $f \in \text{Hom}_C(M_+ \otimes M_-, M_-)$ consider the endomorphism $\mu_+(f) \in \text{End}_C(M_+ \otimes M_-)$ defined as the following composition of morphisms in the monoidal category $\mathcal{C}$ of Section 11.2:

$$M_+ \otimes M_- \xrightarrow{i_+ \otimes \text{id}_-} (M_+ \otimes M_+) \otimes M_- \xrightarrow{\alpha} M_+ \otimes (M_+ \otimes M_-) \xrightarrow{\text{id}_+ \otimes f} M_+ \otimes M_-,$$  \quad (11.5)

where $a = a_{M_+, M_+, M_-}$ is the associativity isomorphism defined by (11.1). Conjugating by the isomorphism $\varphi$ of (11.3), we obtain the endomorphism $\varphi^{-1}\mu_+(f)\varphi \in \text{End}_C(U(\mathfrak{g}))$. Applying this endomorphism to the unit element in $U(\mathfrak{g})[[h]]$, we get the formal power series

$$f^+ = (\varphi^{-1}\mu_+(f)\varphi)(1) \in U(\mathfrak{g})[[h]].$$

By [EK96, Section 4.1], $U_h(\mathfrak{g}_+)$ is the image of the map $f \mapsto f^+$ from $\text{Hom}_C(M_+ \otimes M_-, M_-)$ to $U_h(\mathfrak{g}) = U(\mathfrak{g})[[h]]$.

There is a similar definition for $U_h(\mathfrak{g}_-)$ for any $g \in \text{Hom}_C(M_+ \otimes M_-, M_+)$ define $\mu_-(g) \in \text{End}_C(M_+ \otimes M_-)$ as the following composition of morphisms in $\mathcal{C}$:

$$M_+ \otimes M_- \xrightarrow{\text{id}_+ \otimes i_-} M_+ \otimes (M_- \otimes M_-) \xrightarrow{a^{-1}} (M_+ \otimes M_-) \otimes M_- \xrightarrow{g \otimes \text{id}_-} M_+ \otimes M_-.$$  \quad (11.6)

Applying the endomorphism $\varphi^{-1}\mu_+(f)\varphi \in \text{End}_C(U(\mathfrak{g}))$ to $1 \in U(\mathfrak{g})[[h]]$, we obtain

$$g^- = (\varphi^{-1}\mu_-(g)\varphi)(1) \in U(\mathfrak{g})[[h]].$$

By [EK96, Section 4.1], $U_h(\mathfrak{g}_-)$ is the image of the map $g \mapsto g^-$ from $\text{Hom}_C(M_+ \otimes M_-, M_+)$ to $U_h(\mathfrak{g}) = U(\mathfrak{g})[[h]]$.

11.5. Proof of Theorem 11.1.— By Section 2.1,

$$\mathfrak{g}' = (\mathfrak{g}_+)^{\text{cop}} = (\mathfrak{g}_-)^{\text{cop}} = (\mathfrak{g}_+^{\text{op}})^{\text{cop}}$$

is isomorphic to $\mathfrak{g}_+$ via the map $-\text{id}_{\mathfrak{g}_+}$. Let $\mathfrak{d}' = \mathfrak{g}_+ \oplus \mathfrak{g}'_-$ be the double Lie bialgebra of $\mathfrak{g}'_+$. We have $\mathfrak{d}' = \mathfrak{g}_- \oplus \mathfrak{g}_+ = \mathfrak{g}_+ \oplus \mathfrak{g}_-$ as vector spaces. The following lemma is easily checked.

11.6. Lemma.— The endomorphism $\sigma$ of $\mathfrak{g}_+ \oplus \mathfrak{g}_-$ that is the identity on $\mathfrak{g}_-$ and the opposite of the identity on $\mathfrak{g}_+$ is an isomorphism of Lie bialgebras $\sigma : \mathfrak{d} \rightarrow \mathfrak{d}'$ which fits in the following commutative diagram of Lie bialgebras, where the horizontal morphisms are the natural injections:

$$\begin{array}{ccc}
\mathfrak{g}_- & \hookrightarrow & \mathfrak{d} & \hookrightarrow & \mathfrak{g}_+ \\
\downarrow \text{id} & & \sigma & & \downarrow \text{id} \\
\mathfrak{g}'_+ = \mathfrak{g}_- & \hookrightarrow & \mathfrak{d}' & \hookrightarrow & \mathfrak{g}' = (\mathfrak{g}_+^{\text{op}})^{\text{cop}}.
\end{array}$$
The morphism $\sigma$ sends the 2-tensor $r = \sum_{i=1}^{d} x_i \otimes y_i \in \mathfrak{d} \otimes \mathfrak{d}$ to

$$\sigma(r) = \sum_{i=1}^{d} (-x_i) \otimes y_i = -r \in \mathfrak{d}' \otimes \mathfrak{d}'.$$  

Consequently, for the symmetric 2-tensor $t = r + r_{21}$, we have $\sigma(t) = -t$.

The Lie bialgebra isomorphism $\sigma : \mathfrak{d} \rightarrow \mathfrak{d}'$ induces a bialgebra isomorphism $\sigma : U(\mathfrak{d}) \rightarrow U(\mathfrak{d}')$, hence an algebra isomorphism between their quantizations (cf. Section 5.3):

$$\sigma : U_h(\mathfrak{d}) = U(\mathfrak{d})[[h]] \rightarrow U(\mathfrak{d}')[[h]] = U_h(\mathfrak{d}').$$

For the definition of the comultiplication $\Delta'_h$ of $U_h(\mathfrak{d}')$ we follow Section 11.2 and construct a braided monoidal category $\mathcal{C}'$, using now the double Lie bialgebra $\mathfrak{d}' = \sigma(\mathfrak{d})$, the same Drinfeld associator $\Phi$ as above, and the two-tensor $t' = \sigma(t)$. The morphism $\sigma$ induces a canonical isomorphism $\mathcal{C} = \mathcal{C}'$ of braided monoidal categories.

We also need Verma modules for $\mathfrak{d}'$. Following Section 11.4, they are defined by $M'_\pm = U(\mathfrak{d}') \otimes_{U(\mathfrak{g}'_\pm)} \mathcal{C}$. As a $U(\mathfrak{g}'_\pm)$-module, $M'_\pm$ is free on a generator $1'_\pm$. There is an isomorphism $\varphi' : U(\mathfrak{d}') \rightarrow M'_+ \otimes M'_-$ defined by $\varphi'(1) = 1'_+ \otimes 1'_-$. The homomorphism $\sigma : \mathfrak{d} \rightarrow \mathfrak{d}'$ induces canonical algebra isomorphisms $U(\mathfrak{g}_\pm) = U(\mathfrak{g}'_\pm)$, hence canonical isomorphisms

$$M'_\pm = U(\mathfrak{d}) \otimes_{U(\mathfrak{g}_\pm)} \mathcal{C} = U(\mathfrak{d}') \otimes_{U(\mathfrak{g}'_\pm)} \mathcal{C} = M'_\pm.$$

Using these isomorphisms, we henceforth identify $\mathfrak{d}'$ with $\mathfrak{d}$, $M'_+$ with $M_-$, $M'_-$ with $M_+$, $\varphi' : U(\mathfrak{d}') \rightarrow M'_+ \otimes M'_-$ with the isomorphism of $U(\mathfrak{d})$-modules $\varphi' : U(\mathfrak{d}) \rightarrow M_+ \otimes M_-$ determined by

$$\varphi'(1) = 1_- \otimes 1_+.$$  

By (5.3) the comultiplication $\Delta'_h$ of the bialgebra $U_h(\mathfrak{d}') = U_h(\mathfrak{d})$ is given for $a \in U(\mathfrak{d})[[h]]$ by

$$\Delta'_h(a) = (J'_h)^{-1}(a)J'_h,$$

where $\Delta$ is the standard comultiplication and $J'_h$ is the element in $(U(\mathfrak{d}') \otimes U(\mathfrak{d}'))[[h]] = (U(\mathfrak{d}) \otimes U(\mathfrak{d}))[[h]]$ defined, according to (11.4) and using the above identifications, by

$$(\varphi' \otimes \varphi')(J'_h) = \chi'(1_- \otimes 1_- \otimes 1_+ \otimes 1_+) = \chi'(i_- \otimes i_+)(\varphi'(1))$$

where $\chi'$ is obtained from the morphism $\chi$ of Section 11.3 by exchanging $M_+$ and $M_-$.

Consider the $U(\mathfrak{d})$-linear automorphism $\nu$ of $U(\mathfrak{d})$ defined by

$$\nu = (\varphi')^{-1} c_{M_+, M_-} \varphi,$$

where $c_{M_+, M_-} : M_+ \otimes M_- \rightarrow M_- \otimes M_+$ is the braiding. The morphism $\nu$ is the right multiplication by the invertible element $\omega = \nu(1) \in U(\mathfrak{d})[[h]]$:

$$\nu(a) = a\omega$$

for all $a \in U(\mathfrak{d})[[h]]$. 

55
11.7. Lemma. — We have \( \omega \equiv 1 \mod h \) and

\[
J'_h = \Delta(\omega)^{-1} \exp(ht/2)(J_h)_{21}(\omega \otimes \omega).
\]

Proof. — By (11.2), (11.3), (11.7), and (11.9) we have

\[
\omega = (\varphi')^{-1}(\exp(ht/2)(1_+ \otimes 1_-))_{21} \\
\equiv (\varphi')^{-1}(1_- \otimes 1_+) \equiv 1 \mod h.
\]

Let us compute \( J'_h \). Below we shall prove that

\[
c_{M_- \otimes M_+,M_- \otimes M_+}(c_{M_+,M_- \otimes M_+}c_{M_+,M_-})\chi(i_+ \otimes i_-) = \chi'(i_- \otimes i_+)c_{M_+,M_-}, \tag{11.11}
\]

where \( c_{M_- \otimes M_+,M_- \otimes M_+} : (M_- \otimes M_+) \otimes (M_- \otimes M_+) \rightarrow (M_- \otimes M_+) \otimes (M_- \otimes M_+) \) is the braiding. Then, (11.9), (11.11) and the naturality of the braiding imply

\[
((\varphi')^{-1} \otimes (\varphi')^{-1})\chi'(i_- \otimes i_+)\varphi'\nu = ((\varphi')^{-1} \otimes (\varphi')^{-1})\chi'(i_- \otimes i_+)c_{M_+,M_-} \varphi
\]

\[
= ((\varphi')^{-1} \otimes (\varphi')^{-1})c_{M_- \otimes M_+,M_- \otimes M_+}(c_{M_+,M_- \otimes M_+}c_{M_+,M_-})\chi(i_+ \otimes i_-)\varphi
\]

\[
= c_{U(\varphi),U(\varphi)}((\varphi')^{-1} \otimes (\varphi')^{-1})(c_{M_+,M_- \otimes M_+}c_{M_+,M_-})\chi(i_+ \otimes i_-)\varphi
\]

\[
= c_{U(\varphi),U(\varphi)}(\varphi \otimes \varphi)((\varphi')^{-1} \otimes (\varphi')^{-1})\chi(i_+ \otimes i_-)\varphi. \tag{11.12}
\]

Let us apply both sides of (11.12) to the unit in \( U(\varphi)[[h]] \). By (11.8) and (11.10), we obtain for the left-hand side

\[
\left( ((\varphi')^{-1} \otimes (\varphi')^{-1})\chi'(i_- \otimes i_+)\varphi'\nu \right)(1) = \left( ((\varphi')^{-1} \otimes (\varphi')^{-1})\chi'(i_- \otimes i_+)\varphi' \right)(\omega)
\]

\[
= \Delta(\omega)((\varphi')^{-1} \otimes (\varphi')^{-1})\chi'(i_- \otimes i_+)\varphi'(1)
\]

\[
= \Delta(\omega)J'_h.
\]

For the right-hand side, using (11.2), (11.4), (11.10), and the symmetry of \( t \), we obtain

\[
(c_{U(\varphi),U(\varphi)}(\varphi^{-1} \otimes \varphi^{-1})\chi(i_- \otimes i_-)\varphi)(1) = c_{U(\varphi),U(\varphi)}((\varphi \otimes \varphi)(J_h))
\]

\[
= (\exp(ht/2)J_h(\omega \otimes \omega))_{21}
\]

\[
= \exp(ht/2)(J_h)_{21}(\omega \otimes \omega).
\]

Putting both computations together, we obtain the desired formula for \( J'_h \).

Let us prove (11.11). By a well-known result of Mac Lane’s, any braided monoidal category is equivalent to a strict braided monoidal category. It is therefore licit to omit the associativity isomorphisms in the computations. To simplify notation, we replace in the braidings the subscripts \( M_\pm \) by \( \pm \) and we omit the tensor product signs. With these
conventions, \( \chi = \text{id}_+ \otimes c_{+,-} \otimes \text{id}_- \) and \( \chi' = \text{id}_- \otimes c_{-,+} \otimes \text{id}_+ \). In \( \mathcal{C} \) we have the following sequence of equalities implying (11.11) and justified below:

\[
c_{-+,+-}(c_{+,-} \otimes c_{+,-}) \chi(i_+ \otimes i_-) = c_{-+,+-}(c_{+,-} \otimes c_{+,-})(\text{id}_+ \otimes c_{+,-} \otimes \text{id}_-)(i_+ \otimes i_-)
= (\text{id}_- \otimes c_{+,-} \otimes \text{id}_+)(c_{++,-} \otimes c_{-,-})(i_+ \otimes i_-)
= (\text{id}_- \otimes c_{+,-} \otimes \text{id}_+)(i_+ \otimes i_-)
= (\text{id}_- \otimes c_{+,-} \otimes \text{id}_+)(i_+ \otimes i_-) c_{+,-}
= \chi'(i_+ \otimes i_-) c_{+,-}
\]

Here, the first and the last equalities hold by definition of \( \chi \) and \( \chi' \). The second one is a consequence of the equality

\[
c_{-+,+-}(c_{+,-} \otimes c_{+,-})(\text{id}_+ \otimes c_{+,-} \otimes \text{id}_-) = (\text{id}_- \otimes c_{+,-} \otimes \text{id}_+)(c_{++,-} \otimes c_{-,-}),
\]

which holds in any braided monoidal category. This equality follows from the identity

\[
\sigma_2 \sigma_1 \sigma_3 \sigma_2 \sigma_1 \sigma_3 = \sigma_2^2 \sigma_1 \sigma_3 \sigma_2 \sigma_1 \sigma_3,
\]

which holds in Artin’s braid group on four strands \( B_4 \), where \( \sigma_1, \sigma_2, \sigma_3 \) are the standard generators of \( B_4 \).

The third equality in (11.13) is a consequence of

\[
c_{+,-} \pm = \text{id}_\pm \otimes \text{id}_\pm.
\]

Since both sides of (11.16) are \( U(\mathfrak{g}) \)-linear, it suffices to check this equality on the generator \( 1_\pm \otimes 1_\pm \) of \( M_\pm \otimes M_\pm \). Now, by (11.2) and the vanishing of \( t(1_\pm \otimes 1_\pm) \), we have

\[
c_{+,-}(1_\pm \otimes 1_\pm) = (\exp(ht/2)(1_\pm \otimes 1_\pm))_{21} = (1_\pm \otimes 1_\pm)_{21} = 1_\pm \otimes 1_\pm.
\]

This proves (11.16). The fourth equality in (11.13) holds by naturality of the braiding.

\[\square\]

11.8. Corollary.— Let \( \sigma_\omega : U_h(\mathfrak{g}) \to U_h(\mathfrak{g}') \) be the algebra isomorphism defined by \( \sigma_\omega(a) = \sigma(\omega^{-1}a\omega) \) for all \( a \in U_h(\mathfrak{g}) \). Then \( \sigma_\omega \) is a bialgebra isomorphism \( U_h(\mathfrak{g})_{\text{op}} \cong U_h(\mathfrak{g}') \).

Proof.— We have to check that

\[
\Delta'_h \sigma_\omega = (\sigma_\omega \otimes \sigma_\omega) \Delta_h^{\text{op}}.
\]

It follows from Lemma 11.7 that, for all \( a \in U(\mathfrak{g})[[h]], \)

\[
(\omega^{-1} \otimes \omega^{-1}) \Delta_h^{\text{op}}(a)(\omega \otimes \omega) = (\omega^{-1} \otimes \omega^{-1})(J_h^{-1})_{21}(\omega \otimes \omega)
= (J_h')^{-1}(\omega)^{-1} \exp(ht/2) \Delta(a) \exp(-ht/2) \Delta(\omega) J_h'.
\]

The 2-tensor \( t \) being invariant, \( \Delta(a)t = t\Delta(a) \), hence \( \Delta(a) \exp(ht/2) = \exp(ht/2) \Delta(a) \). Therefore,

\[
(\omega^{-1} \otimes \omega^{-1}) \Delta_h^{\text{op}}(a)(\omega \otimes \omega) = (J_h')^{-1}(\omega)^{-1} \Delta(\omega)^{-1} \Delta(a) \Delta(\omega) J_h'
= (J_h')^{-1}(\omega^{-1}a\omega) J_h'
= \Delta'_h(\omega^{-1}a\omega).
\]

This implies (11.17). \[\square\]
We now complete the proof of Theorem 11.1 by establishing that the bialgebra isomorphism \( \sigma_\omega : U_h(\mathfrak{g})^{\text{cop}} \to U_h(\mathfrak{g}') \) sends \( U_h(\mathfrak{g}_+^\pm) \) onto \( U_h(\mathfrak{g}'_\pm^\pm) \). We give the proof only for \( \mathfrak{g}'_+^\pm \). The proof for \( \mathfrak{g}'_-^\pm \) is similar.

For \( f' \in \text{Hom}_{C'}(M'_+ \otimes M'_-, M'_-) \) consider the endomorphism \( \mu'_+(f') \in \text{End}_C(M'_+ \otimes M'_-) \) defined as the following composition of morphisms in \( C' \):

\[
M'_+ \otimes M'_- \xrightarrow{i'_+ \otimes \text{id}'_+} (M'_+ \otimes M'_+) \otimes M'_- \xrightarrow{\alpha'} M'_+ \otimes (M'_+ \otimes M'_-) \xrightarrow{\text{id}'_+ \otimes f'} M'_+ \otimes M'_-. \tag{11.18}
\]

Here \( \text{id}'_+ \) is the identity morphism of \( M'_+ \), \( i'_+ : M'_+ \to M'_+ \otimes M'_+ \) is the analogue of \( i_+ : M_+ \to M_+ \otimes M_+ \), and \( \alpha' \) is the corresponding associativity isomorphism. Conjugating by the isomorphism \( \varphi' : U(\mathfrak{g}') \to M'_+ \otimes M'_- \), we obtain the endomorphism \( (\varphi')^{-1}\mu'_+(f')\varphi' \in \text{End}_{C'}(U(\mathfrak{g}')) \), hence the formal power series

\[
(f')^+ = ((\varphi')^{-1}\mu'_+(f')\varphi')(1) \in U(\mathfrak{g}')[[h]].
\]

By definition, \( U_h(\mathfrak{g}'_+^\pm) \) is the image of the map \( f' \mapsto (f')^+ \) from \( \text{Hom}_{C}(M'_+ \otimes M'_-, M'_-) \) to \( U_h(\mathfrak{g}') = U(\mathfrak{g}')[[h]] \). Under the above identifications, the morphism (11.18) in \( C' \) becomes for \( f \in \text{Hom}_{C}(M_- \otimes M_+, M_+) \) the composition of morphisms in \( C \)

\[
\mu(f) : M_- \otimes M_+ \xrightarrow{i_- \otimes \text{id}_+} (M_- \otimes M_-) \otimes M_+ \xrightarrow{\alpha} M_- \otimes (M_- \otimes M_+) \xrightarrow{\text{id}_- \otimes f} M_- \otimes M_. \tag{11.19}
\]

Therefore, the submodule \( \sigma^{-1}(U_h(\mathfrak{g}'_+^\pm)) \) of \( U_h(\mathfrak{g}) \) is the image of the map

\[
f \mapsto f_- = ((\varphi')^{-1}\mu(f)\varphi')(1)
\]

from \( \text{Hom}_{C}(M_- \otimes M_+, M_+) \) to \( U_h(\mathfrak{g}) = U(\mathfrak{g})[[h]] \), where \( \varphi' : U(\mathfrak{g}) \to M_- \otimes M_+ \) is defined by (11.7).

Let us compare the map \( f \mapsto f_- \) with the map \( g \mapsto g^- \) of Section 11.4. We shall prove below that

\[
c_{M_+,M_-}^{-1}(g) = \mu(gc_{M_+,M_-}^{-1})c_{M_+,M_-} \quad \tag{11.20}
\]

for all \( g \in \text{Hom}_{C}(M_+ \otimes M_-, M_+) \). It follows from (11.9), (11.10), (11.20), and from the definitions of \( g^- \) and of \( f_- \) that

\[
(gc_{M_+,M_-}^{-1})^- = ((\varphi')^{-1}\mu(gc_{M_+,M_-}^{-1})\varphi')(1)
\]

\[
= (\nu\varphi^{-1}c_{M_+,M_-}^{-1}(gc_{M_+,M_-}^{-1})\varphi\nu^{-1})(1)
\]

\[
= (\nu\varphi^{-1}\mu(g)\varphi\nu^{-1})(1)
\]

\[
= (\nu\varphi^{-1}\mu(g)\varphi)(\omega^{-1})
\]

\[
= \nu(\omega^{-1}(\varphi^{-1}\mu(g)\varphi)(1))
\]

\[
= \nu(\omega^{-1}g^-) = \omega^{-1}g^-\omega = \sigma_\omega(g^-).
\]

Consequently, \( \sigma_\omega(U_h(\mathfrak{g}_-)) = U_h(\mathfrak{g}'_+^\pm) \).
It remains to prove (11.20). We use the simplified notation introduced in the proof of (11.11). By functoriality of the braiding in $\mathcal{C}$, we have

\[(i_- \otimes \text{id}_+)_c = c_{+, -} = (\text{id}_- \otimes g)c_{+, -} \quad \text{and} \quad c_{+, -}(g \otimes \text{id}_-) = (\text{id}_- \otimes g)c_{+, -}, \]  

for $g \in \text{Hom}_\mathcal{C}(M_+ \otimes M_-, M_+)$. Therefore, by definition of $\mu$,

\[c_{+, -}^{-1}(g \otimes \text{id}_-) = (\text{id}_- \otimes g)(a \otimes c_{+, -}^{-1})ac_{+, -}^{-1}(\text{id}_- \otimes g). \]

Since $\mu_{-}(g) = (g \otimes \text{id}_-)a^{-1}(\text{id}_+ \otimes i_-)$, it suffices to observe that by the general properties of braided categories and (11.16),

\[ac_{+, -}^{-1} = ac_{+, -}(\text{id}_+ \otimes c_{+, -}) = (\text{id}_- \otimes c_{+, -})a^{-1}. \]  

This completes the proof of (11.20) and Theorem 11.1. \qed

We end this section by computing the universal $R$-matrix $R'_h$ of $U_h(\mathfrak{d}')$ in terms of the universal $R$-matrix $R_h$ of $U_h(\mathfrak{d})$ and the invertible element $\omega \in U_h(\mathfrak{d})$.

11.9. Lemma. — We have $R'_h = (\sigma_\omega \otimes \sigma_\omega)(R_h)_{21}$.

Proof. — By (5.6) and Lemma 11.7 we have

\[R'_h = (J'^{-1}_h)_{21} \exp(ht/2) J'_h \]

\[= (\omega^{-1} \otimes \omega^{-1}) J_h^{-1} \exp(-ht/2) \Delta(\omega) \exp(ht/2) \Delta(\omega)^{-1} \exp(ht/2)(J_h)_{21}(\omega \otimes \omega). \]

As observed in the proof of Corollary 11.8, $\Delta(a)$ commutes with $\exp(ht/2)$ for any $a \in U_h(\mathfrak{d})$. Hence,

\[R'_h = (\omega^{-1} \otimes \omega^{-1}) J_h^{-1} \exp(ht/2)(J_h)_{21}(\omega \otimes \omega) = (\omega^{-1} \otimes \omega^{-1})(R_h)_{21}(\omega \otimes \omega). \]  

\qed

12. Proof of Theorem 2.11

The aim of this section is to identify the bialgebra $A_{-}$ of Section 9. As an application, we prove Theorem 2.11.

Let us apply the constructions of Sections 6–7 to the Lie bialgebra $\mathfrak{g}'_+ = \mathfrak{g}_{-}$ of Sections 5.2 and 11. We obtain a $\mathbb{C}[[u, v]]$-bialgebra $U_{u, v}(\mathfrak{g}'_+)$ containing a $\mathbb{C}[u][v]]$-bialgebra $A_{u, v}(\mathfrak{g}'_+)$.  

59
12.1. Exchanging $u$ and $v$. Any $\mathbb{C}[[u,v]]$-module $M$ gives rise to a $\mathbb{C}[[u,v]]$-module $\tau(M)$ defined as follows. As a vector space $\tau(M) = M$, but the action of $u, v$ is different: the new action of $u$ is defined as the multiplication by $v$ and the new action of $v$ is defined as the multiplication by $u$. Clearly, $\tau(\tau(M)) = M$. Similarly, exchanging the actions of $u$ and $v$, we transform any $\mathbb{C}[u][[v]]$-module $M$ into a $\mathbb{C}[v][[u]]$-module $\tau(M)$.

For the Lie bialgebra $\mathfrak{g}_+^t = \mathfrak{g}_-$, we obtain a $\mathbb{C}[v][[u]]$-bialgebra $A_{v,u}(\mathfrak{g}_+^t)$ and a $\mathbb{C}[[u,v]]$-bialgebra $U_{v,u}(\mathfrak{g}_+^t)$ by

$$A_{v,u}(\mathfrak{g}_+^t) = \tau(A_{u,v}(\mathfrak{g}_+)) \quad \text{and} \quad U_{v,u}(\mathfrak{g}_+^t) = \tau(U_{u,v}(\mathfrak{g}_+^t)).$$

(12.1)

It is clear that $A_{v,u}(\mathfrak{g}_+^t) \subset U_{v,u}(\mathfrak{g}_+^t)$.

12.2. Theorem. — There is an isomorphism of $\mathbb{C}[[u,v]]$-bialgebras

$$\sigma_\sim : U_{u,v}(\mathfrak{g}_-) \rightarrow U_{u,v}(\mathfrak{g}_+^t)$$

sending $A_{\sim}$ onto $A_{v,u}(\mathfrak{g}_+^t)$.

Proof. — After extending the scalars from $\mathbb{C}[[h]]$ to $\mathbb{C}[[u,v]]$ and exchanging $u$ and $v$, the $\mathbb{C}[[h]]$-bialgebra isomorphism $\sigma : U_h(\mathfrak{h}) \rightarrow U_h(\mathfrak{h}'$) of Theorem 11.1 gives rise to a $\mathbb{C}[[u,v]]$-bialgebra isomorphism

$$\sigma_\sim : U_{u,v}(\mathfrak{h}) \rightarrow U_{u,v}(\mathfrak{h}')$$

(12.2)

sending $U_{u,v}(\mathfrak{h})$ onto $U_{u,v}(\mathfrak{h}')$. The isomorphism $\sigma_\sim$ is given by $a \mapsto \tilde{\sigma}(\tilde{\omega}^{-1} a\tilde{\omega})$, where $\tilde{\sigma} : U_{u,v}(\mathfrak{h}) \rightarrow U_{u,v}(\mathfrak{h}')$ is the algebra isomorphism induced by extension of scalars from the algebra isomorphism $\sigma : U_h(\mathfrak{h}) \rightarrow U_h(\mathfrak{h}')$ of Section 11.5, and where $\tilde{\omega}$ is the invertible element of $U_{u,v}(\mathfrak{h}) = U(\mathfrak{h})[[u,v]]$ coming from the element $\omega \in U_h(\mathfrak{h}) = U(\mathfrak{h})[[h]]$, cf. Section 4.6. As a consequence of Lemma 11.7, we have

$$\tilde{\omega} \equiv 1 \mod uv.$$  

(12.3)

The bialgebra $U_{u,v}(\mathfrak{h}')$ contains a universal $R$-matrix

$$R'_{u,v} \in U_{u,v}(\mathfrak{h}') \otimes_{\mathbb{C}[[u,v]]} U_{u,v}(\mathfrak{h}')$$

defined in the same way as the element $R_{u,v} \in U_{u,v}(\mathfrak{h}) \otimes_{\mathbb{C}[[[u,v]]]} U_{u,v}(\mathfrak{h})$ in Section 6. As an immediate corollary of Lemma 11.9,

$$R'_{u,v} = (\sigma_\sim \otimes \sigma_\sim)(R_{u,v})_{21}.$$  

(12.4)

We have to show that $\sigma_\sim$ maps $A_{-}$ onto $A_{v,u}(\mathfrak{g}_+^t)$. We first describe $A_{u,v}(\mathfrak{g}_+^t)$ following Sections 5.5 and 6.6. To begin with, we need a $\mathbb{C}[[h]]$-linear isomorphism $\alpha'_- : U_h(\mathfrak{g}_-) \rightarrow U(\mathfrak{g}_-)[[h]]$ such that $\alpha_-'(1) = 1$ and $\alpha_-' \equiv \text{id}$ modulo $h$, and a $\mathbb{C}$-linear projection $\pi'_- : U(\mathfrak{g}_-) \rightarrow U^1(\mathfrak{g}_-) = \mathbb{C} \oplus \mathfrak{g}_-$ that is the identity on $U^1(\mathfrak{g}_-)$. We choose them in such a way that the following squares commute:

$$\begin{array}{ccc}
U_h(\mathfrak{g}_+) & \xrightarrow{\alpha_-'} & U(\mathfrak{g}_-)[[h]] \\
\sigma_\sim & \downarrow & \sigma \\
U_h(\mathfrak{g}_-) & \xrightarrow{\alpha'_-} & U(\mathfrak{g}_-)[[h]],
\end{array} \quad \begin{array}{ccc}
U(\mathfrak{g}_+) & \xrightarrow{\pi_-'} & U^1(\mathfrak{g}_+) \\
\sigma & \downarrow & \sigma \\
U(\mathfrak{g}_-) & \xrightarrow{\pi'_-} & U^1(\mathfrak{g}_-)
\end{array}$$

(12.5)
where \(\alpha_+ : U_h(g_+) \rightarrow U(g_+)[[h]]\) has been chosen in Section 6.6 and \(\pi_+ : U(g_+) \rightarrow U^1(g_+)\) in Section 9.1.

For any \(y \in g_-\), let \(\sigma(y)\) be the corresponding element in \(g'_+\) and \(\langle \sigma(y), - \rangle' : U^1(g'_-) \rightarrow C\) be the \(C\)-linear form extending the standard evaluation map \(\langle \sigma(y), - \rangle' : g'_- \rightarrow C\) and such that \(\langle \sigma(y), 1 \rangle' = 0\). Following Section 5.5, given \(y \in g_-\), we define a \(C[[h]]\)-linear form \(f'_{\sigma(y)} : U_h(g'_-) \rightarrow C[[h]]\) for \(a \in U_h(g'_-)\) by

\[
f'_{\sigma(y)}(a) = \langle \sigma(y), \pi'_- \alpha'_-(a) \rangle'.
\]

By extension of scalars, we obtain a \(C[[u, v]]\)-linear form \(\tilde{f}'_{\sigma(y)} : U_{u,v}(g'_-) \rightarrow C[[u, v]]\). By Lemma 6.5, the element

\[
\rho'_+(\tilde{f}'_{\sigma(y)}) = (\text{id} \otimes \tilde{f}'_{\sigma(y)})(R'_{u,v}) \in U_{u,v}(g'_+)
\]

is divisible by \(uv\). Let \((y_1, \ldots, y_d)\) be the basis of \(g_-\) dual to the basis \((x_1, \ldots, x_d)\) of \(g_+\).

In view of Section 6.6, \(A_{u,v}(g'_+)\) is the \(C[u][[v]]\)-submodule of \(U_{u,v}(g'_+)\) generated by the elements

\[
v^{-|\underline{k}|} \rho'_+(\tilde{f}'_{\sigma(y_1)})^{k_1} \cdots \rho'_+(\tilde{f}'_{\sigma(y_d)})^{k_d},
\]

where \(\underline{k}\) runs over all finite sequences of nonnegative integers.

Therefore, \(A_{v,u}(g'_+) = \tau(A_{u,v}(g'_+))\) is the \(C[v][[u]]\)-submodule of \(U_{v,u}(g'_+)\) generated by the elements

\[
u^{-|\underline{k}|} \rho'_+(\tilde{f}'_{\sigma(y_1)})^{k_1} \cdots \rho'_+(\tilde{f}'_{\sigma(y_d)})^{k_d},
\]

where \(\underline{k}\) runs over all finite sequences of nonnegative integers.

In view of the definition of \(A_-\) (see Section 9.1), in order to prove that \(\sigma_-^{-1}(A_-) = A_{v,u}(g'_-)\), it suffices to check that for all \(y \in g_-\)

\[
\sigma_-^{-1}(\rho_-(g_y)) = -\rho'_+(\tilde{f}'_{\sigma(y)}),
\]

where \(\rho_-\) is defined by (6.2) and \(g_y : U_{u,v}(g_+) \rightarrow C[[u, v]]\) is the \(C[[u, v]]\)-linear form extended from the linear form \(g_y : U_h(g_+) \rightarrow C[[h]]\) defined by (9.1).

Let us prove (12.9). First observe that, since \(\sigma = -\text{id}\) on \(g_+\) and \(\sigma = \text{id}\) on \(g_-\), we have

\[
\langle \sigma(y), \sigma(x) \rangle' = -\langle x, y \rangle
\]

for all \(x \in g_+\) and \(y \in g_-\). It follows from (9.1), (12.5), (12.6), and (12.10) that

\[
f'_{\sigma(y)}(\sigma_-(a)) = \langle \sigma(y), \pi'_- \alpha'_-(\sigma_-(a)) \rangle'
\]

\[
= \langle \sigma(y), \sigma \pi_+ \alpha_+(a) \rangle'
\]

\[
= -\langle \pi_+ \alpha_+(a), y \rangle = -g_y(a)
\]

for all \(y \in g_-\) and \(a \in U_h(g_+)\). By extension of scalars, we obtain

\[
\tilde{f}'_{\sigma(y)}(\sigma_-(a)) = -\tilde{g}_y(a)
\]

\[61\]
for all \( y \in g_- \) and \( a \in U_{u,v}(g_+) \).

As a consequence of (6.2), (12.4), (12.7), and (12.11),

\[
\rho'_+(\tilde{f}^l_{\sigma(y)}(R'_{u,v})) = (\text{id} \otimes \tilde{f}^l_{\sigma(y)})(R'_{u,v})
\]

\[
= (\text{id} \otimes \tilde{f}^l_{\sigma(y)})(\sigma'_- \otimes \sigma'_-)(R_{u,v})_{21}
\]

\[
= (\tilde{f}^l_{\sigma(y)} \otimes \text{id})(\sigma'_- \otimes \sigma'_-)(R_{u,v})
\]

\[
= \sigma'_-((\tilde{f}^l_{\sigma(y)} \sigma'_- \otimes \text{id})(R_{u,v}))
\]

\[
= -\sigma'_-(\rho'_-(\tilde{g}_y)).
\]

This proves (12.9) and completes the proof of Theorem 12.2. \( \square \)

12.3. **Proof of Theorem 2.11.**— Under the bialgebra isomorphism \( A^- \cong A_{v,u}(g'_+) \) of Theorem 12.2, the nondegenerate bialgebra pairing \( (\ ,\ )_{u,v} \) of Lemma 9.5 and Corollary 9.9 gives rise to a nondegenerate bialgebra pairing \( A_{u,v}(g_+) \times A_{v,u}(g'_+) \to \mathbb{C}[[u,v]]. \) The second assertion in Theorem 2.11 follows from (9.18) and (12.3). \( \square \)

**Appendix. Biquantization of the trivial bialgebra**

Let \( g_+ \) be a \( d \)-dimensional Lie bialgebra with basis \( (x_1, \ldots, x_d) \) and with dual basis \( (y_1, \ldots, y_d) \). Assume throughout the appendix that \( g_+ \) is the trivial Lie bialgebra, i.e., with zero Lie bracket and cobracket:

\[
[x_i, x_j] = 0 \quad \text{and} \quad \delta(x_i) = 0 \quad (A.1)
\]

for all \( i \) and \( j = 1, \ldots, d \). We now give a complete description of the biquantization \( A_{u,v}(g_+) \) and of the pairing (9.9) under the hypothesis (A.1).

The dual Lie bialgebra \( g_- = (g^+_+)^{\text{cop}} \) is also trivial, whereas the double Lie bialgebra \( \mathfrak{d} = g_+ \oplus g_- \) is not: it follows from (5.1) and (5.2) that the Lie bracket of \( \mathfrak{d} \) is equal to zero, but not its Lie cobracket, which is given by \( \delta(u) = [u \otimes 1 + 1 \otimes u, r] \), where \( r = \sum_{i=1}^d x_i \otimes y_i \).

We first determine the bialgebras \( U_h(\mathfrak{d}) \) and \( U_h(g_{\pm}) \) of Section 5. Since \( \mathfrak{d} \) is a trivial Lie algebra, we have

\[
U_h(\mathfrak{d}) = U(\mathfrak{d})[[h]] = S(\mathfrak{d})[[h]]. \quad (A.2)
\]

This is not only an isomorphism of algebras, but also of bialgebras. Indeed, since \( U_h(\mathfrak{d}) \) is commutative, it follows from (5.3) that its comultiplication is the standard one: \( \Delta_h = \Delta \).

In order to determine the subbialgebras \( U_h(g_{\pm}) \) of \( U_h(\mathfrak{d}) \), we need Sections 11.2–11.4, whose notation we use freely. Consider the braided monoidal category \( \mathcal{C} \) of Section 11.2. We claim that the associativity isomorphisms are trivial:

\[
a_{L,M,N} = \text{id}_L \otimes M \otimes N \quad (A.3)
\]

62
for any triple \((L, M, N)\) of objects in \(\mathcal{C}\). Indeed, since the Lie algebra \(\mathfrak{g}\) is abelian, the morphisms \(t_{L,M} \otimes \text{id}_N\) and \(\text{id}_L \otimes t_{M,N}\) coming up in (11.1) commute with one another. Now, the Drinfeld associator \(\Phi(A, B)\), being the exponential of a Lie series in the variables \(A\) and \(B\), is equal to 1 if \(A\) and \(B\) commute. This proves (A.3).

On the Verma modules \(M_{\pm}\), the braiding \(c_{M_{\pm},M_{\pm}}\) is given by

\[
c_{M_{\pm},M_{\pm}}(1_+ \otimes 1_-) = \exp(ht/2)(1_- \otimes 1_+)
\]

in view of (11.2) and the symmetry of \(t\). Since \(\mathfrak{g}\) is abelian, we have

\[
\exp(ht/2) = \prod_{i=1}^{d} \exp(h(x_i \otimes y_i)/2) \exp(hr_{21}/2).
\]

Now, \(r_{21}(1_- \otimes 1_+) = \sum_{i=1}^{d} y_i 1_- \otimes x_i 1_+ = 0\). Therefore

\[
c_{M_{\pm},M_{\pm}}(1_+ \otimes 1_-) = \prod_{i=1}^{d} \exp(h(x_i \otimes y_i)/2)(1_- \otimes 1_+). \tag{A.4}
\]

Let us give a formula for the isomorphism \(\varphi : U(\mathfrak{g}) \rightarrow M_{\pm} \otimes M_{\pm}\) of (11.3). Since \(\mathfrak{g} = \mathfrak{g}_+ \oplus \mathfrak{g}_-\) as Lie algebras, any element of \(U(\mathfrak{g}) = S(\mathfrak{g})\) is a linear combination of elements of the form \(ab\), where \(a \in S(\mathfrak{g}_+) \subset S(\mathfrak{g})\) and \(b \in S(\mathfrak{g}_-) \subset S(\mathfrak{g})\). We have

\[
\varphi(ab) = b 1_+ \otimes a 1_- \tag{A.5}
\]

Indeed, using Sweedler’s notation, the definition of \(M_{\pm}\) as modules, and the commutativity of \(U(\mathfrak{g}) = S(\mathfrak{g})\), we have

\[
\varphi(ab) = \Delta(ab)(1_+ \otimes 1_-)
= \sum_{(a)(b)} a_{(1)} b_{(1)} 1_+ \otimes a_{(2)} b_{(2)} 1_- \\
= \sum_{(a)(b)} b_{(1)} a_{(1)} 1_+ \otimes a_{(2)} b_{(2)} 1_- \\
= \sum_{(a)(b)} b_{(1)} \varepsilon(a_{(1)}) 1_+ \otimes a_{(2)} \varepsilon(b_{(2)}) 1_- \\
= \left(\sum_{(b)} b_{(1)} \varepsilon(b_{(2)}) 1_+\right) \otimes \left(\sum_{(a)} \varepsilon(a_{(1)}) a_{(2)} 1_-\right) \\
= b 1_+ \otimes a 1_-.
\]

It follows that, for \(a \in S(\mathfrak{g}_+)\) and \(b \in S(\mathfrak{g}_-),\)

\[
\varphi(\exp(ab)) = \exp(b \otimes a)(1_+ \otimes 1_-). \tag{A.6}
\]
A.1. Proposition. — \( U_h(\mathfrak{g}_\pm) = S(\mathfrak{g}_\pm)[[h]] \) as bialgebras.

Proof. — We prove this for \( U_h(\mathfrak{g}_+) \). There is a similar proof for \( U_h(\mathfrak{g}_-) \).

By Section 11.4, \( U_h(\mathfrak{g}_+) \) is the image of the map \( f \mapsto f^+ \) from \( \text{Hom}_\mathfrak{C}(M_+ \otimes M_-, M_-) \) to \( U_h(\mathfrak{d}) = U(\mathfrak{d})[[h]] \). We claim that this image is exactly the submodule \( U(\mathfrak{g}_+)[[h]] \) of \( U(\mathfrak{d})[[h]] \) consisting of the formal power series with coefficients in \( U(\mathfrak{g}_+) \subseteq U(\mathfrak{d}) \). Indeed, an element \( f \in \text{Hom}_\mathfrak{C}(M_+ \otimes M_-, M_-) \) is of the form \( f = \sum_{i \geq 0} f_i h^i \) where the maps \( f_i : M_+ \otimes M_- \to M_- \) are \( U(\mathfrak{d}) \)-linear. Since \( M_+ \otimes M_- \) is a rank-one free module generated by \( 1_+ \otimes 1_- \), the map \( f_i \) is determined by the element \( a_i 1_- = f_i(1_+ \otimes 1_-) \in M_- \), where \( a_i \) is a well-defined element of \( U(\mathfrak{g}_+) \). The claim will be proved if we show that \( f^+ = \sum_{i \geq 0} a_i h^i \).

By (11.5), (A.3) and (A.5) we have

\[
\begin{align*}
f^+ &= (\varphi^{-1} \mu_+(f) \varphi)(1) \\
&= \sum_{i \geq 0} (\varphi^{-1} (\text{id}_+ \otimes f_i) a (i_+ \otimes \text{id}_-) \varphi)(1) h^i \\
&= \sum_{i \geq 0} (\varphi^{-1} (\text{id}_+ \otimes f_i) (i_+ \otimes \text{id}_-) \varphi)(1) h^i \\
&= \sum_{i \geq 0} (\varphi^{-1} (\text{id}_+ \otimes f_i) (i_+ \otimes \text{id}_-))(1_+ \otimes 1_-) h^i \\
&= \sum_{i \geq 0} (\varphi^{-1} (\text{id}_+ \otimes f_i))(1_+ \otimes 1_+) h^i \\
&= \sum_{i \geq 0} \varphi^{-1}(1_+ \otimes a_i 1_-) h^i = \sum_{i \geq 0} a_i h^i.
\end{align*}
\]

The fact that \( U_h(\mathfrak{g}_\pm) = U(\mathfrak{g}_\pm)[[h]] \) is a subbialgebra of \( U(\mathfrak{d})[[h]] \), hence has the standard product and coproduct, follows from the obvious fact that \( U(\mathfrak{g}_\pm) \) is a subbialgebra of \( U(\mathfrak{d}) \). The Lie algebras \( \mathfrak{d} \) and \( \mathfrak{g}_\pm \) being abelian, we have \( U(\mathfrak{g}_\pm) = S(\mathfrak{g}_\pm) \). Consequently, \( U_h(\mathfrak{g}_\pm) = S(\mathfrak{g}_\pm)[[h]] \) as bialgebras.

\[\square\]

A.2. Corollary. — The bialgebra \( \widehat{A}_+ \) is the subbialgebra of \( S(\mathfrak{g}_+)[[u, v]] \) consisting of the formal power series \( \sum_{m,n \geq 0} a_{m,n} u^m v^n \) such that \( a_{m,n} \in \bigoplus_{k=0}^n S^k(\mathfrak{g}_+) \) for all \( m \geq 0 \).

Proof. — By (6.1), Proposition A.1 and Lemma 4.7, we have \( U_{u,v}(\mathfrak{g}_+) = S(\mathfrak{g}_+)[[u, v]] \). We conclude in view of (7.1) and of Proposition 3.8.

\[\square\]

Similarly, the bialgebra \( \widehat{A}_- \) of Section 9.1 is the subbialgebra of \( S(\mathfrak{g}_-)[[u, v]] \) consisting of the formal power series \( \sum_{m,n \geq 0} b_{m,n} u^m v^n \) such that \( b_{m,n} \in \bigoplus_{k=0}^n S^k(\mathfrak{g}_-) \) for all \( n \geq 0 \).

In order to determine the subalgebras \( A_{u,v}(\mathfrak{g}_+) \) and \( A_- \) defined in Sections 6.6 and 9.4, we have to make explicit the element \( R_{u,v} \in U_{u,v}(\mathfrak{g}_+) \otimes C[[u,v]]U_{u,v}(\mathfrak{g}_-) \) of Section 6. Let \( J_h \) and \( R_h \) be the elements of \( (U(\mathfrak{d}) \otimes C U(\mathfrak{d}))[[h]] \) given by (11.4) and (5.6), respectively.
A.3. **Lemma.**— We have $J_h = \exp(hr/2)$ and $R_h = \exp(hr)$.

**Proof.**— By (11.4), (A.4) and (A.5), we have

$$
(\varphi \otimes \varphi)(J_h) = \chi(1_+ \otimes 1_+ \otimes 1_- \otimes 1_-)
= \exp(\frac{ht}{2}) (1_+ \otimes 1_- \otimes 1_+ \otimes 1_-)
= \exp(\frac{hr}{2}) (1_+ \otimes 1_- \otimes 1_+ \otimes 1_-)
$$

$$
= \sum_{n \geq 0} \frac{h^n}{2^n n!} \left( \sum_{i=1}^d 1 \otimes x_i \otimes y_i \otimes 1 \right)^n (1_+ \otimes 1_- \otimes 1_+ \otimes 1_-)
= 1 \otimes \left( \sum_{n \geq 0} \frac{h^n}{2^n n!} \sum_{i_1, \ldots, i_n} x_{i_1} \cdots x_{i_n} 1_- \otimes y_{i_1} \cdots y_{i_n} 1_+ \right) \otimes 1_-
= (\varphi \otimes \varphi) \left( \sum_{n \geq 0} \frac{h^n}{2^n n!} \sum_{i_1, \ldots, i_n} x_{i_1} \cdots x_{i_n} \otimes y_{i_1} \cdots y_{i_n} \right)
= (\varphi \otimes \varphi) (\exp(hr/2)).
$$

Formula (5.6) implies

$$
R_h = (J_h^{-1})_{21} \exp(\frac{ht}{2}) J_h = \exp((-r_{21} + r + r_{21} + r) \frac{h}{2}) = \exp(hr).
$$

\qed

A.4. **Corollary.**— We have

$$
R_{u,v} = \exp(uvr) = \sum_{n \geq 0} \frac{u^nv^n}{n!} \sum_{i_1, \ldots, i_n=1}^d x_{i_1} \cdots x_{i_n} \otimes y_{i_1} \cdots y_{i_n}.
$$

From $R_{u,v}$ we get maps $\rho_+ : U^*_{u,v}(g_-) \to U_{u,v}(g_+)$ and $\rho_- : U^*_{u,v}(g_+) \to U_{u,v}(g_-)$ as in Section 6. Formula (5.10) defines a $C[[h]]$-linear form $f_x : U_h(g_-) = S(g_-)[[h]] \to C[[h]]$, where we may take $\alpha_- = \text{id}$ and $\pi_- : U(g_-) = S(g_-) \to U^1(g_-) = C \oplus g_-$ the natural projection. It follows that the map $\tilde{f}_x : U_{u,v}(g_-) = S(g_-)[[u,v]] \to C[[u,v]]$ of Section 6.4 is given for $b = \sum_{m,n \geq 0} b_{m,n} u^m v^n \in S(g_-)[[u,v]]$ by

$$
\tilde{f}_x(b) = \sum_{n \geq 0} \langle x, \pi(b_{m,n}) \rangle u^m v^n.
$$

(A.7)
A.5. Lemma.— We have \( v^{-1} \rho(x) = ux \) for all \( x \in \mathfrak{g}_+ \).

Proof.— By (6.2), (A.7) and Corollary A.4 we get

\[
\rho(x) = (\text{id} \otimes \tilde{f})(R_{u,v})
= \sum_{n \geq 0} \frac{u^n v^n}{n!} \sum_{i_1, \ldots, i_n} \tilde{f}(y_{i_1} \cdots y_{i_n}) x_{i_1} \cdots x_{i_n}
= \sum_{n \geq 0} \frac{u^n v^n}{n!} \sum_{i_1, \ldots, i_n} \langle x, \pi(y_{i_1} \cdots y_{i_n}) \rangle x_{i_1} \cdots x_{i_n}
= uv \sum_{i=1}^{d} \langle x, \pi(y_i) \rangle x_i = uv \sum_{i=1}^{d} \langle x, y_i \rangle x_i = uv x.
\]

□

A.6. Corollary.— \( A_{u,v}(\mathfrak{g}_+) \) consists of the formal power series \( \sum_{m,n \geq 0} a_{m,n} u^m v^n \) such that \( a_{m,n} \in \bigoplus_{k=0}^{m} S^k(\mathfrak{g}_+) \) for all \( m \geq 0 \), and for all \( n \geq 0 \) there exists \( N \) with \( a_{m,n} = 0 \) for all \( m > N \).

Similarly, the bialgebra \( A_- \) consists of the formal power series \( \sum_{m,n \geq 0} b_{m,n} u^m v^n \) such that \( b_{m,n} \in \bigoplus_{k=0}^{n} S^k(\mathfrak{g}_-) \) for all \( n \geq 0 \), and for all \( m \geq 0 \) there exists \( M \) with \( b_{m,n} = 0 \) for all \( n > M \). Together with Corollary A.6, this implies that

\( A_- = A_{v,u}(\mathfrak{g}_-) \).

Let us describe the bialgebra pairing \(( , )_{u,v} : A_{u,v}(\mathfrak{g}_+) \times A_{u,v}^{\text{cop}} \to C[[u,v]]\) defined by (9.9). By (2.11) and Corollary A.6, it suffices to compute \((ux, vy)_{u,v}\) when \( x \in \mathfrak{g}_+ \) and \( y \in \mathfrak{g}_- \). The following result shows that the pairing \(( , )_{u,v}\) is the standard one.

A.7. Lemma.— We have \((ux, vy)_{u,v} = \langle x, y \rangle\) for all \( x \in \mathfrak{g}_+ \) and \( y \in \mathfrak{g}_- \).

Proof.— By (9.9), (A.7), and Lemma A.5 we have

\[
(ux, vy)_{u,v} = (\rho^{-1}(ux))(vy) = v^{-1} \tilde{f}(vy) = v^{-1} v \langle x, \pi(y) \rangle = \langle x, y \rangle.
\]

□

A.8. Remark.— The reader may check, using (A.4) and (A.6), that the invertible element \( \omega \in U_h(\mathfrak{o}) = S(\mathfrak{o})[[h]] \) defined by (11.10) is given by

\[
\omega = \exp \left( \frac{h}{2} \sum_{i=1}^{d} x_i y_i \right).
